In-Text Concept Questions

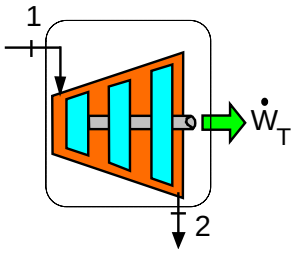
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.a

Make a control volume around the turbine in the steam power plant in Fig. 1.2 and list the flows of mass and energy that are there.

Solution:

We see hot high pressure steam flowing in at state 1 from the steam drum through a flow control (not shown). The steam leaves at a lower pressure to the condenser (heat exchanger) at state 2. A rotating shaft gives a rate of energy (power) to the electric generator set.



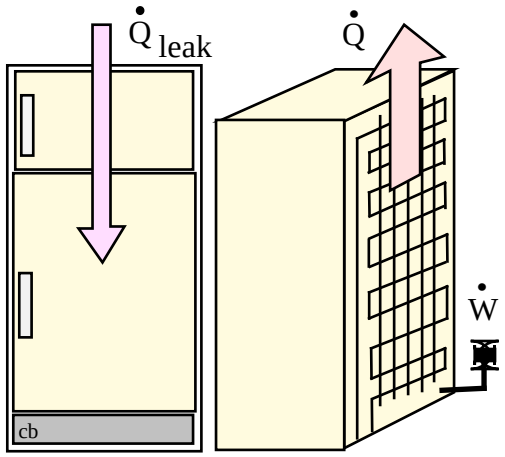
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.b

Take a control volume around your kitchen refrigerator and indicate where the components shown in Figure 1.3 are located and show all flows of energy transfers.

Solution:

The valve and the cold line, the evaporator, is inside close to the inside wall and usually a small blower distributes cold air from the freezer box to the refrigerator room.



The black grille in the back or at the bottom is the condenser that gives heat to the room air.

The compressor sits at the bottom.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.c

Why do people float high in the water when swimming in the Dead Sea as compared with swimming in a fresh water lake?

As the dead sea is very salty its density is higher than fresh water density. The buoyancy effect gives a force up that equals the weight of the displaced water. Since density is higher the displaced volume is smaller for the same force.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.d

Density of liquid water is $\rho = 1008 - T/2$ [kg/m^3] with T in ^{o}C. If the temperature increases, what happens to the density and specific volume?

Solution:

The density is seen to decrease as the temperature increases.

$$\Delta\rho = -\Delta T/2$$

Since the specific volume is the inverse of the density $v = 1/\rho$ it will increase.

1.e

A car tire gauge indicates 195 kPa; what is the air pressure inside?

The pressure you read on the gauge is a gauge pressure, ΔP, so the absolute pressure is found as

$$P = P_o + \Delta P = 101 + 195 = 296 \text{ kPa}$$

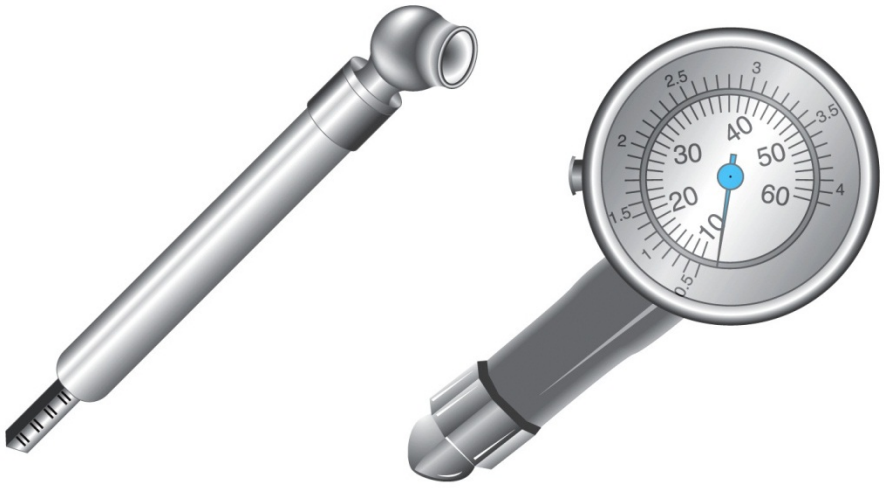


Figure 1.21

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.f

Can I always neglect ΔP in the fluid above location A in figure 1.13? What does that depend on?

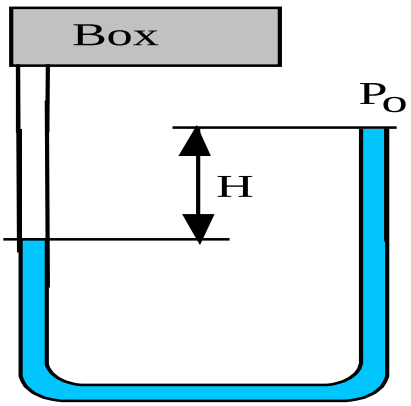
If the fluid density above A is low relative to the manometer fluid then you neglect the pressure variation above position A, say the fluid is a gas like air and the manometer fluid is like liquid water. However, if the fluid above A has a density of the same order of magnitude as the manometer fluid then the pressure variation with elevation is as large as in the manometer fluid and it must be accounted for.

1.g

A U tube manometer has the left branch connected to a box with a pressure of 110 kPa and the right branch open. Which side has a higher column of fluid?

Solution:

Since the left branch fluid surface feels 110 kPa and the right branch surface is at 100 kPa you must go further down to match the 110 kPa. The right branch has a higher column of fluid.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

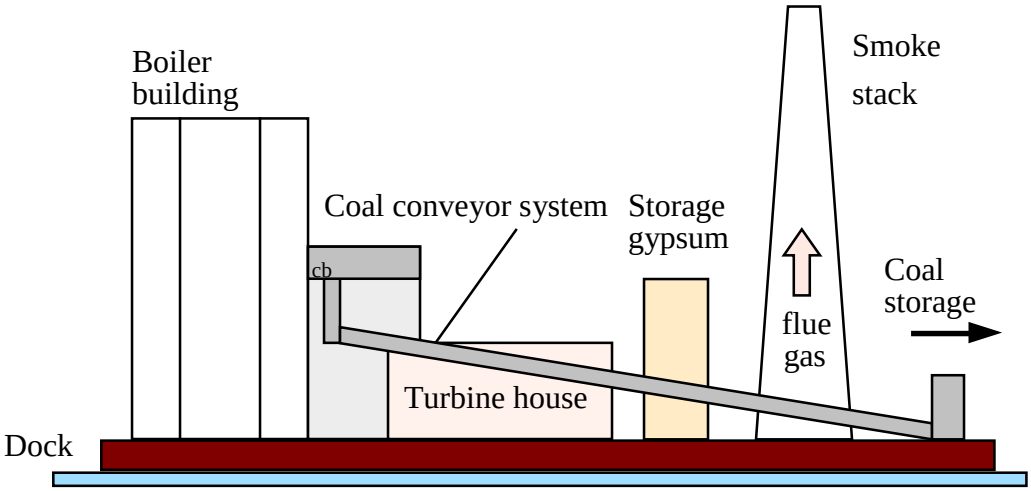
Concept Problems

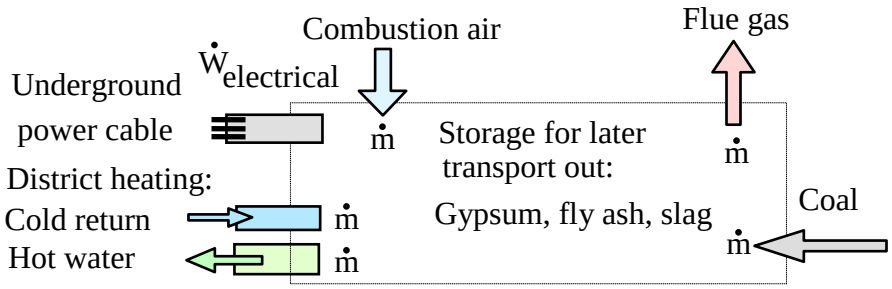
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.1

Make a control volume around the whole power plant in Fig. 1.1 and with the help of Fig. 1.2 list what flows of mass and energy are in or out and any storage of energy. Make sure you know what is inside and what is outside your chosen C.V.

Solution:



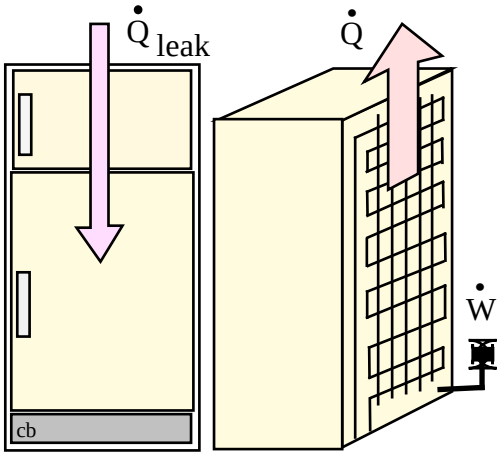


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.2

Make a control volume around the refrigerator in Fig. 1.3. Identify the mass flow of external air and show where you have significant heat transfer and where storage changes.

The valve and the cold line, the evaporator, is inside close to the inside wall and usually a small blower distributes cold air from the freezer box to the refrigerator room.



The black grille in the back or at the bottom is the condenser that gives heat to the room air.

The compressor sits at the bottom.

The storage changes inside the box which is outside of the refrigeration cycle components of Fig. 1.3, when you put some warmer mass inside the refrigerator it is being cooled by the evaporator and the heat is leaving in the condenser.

The condenser warms outside air so the air flow over the condenser line carries away some energy. If natural convection is not enough to do this a small fan is used to blow air in over the condenser (forced convection). Likewise the air being cooled by the evaporator is redistributed inside the refrigerator by a small fan and some ducts.

Since the room is warmer than the inside of the refrigerator heat is transferred into the cold space through the sides and the seal around the door. Also when the door is opened warm air is pulled in and cold air comes out from the refrigerator giving a net energy transfer similar to a heat transfer.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.3

Separate the list P, F, V, v, ρ, T, a, m, L, t, and **V** into intensive, extensive, and non-properties.

Solution:

Intensive properties are independent upon mass: P, v, ρ, T
Extensive properties scales with mass: V, m
Non-properties: F, a, L, t, **V**

Comment: You could claim that acceleration a and velocity **V** are physical properties for the dynamic motion of the mass, but not thermal properties.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.4

A tray of liquid water is placed in a freezer where it cools from 20°C to -5°C. Show the energy flow(s) and storage and explain what changes.

Inside the freezer box, the walls are very cold as they are the outside of the evaporator, or the air is cooled and a small fan moves the air around to redistribute the cold air to all the items stored in the freezer box. The fluid in the evaporator absorbs the energy and the fluid flows over to the compressor on its way around the cycle, see Fig. 1.3. As the water is cooled it eventually reaches the freezing point and ice starts to form. After a significant amount of energy is removed from the water it is turned completely into ice (at 0°C) and then cooled a little more to -5°C. The water has a negative energy storage and the energy is moved by the refrigerant fluid out of the evaporator into the compressor and then finally out of the condenser into the outside room air.

1.5

The overall density of fibers, rock wool insulation, foams and cotton is fairly low. Why is that?

Solution:

All these materials consist of some solid substance and mainly air or other gas. The volume of fibers (clothes) and rockwool that is solid substance is low relative to the total volume that includes air. The overall density is

$$\rho = \frac{m}{V} = \frac{m_{solid} + m_{air}}{V_{solid} + V_{air}}$$

where most of the mass is the solid and most of the volume is air. If you talk about the density of the solid only, it is high.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

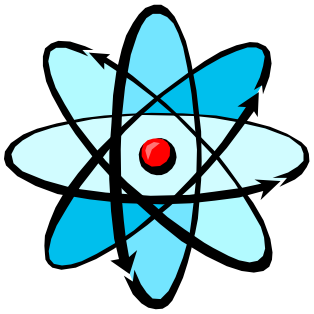
1.6

Is density a unique measure of mass distribution in a volume? Does it vary? If so, on what kind of scale (distance)?

Solution:

Density is an average of mass per unit volume and we sense if it is not evenly distributed by holding a mass that is more heavy in one side than the other. Through the volume of the same substance (say air in a room) density varies only little from one location to another on scales of meter, cm or mm. If the volume you look at has different substances (air and the furniture in the room) then it can change abruptly as you look at a small volume of air next to a volume of hardwood.

Finally if we look at very small scales on the order of the size of atoms the density can vary infinitely, since the mass (electrons, neutrons and positrons) occupy very little volume relative to all the empty space between them.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.7

Water in nature exists in different phases such as solid, liquid and vapor (gas). Indicate the relative magnitude of density and specific volume for the three phases.

Solution:

Values are indicated in Figure 1.8 as density for common substances. More accurate values are found in Tables A.3, A.4 and A.5

Water as solid (ice) has density of around 900 kg/m^3

Water as liquid has density of around 1000 kg/m^3

Water as vapor has density of around 1 kg/m^3 (sensitive to P and T)

Ice cube

Liquid drops falling

Cloud*

* Steam (water vapor) cannot be seen, what you see are tiny drops suspended in air from which we infer that there was some water vapor before it condensed.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.8

What is the approximate mass of 1 L of gasoline? Of helium in a balloon at T_o, P_o?

Solution:

Gasoline is a liquid slightly lighter than liquid water so its density is smaller than 1000 kg/m^3. 1 L is 0.001 m^3 which is a common volume used for food items. A more accurate density is listed in Table A.3 as 750 kg/m^3 so the mass becomes

$$m = \rho V = 750 \text{ kg/m}^3 \times 0.001 \text{ m}^3 = 0.75 \text{ kg}$$

The helium is a gas highly sensitive to P and T, so its density is listed at the standard conditions (100 kPa, 25C) in Table A.5 as $\rho = 0.1615$ kg/m^3,

$$m = \rho V = 0.1615 \text{ kg/m}^3 \times 0.001 \text{ m}^3 = 1.615 \times 10^{-4} \text{ kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.9

Can you carry 1 m^3 of liquid water?

Solution:

The density of liquid water is about 1000 kg/m^3 from Figure 1.7, see also Table A.3. Therefore the mass in one cubic meter is

$$m = \rho V = 1000\ kg/m^3 \times 1\ m^3 = 1000\ kg$$

and we can not carry that in the standard gravitational field.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.10

A heavy refrigerator has four height-adjustable feet. What feature of the feet will ensure that they do not make dents in the floor?

Answer:
The area that is in contact with the floor supports the total mass in the gravitational field.

$$F = PA = mg$$

so for a given mass the smaller the area is the larger the pressure becomes.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.11

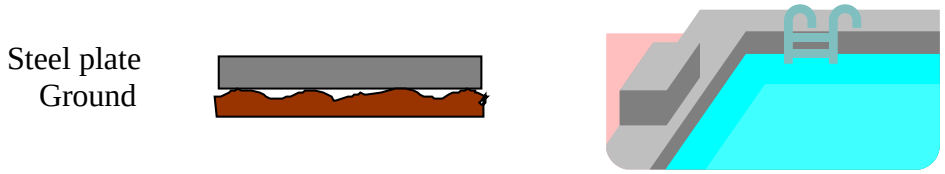
A swimming pool has an evenly distributed pressure at the bottom. Consider a stiff steel plate lying on the ground. Is the pressure below it just as evenly distributed?

Solution:
The pressure is force per unit area from page 13:

$$P = F/A = mg/A$$

The steel plate can be reasonable plane and flat, but it is stiff and rigid. However, the ground is usually uneven so the contact between the plate and the ground is made over an area much smaller than the actual plate area. Thus the local pressure at the contact locations is much larger than the average indicated above.

The pressure at the bottom of the swimming pool is very even due to the ability of the fluid (water) to have full contact with the bottom by deforming itself. This is the main difference between a fluid behavior and a solid behavior.



1.12

What physically determines the variation of the atmospheric pressure with elevation?

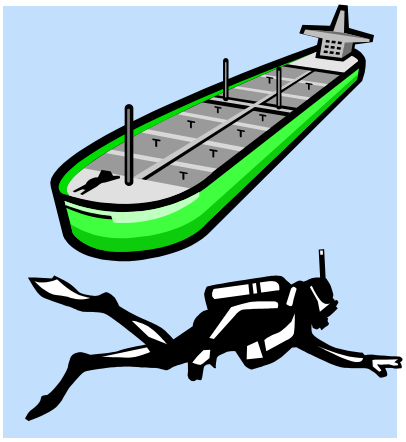
The total mass of the column of air over a unit area and the gravitation gives the force which per unit area is pressure. This is an integral of the density times gravitation over elevation as in Eq.1.4.

To perform the integral the density and gravitation as a function of height (elevation) should be known. Later we will learn that air density is a function of temperature and pressure (and compositions if it varies). Standard curve fits are known that describes this variation and you can find tables with the information about a standard atmosphere. See problems 1.28, 1.64, and 1.95 for some examples.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.13

Two divers swim at 20 m depth. One of them swims right in under a supertanker; the other stays away from the tanker. Who feels a greater pressure?



Solution:
Each one feels the local pressure which is the static pressure only a function of depth.

$$P_{ocean} = P_0 + \Delta P = P_0 + \rho g H$$

So they feel exactly the same pressure.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.14

A manometer with water shows a ΔP of $P_o/20$; what is the column height difference?

Solution:

$$\Delta P = P_o/20 = \rho Hg$$

$$H = P_o/(20\ \rho\ g) = \frac{101.3 \times 1000\ \text{Pa}}{20 \times 997\ \text{kg/m}^3 \times 9.80665\ \text{m/s}^2}$$

$$= \mathbf{0.502\ m}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.15

Does the pressure have to be uniform for equilibrium to exist?

No. It depends on what causes a pressure difference. Think about the pressure increasing as you move down into the ocean, the water at different levels are in equilibrium. However if the pressure is different at nearby locations at same elevation in the water or in air that difference induces a motion of the fluid from the higher towards the lower pressure. The motion will persist as long as the pressure difference exist.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.16

A water skier does not sink too far down in the water if the speed is high enough. What makes that situation different from our static pressure calculations?

The water pressure right under the ski is not a static pressure but a static plus dynamic pressure that pushes the water away from the ski. The faster you go, the smaller amount of water is displaced, but at a higher velocity.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

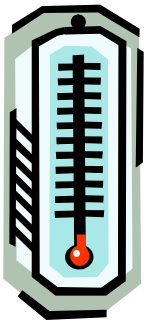
1.17

What is the lowest temperature in degrees Celsuis? In degrees Kelvin?

Solution:

The lowest temperature is absolute zero which is at zero degrees Kelvin at which point the temperature in Celsius is negative

$$T_K = 0 \text{ K} = -273.15 \ ^{o}\text{C}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.18

Convert the formula for water density in In-text Concept Question “d” to be for T in degrees Kelvin.

Solution:

$$\rho = 1008 - T_C/2 \quad [kg/m^3]$$

We need to express degrees Celsius in degrees Kelvin

$$T_C = T_K - 273.15$$

and substitute into formula

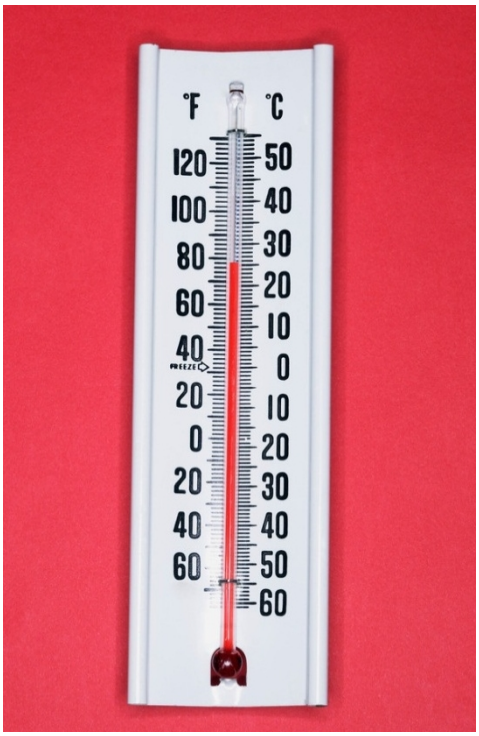
$$\rho = 1008 - T_C/2 = 1008 - (T_K - 273.15)/2 = 1144.6 - T_K/2$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.19

A thermometer that indicates the temperature with a liquid column has a bulb with a larger volume of liquid, why is that?

The expansion of the liquid volume with temperature is rather small so by having a larger volume expand with all the volume increase showing in the very small diameter column of fluid greatly increases the signal that can be read.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.20

What is the main difference between the macroscopic kinetic energy in a motion like the blowing of wind versus the microscopic kinetic energy of individual molecules? Which one can you sense with your hand?

Answer:

The microscopic kinetic energy of individual molecules is too small for us to sense however when the combined action of billions (actually more like in the order of 1 E19) are added we get to the macroscopic magnitude we can sense. The wind velocity is the magnitude and direction of the averaged velocity over many molecules which we sense. The individual molecules are moving in a random motion (with zero average) on top of this mean (or average) motion. A characteristic velocity of this random motion is the speed of sound, around 340 m/s for atmospheric air and it changes with temperature.

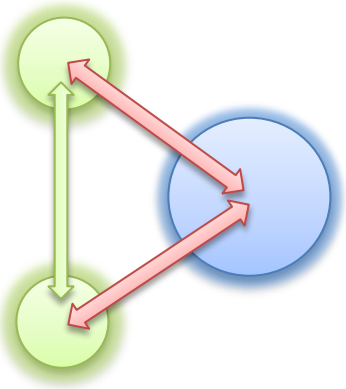
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.21

How can you illustrate the binding energy between the three atoms in water as they sit in a tri-atomic water molecule. Hint: imagine what must happen to create three separate atoms.

Answer:

If you want to separate the atoms you must pull them apart. Since they are bound together with strong forces (like non-linear springs) you apply a force over a distance which is work (energy in transfer) to the system and you could end up with two hydrogen atoms and one oxygen atom far apart so they no longer have strong forces between them. If you do not do anything else the atoms will sooner or later recombine and release all the energy you put in and the energy will come out as radiation or given to other molecules by collision interactions.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Properties, Units, and Force

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.22

An apple "weighs" 60 g and has a volume of 75 cm^3 in a refrigerator at 8°C. What is the apple density? List three intensive and two extensive properties of the apple.

Solution:

$$\rho = \frac{m}{V} = \frac{0.06}{0.000\ 075}\ \frac{kg}{m^3} = 800\ \frac{kg}{m^3}$$

Intensive

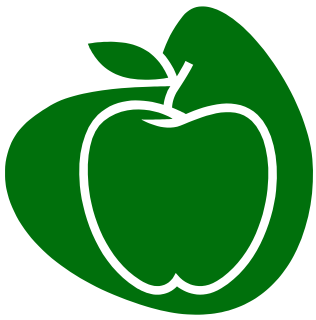
$\rho = 800\ \frac{kg}{m^3}$; $v = \frac{1}{\rho} = 0.001\ 25\ \frac{m^3}{kg}$

T = 8°C; P = 101 kPa

Extensive

m = 60 g = 0.06 kg

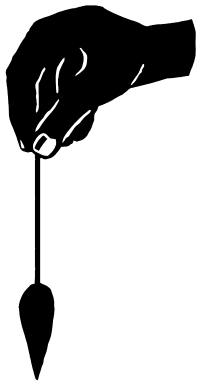
V = 75 cm^3 = 0.075 L = 0.000 075 m^3



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.23

One kilopond (1 kp) is the weight of 1 kg in the standard gravitational field. How many Newtons (N) is that?



$F = ma = mg$

$1\ \text{kp} = 1\ \text{kg} \times 9.807\ \text{m/s}^2 = \mathbf{9.807\ N}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.24

A stainless steel storage tank contains 5 kg of oxygen gas and 7 kg of nitrogen gas. How many kmoles are in the tank?

Table A.2: $M_{O2} = 31.999$; $M_{N2} = 28.013$

$$n_{O2} = m_{O2} / M_{O2} = \frac{5}{31.999} = 0.15625 \text{ kmol}$$

$$n_{O2} = m_{N2} / M_{N2} = \frac{7}{28.013} = 0.24988 \text{ kmol}$$

$$n_{tot} = n_{O2} + n_{N2} = 0.15625 + 0.24988 = \mathbf{0.40613\ kmol}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.25

A steel cylinder of mass 4 kg contains 4 L of liquid water at 25°C at 100 kPa. Find the total mass and volume of the system. List two extensive and three intensive properties of the water

Solution:

Density of steel in Table A.3: $\rho = 7820$ kg/m^3

Volume of steel: $V = m/\rho = \dfrac{4 \text{ kg}}{7820 \text{ kg/m}^3} = 0.000\ 512 \text{ m}^3$

Density of water in Table A.4: $\rho = 997$ kg/m^3

Mass of water: $m = \rho V = 997 \text{ kg/m}^3 \times 0.004 \text{ m}^3 = 3.988$ kg

Total mass: $m = m_{steel} + m_{water} = 4 + 3.988 =$ **7.988 kg**

Total volume: $V = V_{steel} + V_{water} = 0.000\ 512 + 0.004$

$=$ **0.004 512 m^3 = 4.51 L**

Extensive properties: m, V
Intensive properties: ρ (or $v = 1/\rho$), T, P

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

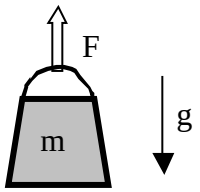
1.26

The "standard" acceleration (at sea level and 45° latitude) due to gravity is 9.80665 m/s^2. What is the force needed to hold a mass of 2 kg at rest in this gravitational field? How much mass can a force of 1 N support?

Solution:

$$ma = 0 = \sum F = F - mg$$

$$F = mg = 2 \text{ kg} \times 9.80665 \text{ m/s}^2 = \mathbf{19.613 \text{ N}}$$



$$F = mg \qquad \Rightarrow$$

$$m = \frac{F}{g} = \frac{1 \text{ N}}{9.80665 \text{ m/s}^2} = \mathbf{0.102 \text{ kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.27

An aluminum piston of 2.5 kg is in the standard gravitational field where a force of 25 N is applied vertically up. Find the acceleration of the piston.

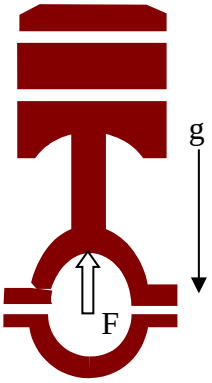
Solution:

$$F_{up} = ma = F - mg$$

$$a = \frac{F - mg}{m} = \frac{F}{m} - g$$

$$= \frac{25\ \text{N}}{2.5\ \text{kg}} - 9.807\ \text{m/s}^2$$

$$= \mathbf{0.193\ ms^{-2}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.28

When you move up from the surface of the earth the gravitation is reduced as $g = 9.807 - 3.32 \times 10^{-6} z$, with z as the elevation in meters. How many percent is the weight of an airplane reduced when it cruises at 11 000 m?

Solution:

$$g_O = 9.807 \text{ ms}^{-2}$$

$$g_H = 9.807 - 3.32 \times 10^{-6} \times 11\,000 = 9.7705 \text{ ms}^{-2}$$

$$W_O = m\, g_O \quad ; \quad W_H = m\, g_H$$

$$W_H / W_O = g_H / g_O = \frac{9.7705}{9.807} = 0.9963$$

Reduction = 1 – 0.9963 = 0.0037 or **0.37%**

i.e. we can neglect that for most applications.

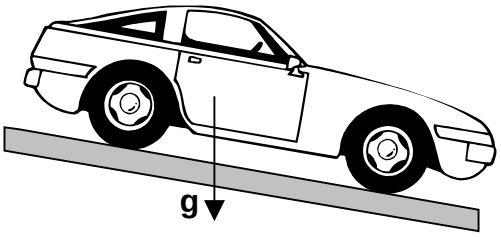
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.29

A car rolls down a hill with a slope so the gravitational "pull" in the direction of motion is one tenth of the standard gravitational force (see Problem 1.26). If the car has a mass of 2500 kg find the acceleration.

Solution:

$$ma = \sum F = mg / 10$$
$$a = mg / 10m = g/10$$
$$= 9.80665 \text{ (m/s}^2\text{)} / 10$$
$$= \mathbf{0.981 \text{ m/s}^2}$$



This acceleration does not depend on the mass of the car.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.30

A van is driven at 60 km/h and is brought to a full stop with constant deceleration in 5 seconds. If the total car and driver mass is 2075 kg find the necessary force.

Solution:

Acceleration is the time rate of change of velocity.

$$a = \frac{d\mathbf{V}}{dt} = \frac{60 \times 1000}{3600 \times 5} = 3.333 \text{ m/s}^2$$

$ma = \sum F$;

$F_{net} = ma = 2075 \text{ kg} \times 3.333 \text{ m/s}^2 =$ **6916 N**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.31

A 1500-kg car moving at 20 km/h is accelerated at a constant rate of 4 m/s^2 up to a speed of 75 km/h. What are the force and total time required?

Solution:

$$a = \frac{d\mathbf{V}}{dt} = \frac{\Delta \mathbf{V}}{\Delta t} \quad =>$$

$$\Delta t = \frac{\Delta \mathbf{V}}{a} = \frac{(75 - 20) \text{ km/h} \times 1000 \text{ m/km}}{3600 \text{ s/h} \times 4 \text{ m/s}^2} = \mathbf{3.82 \text{ sec}}$$

$$F = ma = 1500 \text{ kg} \times 4 \text{ m/s}^2 = \mathbf{6000 \text{ N}}$$

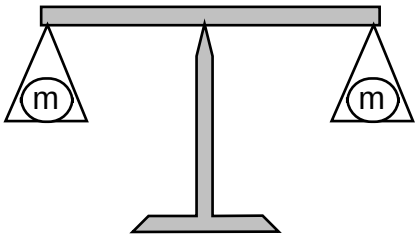
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

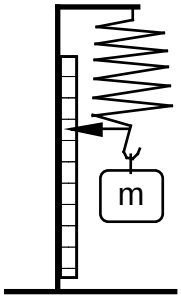
1.32

On the moon the gravitational acceleration is approximately one-sixth that on the surface of the earth. A 5-kg mass is "weighed" with a beam balance on the surface on the moon. What is the expected reading? If this mass is weighed with a spring scale that reads correctly for standard gravity on earth (see Problem 1.26), what is the reading?

Solution:

Moon gravitation is: $g = g_{earth}/6$





Beam Balance Reading is **5 kg**
This is mass comparison

Spring Balance Reading is in kg units
Force comparison length $\propto$ F $\propto$ g

Reading will be $\frac{\mathbf{5}}{\mathbf{6}}$ **kg**

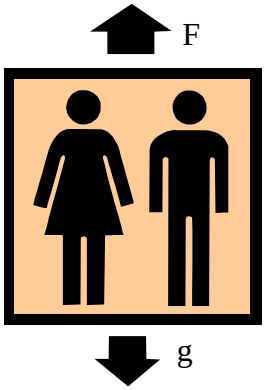
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.33

The elevator in a hotel has a mass of 750 kg, and it carries six people with a total mass of 450 kg. How much force should the cable pull up with to have an acceleration of 1 m/s^2 in the upwards direction?

Solution:

The total mass moves upwards with an acceleration plus the gravitations acts with a force pointing down.



$ma = \sum F = F - mg$

$F = ma + mg = m(a + g)$

$= (750 + 450)\ \text{kg} \times (1 + 9.81)\ \text{m/s}^2$

$= \mathbf{12\ 972\ N}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.34

One of the people in the previous problem weighs 80 kg standing still. How much weight does this person feel when the elevator starts moving?

Solution:

The equation of motion is

$$ma = \sum F = F - mg$$

so the force from the floor becomes

$$F = ma + mg = m(a + g)$$
$$= 80 \text{ kg} \times (1 + 9.81) \text{ m/s}^2$$
$$= 864.8 \text{ N}$$
$$= x \text{ kg} \times 9.81 \text{ m/s}^2$$

Solve for x

$$x = 864.8 \text{ N}/ 9.81 \text{ m/s}^2 = \mathbf{88.15 \text{ kg}}$$

The person then feels like having a mass of 88 kg instead of 80 kg. The weight is really force so to compare to standard mass we should use kp. So in this example the person is experiencing a force of 88 kp instead of the normal 80 kp.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.35

A bottle of 12 kg steel has 1.75 kmole of liquid propane. It accelerates horizontal with 3 m/s^2, what is the needed force?

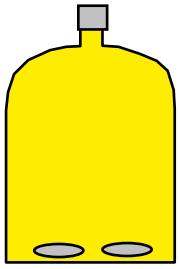
Solution:

The molecular weight for propane is M = 44.094 from Table A.2. The force must accelerate both the container mass and the propane mass.

$$m = m_{steel} + m_{propane} = 12 + (1.75 \times 44.094) = 90.645 \text{ kg}$$

$$ma = \sum F \quad \Rightarrow$$

$$F = ma = 90.645 \text{ kg} \times 3 \text{ m/s}^2 = \mathbf{271.9\ N}$$

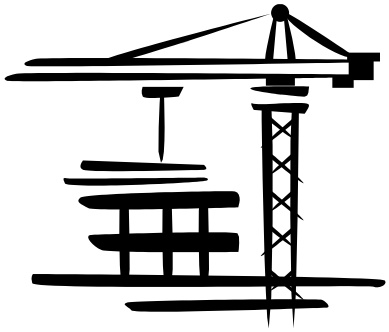


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.36

Some steel beams with a total mass of 700 kg are raised by a crane with an acceleration of 2 m/s^2 relative to the ground at a location where the local gravitational acceleration is 9.5 m/s^2. Find the required force.

Solution:



$F = ma = F_{up} - mg$

$F_{up} = ma + mg = 700 \text{ kg } (2 + 9.5) \text{ m/s}^2$

= **80 500 N**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Specific Volume

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.37

A 1 m^3 container is filled with 400 kg of granite stone, 200 kg dry sand and 0.2 m^3 of liquid 25°C water. Use properties from tables A.3 and A.4. Find the average specific volume and density of the masses when you exclude air mass and volume.

Solution:

Specific volume and density are ratios of total mass and total volume.

$$m_{liq} = V_{liq}/v_{liq} = V_{liq}\,\rho_{liq} = 0.2\ m^3 \times 997\ kg/m^3 = 199.4\ kg$$

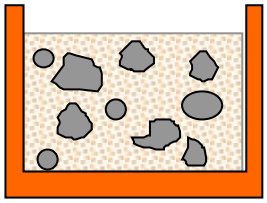
$$m_{TOT} = m_{stone} + m_{sand} + m_{liq} = 400 + 200 + 199.4 = 799.4\ kg$$

$$V_{stone} = mv = m/\rho = 400\ kg/\ 2750\ kg/m^3 = 0.1455\ m^3$$

$$V_{sand} = mv = m/\rho = 200/\ 1500 = 0.1333\ m^3$$

$$V_{TOT} = V_{stone} + V_{sand} + V_{liq}$$

$$= 0.1455 + 0.1333 + 0.2 = 0.4788\ m^3$$



$$v = V_{TOT} / m_{TOT} = 0.4788/799.4 = \mathbf{0.000599\ m^3/kg}$$

$$\rho = 1/v = m_{TOT}/V_{TOT} = 799.4/0.4788 = \mathbf{1669.6\ kg/m^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.38

A power plant that separates carbon-dioxide from the exhaust gases compresses it to a density of 110 kg/m^3 and stores it in an un-minable coal seam with a porous volume of 100 000 m^3. Find the mass they can store.

Solution:

$$m = \rho V = 110 \text{ kg/m}^3 \times 100\,000 \text{ m}^3 = 11 \times 10^6 \text{ kg}$$

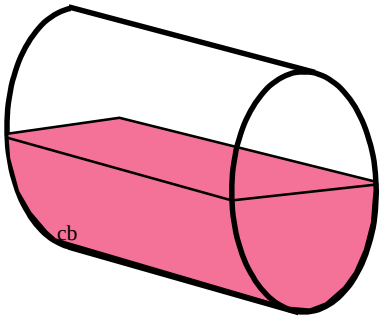
Comment:
Just to put this in perspective a power plant that generates 2000 MW by burning coal would make about 20 million tons of carbon-dioxide a year. That is 2000 times the above mass so it is nearly impossible to store all the carbon-dioxide being produced.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.39

A 15-kg steel gas tank holds 300 L of liquid gasoline, having a density of 800 kg/m^3. If the system is decelerated with 2g what is the needed force?

Solution:



$$m = m_{tank} + m_{gasoline}$$

$$= 15 \text{ kg} + 0.3 \text{ m}^3 \times 800 \text{ kg/m}^3$$

$$= 255 \text{ kg}$$

$$F = ma = 255 \text{ kg} \times 2 \times 9.81 \text{ m/s}^2$$

$$= \mathbf{5003\ N}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.40

A 5 m^3 container is filled with 900 kg of granite (density 2400 kg/m^3) and the rest of the volume is air with density 1.15 kg/m^3. Find the mass of air and the overall (average) specific volume.

Solution:

$$m_{air} = \rho V = \rho_{air} \left(V_{tot} - \frac{m_{granite}}{\rho} \right)$$

$$= 1.15 \left[5 - \frac{900}{2400} \right] = 1.15 \times 4.625 = \mathbf{5.32\ kg}$$

$$v = \frac{V}{m} = \frac{5}{900 + 5.32} = \mathbf{0.005\ 52\ m^3/kg}$$

Comment: Because the air and the granite are not mixed or evenly distributed in the container the overall specific volume or density does not have much meaning.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.41

A tank has two rooms separated by a membrane. Room A has 1 kg air and volume 0.5 m^3, room B has 0.75 m^3 air with density 0.8 kg/m^3. The membrane is broken and the air comes to a uniform state. Find the final density of the air.

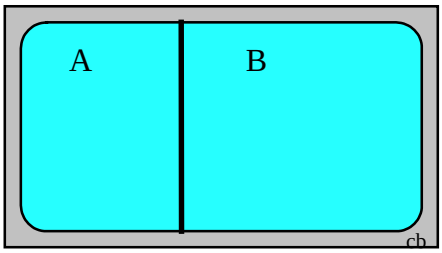
Solution:

Density is mass per unit volume

$$m = m_A + m_B = m_A + \rho_B V_B = 1 + 0.8 \times 0.75 = 1.6 \text{ kg}$$

$$V = V_A + V_B = 0.5 + 0.75 = 1.25 \text{ m}^3$$

$$\rho = \frac{m}{V} = \frac{1.6}{1.25} \frac{\text{kg}}{\text{m}^3} = \mathbf{1.28 \text{ kg/m}^3}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.42

One kilogram of diatomic oxygen (O_2 molecular weight 32) is contained in a 500-L tank. Find the specific volume on both a mass and mole basis (v and $\bar{v}$).

Solution:

From the definition of the specific volume

$$v = \frac{V}{m} = \frac{0.5}{1}\frac{m^3}{kg} = \mathbf{0.5\ m^3/kg}$$

$$\bar{v} = \frac{V}{n} = \frac{V}{m/M} = M\,v = 32\ kg/kmol \times 0.5\ m^3/kg = \mathbf{16\ m^3/kmol}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Pressure

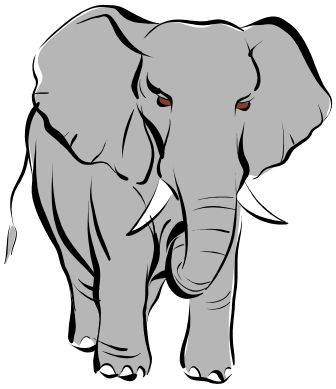
1.43

A 5000-kg elephant has a cross sectional area of 0.02 m^2 on each foot. Assuming an even distribution, what is the pressure under its feet?

Force balance: $ma = 0 = PA - mg$

$$P = mg/A = 5000\ kg \times 9.81\ m/s^2 / (4 \times 0.02\ m^2)$$
$$= 613\ 125\ Pa = \mathbf{613\ kPa}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.44

A valve in a cylinder has a cross sectional area of 11 cm^2 with a pressure of 735 kPa inside the cylinder and 99 kPa outside. How large a force is needed to open the valve?

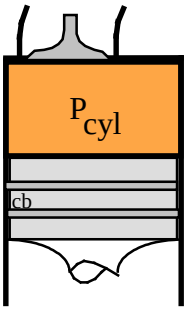
$$F_{net} = P_{in}A - P_{out}A$$

$$= (735 - 99)\ kPa \times 11\ cm^2$$

$$= 6996\ kPa\ cm^2$$

$$= 6996 \times \frac{kN}{m^2} \times 10^{-4}\ m^2$$

$$= \mathbf{700\ N}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.45

The hydraulic lift in an auto-repair shop has a cylinder diameter of 0.2 m. To what pressure should the hydraulic fluid be pumped to lift 40 kg of piston/arms and 700 kg of a car?

Solution:
Force acting on the mass by the gravitational field

$$F\downarrow = ma = mg = 740 \times 9.80665 = 7256.9 \text{ N} = 7.257 \text{ kN}$$

Force balance: $F\uparrow = (P - P_0) A = F\downarrow \quad \Rightarrow \quad P = P_0 + F\downarrow / A$

$$A = \pi D^2 (1 / 4) = 0.031416 \text{ m}^2$$

$$P = 101 \text{ kPa} + \frac{7.257 \text{ kN}}{0.031416 \text{ m}^2} = \mathbf{332 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.46

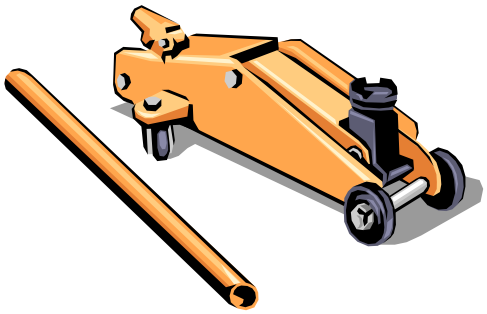
A hydraulic lift has a maximum fluid pressure of 500 kPa. What should the piston-cylinder diameter be so it can lift a mass of 850 kg?

Solution:

With the piston at rest the static force balance is

$$F\uparrow = P\,A = F\downarrow = mg$$
$$A = \pi r^2 = \pi D^2/4$$
$$PA = P\,\pi\,D^2/4 = mg \quad \Rightarrow \quad D^2 = \frac{4mg}{P\,\pi}$$

$$D = 2\sqrt{\frac{mg}{P\pi}} = 2\sqrt{\frac{850\ \text{kg} \times 9.807\ \text{m/s}^2}{500\ \text{kPa} \times \pi \times 1000\ (\text{Pa/kPa})}} = \mathbf{0.146\ m}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.47

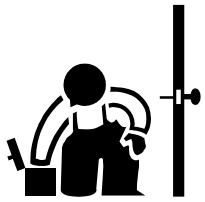
A laboratory room keeps a vacuum of 0.1 kPa. What net force does that put on the door of size 2 m by 1 m?

Solution:

The net force on the door is the difference between the forces on the two sides as the pressure times the area

$$F = P_{outside}\, A - P_{inside}\, A = \Delta P\, A = 0.1\ \text{kPa} \times 2\ \text{m} \times 1\ \text{m} = \mathbf{200\ N}$$

Remember that kPa is kN/m^2.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.48

A vertical hydraulic cylinder has a 125-mm diameter piston with hydraulic fluid inside the cylinder and an ambient pressure of 1 bar. Assuming standard gravity, find the piston mass that will create a pressure inside of 1500 kPa.

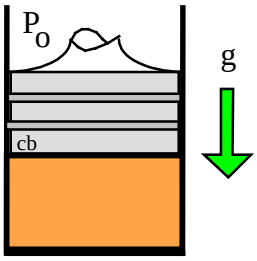
Solution:

Force balance:

$$F\uparrow = PA = F\downarrow = P_0 A + m_p g;$$

$$P_0 = 1 \text{ bar} = 100 \text{ kPa}$$

$$A = (\pi/4)\, D^2 = (\pi/4) \times 0.125^2 = 0.01227 \text{ m}^2$$



$$m_p = (P - P_0)\frac{A}{g} = (\,1500 - 100\,) \text{ kPa} \times 1000 \text{ Pa/kPa} \times \frac{0.01227}{9.80665}\frac{\text{m}^2}{\text{m/s}^2}$$

$$= \mathbf{1752 \text{ kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.49

A 75-kg human footprint is 0.05 m^2 when the human is wearing boots. Suppose you want to walk on snow that can at most support an extra 3 kPa; what should the total snowshoe area be?

Force balance: $ma = 0 = PA - mg$

$$A = \frac{mg}{P} = \frac{75 \text{ kg} \times 9.81 \text{ m/s}^2}{3 \text{ kPa}} = 0.245 \text{ m}^2$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.50

A piston/cylinder with cross sectional area of 0.01 m^2 has a piston mass of 100 kg resting on the stops, as shown in Fig. P1.50. With an outside atmospheric pressure of 100 kPa, what should the water pressure be to lift the piston?

Solution:

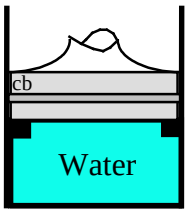
The force acting down on the piston comes from gravitation and the outside atmospheric pressure acting over the top surface.

Force balance: $\quad F\uparrow = F\downarrow = PA = m_p g + P_0 A$

Now solve for P (divide by 1000 to convert to kPa for 2nd term)

$$P = P_0 + \frac{m_p g}{A} = 100 \text{ kPa} + \frac{100 \times 9.80665}{0.01 \times 1000} \text{ kPa}$$

$$= 100 \text{ kPa} + 98.07 \text{ kPa} = \mathbf{198 \text{ kPa}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.51

A large exhaust fan in a laboratory room keeps the pressure inside at 10 cm water vacuum relative to the hallway. What is the net force on the door measuring 1.9 m by 1.1 m?

Solution:

The net force on the door is the difference between the forces on the two sides as the pressure times the area

$$\begin{aligned} F &= P_{outside}\, A - P_{inside}\, A = \Delta P \times A \\ &= 10 \text{ cm } H_2O \times 1.9 \text{ m} \times 1.1 \text{ m} \\ &= 0.10 \times 9.80638 \text{ kPa} \times 2.09 \text{ m}^2 \\ &= \mathbf{2049 \text{ N}} \end{aligned}$$

Table A.1: 1 m H_2O is 9.80638 kPa and kPa is kN/m^2.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.52

A tornado rips off a 100 m^2 roof with a mass of 1000 kg. What is the minimum vacuum pressure needed to do that if we neglect the anchoring forces?

Solution:

The net force on the roof is the difference between the forces on the two sides as the pressure times the area

$$F = P_{inside}\, A - P_{outside} A = \Delta P\, A$$

That force must overcome the gravitation mg, so the balance is

$$\Delta P\, A = mg$$

$$\Delta P = mg/A = (1000 \text{ kg} \times 9.807 \text{ m/s}^2)/100 \text{ m}^2 = \mathbf{98 \text{ Pa} = 0.098 \text{ kPa}}$$

Remember that kPa is kN/m^2.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.53

A 5-kg cannon-ball acts as a piston in a cylinder with a diameter of 0.15 m. As the gun-powder is burned a pressure of 7 MPa is created in the gas behind the ball. What is the acceleration of the ball if the cylinder (cannon) is pointing horizontally?

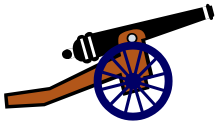
Solution:

The cannon ball has 101 kPa on the side facing the atmosphere.

$$ma = F = P_1 \times A - P_0 \times A = (P_1 - P_0) \times A$$

$$= (7000 - 101)\ \text{kPa} \times \pi\,(0.15^2/4)\ \text{m}^2 = 121.9\ \text{kN}$$

$$a = \frac{F}{m} = \frac{121.9\ \text{kN}}{5\ \text{kg}} = \mathbf{24\ 380\ m/s^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.54

Repeat the previous problem for a cylinder (cannon) pointing 40 degrees up relative to the horizontal direction.

Solution:

$$ma = F = (P_1 - P_0) A - mg \sin 40^0$$

$$ma = (7000 - 101)\ \text{kPa} \times \pi \times (0.15^2 / 4)\ \text{m}^2 - 5 \times 9.807 \times 0.6428\ \text{N}$$

$$= 121.9\ \text{kN} - 31.52\ \text{N} = 121.87\ \text{kN}$$

$$a = \frac{F}{m} = \frac{121.87\ \text{kN}}{5\ \text{kg}} = \mathbf{24\ 374\ m/s^2}$$

1.55

A 2.5 m tall steel cylinder has a cross sectional area of 1.5 m^2. At the bottom with a height of 0.5 m is liquid water on top of which is a 1 m high layer of gasoline. This is shown in Fig. P1.55. The gasoline surface is exposed to atmospheric air at 101 kPa. What is the highest pressure in the water?

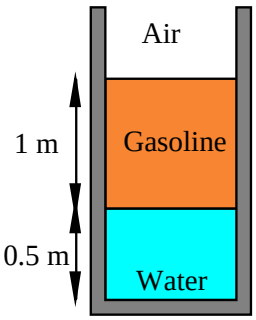
Solution:

The pressure in the fluid goes up with the depth as

$$P = P_{top} + \Delta P = P_{top} + \rho g h$$

and since we have two fluid layers we get

$$P = P_{top} + [(\rho h)_{gasoline} + (\rho h)_{water}]\, g$$



The densities from Table A.4 are:

$$\rho_{gasoline} = 750 \text{ kg/m}^3; \quad \rho_{water} = 997 \text{ kg/m}^3$$

$$P = 101 \text{ kPa} + [750 \times 1 + 997 \times 0.5] \text{ kg/m}^2 \times \frac{9.807}{1000} \text{ (m/s}^2\text{) (kPa/Pa)}$$

$$= \mathbf{113.2 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.56

An underwater buoy is anchored at the seabed with a cable, and it contains a total mass of 250 kg. What should the volume be so that the cable holds it down with a force of 1000 N?

Solution:

We need to do a force balance on the system at rest and the combined pressure over the buoy surface is the buoyancy (lift) equal to the "weight" of the displaced water volume

$$ma = 0 = m_{H2O}g - mg - F$$
$$= \rho_{H2O}Vg - mg - F$$
$$V = (mg + F)/\rho_{H2O}g = (m + F/g)/\rho_{H2O}$$
$$= (250\ \text{kg} + 1000\ \text{N}/9.81\ \text{m/s}^2)\ /\ 997\ \text{kg/m}^3$$
$$= \mathbf{0.353\ m^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.57

At the beach, atmospheric pressure is 1025 mbar. You dive 15 m down in the ocean and you later climb a hill up to 250 m elevation. Assume the density of water is about 1000 kg/m^3 and the density of air is 1.18 kg/m^3. What pressure do you feel at each place?

Solution:

$\Delta P = \rho g h$,

Units from A.1: 1 mbar = 100 Pa (1 bar = 100 kPa).

$$P_{ocean} = P_0 + \Delta P = 1025 \times 100 \text{ Pa} + 1000 \text{ kg/m}^3 \times 9.81 \text{ m/s}^2 \times 15 \text{ m}$$

$$= 2.4965 \times 10^5 \text{ Pa} = \mathbf{250 \text{ kPa}}$$

$$P_{hill} = P_0 - \Delta P = 1025 \times 100 \text{ Pa} - 1.18 \text{ kg/m}^3 \times 9.81 \text{ m/s}^2 \times 250 \text{ m}$$

$$= 0.99606 \times 10^5 \text{ Pa} = \mathbf{99.61 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.58

What is the pressure at the bottom of a 5 m tall column of fluid with atmospheric pressure 101 kPa on the top surface if the fluid is

a) water at 20°C b) glycerine 25°C or c) gasoline 25°C

Solution:

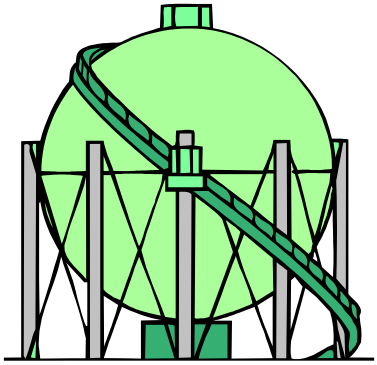
Table A.4: $\rho_{H2O} = 997$ kg/m^3; $\rho_{Glyc} = 1260$ kg/m^3; $\rho_{gasoline} = 750$ kg/m^3

$\Delta P = \rho g h$ $P = P_{top} + \Delta P$

a) $\Delta P = \rho g h = 997 \times 9.807 \times 5 = 48\,888$ Pa
$P = 101 + 48.99 =$ **149.9 kPa**

b) $\Delta P = \rho g h = 1260 \times 9.807 \times 5 = 61\,784$ Pa
$P = 101 + 61.8 =$ **162.8 kPa**

c) $\Delta P = \rho g h = 750 \times 9.807 \times 5 = 36\,776$ Pa
$P = 101 + 36.8 =$ **137.8 kPa**



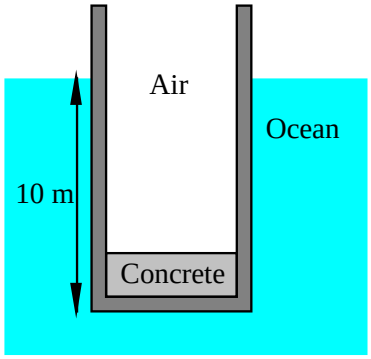
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.59

A steel tank of cross sectional area 3 m^2 and 16 m tall weighs 10 000 kg and it is open at the top, as shown in Fig. P1.59. We want to float it in the ocean so it sticks 10 m straight down by pouring concrete into the bottom of it. How much concrete should I put in?

Solution:

The force up on the tank is from the water pressure at the bottom times its area. The force down is the gravitation times mass and the atmospheric pressure.



$$F\uparrow = PA = (\rho_{ocean} gh + P_0)A$$

$$F\downarrow = (m_{tank} + m_{concrete})g + P_0 A$$

The force balance becomes

$$F\uparrow = F\downarrow = (\rho_{ocean} gh + P_0)A = (m_{tank} + m_{concrete})g + P_0 A$$

Solve for the mass of concrete

$$m_{concrete} = (\rho_{ocean} hA - m_{tank}) = 997 \times 10 \times 3 - 10\,000 = \mathbf{19\,910\ kg}$$

Notice: The first term is the mass of the displaced ocean water. The force up is the weight (mg) of this mass called buoyancy which balances with gravitation and the force from P_0 cancel.

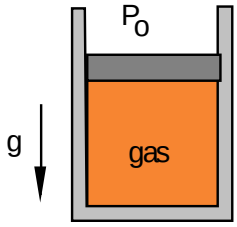
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.60

A piston, m_P= 5 kg, is fitted in a cylinder, A = 15 cm^2, that contains a gas. The setup is in a centrifuge that creates an acceleration of 25 m/s^2 in the direction of piston motion towards the gas. Assuming standard atmospheric pressure outside the cylinder, find the gas pressure.

Solution:

Force balance: $F\uparrow = F\downarrow = P_0 A + m_p g = PA$



$$P = P_0 + \frac{m_p g}{A}$$

$$= 101.325 + \frac{5 \times 25}{1000 \times 0.0015} \frac{\text{kPa kg m/s}^2}{\text{Pa m}^2}$$

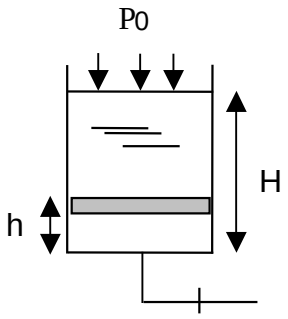
$$= \mathbf{184.7\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.61

Liquid water with density ρ is filled on top of a thin piston in a cylinder with cross-sectional area *A* and total height *H*, as shown in Fig. P1.61. Air is let in under the piston so it pushes up, spilling the water over the edge. Derive the formula for the air pressure as a function of piston elevation from the bottom, *h*.

Solution:



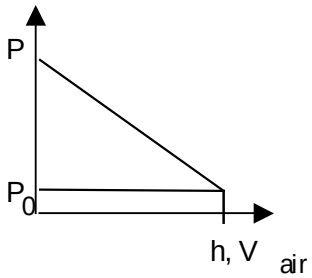
Force balance

Piston: $F\uparrow = F\downarrow$

$$PA = P_0 A + m_{H_2O} g$$

$$P = P_0 + m_{H_2O} g/A$$

$$\mathbf{P = P_0 + (H - h)\rho g}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Manometers and Barometers

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.62

A probe is lowered 16 m into a lake. Find the absolute pressure there?

Solution:

The pressure difference for a column is from Eq.1.2 and the density of water is from Table A.4.

$$\Delta P = \rho g H$$
$$= 997 \ \text{kg/m}^3 \times 9.81 \ \text{m/s}^2 \times 16 \ \text{m}$$
$$= 156\,489 \ \text{Pa} = 156.489 \ \text{kPa}$$

$$P_{ocean} = P_0 + \Delta P$$
$$= 101.325 + 156.489$$
$$= \mathbf{257.8 \ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.63

The density of atmospheric air is about 1.15 kg/m^3, which we assume is constant. How large an absolute pressure will a pilot see when flying 2000 m above ground level where the pressure is 101 kPa.

Solution:

Assume g and ρ are constant then the pressure difference to carry a column of height 2000 m is from Fig.2.10

$$\Delta P = \rho g h = 1.15 \text{ kg/m}^3 \times 9.807 \text{ ms}^{-2} \times 2000 \text{ m}$$
$$= 22\,556 \text{ Pa} = 22.6 \text{ kPa}$$

The pressure on top of the column of air is then

$$P = P_0 - \Delta P = 101 - 22.6 = \mathbf{78.4\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.64

The standard pressure in the atmosphere with elevation (H) above sea level can be correlated as $P = P_0 (1 - H/L)^{5.26}$ with L = 44 300 m. With the local sea level pressure P_0 at 101 kPa, what is the pressure at 10 000 m elevation?

$$\begin{aligned} \mathrm{P} &= P_0 (1 - H/L)^{5.26} \\ &= 101 \text{ kPa } (1 - 10\,000/44\,300)^{5.26} \\ &= \mathbf{26.3 \text{ kPa}} \end{aligned}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.65

A barometer to measure absolute pressure shows a mercury column height of 725 mm. The temperature is such that the density of the mercury is 13 550 kg/m^3. Find the ambient pressure.

Solution:

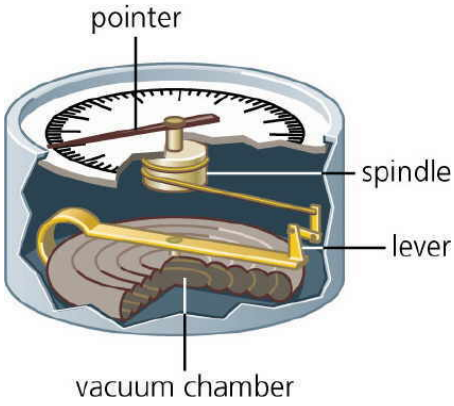
Hg : L = 725 mm = 0.725 m; ρ = 13 550 kg/m^3

The external pressure P balances the column of height L so from Fig. 1.14

$$P = \rho L g = 13\,550 \text{ kg/m}^3 \times 9.80665 \text{ m/s}^2 \times 0.725 \text{ m} \times 10^{-3} \text{ kPa/Pa}$$

$$= \mathbf{96.34 \text{ kPa}}$$

This is a more common type that does not involve mercury as an older wall mounted unit.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.66

A differential pressure gauge mounted on a vessel shows 1.25 MPa and a local barometer gives atmospheric pressure as 0.96 bar. Find the absolute pressure inside the vessel.

Solution:

Convert all pressures to units of kPa.

P_{gauge} = 1.25 MPa = 1250 kPa;

P_0 = 0.96 bar = 96 kPa

$P = P_{gauge} + P_0 = 1250 + 96 =$ **1346 kPa**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.67

A manometer shows a pressure difference of 1 m of liquid mercury. Find ΔP in kPa.

Solution:

Hg : L = 1 m; ρ = 13 580 kg/m^3 from Table A.4 (or read Fig 1.8)

The pressure difference ΔP balances the column of height L so from Eq.1.2

$\Delta P = \rho g L = 13\,580\ \text{kg/m}^3 \times 9.80665\ \text{m/s}^2 \times 1.0\ \text{m} \times 10^{-3}\ \text{kPa/Pa}$

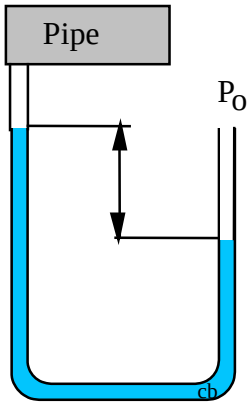
= **133.2 kPa**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.68

Blue manometer fluid of density 925 kg/m^3 shows a column height difference of 3 cm vacuum with one end attached to a pipe and the other open to P_0 = 101 kPa. What is the absolute pressure in the pipe?

Solution:



Since the manometer shows a vacuum we have

$$P_{PIPE} = P_0 - \Delta P$$

$$\Delta P = \rho g h = 925 \text{ kg/m}^3 \times 9.807 \text{ m/s}^2 \times 0.03 \text{ m}$$

$$= 272.1 \text{ Pa} = 0.272 \text{ kPa}$$

$$P_{PIPE} = 101 - 0.272 = \mathbf{100.73 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.69

What pressure difference does a 10 m column of atmospheric air show?

Solution:

The pressure difference for a column is from Eq.1.2

$$\Delta P = \rho g H$$

So we need density of air from Fig. 2.8 or Table A.5, $\rho = 1.2$ kg/m^3

$$\Delta P = 1.2 \text{ kg/m}^3 \times 9.81 \text{ ms}^{-2} \times 10 \text{ m} = 117.7 \text{ Pa} = \mathbf{0.12 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.70

A barometer measures 760 mmHg at street level and 735 mmHg on top of a building. How tall is the building if we assume air density of 1.15 kg/m^3?

Solution:

$$\Delta P = \rho g H$$

$$H = \Delta P/\rho g = \frac{760 - 735}{1.15 \times 9.807} \frac{\text{mmHg}}{\text{kg/m}^2\text{s}^2} \frac{133.32 \text{ Pa}}{\text{mmHg}} = \mathbf{295 \text{ m}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.71

The pressure gauge on an air tank shows 75 kPa when the diver is 10 m down in the ocean. At what depth will the gauge pressure be zero? What does that mean?

Ocean H_20 pressure at 10 m depth is

$$P_{water} = P_0 + \rho Lg = 101.3 + \frac{997 \times 10 \times 9.80665}{1000} = 199 \text{ kPa}$$

Air Pressure (absolute) in tank

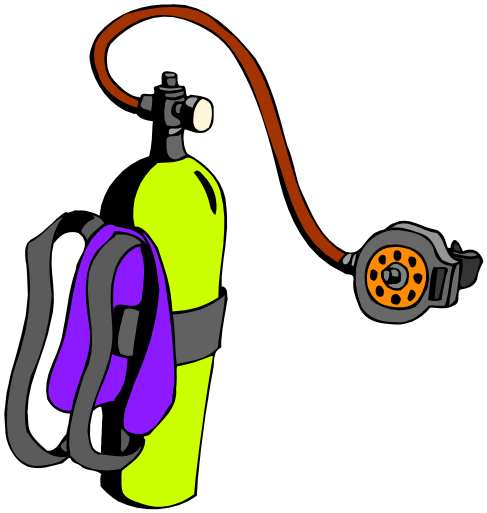
$$P_{tank} = 199 + 75 = 274 \text{ kPa}$$

Tank Pressure (gauge) reads zero at H_20 local pressure

$$274 = 101.3 + \frac{997 \times 9.80665}{1000} L$$

$$L = \mathbf{17.66\ m}$$

At this depth you will have to suck the air in, it can no longer push itself through a valve.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.72

An exploration submarine should be able to go 1200 m down in the ocean. If the ocean density is 1020 kg/m^3 what is the maximum pressure on the submarine hull?

Solution:

Assume we have atmospheric pressure inside the submarine then the pressure difference to the outside water is

$$\Delta P = \rho L g = (1020 \text{ kg/m}^3 \times 1200 \text{ m} \times 9.807 \text{ m/s}^2) / (1000 \text{ Pa/kPa})$$
$$= 12\,007 \text{ kPa} \approx \mathbf{12 \text{ MPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.73

A submarine maintains 101 kPa inside it and it dives 240 m down in the ocean having an average density of 1030 kg/m^3. What is the pressure difference between the inside and the outside of the submarine hull?

Solution:

Assume the atmosphere over the ocean is at 101 kPa, then ΔP is from the 240 m column water.

$$\Delta P = \rho L g$$

$$= (1030 \text{ kg/m}^3 \times 240 \text{ m} \times 9.807 \text{ m/s}^2) / 1000 = \mathbf{2424 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.74

Assume we use a pressure gauge to measure the air pressure at street level and at the roof of a tall building. If the pressure difference can be determined with an accuracy of 1 mbar (0.001 bar) what uncertainty in the height estimate does that corresponds to?

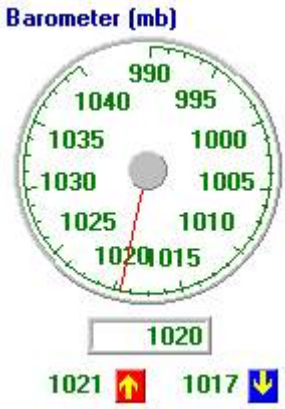
Solution:

$\rho_{air} = 1.169$ kg/m^3 from Table A.5

$\Delta P = 0.001$ bar = 100 Pa

$$L = \frac{\Delta P}{\rho g} = \frac{100}{1.169 \times 9.807} = \mathbf{8.72\ m}$$

As you can see that is not really accurate enough for many purposes.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.75

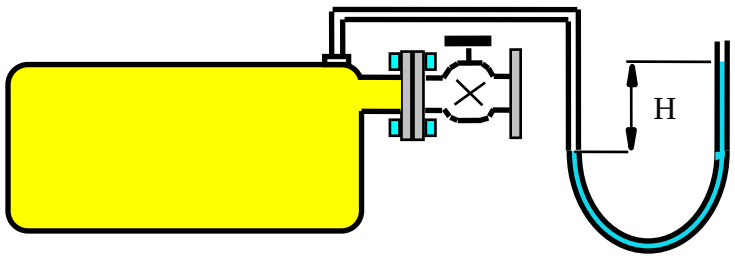
The absolute pressure in a tank is 115 kPa and the local ambient absolute pressure is 97 kPa. If a U-tube with mercury, density 13550 kg/m^3, is attached to the tank to measure the gage pressure, what column height difference would it show?

Solution:

$$\Delta P = P_{tank} - P_0 = \rho g\, H$$

$$H = (P_{tank} - P_0)/\rho g = [(115 - 97) \times 1000]\ \text{Pa} / (13550\ \text{kg/m}^3 \times 9.81\ \text{m/s}^2)$$

$$= \mathbf{0.135\ m = 13.5\ cm}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.76

An absolute pressure gauge attached to a steel cylinder shows 135 kPa. We want to attach a manometer using liquid water a day that P_{atm} = 101 kPa. How high a fluid level difference must we plan for?

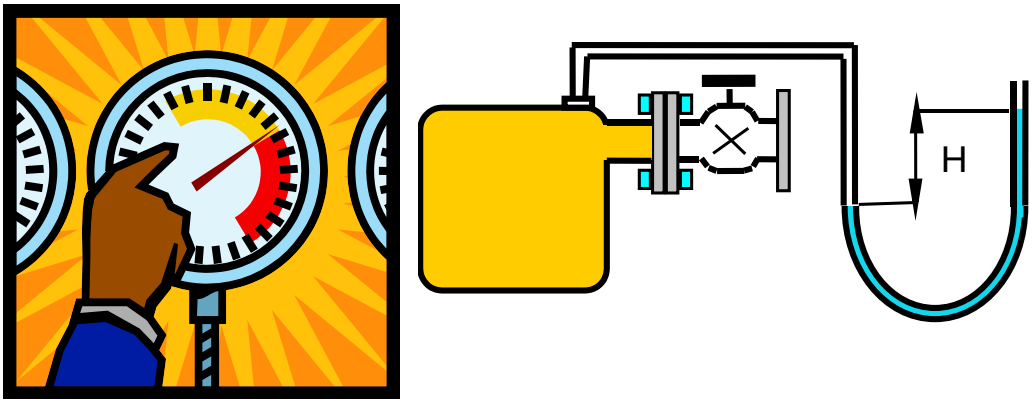
Solution:

Since the manometer shows a pressure difference we have

$$\Delta P = P_{CYL} - P_{atm} = \rho L g$$

$$L = \Delta P / \rho g = \frac{(135 - 101)\ \text{kPa}}{997\ \text{kg m}^{-3} \times 10 \times 9.807\ \text{m/s}^2} \frac{1000\ \text{Pa}}{\text{kPa}}$$

$$= \mathbf{3.467\ m}$$



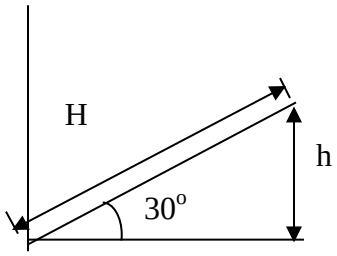
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.77

A U-tube manometer filled with water, density 1000 kg/m^3, shows a height difference of 25 cm. What is the gauge pressure? If the right branch is tilted to make an angle of 30° with the horizontal, as shown in Fig. P1.77, what should the length of the column in the tilted tube be relative to the U-tube?

Solution:

Same height in the two sides in the direction of g.



$$\Delta P = F/A = mg/A = V\rho g/A = h\rho g$$
$$= 0.25\ \text{m} \times 1000\ \text{kg/m}^3 \times 9.807\ \text{m/s}^2$$
$$= 2452.5\ \text{Pa}$$
$$= \mathbf{2.45\ kPa}$$

$$h = H \times \sin 30°$$
$$\Rightarrow H = h/\sin 30° = 2h = \mathbf{50\ cm}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.78

A pipe flowing light oil has a manometer attached as shown in Fig. P1.78. What is the absolute pressure in the pipe flow?

Solution:

Table A.3: $\rho_{oil} = 910$ kg/m^3; $\rho_{water} = 997$ kg/m^3

$$P_{BOT} = P_0 + \rho_{water}\, g\, H_{tot} = P_0 + 997 \text{ kg/m}^3 \times 9.807 \text{ m/s}^2 \times 0.8 \text{ m}$$
$$= P_o + 7822 \text{ Pa}$$

$$P_{PIPE} = P_{BOT} - \rho_{water}\, g\, H_1 - \rho_{oil}\, g\, H_2$$
$$= P_{BOT} - 997 \times 9.807 \times 0.1 - 910 \times 9.807 \times 0.2$$
$$= P_{BOT} - 977.7 \text{ Pa} - 1784.9 \text{ Pa}$$

$$P_{PIPE} = P_o + (7822 - 977.7 - 1784.9) \text{ Pa}$$
$$= P_o + 5059.4 \text{ Pa} = 101.325 + 5.06 = \mathbf{106.4\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.79

The difference in height between the columns of a manometer is 200 mm with a fluid of density 900 kg/m^3. What is the pressure difference? What is the height difference if the same pressure difference is measured using mercury, density 13600 kg/ m^3, as manometer fluid?

Solution:

$$\Delta P = \rho_1 g h_1 = 900 \text{ kg/m}^3 \times 9.807 \text{ m/s}^2 \times 0.2 \text{ m} = 1765.26 \text{ Pa} = \mathbf{1.77\ kPa}$$

$$h_{Hg} = \Delta P / (\rho_{hg}\, g) = (\rho_1\, g h_1) / (\rho_{hg}\, g) = \frac{900}{13600} \times 0.2 \text{ m}$$

$$= \mathbf{0.0132\ m = 13.2\ mm}$$

1.80

Two cylinders are filled with liquid water, $\rho = 1000$ kg/m^3, and connected by a line with a closed valve, as shown in Fig. P1.80. A has 100 kg and B has 500 kg of water, their cross-sectional areas are $A_A = 0.1$ m^2 and $A_B = 0.25$ m^2 and the height h is 1 m. Find the pressure on each side of the valve. The valve is opened and water flows to an equilibrium. Find the final pressure at the valve location.

Solution:

$$V_A = v_{H_2O} m_A = m_A/\rho = 0.1 = A_A h_A \quad \Rightarrow \quad h_A = 1 \text{ m}$$

$$V_B = v_{H_2O} m_B = m_B/\rho = 0.5 = A_B h_B \quad \Rightarrow \quad h_B = 2 \text{ m}$$

$$P_{VB} = P_0 + \rho g(h_B + H) = 101325 + 1000 \times 9.81 \times 3 = 130\,755 \text{ Pa}$$

$$P_{VA} = P_0 + \rho g h_A = 101325 + 1000 \times 9.81 \times 1 = 111\,135 \text{ Pa}$$

Equilibrium: same height over valve in both

$$V_{tot} = V_A + V_B = h_2 A_A + (h_2 - H) A_B \Rightarrow h_2 = \frac{h_A A_A + (h_B + H) A_B}{A_A + A_B} = 2.43 \text{ m}$$

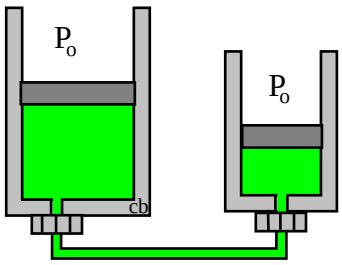
$$P_{V2} = P_0 + \rho g h_2 = 101.325 + (1000 \times 9.81 \times 2.43)/1000 = \mathbf{125.2\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.81

Two piston/cylinder arrangements, A and B, have their gas chambers connected by a pipe. Cross-sectional areas are $A_A = 75$ cm^2 and $A_B = 25$ cm^2 with the piston mass in A being $m_A = 25$ kg. Outside pressure is 100 kPa and standard gravitation. Find the mass m_B so that none of the pistons have to rest on the bottom.

Solution:



Force balance for both pistons: $F\uparrow = F\downarrow$

A: $m_{PA}g + P_0A_A = PA_A$

B: $m_{PB}g + P_0A_B = PA_B$

Same P in A and B gives no flow between them.

$$\frac{m_{PA}g}{A_A} + P_0 = \frac{m_{PB}g}{A_B} + P_0$$

$$\Rightarrow m_{PB} = m_{PA}\, A_A / A_B = 25 \times 25/75 = \mathbf{8.33\ kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

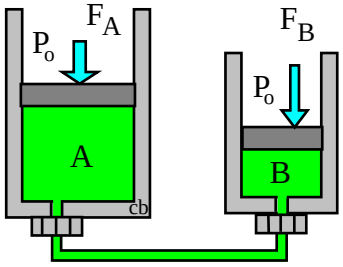
1.82

Two hydraulic piston/cylinders are of same size and setup as in Problem 1.81, but with negligible piston masses. A single point force of 250 N presses down on piston A. Find the needed extra force on piston B so that none of the pistons have to move.

Solution:

$A_A = 75\ cm^2$;

$A_B = 25\ cm^2$



No motion in connecting pipe: $P_A = P_B$

Forces on pistons balance

$$P_A = P_0 + F_A / A_A = P_B = P_0 + F_B / A_B$$

$$F_B = F_A \times \frac{A_B}{A_A} = 250\ N \times \frac{25}{75} = \mathbf{83.33\ N}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

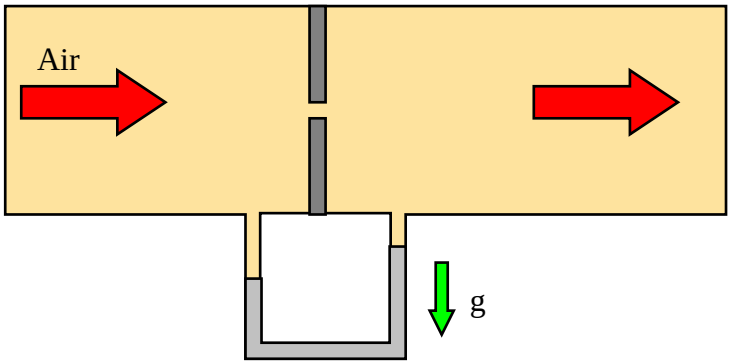
1.83

A piece of experimental apparatus is located where $g = 9.5$ m/s^2 and the temperature is 5°C. An air flow inside the apparatus is determined by measuring the pressure drop across an orifice with a mercury manometer (see Problem 1.91 for density) showing a height difference of 200 mm. What is the pressure drop in kPa?

Solution:

$$\Delta P = \rho g h \; ; \qquad \rho_{Hg} = 13600 \;\; \text{kg/m}^3$$

$$\Delta P = 13\,600 \text{ kg/m}^3 \times 9.5 \text{ m/s}^2 \times 0.2 \text{ m} = 25840 \text{ Pa} = \mathbf{25.84\ kPa}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

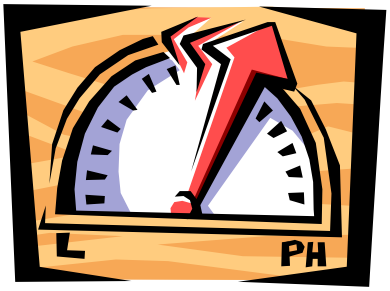
Energy and Temperature

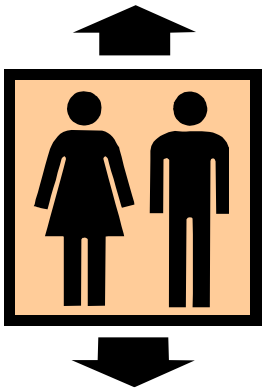
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.84

An escalator brings four people, whose total mass is 300 kg, 25 m up in a building. Explain what happens with respect to energy transfer and stored energy.

The four people (300 kg) have their potential energy raised, which is how the energy is stored. The energy is supplied as electrical power to the motor that pulls the escalator with a cable.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.85

A car moves at 75 km/h; its mass, including people, is 3200 kg. How much kinetic energy does the car have?

$$\text{KE} = ½\ m\ \mathbf{V}^2 = ½ \times\ 3200\ \text{kg} \times \left(\frac{75 \times 1000}{3600}\right)^2\ \text{m}^2/\text{s}^2$$

$$= 694\ 444\ \text{J} = \mathbf{694\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.86

A 52-kg package is lifted up to the top shelf in a storage bin that is 4 m above the ground floor. How much increase in potential energy does the package get?

The potential energy is from Eq.1.5

$$pe = gz$$

so for a certain mass we get

$$PE = mgH = 52 \text{ kg} \times 9.81 \text{ m/s}^2 \times 4 \text{ m} = 2040 \text{ J} = \mathbf{2.04 \text{ kJ}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.87

A car of mass 1775 kg travels with a velocity of 100 km/h. Find the kinetic energy. How high should it be lifted in the standard gravitational field to have a potential energy that equals the kinetic energy?

Solution:

Standard kinetic energy of the mass is

$$\text{KE} = ½\ m\ \mathbf{V}^2 = ½ \times 1775\ \text{kg} \times \left(\frac{100 \times 1000}{3600}\right)^2\ \text{m}^2/\text{s}^2$$

$$= ½ \times 1775 \times 27.778\ \text{Nm} = 684\ 800\ \text{J}$$

$$= \mathbf{684.8\ kJ}$$

Standard potential energy is

$$\text{POT} = mgh$$

$$h = ½\ m\ \mathbf{V}^2 / mg\ = \frac{684\ 800\ \text{Nm}}{1775\ \text{kg} \times 9.807\ \text{m/s}^2} = \mathbf{39.3\ m}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.88

An oxygen molecule with mass m = M m_o = 32 × 1.66 × 10^{-27} kg moves with a velocity of 240 m/s. What is the kinetic energy of the molecule? What temperature does that corresponds to if it has to equal (3/2) *kT* where k is Boltzmans constant and *T* is the absolute temperature in Kelvin.

$$KE = \tfrac{1}{2}\, m\, \mathbf{V}^2 = \tfrac{1}{2} \times 32 \times 1.66 \times 10^{-27}\ kg \times 240^2\ \ m^2/s^2$$
$$= \mathbf{1.53\ E{-}21\ J}$$

So if the KE equals 1.5 kT then we get

$$KE = 1.5\ kT = 1.5 \times 1.38065 \times 10^{-23}\ J/K \times T$$

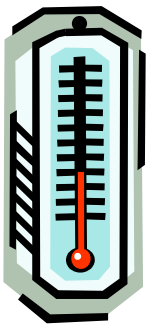
$$T = (2/3)\ KE/k = (2/3) \times 1.53\ E{-}21\ /\ 1.38065 \times 10^{-23} = \mathbf{73.9\ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.89

What is a temperature of –5^{o}C in degrees Kelvin?

Solution:



The offset from Celsius to Kelvin is 273.15 K, so we get

$$T_K = T_C + 273.15 = -5 + 273.15$$
$$= \mathbf{268.15\ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.90

The human comfort zone is between 18 and 24^{o}C, what is the range in Kelvin? What is the maximum relative change from the low to the high temperature?

Solution:

$$T_K = T_C + 273.15$$

The range in K becomes from 291.15 to 297.15 K.
The relative change is 6 degrees up from 291.15 K which is

$$\text{Relative change \%} = \frac{6}{291.15} \times 100 = \mathbf{2.06\%}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.91

The density of mercury changes approximately linearly with temperature as

$$\rho_{Hg} = 13595 - 2.5\,T \ \text{kg/ m}^3 \qquad T \ \text{in Celsius}$$

so the same pressure difference will result in a manometer reading that is influenced by temperature. If a pressure difference of 100 kPa is measured in the summer at 35°C and in the winter at –15°C, what is the difference in column height between the two measurements?

Solution:
The manometer reading h relates to the pressure difference as

$$\Delta P = \rho\, L\, g \quad \Rightarrow \quad L = \frac{\Delta P}{\rho g}$$

The manometer fluid density from the given formula gives

$$\rho_{su} = 13595 - 2.5 \times 35 = 13507.5 \ \text{kg/m}^3$$

$$\rho_{w} = 13595 - 2.5 \times (-15) = 13632.5 \ \text{kg/m}^3$$

The two different heights that we will measure become

$$L_{su} = \frac{100 \times 10^3}{13507.5 \times 9.807} \frac{\text{kPa (Pa/kPa)}}{(\text{kg/m}^3)\ \text{m/s}^2} = 0.7549 \ \text{m}$$

$$L_{w} = \frac{100 \times 10^3}{13632.5 \times 9.807} \frac{\text{kPa (Pa/kPa)}}{(\text{kg/m}^3)\ \text{m/s}^2} = 0.7480 \ \text{m}$$

$$\Delta L = L_{su} - L_{w} = \mathbf{0.0069\ m = 6.9\ mm}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.92

A mercury thermometer measures temperature by measuring the volume expansion of a fixed mass of liquid Hg due to a change in the density, see problem 1.91. Find the relative change (%) in volume for a change in temperature from 10°C to 20°C.

Solution:

From 10°C to 20°C

At 10°C : $\rho_{Hg} = 13595 - 2.5 \times 10 = 13570$ kg/m^3

At 20°C : $\rho_{Hg} = 13595 - 2.5 \times 20 = 13545$ kg/m^3

The volume from the mass and density is: $V = m/\rho$

$$\text{Relative Change} = \frac{V_{20} - V_{10}}{V_{10}} = \frac{(m/\rho_{20}) - (m/\rho_{10})}{m/\rho_{10}}$$

$$= \frac{\rho_{10}}{\rho_{20}} - 1 = \frac{13570}{13545} - 1 = \mathbf{0.0018\ (0.18\%)}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.93

Density of liquid water is $\rho = 1008 - T/2$ [kg/m^3] with T in ^{o}C. If the temperature increases 10^{o}C how much deeper does a 1 m layer of water become?

Solution:

The density change for a change in temperature of 10^{o}C becomes

$$\Delta\rho = -\Delta T/2 = -5 \text{ kg/m}^3$$

from an ambient density of

$$\rho = 1008 - T/2 = 1008 - 25/2 = 995.5 \text{ kg/m}^3$$

Assume the area is the same and the mass is the same $m = \rho V = \rho AH$, then we have

$$\Delta m = 0 = V\Delta\rho + \rho\Delta V \quad \Rightarrow \quad \Delta V = - V\Delta\rho/\rho$$

and the change in the height is

$$\Delta H = \frac{\Delta V}{A} = \frac{H\Delta V}{V} = \frac{-H\Delta\rho}{\rho} = \frac{-1 \times (-5)}{995.5} = \mathbf{0.005\ m}$$

barely measurable.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.94

Using the freezing and boiling point temperatures for water in both Celsius and Fahrenheit scales, develop a conversion formula between the scales. Find the conversion formula between Kelvin and Rankine temperature scales.

Solution:

$$T_{Freezing} = 0\ ^{o}C = 32\ F; \qquad T_{Boiling} = 100\ ^{o}C = 212\ F$$

$$\Delta T = 100\ ^{o}C = 180\ F \ \Rightarrow\ To_{C} = (T_{F} - 32)/1.8 \quad \text{or} \quad T_{F} = 1.8\ To_{C} + 32$$

For the absolute K & R scales both are zero at absolute zero.

$$T_{R} = 1.8 \times T_{K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.95

The atmosphere becomes colder at higher elevation. As an average the standard atmospheric absolute temperature can be expressed as $T_{atm} = 288 - 6.5 \times 10^{-3} z$, where z is the elevation in meters. How cold is it outside an airplane cruising at 12 000 m expressed in Kelvin and in Celsius?

Solution:

For an elevation of z = 12 000 m we get

$$T_{atm} = 288 - 6.5 \times 10^{-3} z = \mathbf{210\ K}$$

To express that in degrees Celsius we get

$$T_C = T - 273.15 = \mathbf{-63.15^{o}C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

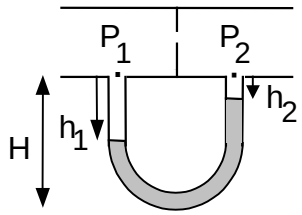
Review Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.96

Repeat problem 1.83 if the flow inside the apparatus is liquid water, $\rho \cong 1000$ kg/m^3, instead of air. Find the pressure difference between the two holes flush with the bottom of the channel. You cannot neglect the two unequal water columns.

Solution:



Balance forces in the manometer:

$$(H - h_2) - (H - h_1) = \Delta h_{Hg} = h_1 - h_2$$

$$P_1 A + \rho_{H_2O} h_1 g A + \rho_{Hg}(H - h_1) g A$$
$$= P_2 A + \rho_{H_2O} h_2 g A + \rho_{Hg}(H - h_2) g A$$

$$\Rightarrow P_1 - P_2 = \rho_{H_2O}(h_2 - h_1) g + \rho_{Hg}(h_1 - h_2) g$$

$$P_1 - P_2 = \rho_{Hg} \Delta h_{Hg} g - \rho_{H_2O} \Delta h_{Hg} g$$

$$= (13\,600 \times 0.2 \times 9.5 - 1000 \times 0.2 \times 9.5)\ \text{kg/m}^3 \times \text{m} \times \text{m/s}^2$$

$$= (25\,840 - 1900)\ \text{Pa} = 23\,940\ \text{Pa} = \mathbf{23.94\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.97

A dam retains a lake 6 m deep. To construct a gate in the dam we need to know the net horizontal force on a 5 m wide and 6 m tall port section that then replaces a 5 m section of the dam. Find the net horizontal force from the water on one side and air on the other side of the port.

Solution:

$P_{bot} = P_0 + \Delta P$

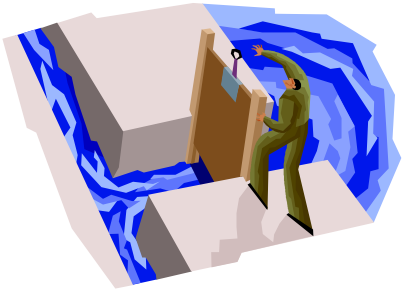
$\Delta P = \rho g h = 997\ kg/m^3 \times 9.807\ m/s^2 \times 6\ m = 58\ 665\ Pa = 58.66\ kPa$

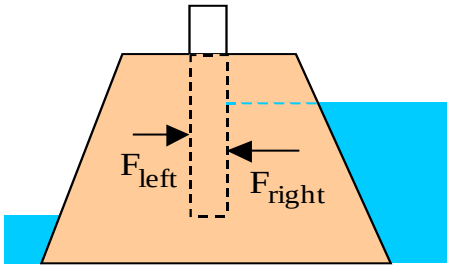
Neglect ΔP in air

$F_{net} = F_{right} - F_{left} = P_{avg}\ A - P_0 A$

$P_{avg} = P_0 + 0.5\ \Delta P$ Since a linear pressure variation with depth.

$F_{net} = (P_0 + 0.5\ \Delta P)A - P_0 A = 0.5\ \Delta P\ A = 0.5 \times 58.66 \times 5 \times 6 =$ **880 kN**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.98

In the city water tower, water is pumped up to a level 25 m above ground in a pressurized tank with air at 125 kPa over the water surface. This is illustrated in Fig. P1.98. Assuming the water density is 1000 kg/m^3 and standard gravity, find the pressure required to pump more water in at ground level.

Solution:

$$\Delta P = \rho \, L \, g$$

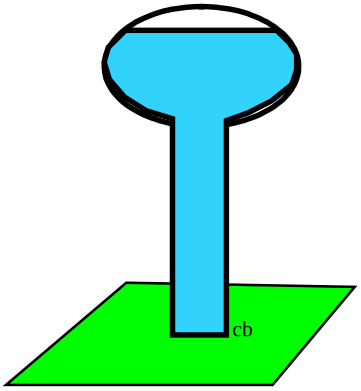
$$= 1000 \text{ kg/m}^3 \times 25 \text{ m} \times 9.807 \text{ m/s}^2$$

$$= 245\,175 \text{ Pa} = 245.2 \text{ kPa}$$

$$P_{bottom} = P_{top} + \Delta P$$

$$= 125 + 245.2$$

$$= \mathbf{370 \text{ kPa}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.99

The main waterline into a tall building has a pressure of 600 kPa at 5 m elevation below ground level. How much extra pressure does a pump need to add to ensure a water line pressure of 200 kPa at the top floor 150 m above ground?

Solution:

The pump exit pressure must balance the top pressure plus the column ΔP. The pump inlet pressure provides part of the absolute pressure.

$P_{after\ pump} = P_{top} + \Delta P$

$\Delta P = \rho g h = 997\ kg/m^3 \times 9.807\ m/s^2 \times (150 + 5)\ m$

$= 1\ 515\ 525\ Pa = 1516\ kPa$

$P_{after\ pump} = 200 + 1516 = 1716\ kPa$

$\Delta P_{pump} = 1716 - 600 =$ **1116 kPa**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.100

Two cylinders are connected by a piston as shown in Fig. P1.100. Cylinder A is used as a hydraulic lift and pumped up to 500 kPa. The piston mass is 25 kg and there is standard gravity. What is the gas pressure in cylinder B?

Solution:

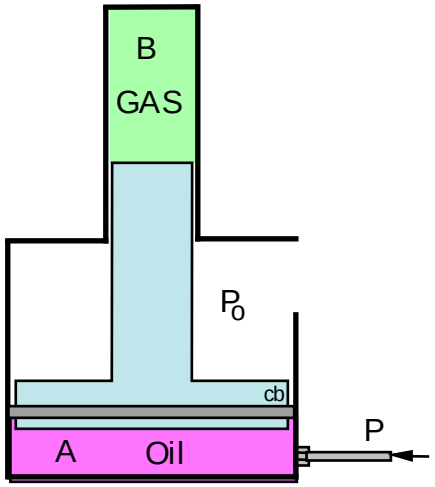
Force balance for the piston: $P_B A_B + m_p g + P_0(A_A - A_B) = P_A A_A$

$A_A = (\pi/4)0.1^2 = 0.00785\ m^2$; $A_B = (\pi/4)0.025^2 = 0.000\ 491\ m^2$

$P_B A_B = P_A A_A - m_p g - P_0(A_A - A_B) = 500 \times 0.00785 - (25 \times 9.807/1000)$

$- 100\ (0.00785 - 0.000\ 491) = 2.944$ kN

$P_B = 2.944/0.000\ 491 = 5996$ kPa = **6.0 MPa**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

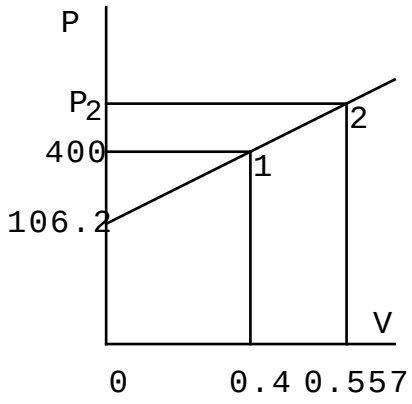
1.101

A 5-kg piston in a cylinder with diameter of 100 mm is loaded with a linear spring and the outside atmospheric pressure of 100 kPa as shown in Fig. P1.101. The spring exerts no force on the piston when it is at the bottom of the cylinder and for the state shown, the pressure is 400 kPa with volume 0.4 L. The valve is opened to let some air in, causing the piston to rise 2 cm. Find the new pressure.

Solution:

A linear spring has a force linear proportional to displacement. F = k x, so the equilibrium pressure then varies linearly with volume: P = a + bV, with an intersect a and a slope b = dP/dV. Look at the balancing pressure at zero volume (V -> 0) when there is no spring force $F = PA = P_o A + m_p g$ and the initial state. These two points determine the straight line shown in the P-V diagram.

Piston area = $A_p = (\pi/4) \times 0.1^2 = 0.00785\ m^2$



$$a = P_0 + \frac{m_p g}{A_p} = 100\ kPa + \frac{5 \times 9.80665}{0.00785}\ Pa$$

$$= 106.2\ kPa \quad \text{intersect for zero volume.}$$

$$V_2 = 0.4 + 0.00785 \times 20 = 0.557\ L$$

$$P_2 = P_1 + \frac{dP}{dV}\Delta V$$

$$= 400 + \frac{(400\text{-}106.2)}{0.4 - 0}(0.557 - 0.4)$$

$$= \mathbf{515.3\ kPa}$$

Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.102E

A mass of 2 lbm has acceleration of 5 ft/s^2, what is the needed force in lbf?

Solution:

Newtons 2nd law: $F = ma$

$$F = ma = 2 \text{ lbm} \times 5 \text{ ft/s}^2 = 10 \text{ lbm ft/s}^2$$
$$= \frac{10}{32.174} \text{ lbf} = \mathbf{0.31 \text{ lbf}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.103E

How much mass is in 1 gallon of gasoline? If helium in a balloon at atmospheric *P* and *T*?

Solution:

A volume of 1 gal equals 231 in^3, see Table A.1. From Table F.3 the density is 46.8 lbm/ft^3, so we get

$$m = \rho V = 46.8 \text{ lbm/ft}^3 \times 1 \times (231/12^3) \text{ ft}^3 = \mathbf{6.256 \text{ lbm}}$$

A more accurate value from Table F.3 is $\rho = 848 \text{ lbm/ft}^3$.

For the helium we see Table F.4 that density is $10.08 \times 10^{-3} \text{ lbm/ft}^3$ so we get

$$m = \rho V = 10.08 \times 10^{-3} \text{ lbm/ft}^3 \times 1 \times (231/12^3) \text{ ft}^3 = \mathbf{0.00135 \text{ lbm}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.104E

Can you easily carry a one gallon bar of solid gold?

Solution:

The density of solid gold is about 1205 lbm/ft^3 from Table F.2, we could also have read Figure 1.7 and converted the units.

$$V = 1 \text{ gal} = 231 \text{ in}^3 = 231 \times 12^{-3} \text{ ft}^3 = 0.13368 \text{ ft}^3$$

Therefore the mass in one gallon is

$$m = \rho V = 1205 \text{ lbm/ft}^3 \times 0.13368 \text{ ft}^3$$
$$= 161 \text{ lbm}$$

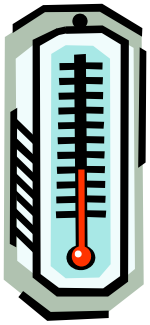
and some people can just about carry that in the standard gravitational field.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.105E

What is the temperature of –5F in degrees Rankine?

Solution:



The offset from Fahrenheit to Rankine is 459.67 R, so we get

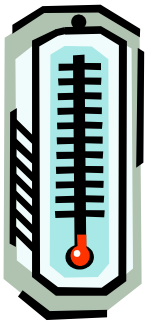
$$T_R = T_F + 459.67 = -5 + 459.67$$
$$= \mathbf{454.7\ R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.106E

What is the smallest temperature in degrees Fahrenheit you can have? Rankine?

Solution:



The lowest temperature is absolute zero which is at zero degrees Rankine at which point the temperature in Fahrenheit is negative

$$T_R = 0 \text{ R} = -459.67 \text{ F}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.107E

What is the relative magnitude of degree Rankine to degree Kelvin

Look in Table A.1 p. 757:

$$1 \text{ K} = 1 \text{ }^{\text{o}}\text{C} = 1.8 \text{ R} = 1.8 \text{ F}$$

$$1 \text{ R} = \frac{5}{9} \text{ K} = 0.5556 \text{ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.108E

Chemical reaction rates genrally double for a 10 K increase in temperature. How large an increase is that in Fahrenheit?

From the Conversion Table A.1: $1\ \text{K} = 1\ ^{o}\text{C} = 1.8\ \text{R} = 1.8\ \text{F}$

So the 10 K increase becomes

$$10\ \text{K} = 18\ \text{F}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Properties and Units

1.109E

An apple weighs 0.2 lbm and has a volume of 6 in^3 in a refrigerator at 38 F. What is the apple density? List three intensive and two extensive properties for the apple.

Solution:

$$\rho = \frac{m}{V} = \frac{0.2}{6}\ \frac{lbm}{in^3} = 0.0333\ \frac{lbm}{in^3} = 57.6\ \frac{lbm}{ft^3}$$

Intensive

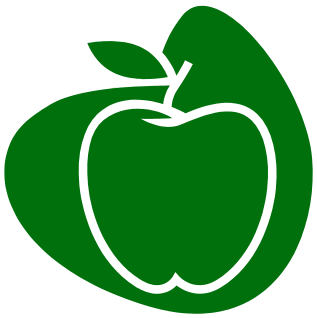
$$\rho = 57.6\ \frac{lbm}{ft^3}; \qquad v = \frac{1}{\rho} = 0.0174\ \frac{ft^3}{lbm}$$

T = 38 F; P = 14.696 lbf/in^2

Extensive

m = 0.2 lbm

V = 6 in^3 = 0.026 gal = 0.00347 ft^3

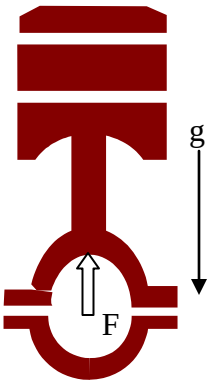


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.110E

A steel piston of 10 lbm is in the standard gravitational field where a force of 10 lbf is applied vertically up. Find the acceleration of the piston.

Solution:



$$F_{up} = ma = F - mg$$

$$a = \frac{F - mg}{m} = \frac{F}{m} - g$$

$$= \frac{10 \text{ lbf}}{10 \text{ lbm}} - 32.174 \text{ ft/s}^2$$

$$= (1 \times 32.174 - 32.174) \text{ ft/s}^2$$

$$= \mathbf{0 \text{ fts}^{-2}}$$

The mass does not move, it is held stationary.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Force, Energy, Density

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.111E

A 2500-lbm car moving at 25 mi/h is accelerated at a constant rate of 15 ft/s^2 up to a speed of 50 mi/h. What are the force and total time required?

Solution:

$$a = \frac{d\mathbf{V}}{dt} = \frac{\Delta \mathbf{V}}{\Delta t} \quad \Rightarrow \quad \Delta t = \frac{\Delta \mathbf{V}}{a}$$

$$\Delta t = \frac{(50 - 25) \text{ mi/h} \times 1609.34 \text{ m/mi} \times 3.28084 \text{ ft/m}}{3600 \text{ s/h} \times 15 \text{ ft/s}^2} = \mathbf{2.44 \text{ sec}}$$

$$F = ma = 2500 \text{ lbm} \times 15 \text{ ft/s}^2 / (32.174 \text{ lbm ft /lbf-s}^2)$$

$$= \mathbf{1165 \text{ lbf}}$$

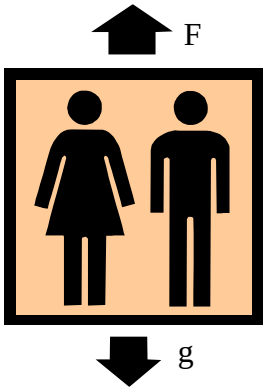
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.112E

An escalator brings four people of total 600 lbm and a 1000 lbm cage up with an acceleration of 3 ft/s^2 what is the needed force in the cable?

Solution:

The total mass moves upwards with an acceleration plus the gravitations acts with a force pointing down.



$ma = \sum F = F - mg$

$F = ma + mg = m(a + g)$

$= (1000 + 600)\ \text{lbm} \times (3 + 32.174)\ \text{ft/s}^2$

$= \mathbf{56\ 278\ lbm\ ft/s^2} = \mathbf{56\ 278\ lbf}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.113E

One pound-mass of diatomic oxygen (O_2 molecular weight 32) is contained in a 100-gal tank. Find the specific volume on both a mass and mole basis (v and $\bar{v}$).

Solution:

$$V = 100 \times 231 \text{ in}^3 = (23\ 100/12^3)\ \text{ft}^3 = 13.37 \text{ ft}^3$$

conversion seen in Table A.1

This is based on the definition of the specific volume

$$v = V/m = 13.37 \text{ ft}^3/1 \text{ lbm} = \mathbf{13.37\ ft^3/lbm}$$

$$\bar{v} = V/n = \frac{V}{m/M} = Mv = 32 \times 13.37 = \mathbf{427.8\ ft^3/lbmol}$$

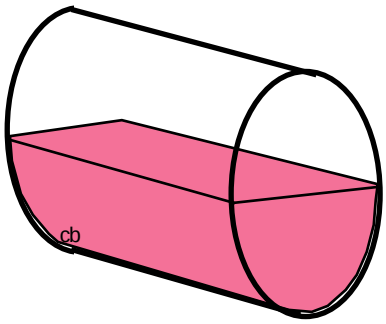
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.114E

A 30-lbm steel gas tank holds 10 ft^3 of liquid gasoline, having a density of 50 lbm/ft^3. What force is needed to accelerate this combined system at a rate of 15 ft/s^2?

Solution:

$$m = m_{tank} + m_{gasoline}$$
$$= 30 \text{ lbm} + 10 \text{ ft}^3 \times 50 \text{ lbm/ft}^3$$
$$= 530 \text{ lbm}$$



$$F = ma = (530 \text{ lbm} \times 15 \text{ ft/s}^2) / (32.174 \text{ lbm ft/s}^2\text{- lbf}) = \mathbf{247.1\ lbf}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.115E

A powerplant that separates carbon-dioxide from the exhaust gases compresses it to a density of 8 lbm/ft^3 and stores it in an un-minable coal seam with a porous volume of 3 500 000 ft^3. Find the mass they can store.

Solution:

$$m = \rho V = 8 \text{ lbm/ft}^3 \times 3\,500\,000 \text{ ft}^3 = 2.8 \times 10^7 \text{ lbm}$$

Just to put this in perspective a power plant that generates 2000 MW by burning coal would make about 20 million tons of carbon-dioxide a year. That is 2000 times the above mass so it is nearly impossible to store all the carbon-dioxide being produced.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.116E

A laboratory room keeps a vacuum of 4 in. of water due to the exhaust fan. What is the net force on a door of size 6 ft by 3 ft?

Solution:

The net force on the door is the difference between the forces on the two sides as the pressure times the area

$$F = P_{outside} A - P_{inside} A = \Delta P \times A$$
$$= 4 \text{ in } H_2O \times 6 \text{ ft} \times 3 \text{ ft}$$
$$= 4 \times 0.036126 \text{ lbf/in}^2 \times 18 \text{ ft}^2 \times 144 \text{ in}^2/\text{ft}^2$$
$$= \mathbf{374.6 \text{ lbf}}$$

Table A.1: 1 in. H_2O is 0.036 126 lbf/in^2, a unit also often listed as psi.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.117E

A 150-lbm human total footprint is 0.5 ft when the person is wearing boots. If snow can support an extra 1 psi, what should the total snow shoe area be?

Force balance: $ma = 0 = PA - mg$

$$A = \frac{mg}{P} = \frac{150 \text{ lbm} \times 32.174 \text{ ft/s}^2}{1 \text{ lbf/in}^2} = \frac{150 \text{ lbm} \times 32.174 \text{ ft/s}^2}{32.174 \text{ lbm-ft/(s}^2\text{in}^2\text{)}}$$

$$= \mathbf{150 \text{ in}^2} = 1.04 \text{ ft}^2$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.118E

A tornado rips off a 1000 ft^2 roof with a mass of 2000 lbm. What is the minimum vacuum pressure needed to do that if we neglect the anchoring forces?

Solution:

The net force on the roof is the difference between the forces on the two sides as the pressure times the area

$$F = P_{inside}\, A - P_{outside} A = \Delta P\, A$$

That force must overcome the gravitation mg, so the balance is

$$\Delta P\, A = mg$$

$$\Delta P = mg/A = (2000 \text{ lbm} \times 32.174 \text{ ft/s}^2)/1000 \text{ ft}^2$$
$$= 2000/(1000 \times 144) \text{ psi} = \mathbf{0.0139 \text{ psi}}$$

Remember that psi = lbf/in^2.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.119E

A manometer shows a pressure difference of 3.5 in of liquid mercury. Find ΔP in psi.

Solution:

Hg : L = 3.5 in; ρ = 848 lbm/ft^3 from Table F.3

Pressure: 1 psi = 1 lbf/ in^2

The pressure difference ΔP balances the column of height L so from Eq.2.2

$\Delta P = \rho g L$ = 848 lbm/ft^3 × 32.174 ft/s^2 × (3.5/12) ft

= 247.3 lbf/ft^2 = (247.3 / 144) lbf/in^2

= **1.72 psi**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.120E

A 7 ft m tall steel cylinder has a cross sectional area of 15 ft^2. At the bottom with a height of 2 ft m is liquid water on top of which is a 4 ft high layer of gasoline. The gasoline surface is exposed to atmospheric air at 14.7 psia. What is the highest pressure in the water?

Solution:

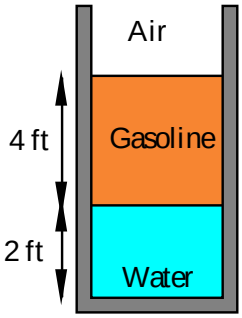
The pressure in the fluid goes up with the depth as

$$P = P_{top} + \Delta P = P_{top} + \rho g h$$

and since we have two fluid layers we get

$$P = P_{top} + [(\rho h)_{gasoline} + (\rho h)_{water}]g$$

The densities from Table F.3 are:



$$\rho_{gasoline} = 46.8 \text{ lbm/ft}^3; \quad \rho_{water} = 62.2 \text{ lbm/ft}^3$$

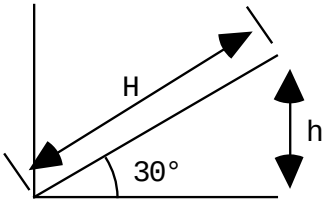
$$P = 14.7 + [46.8 \times 4 + 62.2 \times 2] \frac{32.174}{144 \times 32.174} = \mathbf{16.86 \text{ lbf/in}^2}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.121E

A U-tube manometer filled with water, density 62.3 lbm/ft^3, shows a height difference of 10 in. What is the gauge pressure? If the right branch is tilted to make an angle of 30° with the horizontal, as shown in Fig. P1.77, what should the length of the column in the tilted tube be relative to the U-tube?

Solution:



$$\Delta P = F/A = mg/A = h\rho g$$

$$= \frac{(10/12) \times 62.3 \times 32.174}{32.174 \times 144}$$

$$= P_{gauge} = \mathbf{0.36\ lbf/in^2}$$

$$h = H \times \sin 30°$$

$$\Rightarrow \ H = h/\sin 30° \ = 2h = 20 \text{ in} = \mathbf{0.833\ ft}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.122E

A piston/cylinder with cross-sectional area of 0.1 ft^2 has a piston mass of 200 lbm resting on the stops, as shown in Fig. P1.50. With an outside atmospheric pressure of 1 atm, what should the water pressure be to lift the piston?

Solution:

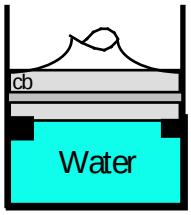
The force acting down on the piston comes from gravitation and the outside atmospheric pressure acting over the top surface.

Force balance: $F\uparrow = F\downarrow = PA = m_p g + P_0 A$

Now solve for P (multiply by 144 to convert from ft^2 to in^2)

$$P = P_0 + \frac{m_p g}{A} = 14.696 + \frac{200 \times 32.174}{0.1 \times 144 \times 32.174}$$

$$= 14.696 \text{ psia} + 13.88 \text{ psia} = \mathbf{28.58\ lbf/in^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.123E

The main waterline into a tall building has a pressure of 90 psia at 16 ft elevation below ground level. How much extra pressure does a pump need to add to ensure a waterline pressure of 30 psia at the top floor 450 ft above ground?

Solution:

The pump exit pressure must balance the top pressure plus the column ΔP. The pump inlet pressure provides part of the absolute pressure.

$$P_{after\ pump} = P_{top} + \Delta P$$

$$\Delta P = \rho g h = 62.2\ \text{lbm/ft}^3 \times 32.174\ \text{ft/s}^2 \times (450 + 16)\ \text{ft} \times \frac{1\ \text{lbf s}^2}{32.174\ \text{lbm ft}}$$

$$= 28\,985\ \text{lbf/ft}^2 = 201.3\ \text{lbf/in}^2$$

$$P_{after\ pump} = 30 + 201.3 = 231.3\ \text{psia}$$

$$\Delta P_{pump} = 231.3 - 90 = \mathbf{141.3\ psi}$$

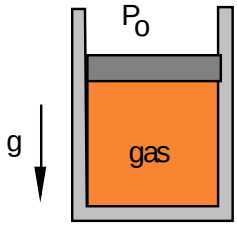
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.124E

A piston, m_p = 10 lbm, is fitted in a cylinder, A = 2.5 in.^{2}, that contains a gas. The setup is in a centrifuge that creates an acceleration of 75 ft/s^2. Assuming standard atmospheric pressure outside the cylinder, find the gas pressure.

Solution:

Force balance: $F\uparrow = F\downarrow = P_0 A + m_p g = PA$



$$P = P_0 + \frac{m_p g}{A}$$

$$= 14.696 + \frac{10 \times 75}{2.5 \times 32.174} \frac{\text{lbm}}{\text{in}^2} \frac{\text{ft/s}^2}{\text{lbf-s}^2} \frac{\text{lbf-s}^2}{\text{lbm-ft}}$$

$$= 14.696 + 9.324 = \mathbf{24.02\ lbf/in^2}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Temperature

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.125E

The human comfort zone is between 18 and 24°C. What is that range in Fahrenheit?

$$T = 18°C = 32 + 1.8 \times 18 = 64.4 \text{ F}$$
$$T = 24°C = 32 + 1.8 \times 24 = 75.2 \text{ F}$$

So the range is like **64 to 75 F**.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.126E

The atmosphere becomes colder at higher elevation. As an average the standard atmospheric absolute temperature can be expressed as $T_{atm} = 518 - 3.84 \times 10^{-3} z$, where z is the elevation in feet. How cold is it outside an airplane cruising at 32 000 ft expressed in Rankine and in Fahrenheit?

Solution:

For an elevation of z = 32 000 ft we get

$$T_{atm} = 518 - 3.84 \times 10^{-3} z = \mathbf{395.1\ R}$$

To express that in degrees Fahrenheit we get

$$T_F = T - 459.67 = \mathbf{-64.55\ F}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

1.127E

The density of mercury changes approximately linearly with temperature as

$$\rho_{Hg} = 851.5 - 0.086\ T \ \text{lbm/ft}^3 \qquad T \ \text{in degrees Fahrenheit}$$

so the same pressure difference will result in a manometer reading that is influenced by temperature. If a pressure difference of 14.7 lbf/in.^{2} is measured in the summer at 95 F and in the winter at 5 F, what is the difference in column height between the two measurements?

Solution:

$$\Delta P = \rho g h \quad \Rightarrow \quad h = \Delta P/\rho g$$

$$\rho_{su} = 843.33 \ \text{lbm/ft}^3; \qquad \rho_w = 851.07 \ \text{lbm/ft}^3$$

$$h_{su} = \frac{14.7 \times 144 \times 32.174}{843.33 \times 32.174} = 2.51 \ \text{ft} = 30.12 \ \text{in}$$

$$h_w = \frac{14.7 \times 144 \times 32.174}{851.07 \times 32.174} = 2.487 \ \text{ft} = 29.84 \ \text{in}$$

$$\Delta h = h_{su} - h_w = 0.023 \ \text{ft} = \mathbf{0.28\ in}$$

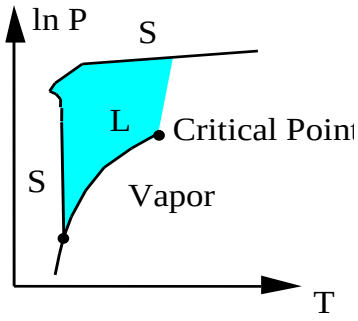
In-Text Concept Questions

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.a

If the pressure is smaller than the smallest P_{sat} at a given T, what is the phase?

Refer to the phase diagrams in Figures 2.4 and 2.5. For a lower P you are below the vaporization curve (or the sublimation curve) and that is the superheated vapor region. You have the gas phase.



2.b

An external water tap has the valve activated by a long spindle so the closing mechanism is located well inside the wall. Why is that?

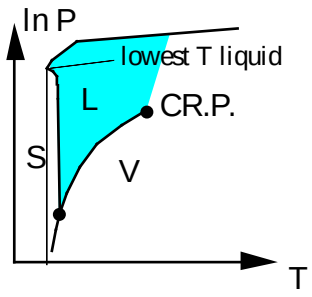
Solution:
By having the spindle inside the wall the coldest location with water when the valve is closed is kept at a temperature above the freezing point. If the valve spindle was outside there would be some amount of water that could freeze while it is trapped inside the pipe section potentially rupturing the pipe.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.c

What is the lowest temperature (approximately) at which water can be liquid?

Look at the phase diagram in Fig. 2.4. At the border between ice I, ice III and the liquid region is a triple point which is the lowest T where you can have liquid. From the figure it is estimated to be about 255 K i.e. at -18^{o}C.



T ≈ 255 K ≈ - 18°C

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.d

Some tools should be cleaned in water at a least 150^{o}C. How high a P is needed?

Solution:

If I need liquid water at 150^{o}C I must have a pressure that is at least the saturation pressure for this temperature.

Table B.1.1: 150^{o}C, P_{sat} = 475.9 kPa.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.e

Water at 200 kPa has a quality of 50%. Is the volume fraction V_g/V_{tot} < 50% or > 50%?

This is a two-phase state at a given pressure and without looking in the table we know that v_f is much smaller than v_g.

From the definition of quality we get the masses from total mass, m, as

$$m_f = (1 - x)\, m, \qquad m_g = x\, m$$

The volumes are

$$V_f = m_f\, v_f = (1 - x)\, m\, v_f, \qquad V_g = m_g\, v_g = x\, m\, v_g$$

So when half the mass is liquid and the other half is vapor the liquid volume is much smaller that the vapor volume. The vapor volume is thus much more than 50% of the total volume. Only right at the critical point is $v_f = v_g$ for all other states $v_g > v_f$ and the difference is larger for smaller pressures.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.f

Why are most of the compressed liquid or solid regions not included in the printed tables?

For the compressed liquid and the solid phases the specific volume and thus density is nearly constant. These surfaces are very steep nearly constant v and there is then no reason to fill up a table with the same value of v for different P and T.

2.g

Why is it not typical to find tables for Ar, He, Ne or air like an Appendix B table?

The temperature at which these substances are close to the two-phase region is very low. For technical applications with temperatures around atmospheric or higher they are ideal gases. Look in Table A.2 and we can see the critical temperatures as

Ar : 150.8 K He: 5.19 K Ne: 44.4 K

It requires a special refrigerator in a laboratory to bring a substance down to these cryogenic temperatures.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.h

What is the percent change in volume as liquid water freezes? Mention some effects the volume change can have in nature and in our households.

The density of water in the different phases can be found in Tables A.3 and A.4 and in Table B.1.

From Table B.1.1 $v_f = 0.00100$ m^3/kg

From Table B.1.5 $v_i = 0.0010908$ m^3/kg

Percent change: $$100\,\frac{v_i - v_f}{v_f} = 100 \times \frac{0.0010908 - 0.001}{0.001} = 9.1\ \%\ \text{increase}$$

Liquid water that seeps into cracks or other confined spaces and then freezes will expand and widen the cracks. This is what destroys any porous material exposed to the weather on buildings, roads and mountains. It can burst water pipes and crack engine blocks (that is why you put anti-freeze in it).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.i

How accurate is it to assume that methane is an ideal gas at room conditions?

From Table A.2: $T_c = 190.4$ K, $P_c = 4.60$ MPa

So at room conditions we have much higher $T > T_c$ and $P << P_c$ so this is the ideal gas region. To confirm look in Table B.7.2

$$100 \text{ kPa}, 300 \text{ K}, \quad v = 1.55215 \text{ m}^3/\text{kg}$$

Find the compressibility factor (R from Table A.5) as

$$Z = Pv/RT = \frac{100 \text{ kPa} \times 1.55215 \text{ m}^3/\text{kg}}{0.5183 \text{ kJ/kg-K} \times 300 \text{ K}} = 0.99823$$

so Z is 1 with an accuracy of 0.2% better than most measurements can be done.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.j

I want to determine a state of some substance, and I know that P = 200 kPa; is it helpful to write PV = mRT to find the second property?

NO. You need a second property.

Notice that two properties are needed to determine a state. The EOS can give you a third property if you know two, like (P,T) gives v just as you would get by entering a table with a set (P,T). This EOS substitutes for a table when it is applicable.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.k

A bottle at 298 K should have liquid propane; how high a pressure is needed? (use Fig. D.1)

To have a liquid the pressure must be higher than or equal to the saturation pressure. There is no printed propane table so we use the compressibility chart and Table A.2

Propane Table A.2: $T_c = 369.8$ K, $P_c = 4.25$ MPa

The reduced temperature is:

$$T_r = \frac{T}{T_c} = \frac{298}{369.8} = 0.806,$$

for which we find in Fig. D.1: $P_{r\,sat} = 0.25$

$$P = P_{r\,sat} P_c = 0.25 \times 4.25 \text{ MPa} = \mathbf{1.06\ MPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.l

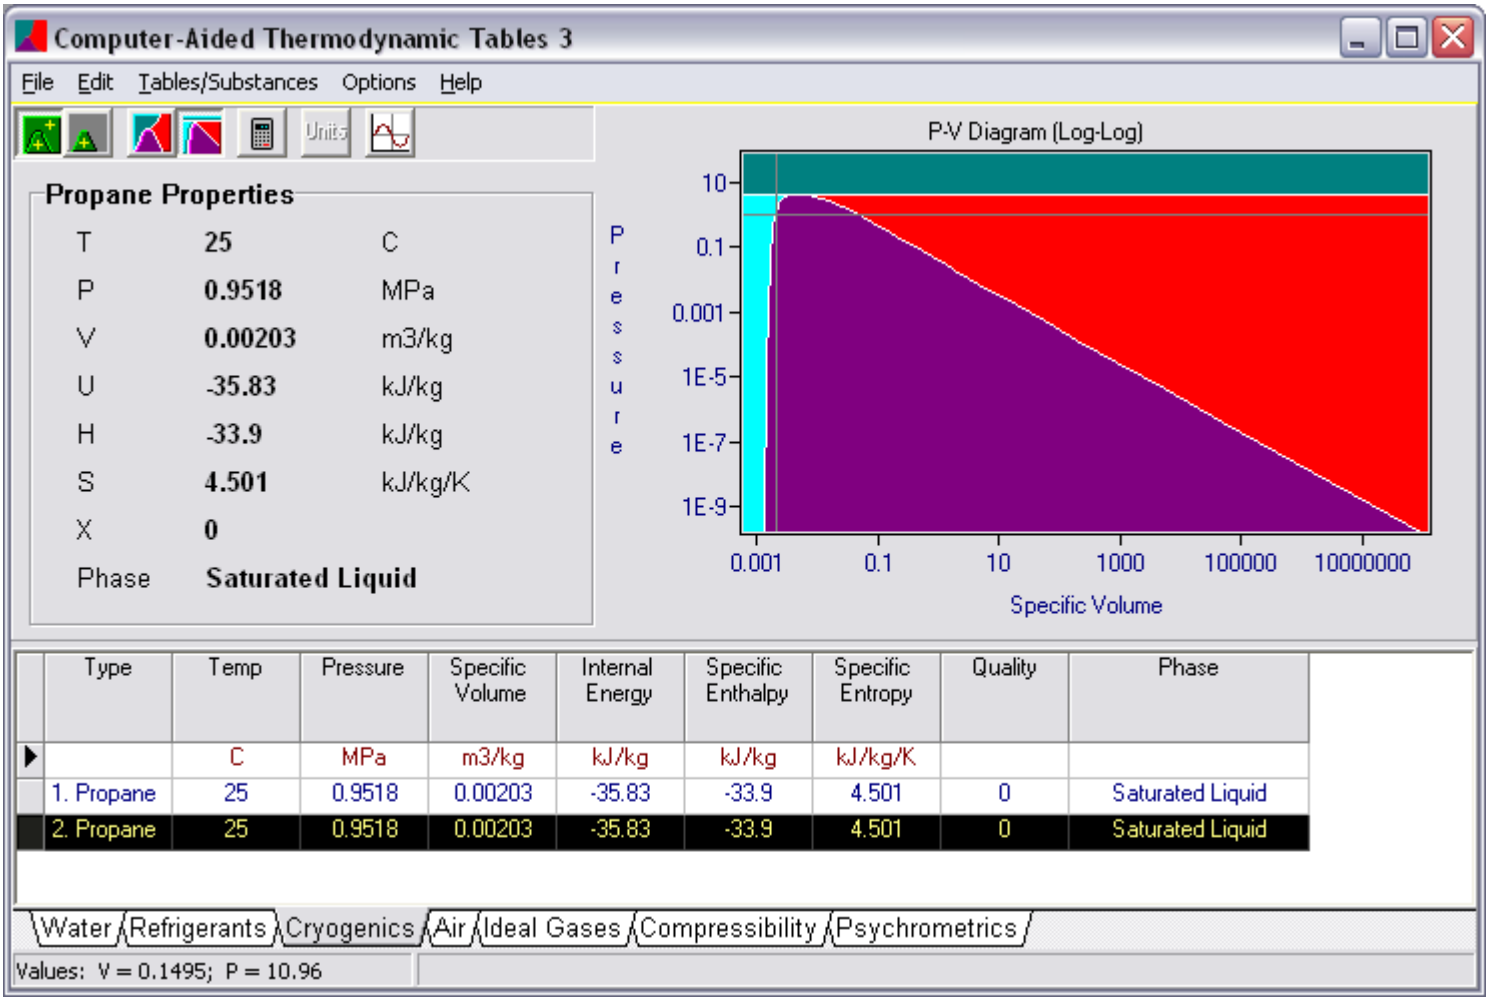
A bottle at 298 K should have liquid propane; how high a pressure is needed? (use the software)

To have a liquid the pressure must be higher than or equal to the saturation pressure. There is no printed propane table but the software has propane included

Start CATT3, select cryogenic substances, propane

select calculator, select case 4 (T, x) = (25^{o}C, 0)

⇨ P = **0.9518 MPa**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.1

Are the pressures in the tables absolute or gauge pressures?

Solution:
The behavior of a pure substance depends on the absolute pressure, so P in the tables is absolute.

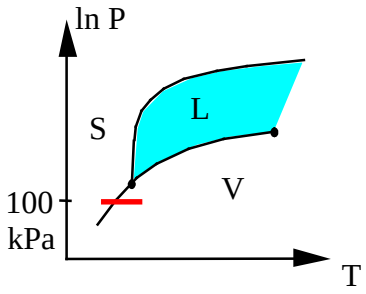
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.2

What is the minimum pressure for which I can have liquid carbon dioxide?

Look at the phase diagram in Fig. 2.5. The minimum P in the liquid phase is at the triple point. From Table 2.2 this is at **520 kPa** (a similar value around 4-500 kPa is seen in Fig. 2.5).

The 100 kPa is below the triple point.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.3

When you skate on ice, a thin liquid film forms under the skate. How can that be?

The ice is at some temperature below the freezing temperature for the atmospheric pressure of 100 kPa = 0.1 MPa and thus to the left of the fusion line in the solid ice I region of Fig. 2.4. As the skate comes over the ice the pressure is increased dramatically right under the blade so it brings the state straight up in the diagram crossing the fusion line and brings it into a liquid state at same temperature.

The very thin liquid film under the skate changes the friction to be viscous rather than a solid to solid contact friction. Friction is thus significantly reduced.

Comment: The latest research has shown that the pressure may not be enough to generate the liquid, but that such a liquid layer always exist on an ice surface, maybe only a few molecules thick (dependent upon temperature). At really low T say -40^{o}C no such liquid layer exists which is why your finger can stick to such a surface.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.4

At a higher elevation like in mountains the pressure is lower, what effect does that have for cooking food?

A lower pressure means that water will boil at a lower temperature, see the vaporization line in Fig. 2.4, or in Table B.1.2 showing the saturated temperature as a function of the pressure. You therefore must increase the cooking time a little.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.5

Water at room temperature and room pressure has $v \approx 1 \times 10^n$ m^3/kg what is n?

See Table B.1.1 or B.1.2 to determine it is in the liquid phase (you should know this already).

Table A.4 or from B1.1 at 20^{o}C: n = –3 ($v = 0.00100$ m^3/kg)

2.6

Can a vapor exist below the triple point temperature?

Look at the phase diagrams in Figs 2.4 and 2.5. Below the triple point the sublimation curve has very small pressures, but not zero. So for pressures below the saturation pressure the substance is a vapor. If the phase diagram is plotted in linear coordinates the small vapor region is nearly not visible.

2.7

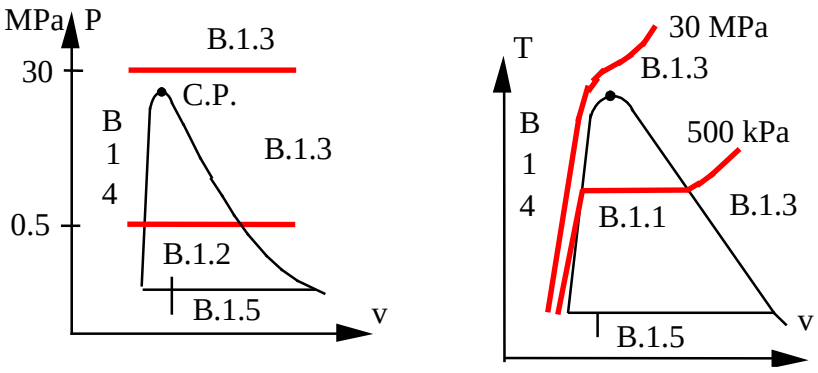
In Example 2.1 b is there any mass at the indicated specific volume? Explain.

This state is a two-phase mixture of liquid and vapor. There is no mass at the indicated state, the v value is an average for all the mass, so there is some mass at the saturated vapor state (fraction is the quality x) and the remainder of the mass is saturated liquid (fraction 1-x).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.8

Sketch two constant-pressure curves (500 kPa and 30 000 kPa) in a T-v diagram and indicate on the curves where in the water tables you see the properties.



The 30 MPa line in Table B.1.4 starts at 0^{o}C and table ends at 380^{o}C, the line is continued in Table B.1.3 starting at 375^{o}C and table ends at 1300^{o}C.

The 500 kPa line in Table B.1.4 starts at 0.01^{o}C and table ends at the saturated liquid state (151.86^{o}C). The line is continued in Table B.1.3 starting at the saturated vapor state (151.86^{o}C) continuing up to 1300^{o}C.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.9

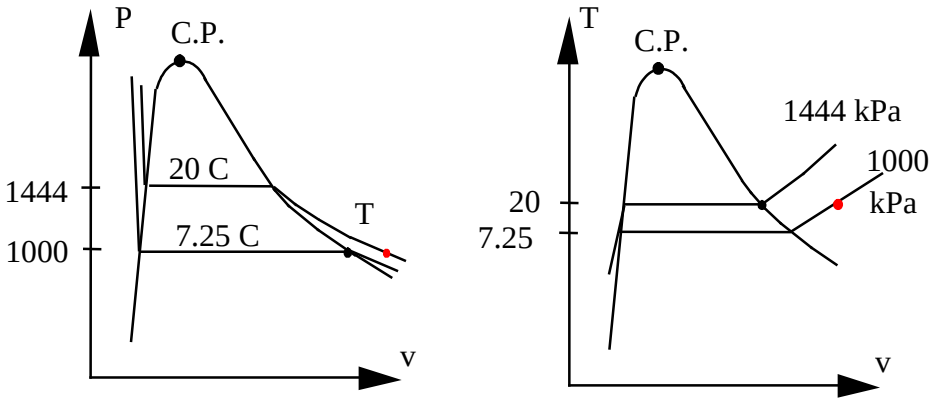
If I have 1 L of R-410A at 1 MPa, 20°C how much mass is that?

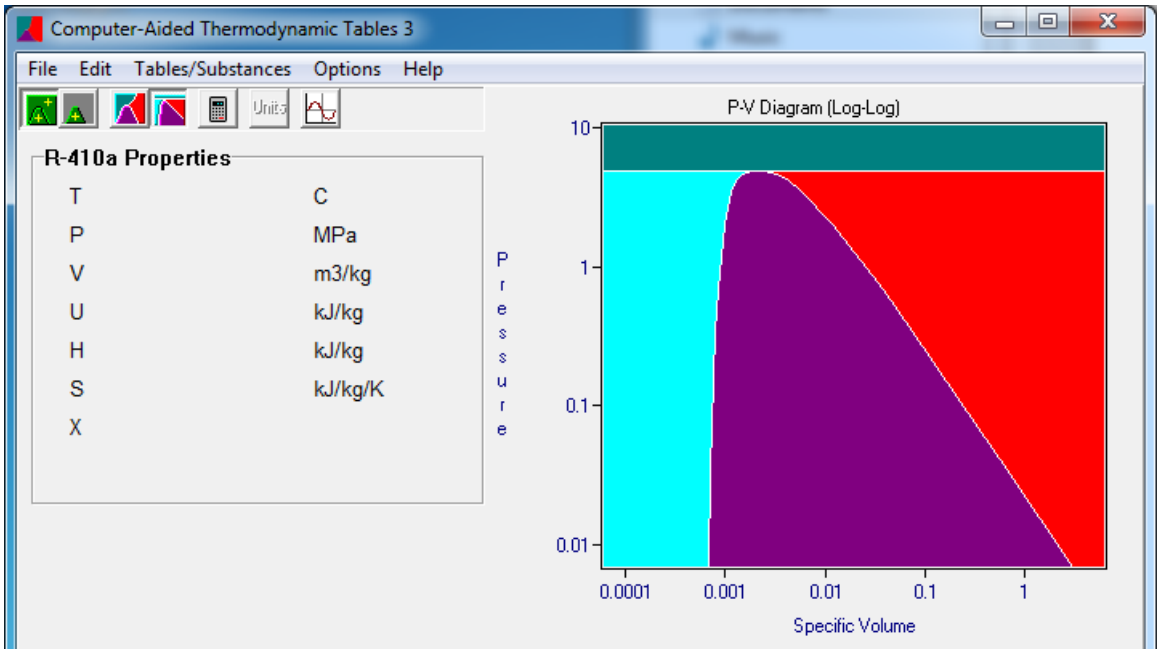
R-410A Tables B.4:

B.4.1 P_{sat} = 1444.2 kPa at 20°C so superheated vapor.

B.4.2 v = 0.02838 m^3/kg under subheading 1000 kPa

$$m = \frac{V}{v} = \frac{0.001\ m^3}{0.02838\ m^3/kg} = \mathbf{0.0352\ kg} = \mathbf{35.2\ g}$$



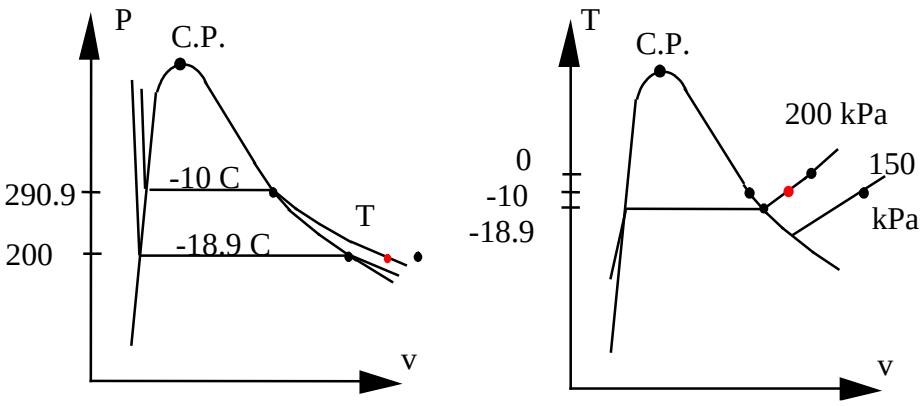


The P-v (log-log) diagram from CATT3, P in MPa and v in m^3/kg.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.10

Locate the state of ammonia at 200 kPa, -10^{o}C. Indicate in both the P-v and the T-v diagrams the location of the nearest states listed in the printed Table B.2



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.11

Why are most of the compressed liquid or solid regions not included in the printed tables?

For the compressed liquid and the solid phases the specific volume and thus density is nearly constant. These surfaces are very steep nearly constant v and there is then no reason to fill up a table with the same value of v for different P and T.

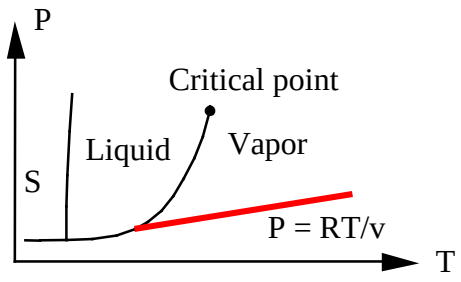
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.12

How does a constant v-process look like for an ideal gas in a P-T diagram?

For an ideal gas: Pv = RT so then P = (R/v) T

Constant v is a straight line with slope (R/v) in the P-T diagram



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.13

If v = RT/P for an ideal gas what is the similar equation for a liquid?

The equation for a liquid is: $v = \text{Constant} = v_o$

If you include that v increases a little with T then: $v = v_o + C\,(T - T_o)$
where C is a small constant with units $m^3/kg\text{-}K$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.14

To solve for v given (P, T) in Eq.2.14 , what is the mathematical problem?

To solve for v in Eq. 2.14 multiply with the de-numerators so we get the form

$$P\, f_1(v) = RT\, f_2(v) - a\,(v - b)$$

This is a 3rd order polynomial (a cubic) function in v. The problem then is to find the roots or zero points in this cubic equation. The mathematical subject to study is to find zero points of functions (or roots). Typically you will do it by some iteration technique. Successive substitutions, bi-section, Newton-Raphson are some of the methods you should learn.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.15

As the pressure of a gas becomes larger, Z becomes larger than 1. What does that imply?

$$Pv = Z\,RT$$

So for a given P, the specific volume v is then larger than predicted by the ideal gas law. The molecules are pressed so close together that they have repulsive forces between them (the electron clouds are getting closer). The ideal gas law assumes the atoms (molecules) are point masses with no interactions between them and thus has a limit of zero specific volume as P goes to infinity. Real molecules occupy some volume and the outer shell has a number of electrons with negative charges which can interact with one another if they are close enough.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Phase Diagrams, Triple and Critical Points

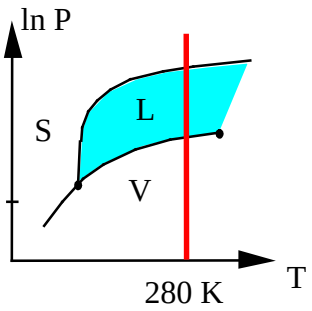
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.16

Carbon dioxide at 280 K can be in different phases. Indicate the pressure range you have for each of the three phases (vapor, liquid and solid).

Look at the P-T phase diagram in Fig. 2.5 at 280 K:

P < 4000 kPa	vapor
4000 kPa < P < 400 MPa	liquid
400 MPa < P	solid



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.17

Modern extraction techniques can be based on dissolving material in supercritical fluids such as carbon dioxide. How high are pressure and density of carbon dioxide when the pressure and temperature are around the critical point? Repeat for ethyl alcohol.

Solution:

CO_2 :

Table A.2: P_c = **7.38 MPa**, T_c = 304 K, v_c = 0.00212 m^3/kg

$$\rho_c = 1/v_c = 1/0.00212 = \mathbf{472\ kg/m^3}$$

C_2H_5OH:

Table A.2: P_c = **6.14 MPa**, T_c = 514 K, v_c = 0.00363 m^3/kg

$$\rho_c = 1/v_c = 1/0.00363 = \mathbf{275\ kg/m^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.18

The ice cap on the North Pole could be 1000 m thick with a density of 920 kg/m^3. Find the pressure at the bottom and the corresponding melting temperature.

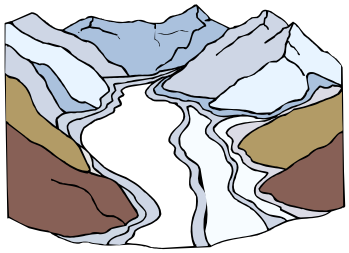
Solution:

ρ_{ICE} = 920 kg/m^3

$\Delta P = \rho g H$ = 920 kg/m^3 × 9.80665 m/s^2 × 1000 m = 9 022 118 Pa

$P = P_O + \Delta P$ = 101.325 + 9022 = **9123 kPa**

See figure 3.7 liquid solid interphase => $\mathbf{T_{LS} = -1°C}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

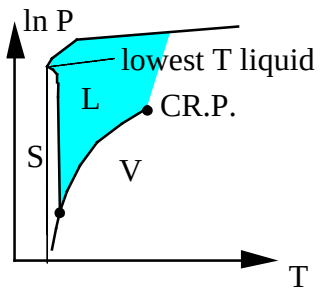
2.19

Find the lowest temperature at which it is possible to have water in the liquid phase. At what pressure must the liquid exist?

Solution:

There is no liquid at lower temperatures than on the fusion line, see Fig. 3.7, saturated ice III to liquid phase boundary is at

T ≈ 263K ≈ - 10°C and
P ≈ 210 MPa



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.20

Water at 27°C can exist in different phases dependent upon the pressure. Give the approximate pressure range in kPa for water being in each one of the three phases vapor, liquid or solid.

Solution:

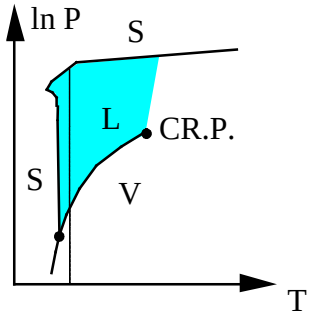
The phases can be seen in Fig. 2.4, a sketch of which is shown to the right.

T = 27 °C = 300 K

From Fig. 2.4:

$P_{VL} \approx 4 \times 10^{-3}$ MPa = 4 kPa,

$P_{LS} = 10^{3}$ MPa



0 < P < 4 kPa VAPOR

0.004 MPa < P < 1000 MPa LIQUID

P > 1000 MPa SOLID (ICE)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.21

Dry ice is the name of solid carbon dioxide. How cold must it be at atmospheric (100 kPa) pressure? If it is heated at 100 kPa what eventually happens?

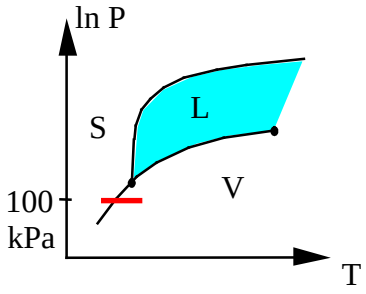
Solution:

The phase boundaries are shown in Figure 2.5

At 100 kPa the carbon dioxide is solid if **T < 190 K**

It goes directly to a vapor state without becoming a liquid hence its name.

The 100 kPa is below the triple point.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.22

What is the lowest temperature in Kelvin for which you can see metal as a liquid if the metal is *a.* mercury *b.* zinc

Solution:

Assume the two substances have a phase diagram similar to Fig. 2.5, then the triple point is the lowest T with liquid possible the data is from Table 2.1

$$T_a = -39^oC = \mathbf{234\ K}$$

$$T_b = 419^oC = \mathbf{692\ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.23

A substance is at 2 MPa, 17°C in a rigid tank. Using only the critical properties can the phase of the mass be determined if the substance is oxygen, water or propane?

Solution:

Find state relative to critical point properties which are from Table A.2:

a) Oxygen O_2 : 5.04 MPa 154.6 K

b) Water H_2O : 22.12 MPa 647.3 K

c) Propane C_3H_8 : 4.25 MPa 369.8 K

State is at 17 °C = 290 K and 2 MPa < P_c

for all cases:

O_2 : T >> T_c Superheated vapor P < Pc

H_2O : T << T_c ; P << P_c

you cannot say.

C_3H_8 : T < T_c ; P < P_c you cannot say

2.24

Give the phase for the following states.

Solution:

a. CO_2 $T = 40^\circ C$ $P = 0.5$ MPa Table A.2

$T > T_c$ => also $P << P_c$

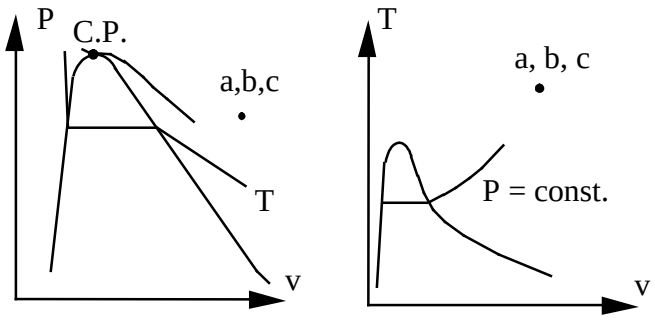
superheated vapor assume ideal gas Table A.5

b. Air $T = 20^\circ C$ $P = 200$ kPa Table A.2

superheated vapor assume ideal gas Table A.5

c. NH_3 $T = 170^\circ C$ $P = 600$ kPa Table B.2.2 or A.2

$T > T_c$ => **superheated vapor**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

General Tables

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.25

Give the phase for the following states.

Solution:

a. H_2O $T = 260^\circ C$ $P = 5$ MPa Table B.1.1 **or** B.1.2

B.1.1 For given T read: $P_{sat} = 4.689$ MPa

$P > P_{sat}$ => **compressed liquid**

B.1.2 For given P read: $T_{sat} = 264^\circ C$

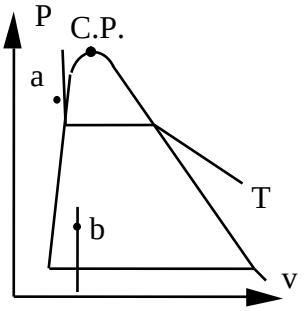
$T < T_{sat}$ => **compressed liquid**

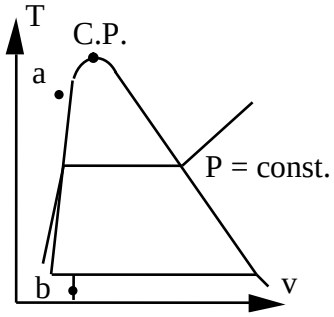
b. H_2O $T = -2^\circ C$ $P = 100$ kPa Table B.1.1 $T < T_{triple\ point}$

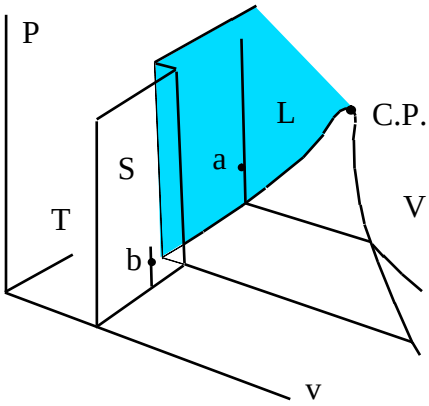
Table B.1.5 at $-2^\circ C$ read: $P_{sat} = 0.518$ kPa

since $P > P_{sat}$ => **compressed solid**

Note state b in P-v, see the 3-D figure, is up on the solid face.







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.26

Determine the phase of the substance at the given state using Appendix B tables

a) Water 100°C, 500 kPa

b) Ammonia -10°C, 150 kPa

c) R-410A 0°C, 350 kPa

Solution:

a) From Table B.1.1 $P_{sat}(100°C) = 101.3$ kPa

500 kPa > P_{sat} then it is compressed liquid

OR from Table B.1.2 $T_{sat}(500 \text{ kPa}) = 152°C$

100°C < T_{sat} then it is subcooled liquid = compressed liquid

b) Ammonia NH_3 :

Table B.2.1: $P < P_{sat}(-10\ °C) = 291$ kPa

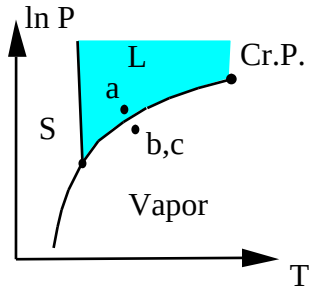
Superheated vapor

c) R-410A

Table B.4.1: $P < P_{sat}(0\ °C) = 799$ kPa

Superheated vapor.

The S-L fusion line goes slightly to the left for water. It tilts slightly to the right for most other substances.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.27

Give the missing property of P-v-T and x for water at

a. P = 10 MPa, v = 0.003 m^3/kg b. 1 MPa, 190°C

c. 200°C, 0.1 m^3/kg d. 10 kPa, 10°C

Solution:

For all states start search in table B.1.1 (if T given) or B.1.2 (if P given)

a. P = 10 MPa, v = 0.003 m^3/kg so look in B.1.2 at 10 MPa

T = 311°C; v_f = 0.001452 < v < v_g = 0.01803 m^3/kg, so L+V

=> $x = (v - v_f)/v_{fg} = (0.003 - 0.001452)/0.01657 = 0.093$

b. 1 MPa, 190°C : Only one of the two look-ups is needed

B.1.1: $P < P_{sat}$ = 1254.4 kPa so it is superheated vapor

B.1.2: $T > T_{sat}$ = 179.91°C so it is superheated vapor

B.1.3: $v = 0.19444 + (0.20596 - 0.19444)\dfrac{190 - 179.91}{200 - 179.91} = 0.2002$ m^3/kg

c. 200°C, 0.1 m^3/kg: look in B.1.1: $P = P_{sat}$ = 1553.8 kPa

v_f = 0.001156 m^3/kg < v < v_g = 0.12736 m^3/kg, so L+V

=> $x = (v - v_f)/v_{fg} = (0.1 - 0.001156)/0.1262 = 0.7832$

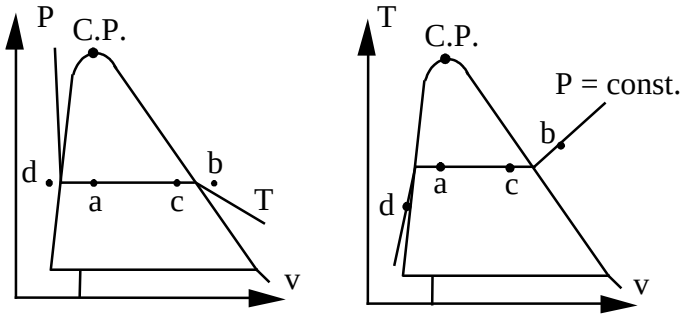
d. 10 kPa, 10°C : Only one of the two look-ups is needed

From B.1.1: $P > P_g$ = 1.2276 kPa so compressed liquid

From B.1.2: $T < T_{sat}$ = 45.8°C so compressed liquid

From B.1.1: $v = v_f$ = 0.001 m^3/kg (at given T, not given P)

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.28

For water at 200 kPa with a quality of 10%, find the volume fraction of vapor.

This is a two-phase state at a given pressure:

Table B.1.2: $v_f = 0.001\ 061\ m^3/kg$, $v_g = 0.88573\ m^3/kg$

From the definition of quality we get the masses from total mass, m, as

$$m_f = (1 - x)\, m, \qquad m_g = x\, m$$

The volumes are

$$V_f = m_f\, v_f = (1 - x)\, m\, v_f, \qquad V_g = m_g\, v_g = x\, m\, v_g$$

So the volume fraction of vapor is

$$\text{Fraction} = \frac{V_g}{V} = \frac{V_g}{V_g + V_f} = \frac{x\, m\, v_g}{x\, m\, v_g + (1 - x) m\, v_f}$$

$$= \frac{0.1 \times 0.88573}{0.1 \times 0.88573 + 0.9 \times 0.001061} = \frac{0.088573}{0.0895279} = \mathbf{0.9893}$$

Notice that the liquid volume is only about 1% of the total. We could also have found the overall $v = v_f + x v_{fg}$ and then $V = m\, v$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.29

Determine whether refrigerant R-410A in each of the following states is a compressed liquid, a superheated vapor, or a mixture of saturated liquid and vapor.

Solution:

All cases are seen in Table B.4.1

a. 50°C, 0.05 m^3/kg — From table B.4.1 at 50°C v_g = 0.00707 m^3/kg
since $v > v_g$ we have **superheated vapor**

b. 1.0 MPa, 20°C — From table B.4.1 at 20°C P_g = 909.9 kPa
since $P < P_g$ we have **superheated vapor**

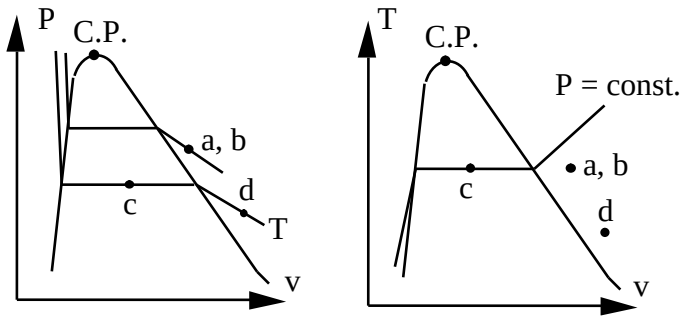
c. 0.1 MPa, 0.1 m^3/kg — From table B.4.1 at 0.1 MPa (use 101 kPa)
v_f = 0.00074 and v_g = 0.2395 m^3/kg
as $v_f < v < v_g$ we have a **mixture of liquid & vapor**

d –20°C, 200 kPa — **superheated vapor**, $P < P_g$ = 400 kPa at -20°C

2.30

Show the states in Problem 2.29 in a sketch of the P-v diagram.

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

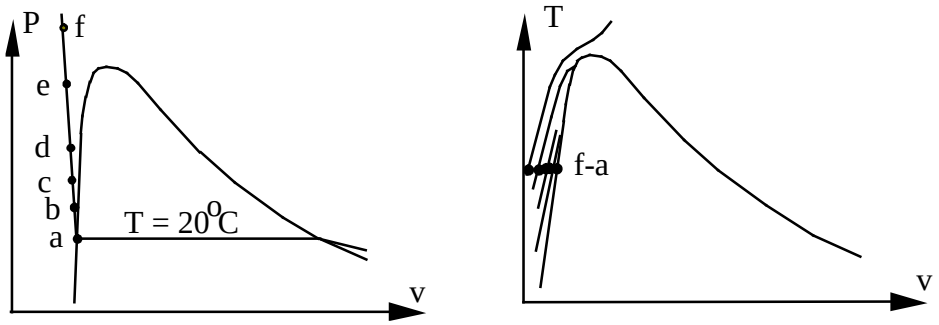
2.31

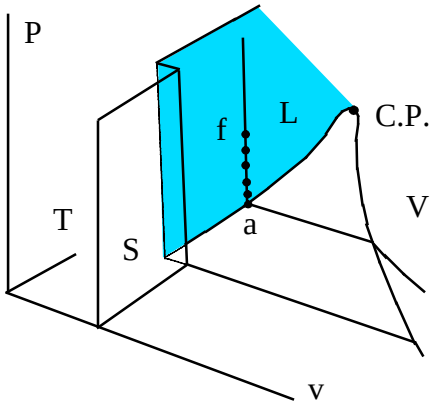
How great is the change in liquid specific volume for water at 20°C as you move up from state i towards state j in Fig. 2.14, reaching 15 000 kPa?

State "i", here "a", is saturated liquid and up is then compressed liquid states

a	Table B.1.1:	v_f = 0.001 002 m^3/kg	at	2.34 kPa
b	Table B.1.4:	v_f = 0.001 002 m^3/kg	at	500 kPa
c	Table B.1.4:	v_f = 0.001 001 m^3/kg	at	2000 kPa
d	Table B.1.4:	v_f = 0.001 000 m^3/kg	at	5000 kPa
e	Table B.1.4:	v_f = 0.000 995 m^3/kg	at	15 000 kPa
f	Table B.1.4:	v_f = 0.000 980 m^3/kg	at	50 000 kPa

Notice how small the changes in v are for very large changes in P.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.32

Fill out the following table for substance ammonia:
Solution:

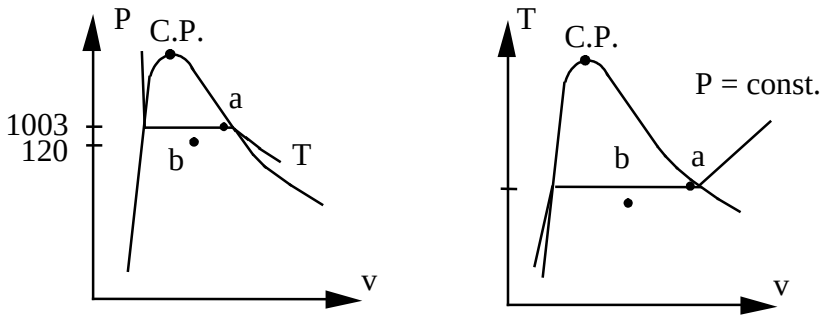
	P [kPa]	T [^{o}C]	v [m^3/kg]	x
a)	**1003**	25	0.1185	**0.9238**
b)	**119.5**	-30	**0.4824**	0.5

a) B.2.1 $v_f < v < v_g$ => two-phase mix Look in B.2.1
=> $x = (v - v_f)/v_{fg} = (0.1185 - 0.001658)/0.12647 = 0.9238$

b) B.2.1 $P = P_{sat} = 119.5$ kPa
$v = v_f + x\, v_{fg} = 0.001476 + 0.5 \times 0.96192 = 0.4824$ m^3/kg

2.33

Place the two states a-b listed in Problem 2.32 as labeled dots in a sketch of the P-v and T-v diagrams.
Solution:



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.34

Give the missing property of P, T, v and x for R-410A at

a. $T = -20^{o}C$, $P = 450$ kPa

b. $P = 300$ kPa, $v = 0.092$ m^3/kg

Solution:

a) B.4.1 $P > P_{sat} = 399.6$ kPa $\Rightarrow$ **compressed liquid**

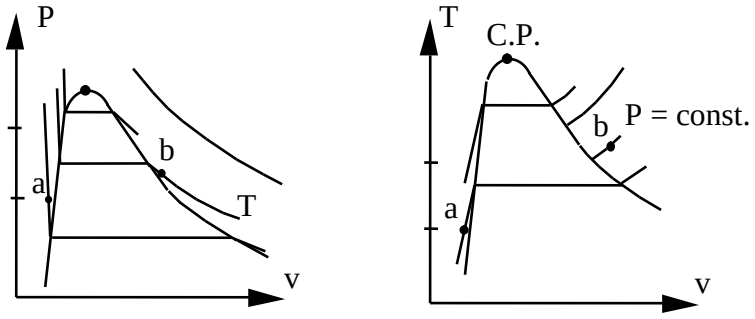
$v \sim v_f = 0.000803$ m^3/kg

x = undefined

b) B.4.2 $v > v_g$ at 300 kPa $\Rightarrow$ **superheated vapor**

$$T = -20 + [0 - (-20)] \left(\frac{0.092 - 0.08916}{0.09845 - 0.08916} \right) = -13.89°C$$

x = undefined



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.35

Fill out the following table for substance water:
Solution:

	P [kPa]	T [^{o}C]	v [m^3/kg]	x
a)	500	20	**0.001002**	**Undefined**
b)	500	**151.86**	0.20	**0.532**
c)	1400	200	**0.14302**	**Undefined**
d)	**8581**	300	**0.01762**	0.8

a) Table B.1.1 $P > P_{sat}$ so it is compressed liquid => Table B.1.4

b) Table B.1.2 $v_f < v < v_g$ so two phase L + V

$$x = \frac{v - v_f}{v_{fg}} = (0.2 - 0.001093) / 0.3738 = 0.532$$

$$T = T_{sat} = 151.86^{o}C$$

c) Only one of the two look-up is needed

Table B.1.1 $200^{o}C$ $P < P_{sat}$ = => superheated vapor

Table B.1.2 1400 kPa $T > T_{sat} = 195^{o}C$

Table B.1.3 sub-table for 1400 kPa gives the state properties

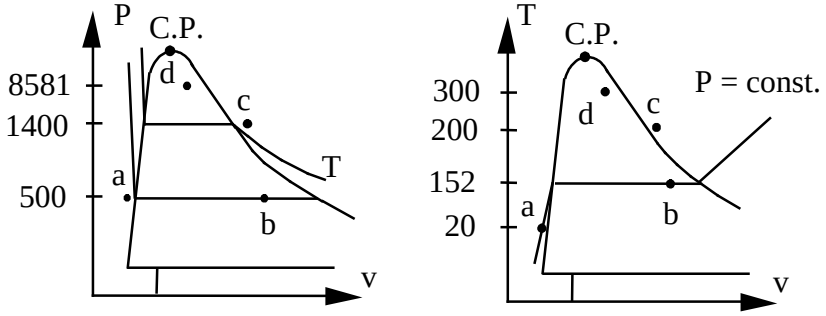
d) Table B.1.1 since quality is given it is two-phase

$$v = v_f + x \times v_{fg} = 0.001404 + 0.8 \times 0.02027 = 0.01762 \text{ m}^3/\text{kg}$$

2.36

Place the four states a-d listed in Problem 2.35 as labeled dots in a sketch of the P-v and T-v diagrams.

Solution:



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.37

Determine the specific volume for R-410A at these states:

a. –15°C, 400 kPa

b. 20°C, 1500 kPa

c. 20°C, quality 25%

a) Table B.4.1: $P < P_{sat} = 480.4$ kPa, so superheated vapor.

B.4.2 $v = 0.06475 + (0.07227 - 0.06475)\dfrac{-15 - (-19.98)}{0 - (-19.98)} = 0.06662\ m^3/kg$

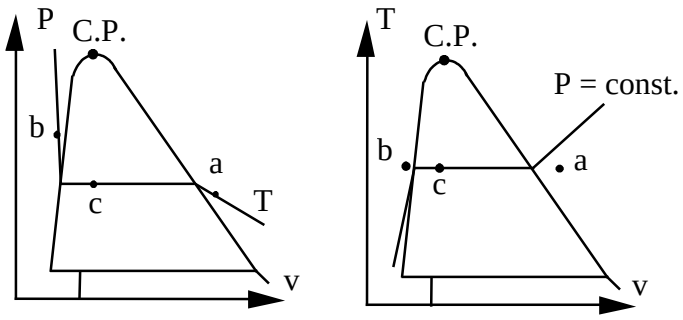
b) Table B.4.1: $P > P_{sat} = 1444$ kPa, so compressed liquid

$v \approx v_f = 0.000923\ m^3/kg$

c) Table B.4.1: $v_f = 0.000923\ m^3/kg$, $v_{fg} = 0.01666\ m^3/kg$ so

$$v = v_f + x\, v_{fg} = 0.000923 + 0.25 \times 0.01666 = 0.00509\ m^3/kg$$

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.38

Give the missing property of P, T, v and x for CH_4 at:

a. T = 155 K, v = 0.04 m^3/kg

b. T = 350 K, v = 0.25 m^3/kg

a) B.7.1 $v < v_g = 0.04892$ m^3/kg $\Rightarrow$ 2-phase

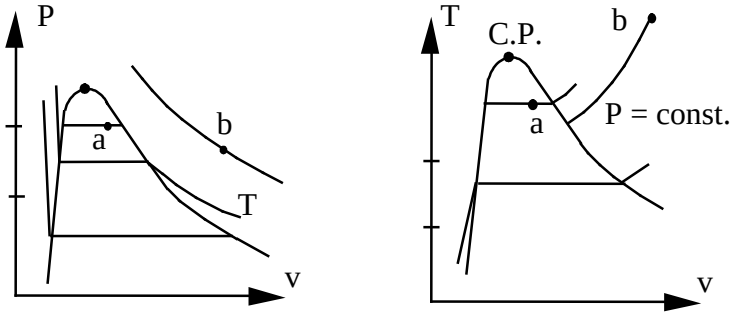
$$x = \frac{v - v_f}{v_{fg}} = \frac{0.04 - 0.002877}{0.04605} = \mathbf{0.806}$$

$P = P_{sat} = \mathbf{1296\ kPa}$

b) B.7.1 $T > T_c$ and $v >> v_c$ $\Rightarrow$ superheated vapor B.7.2

located between 600 & 800 kPa

$$P = 600 + 200\,\frac{0.25 - 0.30067}{0.2251 - 0.30067} = \mathbf{734\ kPa}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.39

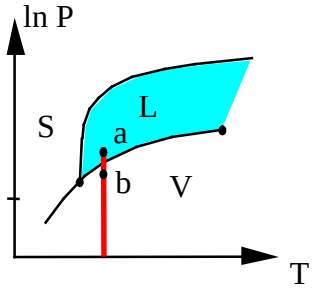
Give the specific volume of carbon-dioxide at -20°C for 2000 kPa and repeat for 1400 kPa.

Table B.3.1: -20°C P_{sat} = 1969 kPa,

at 2000 kPa state is compressed liquid: $v = v_f = 0.000969$ m^3/kg

at 1400 kPa state is superheated vapor: $v = 0.0296$ m^3/kg

The 2000 kPa is above and the 1400 kPa is below the vaporization line.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.40

Calculate the following specific volumes

a. CO_2 10°C, 80% quality

b. Water 4 MPa, 90% quality

c. Nitrogen 120 K, 60% quality

Solution:

All states are two-phase with quality given. The overall specific volume is given by Eq.2.1 or 2.2

$$v = v_f + x\, v_{fg} = (1\text{-}x)v_f + x\, v_g$$

a. CO_2 10°C, 80% quality in Table B.3.1

$$v = 0.001161 + x \times 0.00624 = 0.006153 \text{ m}^3/\text{kg}$$

b. Water 4 MPa, 90% quality in Table B.1.2

$$v = 0.001252(1\text{-}x) + x \times 0.04978 = 0.04493 \text{ m}^3/\text{kg}$$

c. Nitrogen 120 K, 60% quality in Table B.6.1

$$v = 0.001915 + x \times 0.00608 = 0.005563 \text{ m}^3/\text{kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.41

Give the missing property of P, T, v, and x for:

a) R-410A at T = 25°C, v = 0.01 m^3/kg

b) R-410A at 400 kPa, v = 0.075 m^3/kg

c) NH3 at 10°C, v = 0.1 m^3/kg

Solution:

a) Table B.4.1 $v < v_g = 0.01514$ m^3/kg so state is two-phase L + V

$P = P_{sat} =$ **1653.6 kPa**

$x = \dfrac{v - v_f}{v_{fg}} = (0.01 - 0.000944)/0.01420 =$ **0.6377**

b) Table B.4.1 $v > v_g$ so go to B.4.2 superheated vapor 400 kPa.

Make linear interpolation

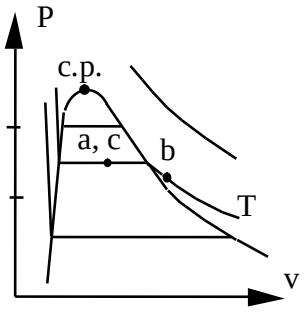
$$T = 0 + (20 - 0)\frac{0.075 - 0.07227}{0.07916 - 0.07227} = 7.92, \quad x \text{ is undefined}$$

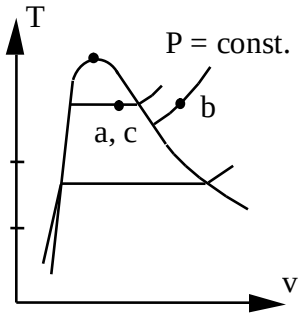
c) Table B.2.1 $v_f < v < v_g = 0.01514$ m^3/kg so state is two-phase L + V

$P = P_{sat} =$ **615.2 kPa**

$x = \dfrac{v - v_f}{v_{fg}} = (0.1 - 0.0016)/0.20381 =$ **0.4828**

Each state is positioned relative to the two-phase region not to each other





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.42

You want a pot of water to boil at 105°C. How heavy a lid should you put on the 15 cm diameter pot when P_{atm} = 101 kPa?

Solution:

Table B.1.1 at 105°C : P_{sat} = 120.8 kPa

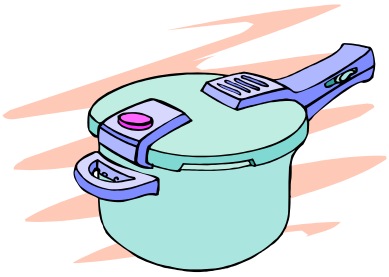
$$A = \frac{\pi}{4} D^2 = \frac{\pi}{4} 0.15^2 = 0.01767 \text{ m}^2$$

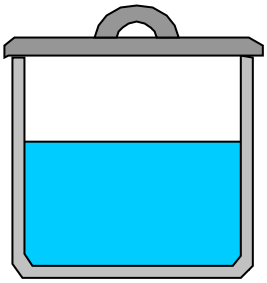
$$F_{net} = (P_{sat} - P_{atm}) A = (120.8 - 101) \text{ kPa} \times 0.01767 \text{ m}^2$$
$$= 0.3498 \text{ kN} = 350 \text{ N}$$

$$F_{net} = m_{lid} g$$

$$m_{lid} = F_{net}/g = \frac{350}{9.807} \frac{\text{N}}{\text{m/s}^2} = \mathbf{35.7\ kg}$$

Some lids are clamped on, the problem deals with one that stays on due to its weight.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.43

Water at 400 kPa with a quality of 25% has its pressure raised 50 kPa in a constant volume process. What is the new quality and temperature?

Solution:

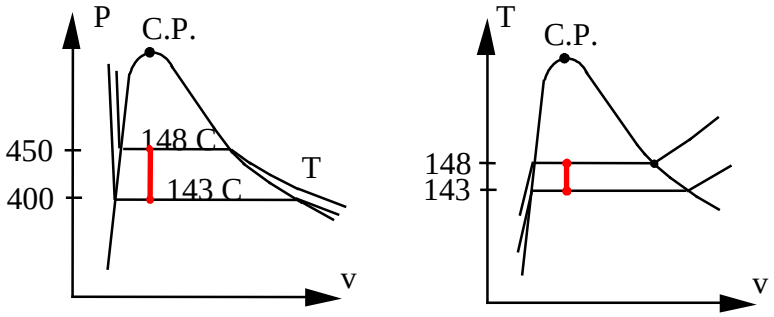
State 1 from Table B.1.2 at 400 kPa

$$v = v_f + x\, v_{fg} = 0.001084 + 0.25 \times 0.46138 = 0.11643 \text{ m}^3/\text{kg}$$

State 2 has same v at P = 450 kPa also from Table B.1.2

$$x = \frac{v - v_f}{v_{fg}} = \frac{0.11643 - 0.001088}{0.41289} = \mathbf{0.279}$$

$$T = T_{sat} = \mathbf{147.93\ °C}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.44

A sealed rigid vessel has volume of 1 m^3 and contains 2 kg of water at 100°C. The vessel is now heated. If a safety pressure valve is installed, at what pressure should the valve be set to have a maximum temperature of 200°C?

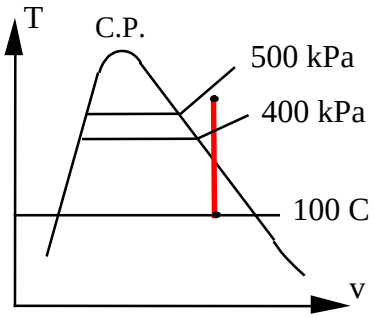
Solution:

Process: v = V/m = constant

State 1: $v_1 = 1/2 = 0.5$ m^3/kg

from Table B.1.1

it is 2-phase



State 2: 200°C, 0.5 m^3/kg

Table B.1.3 between 400

and 500 kPa so interpolate

$$P \cong 400 + \frac{0.5 - 0.53422}{0.42492 - 0.53422} \times (500 - 400) = \mathbf{431.3\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.45

Saturated water vapor at 200 kPa is in a constant pressure piston cylinder. At this state the piston is 0.1 m from the cylinder bottom. How much is this distance and the temperature if the water is cooled to occupy half the original volume?

Solution:

State 1: B 1.2 $v_1 = v_g\,(200\text{ kPa}) = 0.8857\ \text{m}^3/\text{kg}$, $T_1 = 120.2°\text{C}$

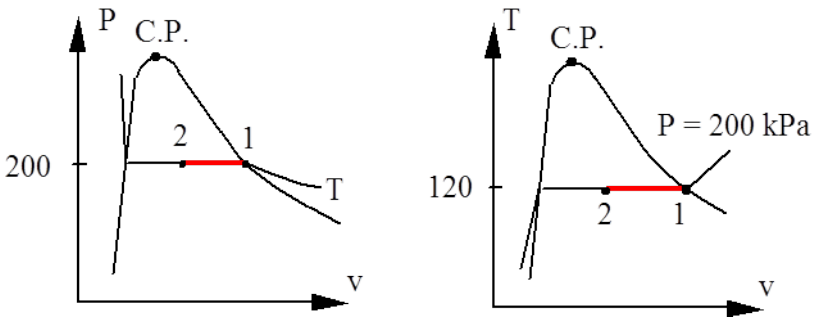
Process: P = constant = 200 kPa

State 2: P, $v_2 = v_1/2 = 0.44285\ \text{m}^3/\text{kg}$

Table B.1.2 $v_2 < v_g$ so two phase $T_2 = T_{sat} = 120.2°\text{C}$

Height is proportional to volume

$h_2 = h_1 \times v_2/v_1 = 0.1\text{ m} \times 0.5 =$ **0.05m**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.46

Saturated liquid water at 60°C is put under pressure to decrease the volume by 1% keeping the temperature constant. To what pressure should it be compressed?

Solution:

State 1: T = 60°C , x = 0.0; Table B.1.1: $v = 0.001017\ m^3/kg$

Process: T = constant = 60°C

State 2: T, $v = 0.99 \times v_{f\ (60°C)} = 0.99 \times 0.001017 = 0.0010068\ m^3/kg$

Between 20 & 30 MPa in Table B.1.4, P ≅ **23.8 MPa**

2.47

Water at 400 kPa with a quality of 25% has its temperature raised 20^{o}C in a constant pressure process. What is the new quality and specific volume?

Solution:

State 1 from Table B.1.2 at 400 kPa

$$v = v_f + x\, v_{fg} = 0.001084 + 0.25 \times 0.46138 = 0.126185 \text{ m}^3/\text{kg}$$

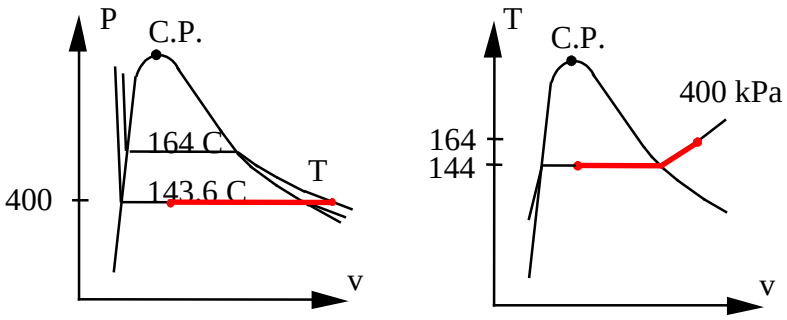
State 2 has same P from Table B.1.2 at 400 kPa

$$T_2 = T_{sat} + 20 = 143.63 + 20 = 163.63^{o}\text{C}$$

so state is superheated vapor look in B.1.3 and interpolate between 150 and 200 C in the 400 kPa superheated vapor table.

x = **undefined**

$$v_2 = 0.47084 + (0.53422 - 0.47084)\frac{163.63 - 150}{200 - 150} = \mathbf{0.4881\ m^3/kg}$$



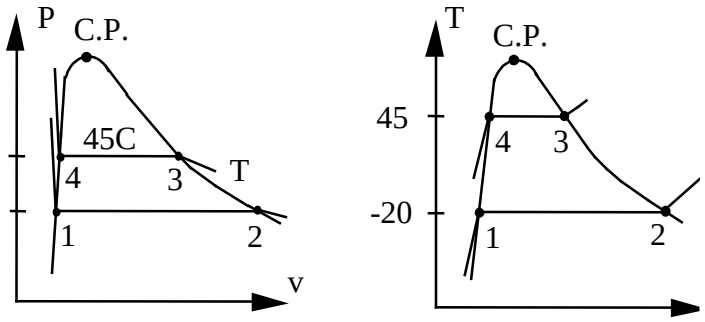
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.48

In your refrigerator the working substance evaporates from liquid to vapor at -20 ^{o}C inside a pipe around the cold section. Outside (on the back or below) is a black grille inside which the working substance condenses from vapor to liquid at +45 ^{o}C. For each location find the pressure and the change in specific volume (v) if the substance is ammonia.

Solution:
The properties come from the saturated tables where each phase change takes place at constant pressure and constant temperature.

Substance	TABLE	T	P_{sat} , kPa	$\Delta v = v_{fg}$, m^3/kg
Ammonia	B.2.1	45 ^{o}C	1782	0.0707
Ammonia	B.2.1	-20 ^{o}C	190	0.622



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

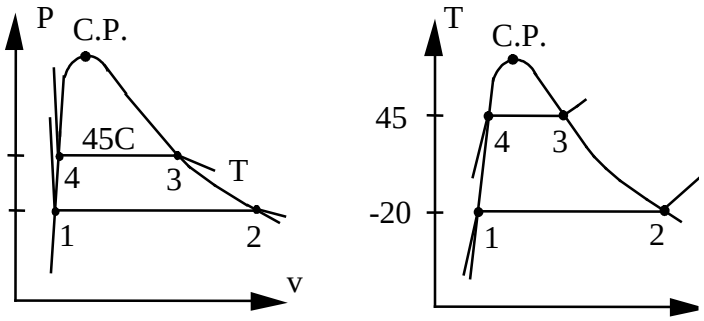
2.49

Repeat the previous problem with the substances
a) R-134a b) R-410A

In your refrigerator, the working substance evaporates from liquid to vapor at -20 ^{o}C inside a pipe around the cold section. Outside (on the back or below) is a black grille inside which the working substance condenses from vapor to liquid at +45 ^{o}C. For each location find the pressure and the change in specific volume (v).

Solution:
The properties come from the saturated tables where each phase change takes place at constant pressure and constant temperature.

Substance	TABLE	T	P_{sat} , kPa	$\Delta v = v_{fg}$, m^3/kg
R-134a	B.5.1	45 ^{o}C	1160	0.0165
R-134a	B.5.1	-20 ^{o}C	134	0.146
R-410A	B.4.1	45 ^{o}C	2728	0.00723
R-410A	B.4.1	-20 ^{o}C	400	0.064



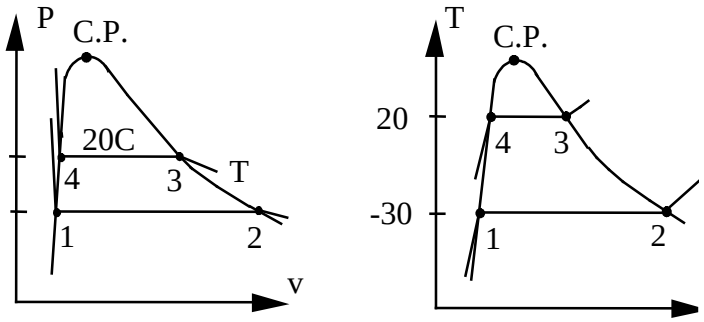
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.50

Repeat Problem 2.48 with CO_2, condenser at + 20°C and evaporator at -30°C.

Solution:
The properties come from the saturated tables where each phase change takes place at constant pressure and constant temperature.

Substance	TABLE	T	P_{sat} , kPa	$\Delta v = v_{fg}$, m^3/kg
CO_2	B.3.1	20 °C	5729	0.00386
CO_2	B.3.1	-30 °C	1428	0.026



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.51

A glass jar is filled with saturated water at 500 kPa, quality 25%, and a tight lid is put on. Now it is cooled to –10°C. What is the mass fraction of solid at this temperature?

Solution:

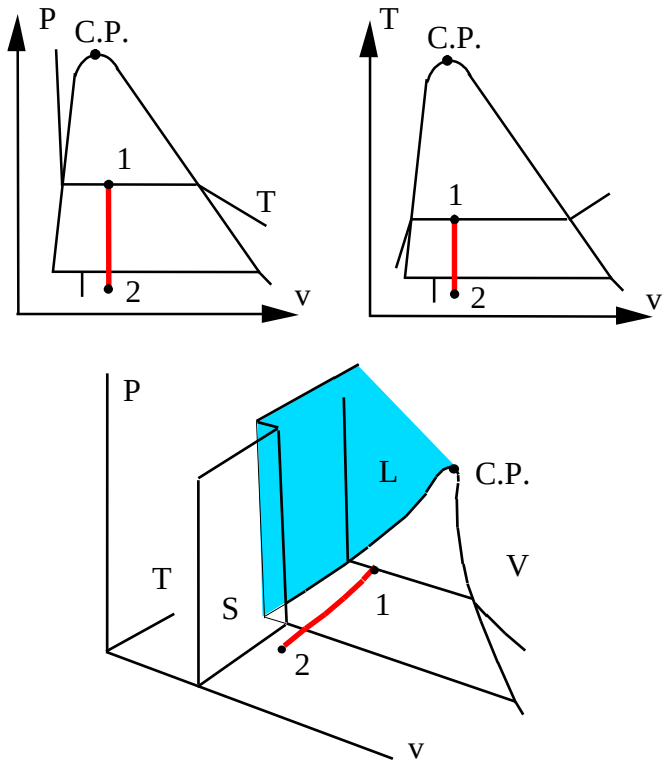
Constant volume and mass $\Rightarrow$ $v_1 = v_2 = V/m$

From Table B.1.2: $v_1 = 0.001093 + 0.25 \times 0.3738 = 0.094543$ m^3/kg

From Table B.1.5: $v_2 = 0.0010891 + x_2 \times 446.756 = v_1 = 0.094543$ m^3/kg

$\Rightarrow$ $x_2 = 0.0002$ mass fraction vapor

$x_{solid} = 1 - x_2 = 0.9998$ or **99.98 %**



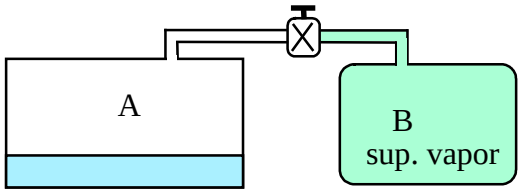
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.52

Two tanks are connected as shown in Fig. P2.52, both containing water. Tank A is at 200 kPa, $v = 0.5$ m^3/kg, $V_A = 1$ m^3 and tank B contains 3.5 kg at 0.5 MPa, 400°C. The valve is now opened and the two come to a uniform state. Find the final specific volume.

Solution:

Control volume: both tanks. Constant total volume and mass process.



State A1: (P, v) $m_A = V_A/v_A = 1/0.5 = 2$ kg

State B1: (P, T) Table B.1.3 $v_B = 0.6173$ m^3/kg

$\Rightarrow V_B = m_B v_B = 3.5 \text{ kg} \times 0.6173 \text{ m}^3/\text{kg} = 2.1606 \text{ m}^3$

Final state: $m_{tot} = m_A + m_B = 5.5$ kg

$V_{tot} = V_A + V_B = 3.1606$ m^3

$v_2 = V_{tot}/m_{tot} =$ **0.5746 m^3/kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.53

Saturated vapor R-134a at 60°C changes volume at constant temperature. Find the new pressure, and quality if saturated, if the volume doubles. Repeat the question for the case the volume is reduced to half the original volume.

Solution:

1: (T, x) B.4.1: $v_1 = v_g = 0.01146\ m^3/kg$, $P_1 = P_{sat} = 1681.8$ kPa

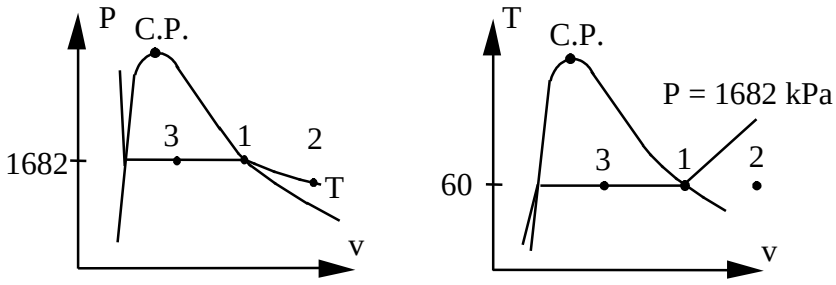
2: $v_2 = 2v_1 = 0.02292\ m^3/kg$ superheated vapor
Interpolate between 1000 kPa and 1200 kPa

$$P_2 = 1000 + 200 \times \frac{0.02292 - 0.02311}{0.01844 - 0.02311} = \mathbf{1008\ kPa}$$

3: $v_3 = v_1/2 = 0.00573\ m^3/kg < v_g$: two phase

$$x_3 = \frac{v_3 - v_f}{v_{fg}} = \frac{0.00573 - 0.000951}{0.01051} = \mathbf{0.4547}$$

$P_3 = P_{sat} = \mathbf{1681.8\ kPa}$



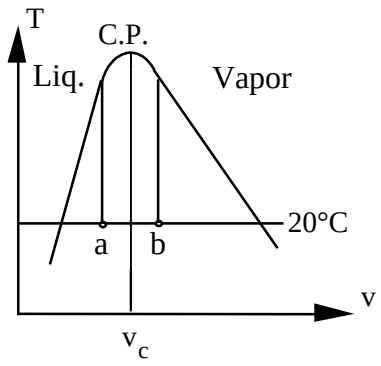
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.54

A steel tank contains 6 kg of propane (liquid + vapor) at 20°C with a volume of 0.015 m^3. The tank is now slowly heated. Will the liquid level inside eventually rise to the top or drop to the bottom of the tank? What if the initial mass is 1 kg instead of 6 kg?

Solution:

Constant volume and mass $v_2 = v_1 = \frac{V}{m} = \frac{0.015\ m^3}{6\ kg} = 0.0025\ m^3/kg$



A.2: $v_c = 0.00454\ m^3/kg > v_1$

eventually reaches sat. liquid.

$\Rightarrow$ **level rises to top**

If m = 1 kg $\Rightarrow$ $v_1 = 0.015\ m^3/kg > v_c$

then it will reach saturated vapor.

$\Rightarrow$ **level falls**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.55

Saturated water vapor at 60°C has its pressure decreased to increase the volume by 10% keeping the temperature constant. To what pressure should it be expanded?

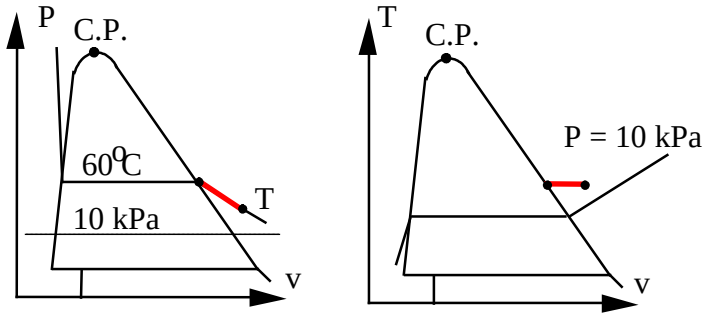
Solution:

Initial state: $v = 7.6707\ m^3/kg$ from table B.1.1

Final state: $v = 1.10 \times v_g = 1.1 \times 7.6707 = 8.4378\ m^3/kg$

Interpolate at 60°C between saturated (P = 19.94 kPa) and superheated vapor P = 10 kPa in Tables B.1.1 and B.1.3

$$P \cong 19.941 + (10 - 19.941)\frac{8.4378 - 7.6707}{15.3345 - 7.6707} = \mathbf{18.9\ kPa}$$



Comment: T,v $\Rightarrow$ P = 18 kPa (software) v is not linear in P, more like 1/P, so the linear interpolation in P is not very accurate.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.56

Ammonia at 20^{o}C with a quality of 50% and total mass 2 kg is in a rigid tank with an outlet valve at the top. How much vapor (mass) can you take out through the valve assuming the temperature stays constant?

Solution:

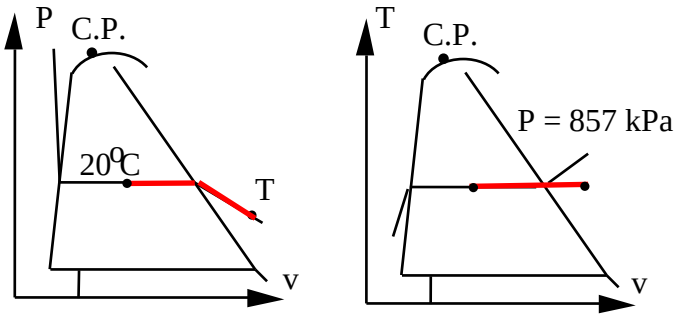
The top has saturated vapor at 20^{o}C as long as there is a two phase inside. When there is no more liquid and vapor will be taken out pressure will drop for the remaining vapor so we can take it out until we reach P_0.

$$V = m_1 v_1 = 2 \text{ kg} \times 0.5\ (0.001638 + 0.14922)\ \text{m}^3/\text{kg} = 0.15086\ \text{m}^3$$

$$v_2 = 1.4153\ \text{m}^3/\text{kg} \quad \text{(from Table B.2.2 at 100 kPa)}$$

$$m_2 = V/v_2 = 0.15086\ \text{m}^3 / 1.4153\ \text{m}^3/\text{kg} = 0.1066\ \text{kg}$$

$$m = m_1 - m_2 = 2 - 0.1066 = \mathbf{1.893\ kg}$$



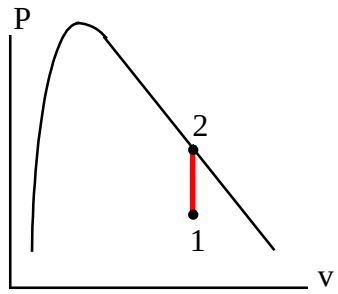
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.57

A sealed rigid vessel of 2 m^3 contains a saturated mixture of liquid and vapor R-134a at 10°C. If it is heated to 50°C, the liquid phase disappears. Find the pressure at 50°C and the initial mass of the liquid.

Solution:

Process: constant volume and constant mass.



State 2 is saturated vapor, from table B.5.1

$P_2 = P_{sat}(50°C) =$ **1.318 MPa**

State 1: same specific volume as state 2

$v_1 = v_2 = 0.015124\ m^3/kg$

$v_1 = 0.000794 + x_1 \times 0.048658$

$\Rightarrow x_1 = 0.2945$

$m = V/v_1 = 2\ m^3/0.015124\ m^3/kg = 132.24\ kg;$

$m_{liq} = (1 - x_1)\ m =$ **93.295 kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.58

A storage tank holds methane at 120 K, with a quality of 25 %, and it warms up by 5°C per hour due to a failure in the refrigeration system. How long time will it take before the methane becomes single phase and what is the pressure then?

Solution: Use Table B.7.1

Assume rigid tank v = constant = v_1

$$v_1 = 0.002439 + 0.25 \times 0.30367$$

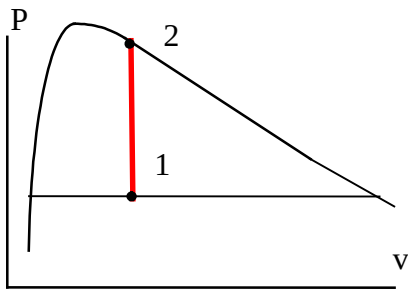
$$= 0.078366 \ m^3/kg$$

We then also see that

$$v_1 > v_c = 0.00615 \ m^3/kg$$

All single phase when

$$v = v_g \Rightarrow T \cong 145 \ K$$



$$\Delta t = \frac{\Delta T}{(5°C/h)} \cong \frac{145 - 120}{5} = \textbf{5 hours;} \qquad P = P_{sat} = \textbf{824 kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

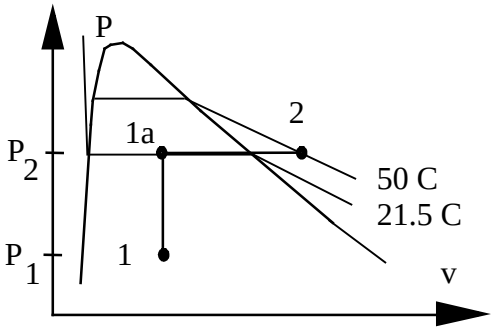
2.59

Ammonia at 10°C and mass 10 kg is in a piston cylinder with an initial volume of 1 m^3. The piston initially resting on the stops has a mass such that a pressure of 900 kPa will float it. Now the ammonia is slowly heated to 50°C. Find the final pressure and volume.

Solution:

C.V. Ammonia, constant mass.

Process: V = constant, unless $P = P_{float}$



State 1: T = 10 °C,

$$v_1 = \frac{V}{m} = \frac{1}{10} = 0.1 \text{ m}^3/\text{kg}$$

From Table B.2.1 $v_f < v < v_g$

$$x_1 = \frac{v - v_f}{v_{fg}} = \frac{0.1 - 0.0016}{0.20381} = 0.4828$$

State 1a: P = 900 kPa, $v = v_1 = 0.1 \text{ m}^3/\text{kg} < v_g$ at 900 kPa

This state is two-phase $T_{1a} = 21.52°C$

Since $T_2 > T_{1a}$ then $v_2 > v_{1a}$

State 2: 50°C and on line(s) means

P_2 = **900 kPa** which is superheated vapor.

Table B.2.2 : $v_2 = (0.18465 + 0.14499)/2 = 0.16482 \text{ m}^3/\text{kg}$

$V_2 = mv_2 =$ **1.6482 m^3**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.60

A 400-m^3 storage tank is being constructed to hold LNG, liquified natural gas, which may be assumed to be essentially pure methane. If the tank is to contain 90% liquid and 10% vapor, by volume, at 100 kPa, what mass of LNG (kg) will the tank hold? What is the quality in the tank?

Solution:

CH_4 is in the section B tables.

From Table B.7.1: $v_f \cong 0.002366\ m^3/kg$, (interpolated)

From Table B.7.2: $v_g \cong 0.55665\ m^3/kg$ (first entry 100 kPa)

$$m_{liq} = \frac{V_{liq}}{v_f} = \frac{0.9 \times 400}{0.002366} = 152\ 155.5\ kg; \quad m_{vap} = \frac{V_{vap}}{v_g} = \frac{0.1 \times 400}{0.55665} = 71.86\ kg$$

$$m_{tot} = \mathbf{152\ 227\ kg}, \quad x = m_{vap} / m_{tot} = \mathbf{4.72 \times 10^{-4}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.61

A boiler feed pump delivers 0.05 m^3/s of water at 240°C, 20 MPa. What is the mass flowrate (kg/s)? What would be the percent error if the properties of saturated liquid at 240°C were used in the calculation? What if the properties of saturated liquid at 20 MPa were used?

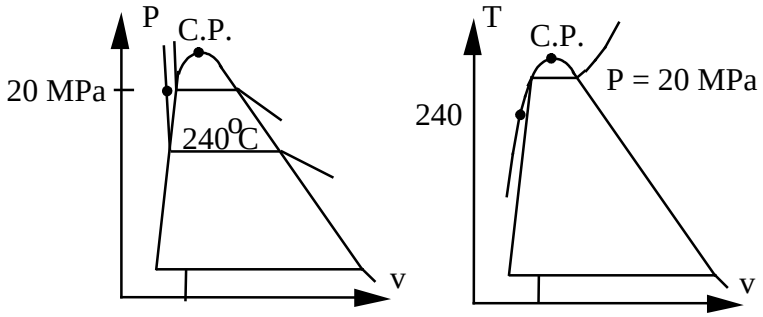
Solution:

State 1: (T, P) compressed liquid seen in B.1.4: $v = 0.001205$ m^3/kg

$\dot{m} = \dot{V}/v = 0.05/0.001205 =$ **41.5 kg/s**

$v_{f\,(240°C)} = 0.001229$ m^3/kg $\Rightarrow$ $\dot{m} = 40.68$ kg/s **error 2%**

$v_{f\,(20\ MPa)} = 0.002036$ m^3/kg $\Rightarrow$ $\dot{m} = 24.56$ kg/s **error 41%**



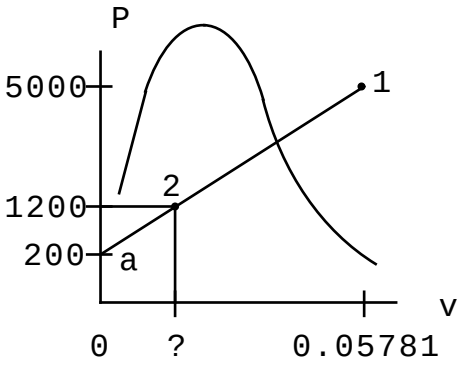
The constant T line is nearly vertical for the liquid phase in the P-v diagram. The state is at so high P, T that the saturated liquid line is not extremely steep.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.62

A piston/cylinder arrangement is loaded with a linear spring and the outside atmosphere. It contains water at 5 MPa, 400°C with the volume being 0.1 m^3. If the piston is at the bottom, the spring exerts a force such that P_{lift} = 200 kPa. The system now cools until the pressure reaches 1200 kPa. Find the mass of water, the final state (T_2, v_2) and plot the *P–v* diagram for the process.

Solution:



1: Table B.1.3 $\Rightarrow$ v_1 = 0.05781 m^3/kg

$m = V/v_1 = 0.1/0.05781 = 1.73$ kg

Straight line: $P = P_a + C \times v$

$$v_2 = v_1 \frac{P_2 - P_a}{P_1 - P_a} = \mathbf{0.01204\ m^3/kg}$$

$v_2 < v_g$(1200 kPa) so two-phase T_2 = **188°C**

$\Rightarrow$ $x_2 = (v_2 - 0.001139)/0.1622 = 0.0672$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.63

A pressure cooker (closed tank) contains water at 100°C with the liquid volume being 1/20 of the vapor volume. It is heated until the pressure reaches 2.0 MPa. Find the final temperature. Has the final state more or less vapor than the initial state?

Solution:

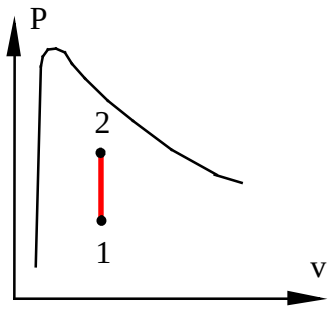
State 1: $V_f = m_f v_f = V_g/20 = m_g v_g/20$;

Table B.1.1: $v_f = 0.001044$ m^3/kg, $v_g = 1.6729$ m^3/kg

$$x_1 = \frac{m_g}{m_g + m_f} = \frac{20\, m_f v_f / v_g}{m_f + 20\, m_f v_f / v_g} = \frac{20\, v_f}{20\, v_f + v_g} = \frac{0.02088}{0.02088 + 1.6729} = 0.01233$$

$$v_1 = 0.001044 + 0.01233 \times 1.67185 = 0.02166 \text{ m}^3/\text{kg}$$

State 2: $v_2 = v_1 = 0.02166$ m^3/kg $< v_g$(2MPa) from B.1.2 so two-phase



At state 2: $v_2 = v_f + x_2\, v_{fg}$

$0.02166 = 0.001177 + x_2 \times 0.09845$

=> $x_2 = 0.208$

More vapor at final state

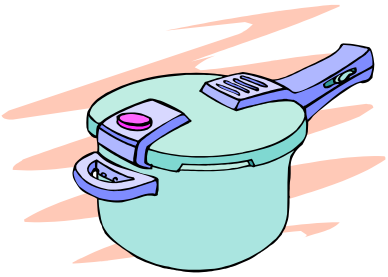
$T_2 = T_{sat}$(2MPa) = **212.4°C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.64

A pressure cooker has the lid screwed on tight. A small opening with A = 5 mm^2 is covered with a petcock that can be lifted to let steam escape. How much mass should the petcock have to allow boiling at 120°C with an outside atmosphere at 101.3 kPa?

Table B.1.1.: P_{sat} = 198.5 kPa



$$F = mg = \Delta P \times A$$

$$m = \Delta P \times A/g$$

$$= \frac{(198.5\text{-}101.3)\times 1000\times 5\times 10^{-6}}{9.807} \frac{N}{ms^{-2}}$$

= 0.0496 kg = **50 g**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Ideal Gas Law

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.65

What is the relative (%) change in P if we double the absolute temperature of an ideal gas keeping mass and volume constant? What will it be if we double V having m, T constant.

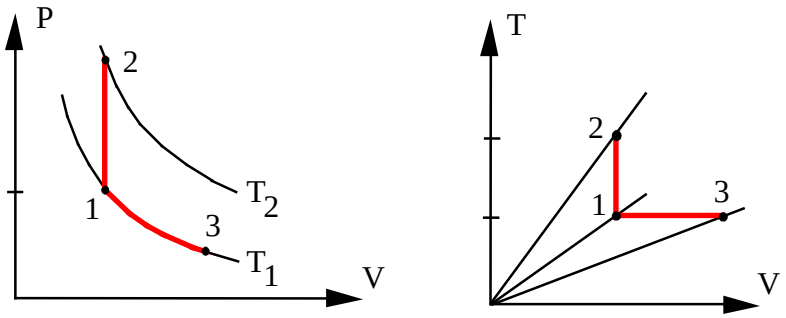
Ideal gas law: $PV = mRT$

State 2: $P_2V = mRT_2 = mR2T_1 = 2P_1V \quad \Rightarrow \quad P_2 = 2P_1$

Relative change = $\Delta P/P_1 = P_1/P_1 = 1 =$ **100%**

State 3: $P_3V_3 = mRT_1 = P_1V_1 \quad \Rightarrow \quad P_3 = P_1V_1/V_3 = P_1/2$

Relative change = $\Delta P/P_1 = -P_1/2P_1 = -0.5 =$ **-50%**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.66

A 1-m^3 tank is filled with a gas at room temperature 20°C and pressure 200 kPa. How much mass is there if the gas is a) air, b) neon or c) propane ?

Solution:

Use Table A.2 to compare T and P to the critical T and P with

T = 20°C = 293.15 K ; P = 200 kPa << P_c for all

Air : T >> $T_{C,N2}$; $T_{C,O2}$ = 154.6 K so ideal gas; R= 0.287 kJ/kg K

Neon: T >> T_c = 44.4 K so ideal gas; R = 0.41195 kJ/kg K

Propane: T < T_c = 370 K, but P << P_c = 4.25 MPa

so gas R = 0.18855 kJ/kg K

All states are ideal gas states so the ideal gas law applies

$$PV = mRT$$

a) $$m = \frac{PV}{RT} = \frac{200 \text{ kPa} \times 1 \text{ m}^3}{0.287 \text{ kJ/kgK} \times 293.15 \text{ K}} = \mathbf{2.377 \text{ kg}}$$

b) $$m = \frac{PV}{RT} = \frac{200 \text{ kPa} \times 1 \text{ m}^3}{0.41195 \text{ kJ/kgK} \times 293.15 \text{ K}} = \mathbf{1.656 \text{ kg}}$$

c) $$m = \frac{PV}{RT} = \frac{200 \text{ kPa} \times 1 \text{ m}^3}{0.18855 \text{ kJ/kgK} \times 293.15 \text{ K}} = \mathbf{3.618 \text{ kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.67

Calculate the ideal gas constant for argon and hydrogen based on table A.2 and verify the value with Table A.5

argon: $R = \dfrac{\bar{R}}{M} = \dfrac{8.3145}{39.948} = 0.2081$ kJ/kgK same as Table A.5

hydrogen: $R = \dfrac{\bar{R}}{M} = \dfrac{8.3145}{2.016} = 4.124256$ kJ/kgK same as Table A.5

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.68

A pneumatic cylinder (a piston cylinder with air) must close a door with a force of 500 N. The cylinder cross-sectional area is 5 cm^2. With V = 50 cm^3, T = 20°C, what is the air pressure and its mass?

$$F = PA - P_o A \Rightarrow$$

$$P = P_o + F/A = 100 \text{ kPa} + \frac{500 \text{ N}}{0.0005 \text{ m}^2 \times 1000 \text{ N/kN}} = \mathbf{1100 \text{ kPa}}$$

$$m = \frac{P_1 V_1}{RT_1} = \frac{1100 \text{ kPa} \times 0.00005 \text{ m}^3}{0.287 \text{ kJ/kgK} \times 293 \text{ K}} = \mathbf{0.00065 \text{ kg} = 0.65 \text{ g}}$$

Comment: Dependent upon your understanding of the problem you could also have neglected the atmospheric pressure to get 1000 kPa and 0.59 g for answers.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.69

Is it reasonable to assume that at the given states the substance behaves as an ideal gas?

Solution:

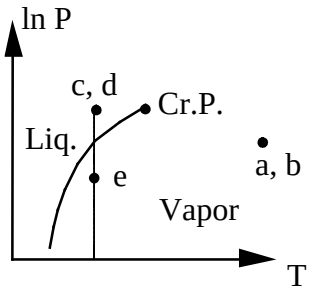
a) Oxygen, O_2 at 30°C, 3 MPa **Ideal Gas** ($T \gg T_C = 155$ K from A.2)

b) Methane, CH_4 at 30°C, 3 MPa **Ideal Gas** ($T \gg T_C = 190$ K from A.2)

c) Water, H_2O at 30°C, 3 MPa **NO** compressed liquid $P > P_{sat}$ (B.1.1)

d) R-134a at 30°C, 3 MPa **NO** compressed liquid $P > P_{sat}$ (B.5.1)

e) R-134a at 30°C, 100 kPa **Ideal Gas** P is low $< P_{sat}$ (B.5.1)

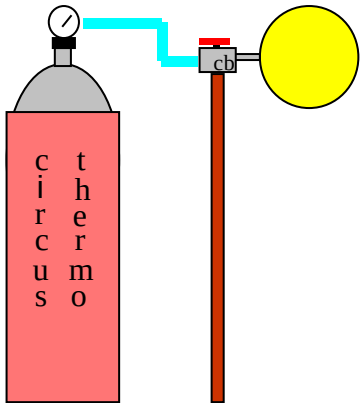


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.70

Helium in a steel tank is at 250 kPa, 300 K with a volume of 0.1 m^3. It is used to fill a balloon and when the pressure drops to 125 kPa, the flow of helium stops by itself. If all the helium still is at 300 K, how big a balloon did I get?

Solution:



State 1: m = V/v assume ideal gas so

$$m = \frac{P_1 V_1}{RT_1} = \frac{250 \text{ kPa} \times 0.1 \text{ m}^3}{2.0771 \text{ kJ/kgK} \times 300 \text{ K}}$$
$$= 0.0401 \text{ kg}$$

State 2: Same mass so then ($T_2 = T_1$)

$$V_2 = \frac{mRT_2}{P_2} = \frac{P_1 V_1 \, RT_2}{RT_1 \, P_2} = V_1 \frac{P_1}{P_2} = 0.1 \text{ m}^3 \frac{250}{125} = 0.2 \text{ m}^3$$

The balloon volume is

$$V_{balloon} = V_2 - V_1 = 0.2 - 0.1 = \mathbf{0.1 \ m^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.71

A hollow metal sphere of 150-mm inside diameter is weighed on a precision beam balance when evacuated and again after being filled to 875 kPa with an unknown gas. The difference in mass is 0.0025 kg, and the temperature is 25°C. What is the gas, assuming it is a pure substance listed in Table A.5 ?

Solution:

Assume an ideal gas with total volume: $V = \frac{\pi}{6}(0.15)^3 = 0.001767\ m^3$

$$M = \frac{m\bar{R}T}{PV} = \frac{0.0025\ kg \times 8.3145\ kJ/kmol\text{-}K \times 298.2\ K}{875\ kPa \times 0.001767\ m^3}$$

$$= \mathbf{4.009}\ kg/kmol \approx M_{He}$$

=> **Helium Gas**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.72

A spherical helium balloon of 10 m in diameter is at ambient T and P, 15°C and 100 kPa. How much helium does it contain? It can lift a total mass that equals the mass of displaced atmospheric air. How much mass of the balloon fabric and cage can then be lifted?

We need to find the masses and the balloon volume

$$V = \frac{\pi}{6} D^3 = \frac{\pi}{6} 10^3 = 523.6 \text{ m}^3$$

$$m_{He} = \rho V = \frac{V}{v} = \frac{PV}{RT} = \frac{100 \text{ kPa} \times 523.6 \text{ m}^3}{2.0771 \text{ kJ/kgK} \times 288 \text{ K}} = \mathbf{87.5 \text{ kg}}$$

$$m_{air} = \frac{PV}{RT} = \frac{100 \text{ kPa} \times 523.6 \text{ m}^3}{0.287 \text{ kJ/kgK} \times 288 \text{ K}}$$
$$= 633 \text{ kg}$$

$$m_{lift} = m_{air} - m_{He} = 633\text{-}87.5 = \mathbf{545.5 \text{ kg}}$$

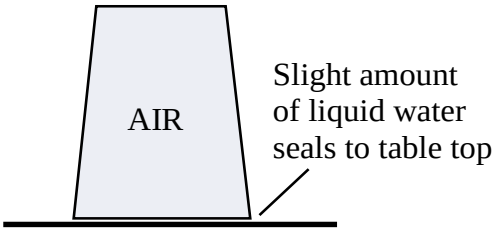
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.73

A glass is cleaned in 45°C hot water and placed on the table bottom up. The room air at 20°C that was trapped in the glass gets heated up to 40°C and some of it leaks out so the net resulting pressure inside is 2 kPa above ambient pressure of 101 kPa. Now the glass and the air inside cools down to room temperature. What is the pressure inside the glass?

Solution:

1 air: 40°C, 103 kPa
2 air: 20°C, ?



Constant Volume: $V_1 = V_2$,

Constant Mass $m_1 = m_2$

Ideal Gas $P_1V_1 = m_1RT_1$ and $P_2V_2 = m_1RT_2$

Take Ratio

$$P_2 = P_1 \frac{T_1}{T_2} = 103 \text{ kPa} \times \frac{20 + 273}{40 + 273} = \mathbf{96.4\ kPa}$$

This is a vacuum relative to atm pressure so the glass is pressed against table.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.74

Air in an internal combustion engine has 227^{o}C, 1000 kPa with a volume of 0.1 m^3. Now combustion heats it to 1800 K in a constant volume process. What is the mass of air and how high does the pressure become?

The mass comes from knowledge of state 1 and ideal gas law

$$m = \frac{P_1 V_1}{RT_1} = \frac{1000 \text{ kPa} \times 0.1 \text{ m}^3}{0.287 \text{ kJ/kgK} \times (227 + 273) \text{ K}} = \mathbf{0.697 \text{ kg}}$$

The final pressure is found from the ideal gas law written for state 1 and state 2 and then eliminate the mass, gas constant and volume ($V_2 = V_1$) between the equations

$$P_1 V_1 = m RT_1 \qquad \text{and} \qquad P_2 V_2 = m RT_2$$

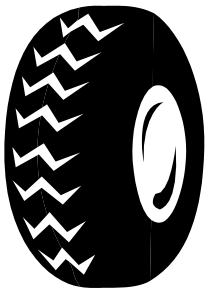
$$P_2 = P_1 \times T_2/T_1 = 1000 \text{ kPa} \times \frac{1800}{500} = \mathbf{3600 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.75

Air in an automobile tire is initially at −10°C and 190 kPa. After the automobile is driven awhile, the temperature gets up to 10°C. Find the new pressure. You must make one assumption on your own.

Solution:



Assume constant volume $V_2 = V_1$ and that air is an ideal gas

$$P_1V_1 = mRT_1 \quad \text{and} \quad P_2V_2 = mRT_2$$

so

$$P_2 = P_1 \times T_2/T_1$$

$$= 190 \text{ kPa} \times \frac{283.15}{263.15} = \mathbf{204.4\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.76

A rigid tank of 1 m^3 contains nitrogen gas at 600 kPa, 400 K. By mistake someone lets 0.5 kg flow out. If the final temperature is 375 K what is the final pressure?

Solution:

$$m = \frac{PV}{RT} = \frac{600 \text{ kPa} \times 1 \text{ m}^3}{0.2968 \text{ kJ/kgK} \times 400 \text{ K}} = 5.054 \text{ kg}$$

$$m_2 = m - 0.5 = 4.554 \text{ kg}$$

$$P_2 = \frac{m_2 R T_2}{V} = \frac{4.554 \text{ kg} \times 0.2968 \text{ kJ/kgK} \times 375 \text{ K}}{1 \text{ m}^3} = \mathbf{506.9 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.77

Assume we have 3 states of saturated vapor R-134a at +40 ^{o}C, 0 ^{o}C and –40 ^{o}C. Calculate the specific volume at the set of temperatures and corresponding saturated pressure assuming ideal gas behavior. Find the percent relative error = 100(v – v_g)/v_g with v_g from the saturated R-134a table.

Solution:

R-134a. Table values from Table B.5.1 P_{sat}, $v_g(T)$

Ideal gas constant from Table A.5: $R_{R\text{-}134a}$ = 0.08149 kJ/kg K

T	P_{sat} , kPa	v_g, m^3/kg	$v_{ID.G.} = RT / P_{sat}$	error %
-40 ^{o}C	51.8	0.35696	0.36678	2.75
0 ^{o}C	294	0.06919	0.07571	9.4
40 ^{o}C	1017	0.02002	0.02509	25.3

2.78

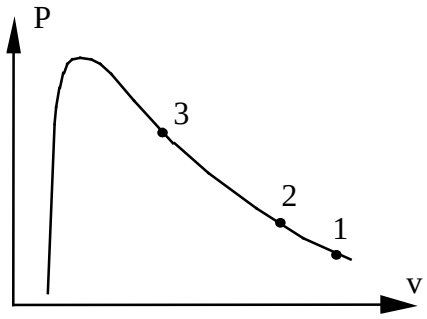
Do Problem 2.77 for R-410A.

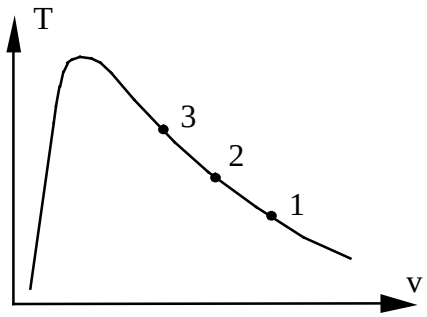
Solution:

R-410A. Table values from Table B.4.1 P_{sat}, $v_g(T)$

Ideal gas constant from Table A.5: $R_{R\text{-}410a} = 0.1146$ kJ/kg K

T	P_{sat} , kPa	v_g, m^3/kg	$v_{ID.G.} = RT / P_{sat}$	error %
-40 °C	175.0	0.14291	0.1527	6.8
0 °C	798.7	0.03267	0.03919	20
40 °C	2420.7	0.00967	0.01483	53.3





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.79

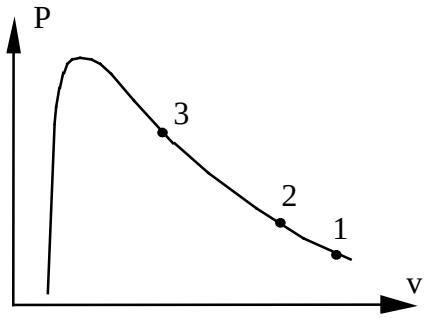
Do Problem 2.77 for the substance ammonia.

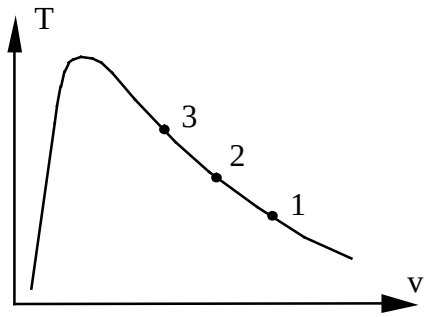
Solution:

NH3. Table values from Table B.2.1 P_{sat}, $v_g(T)$

Ideal gas constant from Table A.5: $R_{ammonia} = 0.4882$ kJ/kg K

T	P_{sat} , kPa	v_g, m^3/kg	$v_{ID.G.} = RT / P_{sat}$	error %
-40 °C	71.7	1.5526	1.5875	2.25
0 °C	429.6	0.28929	0.3104	7.3
40 °C	1555	0.08313	0.09832	18.3





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.80

A 1 m^3 rigid tank has propane at 100 kPa, 300 K and connected by a valve to another tank of 0.5 m^3 with propane at 250 kPa, 400 K. The valve is opened and the two tanks come to a uniform state at 325 K. What is the final pressure?

Solution:

Propane is an ideal gas ($P << P_c$) with R = 0.1886 kJ/kgK from Tbl. A.5

$$m_A = \frac{P_A V_A}{RT_A} = \frac{100 \text{ kPa} \times 1 \text{ m}^3}{0.1886 \text{ kJ/kgK} \times 300 \text{ K}} = 1.7674 \text{ kg}$$

$$m_B = \frac{P_B V_B}{RT_B} = \frac{250 \text{ kPa} \times 0.5 \text{ m}^3}{0.1886 \text{ kJ/kgK} \times 400 \text{ K}} = 1.6564 \text{ kg}$$

$$V_2 = V_A + V_B = 1.5 \text{ m}^3$$

$$m_2 = m_A + m_B = 3.4243 \text{ kg}$$

$$P_2 = \frac{m_2 RT_2}{V_2} = \frac{3.4243 \text{ kg} \times 0.1886 \text{ kJ/kgK} \times 325 \text{ K}}{1.5 \text{ m}^3} = \mathbf{139.9 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.81

A vacuum pump is used to evacuate a chamber where some specimens are dried at 50°C. The pump rate of volume displacement is 0.5 m^3/s with an inlet pressure of 0.1 kPa and temperature 50°C. How much water vapor has been removed over a 30-min period?

Solution:

Use ideal gas since P << lowest P in steam tables.

From table A.5 we get R = 0.46152 kJ/kg K

$m = \dot{m}\,\Delta t$ with mass flow rate as: $\dot{m} = \dot{V}/v = P\dot{V}/RT$ (ideal gas)

$$\Rightarrow \quad m = P\dot{V}\Delta t/RT = \frac{0.1\ \text{kPa} \times 0.5\ \text{m}^3/\text{s} \times 30\ \text{min} \times 60\ \text{s/min}}{0.46152\ \text{kJ/kgK} \times 323.15\ \text{K}} = \mathbf{0.603\ kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.82

A 1-m^3 rigid tank with air at 1 MPa, 400 K is connected to an air line as shown in Fig. P2.82. The valve is opened and air flows into the tank until the pressure reaches 5 MPa, at which point the valve is closed and the temperature inside is 450K.

a. What is the mass of air in the tank before and after the process?

b. The tank eventually cools to room temperature, 300 K. What is the pressure inside the tank then?

Solution:

P, T known at both states and assume the air behaves as an ideal gas.

$$m_{air1} = \frac{P_1 V}{RT_1} = \frac{1000 \text{ kPa} \times 1 \text{ m}^3}{0.287 \text{ kJ/kgK} \times 400 \text{ K}} = \mathbf{8.711 \text{ kg}}$$

$$m_{air2} = \frac{P_2 V}{RT_2} = \frac{5000 \text{ kPa} \times 1 \text{ m}^3}{0.287 \text{ kJ/kgK} \times 450 \text{ K}} = \mathbf{38.715 \text{ kg}}$$

Process $2 \rightarrow 3$ is constant V, constant mass cooling to T_3

$$P_3 = P_2 \times (T_3/T_2) = 5000 \text{ kPa} \times (300/450) = \mathbf{3.33 \text{ MPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.83

A cylindrical gas tank 1 m long, inside diameter of 20 cm, is evacuated and then filled with carbon dioxide gas at 20°C. To what pressure should it be charged if there should be 1.2 kg of carbon dioxide?

Solution:

Assume CO_2 is an ideal gas, table A.5: R = 0.1889 kJ/kg K

$$V_{cyl} = A \times L = \frac{\pi}{4}(0.2)^2 \times 1 = 0.031416 \text{ m}^3$$

$$P\,V = mRT \quad \Rightarrow \quad P = \frac{mRT}{V}$$

$$\Rightarrow P = \frac{1.2 \text{ kg} \times 0.1889 \text{ kJ/kg K} \times (273.15 + 20) \text{ K}}{0.031416 \text{ m}^3} = \mathbf{2115 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.84

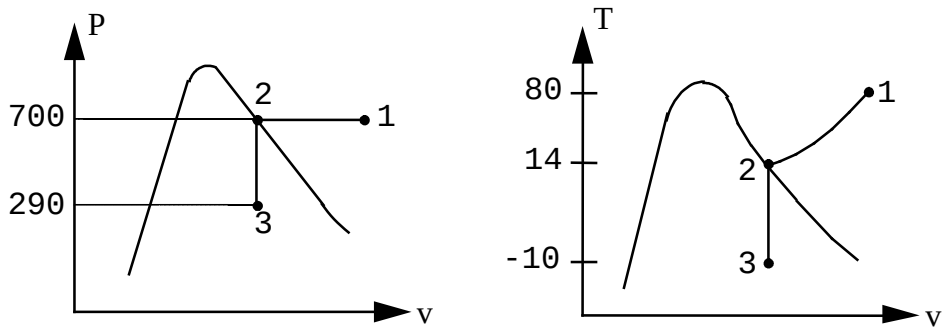
Ammonia in a piston/cylinder arrangement is at 700 kPa, 80°C. It is now cooled at constant pressure to saturated vapor (state 2) at which point the piston is locked with a pin. The cooling continues to −10°C (state 3). Show the processes 1 to 2 and 2 to 3 on both a *P*–*v* and *T*–*v* diagram.

Solution:

State 1: T, P from table B.2.2 this is superheated vapor.

State 2: T, x from table B.2.1

State 3: T, v two-phase



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Compressibility Factor

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.85

Find the compressibility factor (Z) for saturated vapor ammonia at 100 kPa and at 2000 kPa.

Table B.2.2: $v_1 = 1.1381\ m^3/kg$, $T_1 = -33.6^oC$, $P_1 = 100$ kPa

$v_2 = 0.06444\ m^3/kg$, $T_2 = 49.37^oC$, $P_2 = 2000$ kPa

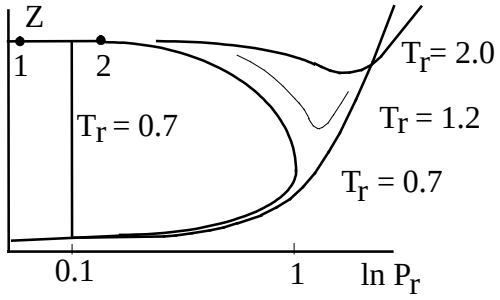
Table A.5: $R = 0.4882$ kJ/kg K

Extended gas law: $Pv = ZRT$ so we can calculate Z from this

$$Z_1 = \frac{P_1 v_1}{RT_1} = \frac{100\ \text{kPa} \times 1.1381\ \text{m}^3/\text{kg}}{0.4882\ \text{kJ/kg-K} \times (273.15 - 33.6)\ \text{K}} = 0.973$$

$$Z_2 = \frac{P_2 v_2}{RT_2} = \frac{2000\ \text{kPa} \times 0.06444\ \text{m}^3/\text{kg}}{0.4882\ \text{kJ/kg-K} \times (273.15 + 49.37)\ \text{K}} = 0.8185$$

So state 1 is close to ideal gas and state 2 is not so close.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.86

Find the compressibility for nitrogen at

a. 2000 kPa, 120 K ; b. 2000 kPa, 300 K ; c. 120 K, v = 0.005 m^3/kg

Solution:

Table B.6 has the properties for nitrogen.

a) B.6.2: v = 0.01260 m^3/kg

$$Z = Pv/RT = \frac{2000 \text{ kPa} \times 0.01260 \text{ m}^3/\text{kg}}{0.2968 \text{ kJ/kg-K} \times 120 \text{ K}} = \mathbf{0.707}$$

b) B.6.2: v = 0.04440 m^3/kg

$$Z = Pv/RT = \frac{2000 \text{ kPa} \times 0.04440 \text{ m}^3/\text{kg}}{0.2968 \text{ kJ/kg-K} \times 300 \text{ K}} = \mathbf{0.997}$$

c) B.6.1: $v_f < v < v_g$ so this is a two-phase state.

$$Z = Pv/RT = \frac{2000 \text{ kPa} \times 0.005 \text{ m}^3/\text{kg}}{0.2968 \text{ kJ/kg-K} \times 120 \text{ K}} = \mathbf{0.28}$$

The liquid in this state is incompressible with a low volume and the vapor is very close to the critical point. If you calculate a quality it is x = 0.507. The compressibility for the saturated vapor alone is 0.44.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.87

Find the compressibility for carbon dioxide at 60^{o}C and 10 MPa using Fig. D.1

Solution:

Table A.2 CO2: T_c = 304.1 K P_c = 7.38 MPa

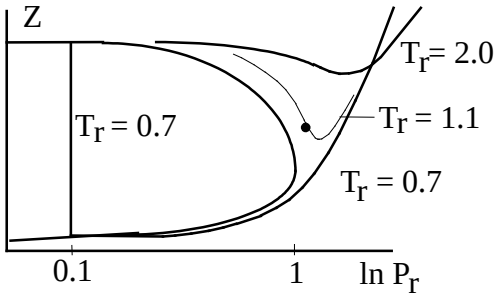
$T_r = T/T_c = 333/304.1 = 1.095$

$P_r = P/P_c = 10/7.38 = 1.355$

From Figure D.1: **Z ≈ 0.45**

Compare with table B.3.2: $v = 0.00345\ m^3/kg$

$$Z = Pv/RT = \frac{10\ 000\ kPa \times 0.00345\ m^3/kg}{0.1889\ kJ/kg\text{-}K \times 333\ K} = 0.55$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.88

What is the percent error in specific volume if the ideal gas model is used to represent the behavior of superheated ammonia at 40°C, 500 kPa? What if the generalized compressibility chart, Fig. D.1, is used instead?

Solution:

NH_3 T = 40°C = 313.15 K, T_c = 405.5 K, P_c = 11.35 MPa from Table A.1

Table B.2.2: v = **0.2923 m^3/kg**

Ideal gas: $v = \frac{RT}{P} = \frac{0.48819 \text{ kJ/kgK} \times 313 \text{ K}}{500 \text{ kPa}}$ = **0.3056 m^3/kg** $\Rightarrow$ **4.5% error**

Figure D.1: $T_r = \frac{313.15}{405.5} = 0.772$, $P_r = \frac{0.5}{11.35} = 0.044$ $\Rightarrow$ Z = **0.97**

$v = \frac{ZRT}{P}$ = **0.2964 m^3/kg** $\Rightarrow$ **1.4% error**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.89

A cylinder fitted with a frictionless piston contains butane at 25°C, 500 kPa. Can the butane reasonably be assumed to behave as an ideal gas at this state ?

Solution

Butane 25°C, 500 kPa, Table A.2: $T_c = 425$ K; $P_c = 3.8$ MPa

$$T_r = \frac{25 + 273}{425} = 0.701; \qquad P_r = \frac{0.5}{3.8} = 0.13$$

Look at generalized chart in Figure D.1

Actual $P_r > P_{r,\,sat} = 0.1$ => **liquid!! not a gas**

The pressure should be less than 380 kPa to have a gas at that T.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.90

Estimate the saturation pressure of chlorine at 300 K.

Solution:
We do not have a table in the B section for Chlorine so we must use the generalized chart.

Table A.2: $P_c = 7.98$ MPa, $T_c = 416.9$ K

$T_r = T/T_c = 300 / 416.9 = 0.7196$

Figure D.1: $P_{r\,sat} = 0.13$ (same estimation from Table D.4)

$P = P_c P_{r\,sat} = 7.98 \times 0.13 =$ **1.04 MPa**

If you use the CATT3 program then you will find $P_{r\,sat} = 0.122$ and P = 973 kPa

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.91

A bottle with a volume of 0.1 m^3 contains butane with a quality of 75% and a temperature of 300 K. Estimate the total butane mass in the bottle using the generalized compressibility chart.

Solution:

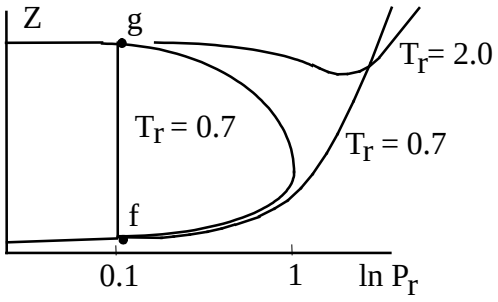
We need to find the property v the mass is: $m = V/v$

so find v given T_1 and x as : $v = v_f + x\, v_{fg}$

Table A.2: Butane $T_c = 425.2$ K $P_c = 3.8$ MPa = 3800 kPa

$T_r = 300/425.2 = 0.705$ =>

From Fig. D.1 or table D.4: $Z_f \approx 0.02$; $Z_g \approx 0.9$; $P_{r\,sat} = 0.1$



$P = P_{sat} = P_{r\,sat} \times P_c = 0.1 \times 3.80$ MPa $\times 1000$ kPa/MPa = 380 kPa

$v_f = Z_f RT/P = 0.02 \times 0.14304$ kJ/kgK $\times$ 300 K/380 kPa = 0.00226 m^3/kg

$v_g = Z_g RT/P = 0.9 \times 0.14304$ kJ/kgK $\times$ 300 K/380 kPa = 0.1016 m^3/kg

$v = 0.00226 + 0.75 \times (0.1016 - 0.00226) = 0.076765$ m^3/kg

$$m = \frac{V}{v} = \frac{0.1}{0.076765} = \mathbf{1.303\ kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.92

Find the volume of 2 kg of ethylene at 270 K, 2500 kPa using Z from Fig. D.1

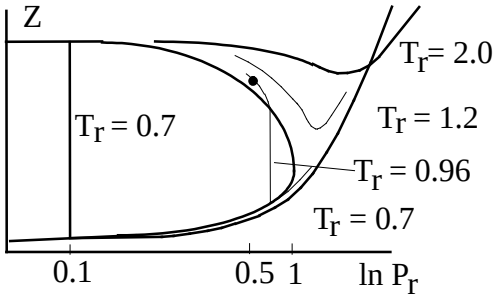
Ethylene Table A.2: $T_c = 282.4$ K, $P_c = 5.04$ MPa
Table A.5: $R = 0.2964$ kJ/kg K

The reduced temperature and pressure are:

$$T_r = \frac{T}{T_c} = \frac{270}{282.4} = 0.956, \quad P_r = \frac{P}{P_c} = \frac{2.5}{5.04} = 0.496$$

Enter the chart with these coordinates and read: $Z = 0.76$

$$V = \frac{mZRT}{P} = \frac{2 \text{ kg} \times 0.76 \times 0.2964 \text{ kJ/kg-K} \times 270 \text{ K}}{2500 \text{ kPa}} = \mathbf{0.0487\ m^3}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.93

For $T_r = 0.7$, what is the ratio v_g/v_f using Fig. D.1 compared to Table. D.3

For the saturated states we can use Fig. D.1 with the estimates

$$Z_f = 0.02, \qquad Z_g = 0.9$$

so

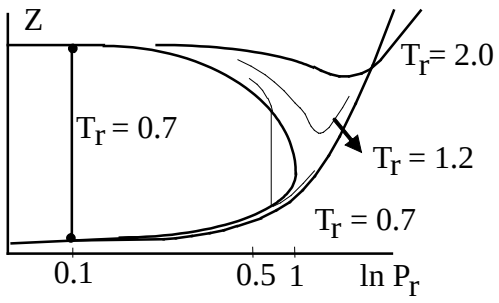
$$v_g/v_f = (ZRT/P)_g / (ZRT/P)_f = Z_g/Z_f = \frac{0.02}{0.9} = \mathbf{0.0222}$$

Table D.3 list the entries more accurately than we can read the figure

$$Z_f = 0.017, \qquad Z_g = 0.897$$

so

$$v_g/v_f = (ZRT/P)_g / (ZRT/P)_f = Z_g/Z_f = \frac{0.017}{0.897} = \mathbf{0.0189}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.94

Argon is kept in a rigid 5 m^3 tank at –30°C, 3 MPa. Determine the mass using the compressibility factor. What is the error (%) if the ideal gas model is used?

Solution:

No Argon table, so we use generalized chart Fig. D.1

$T_r = 243.15/150.8 = 1.612, \quad P_r = 3000/4870 = 0.616 \quad \Rightarrow \quad Z \cong 0.96$

$$m = \frac{PV}{ZRT} = \frac{3000 \text{ kPa} \times 5 \text{ m}^3}{0.96 \times 0.2081 \text{ kJ/kgK} \times 243.2 \text{ K}} = \mathbf{308.75 \text{ kg}}$$

Ideal gas $Z = 1$

$$m = \frac{PV}{RT} = 296.4 \text{ kg} \qquad \mathbf{4\% \text{ error}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.95

Refrigerant R-32 is at -10 ^{o}C with a quality of 15%. Find the pressure and specific volume.

Solution:

For R-32 there is no section B table printed. We will use compressibility chart.

From Table A.2: $T_c = 351.3$ K ; $P_c = 5.78$ MPa ;

From Table A.5: $R = 0.1598$ kJ/kg K

$T_r = T/T_c = 263/351.3 = 0.749$

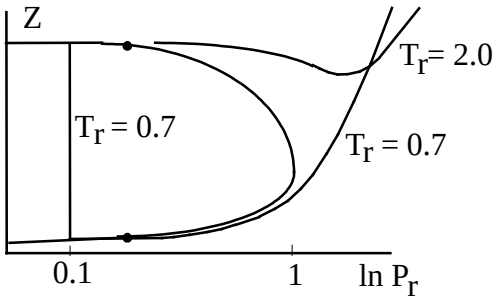
From Table D.4 or Figure D.1, $Z_f \approx 0.029$; $Z_g \approx 0.86$; $P_{r\,sat} \approx 0.16$

$P = P_{r\,sat} P_c = 0.16 \times 5780 =$ **925 kPa**

$v = v_f + x\, v_{fg} = (Z_f + x \times Z_{fg})\, RT/P$

$= [0.029 + 0.15 \times (0.86 - 0.029)] \times 0.1598$ kJ/kg-K $\times$ 263 K/ 925 kPa

$=$ **0.007 m^3/kg**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.96

To plan a commercial refrigeration system using R-123 we would like to know how much more volume saturated vapor R-123 occupies per kg at -30 ^{o}C compared to the saturated liquid state.

Solution:

For R-123 there is no section B table printed. We will use compressibility chart.

From Table A.2 $T_c = 456.9$ K ; $P_c = 3.66$ MPa ; $M = 152.93$

$T_r = T/T_c = 243/456.9 = 0.53$

$R = \bar{R}/M = 8.31451$ kJ/kmol-K / 152.93 kg/kmol = 0.0544 kJ/kgK

The value of T_r is below the range in Fig. D.1 so use the table D.4

Table D.4, $Z_g = 0.979$ $Z_f = 0.00222$

$Z_{fg} = 0.979 - 0.0022 = 0.9768$; $P_r = P_{r\,sat} = 0.0116$

$P = P_r \times P_c = 42.5$ kPa

$v_{fg} = Z_{fg}\, RT/P = 0.9768 \times 0.0544$ kJ/kgK $\times$ 243 K / 42.5 kPa

$= \mathbf{0.304\ m^3/kg}$

Comment: If you check with the software the solution is off by a factor of 6. The linear interpolation is poor and so is the approximation for $P_{r\,sat}$ so the real saturation pressure should be 6.75 kPa. Also the very small value of Z_f is inaccurate by itself, minute changes in the curve gives large relative variations.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.97

A new refrigerant R-125 is stored as a liquid at -20 ^{o}C with a small amount of vapor. For a total of 1.5 kg R-125 find the pressure and the volume.

Solution:

As there is no section B table use compressibility chart.

Table A.2: R-125 T_c = 339.2 K P_c = 3.62 MPa

$T_r = T / T_c = 253.15 / 339.2 = 0.746$

We can read from Figure D.1 or a little more accurately interpolate from table D.4 entries:

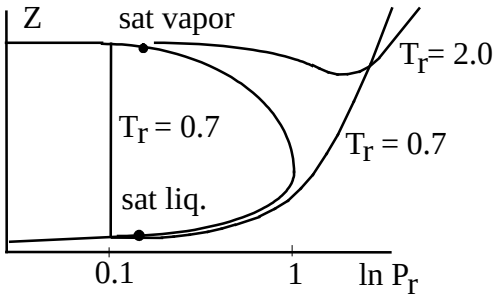
$P_{r\,sat} = 0.16$; $Z_g = 0.86$; $Z_f = 0.029$

$P = P_{r\,sat} P_c = 0.16 \times 3620$ kPa = **579 kPa**

$V_{liq} = Z_f m_{liq} RT/P$

$= 0.029 \times 1.5$ kg $\times$ 0.06927 kJ/kgK $\times$ 253.15 K/ 579 kPa

= **0.0013 m^3**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Equations of State

For these problems see appendix D for the equation of state (EOS) and chapter 12.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.98

Determine the pressure of nitrogen at 160 K, v = 0.00291 m^3/kg using ideal gas, van der Waal Equation of State and the nitrogen table.

Nitrogen from table A.2: $T_c = 126.2$ K, $P_c = 3390$ kPa,

Ideal gas: $P = \frac{RT}{v} = \frac{0.2968 \times 160}{0.00291} \frac{\text{kJ/kg-K} \times \text{K}}{\text{m}^3/\text{kg}} = \mathbf{16\ 319\ kPa}$

For **van der Waal equation of state** from Table D.1 we have

$$b = \frac{1}{8}\frac{RT_c}{P_c} = 0.125 \times \frac{0.2968 \times 126.2}{3390} = 0.001\ 381\ \text{m}^3/\text{kg},$$

$$a = 27\, b^2 P_c = 27 \times (0.001\ 381)^2 \times 3390 = 0.174\ 562\ \text{kPa}\ (\text{m}^3/\text{kg})^2$$

The EOS is: $P = \frac{RT}{v - b} - \frac{a}{v^2} = \frac{0.2968 \times 160}{0.00291 - 0.001\ 381} - \frac{0.174\ 562}{0.00291^2} = \mathbf{10\ 444\ kPa}$

Table B.6.2: P = **10 000 kPa**.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.99

Determine the pressure of nitrogen at 160 K, v = 0.00291 m^3/kg using Redlich-Kwong Equation of State and the nitrogen table.

Nitrogen from table A.2: $T_c = 126.2$ K, $P_c = 3390$ kPa,
$T_r = T/T_c = 160/126.2 = 1.26783$

For **Redlich-Kwong EOS** we have the parameters from Table D.1

$$b = 0.08664 \frac{RT_c}{P_c} = 0.08664 \times \frac{0.2968 \times 126.2}{3390} = 0.000\ 957\ 3\ m^3/kg,$$

$$a = 0.42748\ T_r^{-1/2} \frac{R^2 T_c^2}{P_c} = 0.42748 \times \frac{0.2968^2 \times 126.2^2}{1.2678^{1/2} \times 3390} = 0.157\ 122\ kPa\ (m^3/kg)^2$$

The equation is:

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

$$= \frac{0.2968 \times 160}{0.00291 - 0.000\ 9573} - \frac{0.157122}{0.00291^2 + 0.000\ 9573 \times 0.00291}$$

$$= \mathbf{10\ 357\ kPa}$$

Table B.6.2: P = **10 000 kPa**.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.100

Determine the pressure of nitrogen at 160 K, v = 0.00291 m^3/kg using Soave Equation of State and the nitrogen table.

Nitrogen from table A.2: $T_c = 126.2$ K, $P_c = 3390$ kPa,

$T_r = T/T_c = 160/126.2 = 1.26783$

For **Soave EOS** see Appendix D (very close to Redlich-Kwong)

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

where the parameters are from Table D.1 and D.4

$$\omega = 0.039$$

$$f = 0.48 + 1.574\omega - 0.176\omega^2 = 0.54112$$

$$a_o = 0.42748\,[1 + f\,(1 - T_r^{1/2})\,]^{\,2} = 0.371184$$

$$b = 0.08664\,\frac{RT_c}{P_c} = 0.08664 \times \frac{0.2968 \times 126.2}{3390} = 0.000\,957\,3 \text{ m}^3/\text{kg},$$

$$a = 0.371184\,\frac{R^2T_c^2}{P_c} = 0.371184 \times \frac{0.2968^2 \times 126.2^2}{3390} = 0.153\,616 \text{ kPa } (\text{m}^3/\text{kg})^2$$

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

$$= \frac{0.2968 \times 160}{0.00291 - 0.000\,9573} - \frac{0.153\,616}{0.00291^2 + 0.000\,9573 \times 0.00291}$$

$$= \mathbf{10\,669 \text{ kPa}}$$

Nitrogen Table B.6.2: P = **10 000 kPa**.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.101

Carbon dioxide at 60^{o}C is pumped at a very high pressure 10 MPa into an oil well to reduce the oil viscosity for better oil flow. We want to find its specific volume from the CO_2 table, ideal gas and van der Waals equation of state by iteration.

Table B.3.2: v = **0.00345 m^3/kg**.

Ideal gas: $$v = \frac{RT}{P} = \frac{0.1889 \times (60 + 273.15)}{10\ 000} \frac{\text{kJ/kg-K} \times \text{K}}{\text{kPa}} = \mathbf{0.006\ 293\ m^3/kg}$$

Carbon dioxide from table A.2: $T_c = 304.1$ K, $P_c = 7380$ kPa,

For **van der Waal equation of state** from Table D.1 we have

$$b = \frac{1}{8}\frac{RT_c}{P_c} = 0.125 \times \frac{0.1889 \times 304.1}{7380} = 0.000\ 972\ 98\ \text{m}^3/\text{kg},$$

$$a = 27\, b^2\, P_c = 27 \times (0.000\ 972\ 98)^2 \times 7380 = 0.188\ 6375\ \text{kPa}\ (\text{m}^3/\text{kg})^2$$

The EOS is: $$P = \frac{RT}{v - b} - \frac{a}{v^2}$$

Since it is nonlinear in v we use trial and error starting with the Table entry.

$$v = 0.00345: \quad P = \frac{0.1889 \times 333.15}{0.00345 - 0.000\ 972\ 98} - \frac{0.188\ 6375}{0.00345^2} = 9557.8\ \text{kPa} \quad \text{low}$$

$$v = 0.003 \qquad P = \frac{0.1889 \times 333.15}{0.003 - 0.000\ 972\ 98} - \frac{0.188\ 6375}{0.003^2} = 10\ 086.8\ \text{kPa} \quad \text{high}$$

$$v = 0.00307: \quad P = \frac{0.1889 \times 333.15}{0.00307 - 0.000\ 972\ 98} - \frac{0.188\ 6375}{0.00307^2} = 9995.4 \quad \text{OK.}$$

v = **0.00307 m^3/kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.102

Solve the previous problem using the Redlich-Kwong equation of state. Notice this becomes trial and error.

Carbon dioxide from table A.2: $T_c = 304.1$ K, $P_c = 7380$ kPa,

$$T_r = T/T_c = 333.15/304.1 = 1.09553$$

For **Redlich-Kwong EOS** we have the parameters from Table D.1

$$b = 0.08664 \frac{RT_c}{P_c} = 0.08664 \times \frac{0.1889 \times 304.1}{7380} = 0.000\,6744 \text{ m}^3/\text{kg},$$

$$a = 0.42748\, T_r^{-1/2} \frac{R^2 T_c^2}{P_c} = 0.42748 \times \frac{0.1889^2 \times 304.1^2}{1.09553^{1/2} \times 7380} = 0.18262 \text{ kPa } (\text{m}^3/\text{kg})^2$$

The equation is:

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

$$10\,000 = \frac{0.1889 \times 333.15}{v - 0.000\,6744} - \frac{0.18262}{v^2 + 0.000\,6744 \times v}$$

Trial and error on v (start guided by Table B.3.2):

$v = 0.0035$ m^3/kg ⇨ P = 9772.8 kPa so v smaller

$v = 0.0033$ m^3/kg ⇨ P = 10044.7 kPa so v larger

$v = 0.0034$ m^3/kg ⇨ P = 9906.5 kPa

linear interpolation gives

$v =$ **0.00333 m^3/kg** ⇨ P = 10002.7 kPa OK.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.103

Solve Problem 2.101 using the Soave equation of state, ω = 0.239. Notice this becomes trial and error.

Carbon dioxide from table A.2: $T_c = 304.1$ K, $P_c = 7380$ kPa,

$$T_r = T/T_c = 333.15/304.1 = 1.09553$$

For **Soave EOS** see Appendix D (very close to Redlich-Kwong)

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

where the parameters are from Table D.1 and D.4

$$\omega = 0.239$$

$$f = 0.48 + 1.574\omega - 0.176\omega^2 = 0.84613$$

$$a_o = 0.42748\,[1 + f\,(1 - T_r^{1/2})\,]^{\,2} = 0.394381$$

$$b = 0.08664\,\frac{RT_c}{P_c} = 0.08664 \times \frac{0.1889 \times 304.1}{7380} = 0.000\,6744\ \text{m}^3/\text{kg},$$

$$a = 0.394381\,\frac{R^2T_c^2}{P_c} = 0.394381 \times \frac{0.1889^2 \times 304.1^2}{7380} = 0.176\,342\ \text{kPa}\ (\text{m}^3/\text{kg})^2$$

The equation is:

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

$$10\,000 = \frac{0.1889 \times 333.15}{v - 0.000\,6744} - \frac{0.176\,342}{v^2 + 0.000\,6744 \times v}$$

Trial and error on v (start guided by Table B.3.2):

$v = 0.0035\ \text{m}^3/\text{kg}$ ⇨ P = 10 202 kPa so v larger

$v = 0.0036\ \text{m}^3/\text{kg}$ ⇨ P = 10 051 kPa so v close

$v = 0.00363\ \text{m}^3/\text{kg}$ ⇨ P = 10 006 kPa OK

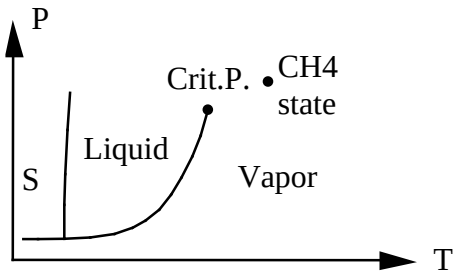
2.104

A tank contains 8.35 kg methane in 0.1 m^3 at 250 K. Find the pressure using ideal gas, van der Waal EOS and the methane table.

The state is given by (T = 250 K, v = V/m = 0.1/8.35 = 0.011976 m^3/kg)

Table A.2 or B.7.2:
T_c = 190.4 K,
P_c = 4600 kPa

$$T_r = \frac{T}{T_c} = \frac{250}{190.4} = 1.313$$



Ideal gas model: $$P = \frac{RT}{v} = \frac{0.5183 \times 250}{0.011976} = 10\ 820 \text{ kPa}$$

For **van der Waal equation of state** from Table D.1 we have

$$b = \frac{1}{8}\frac{RT_c}{P_c} = 0.125 \times \frac{0.5183 \times 190.4}{4600} = 0.002\ 681\ 64 \text{ m}^3/\text{kg},$$

$$a = 27\, b^2\, P_c = 27 \times (0.002\ 681\ 64)^2 \times 4600 = 0.893\ 15 \text{ kPa } (\text{m}^3/\text{kg})^2$$

The EOS is: $$P = \frac{RT}{v - b} - \frac{a}{v^2} = \frac{0.5183 \times 250}{0.011976 - 0.002\ 681\ 64} - \frac{0.89315}{0.011976^2} = 7714 \text{ kPa}$$

Locating the state in **Table B.7.2:** P = 8000 kPa, very close

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.105

Do the previous problem using the Redlich-Kwong equation of state.

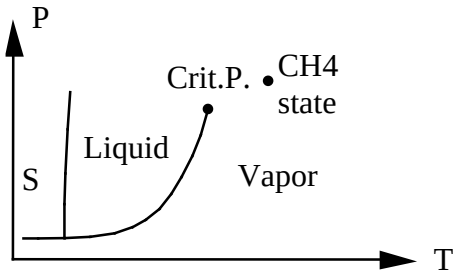
The state is given by (T = 250 K, v = V/m = 0.1/8.35 = 0.011976 m^3/kg)

Table A.2 or B.7.2:

T_c = 190.4 K,

P_c = 4600 kPa

$$T_r = \frac{T}{T_c} = \frac{250}{190.4} = 1.313$$



Ideal gas model: $$P = \frac{RT}{v} = \frac{0.5183 \times 250}{0.011976} = 10\ 820 \text{ kPa}$$

For **Redlich-Kwong equation of state** we have the parameters from Table D.1

$$b = 0.08664 \frac{RT_c}{P_c} = 0.08664 \times \frac{0.5183 \times 190.4}{4600} = 0.001\ 858\ 7 \text{ m}^3/\text{kg},$$

$$a = 0.42748\ T_r^{-1/2} \frac{R^2 T_c^2}{P_c} = 0.42748 \times \frac{0.5183^2 \times 190.4^2}{1.313^{1/2} \times 4600} = 0.789809 \text{ kPa } (\text{m}^3/\text{kg})^2$$

The equation is:

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

$$= \frac{0.5183 \times 250}{0.011976 - 0.0018587} - \frac{0.789809}{0.011976^2 + 0.0018587 \times 0.011976}$$

$$= 8040 \text{ kPa}$$

Locating the state in **Table B.7.2:** P = 8000 kPa, very close

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.106

Do Problem 2.104 using the Soave EOS.

A tank contains 8.35 kg methane in 0.1 m^3 at 250 K. Find the pressure using ideal gas, van der Waal EOS and the methane table.

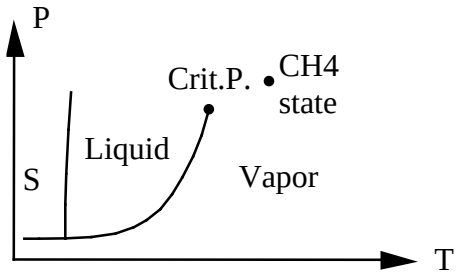
The state is given by (T = 250 K, v = V/m = 0.1/8.35 = 0.011976 m^3/kg)

Table A.2 or B.7.2:

T_c = 190.4 K,

P_c = 4600 kPa

$$T_r = \frac{T}{T_c} = \frac{250}{190.4} = 1.313$$



Ideal gas model: $$P = \frac{RT}{v} = \frac{0.5183 \times 250}{0.011976} = 10\ 820 \text{ kPa}$$

For **Soave EOS** we have the parameters from Table D.1 and D.4

$$\omega = 0.011$$

$$f = 0.48 + 1.574\omega - 0.176\omega^2 = 0.49729$$

$$a_o = 0.42748\ [1 + f\ (1 - T_r^{1/2})\ ]^{\,2} = 0.367714$$

$$b = 0.08664 \frac{RT_c}{P_c} = 0.08664 \times \frac{0.5183 \times 190.4}{4600} = 0.001\ 8587 \text{ m}^3/\text{kg},$$

$$a = 0.367714 \frac{R^2T_c^2}{P_c} = 0.367714 \times \frac{0.5183^2 \times 190.4^2}{4600} = 0.778\ 482 \text{ kPa } (\text{m}^3/\text{kg})^2$$

The equation is:

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

$$= \frac{0.5183 \times 250}{0.011976 - 0.001\ 8587} - \frac{0.778\ 482}{0.011976^2 + 0.0018587 \times 0.011976}$$

$$= \mathbf{8108.7 \text{ kPa}}$$

Locating the state in **Table B.7.2:** P = 8000 kPa

2.107

Determine the quality (if saturated) or temperature (if superheated) of the following substances at the given two states:
Solution:

a) Water, H_2O, use Table B.1.1 or B.1.2

1) 120°C, 1 m^3/kg $v > v_g$ superheated vapor, **T = 120 °C**

2) 10 MPa, 0.01 m^3/kg => two-phase $v < v_g$

$x = (0.01 - 0.001452) / 0.01657 =$ **0.516**

b) Nitrogen, N_2, table B.6

1) 1 MPa, 0.03 m^3/kg => superheated vapor since $v > v_g$

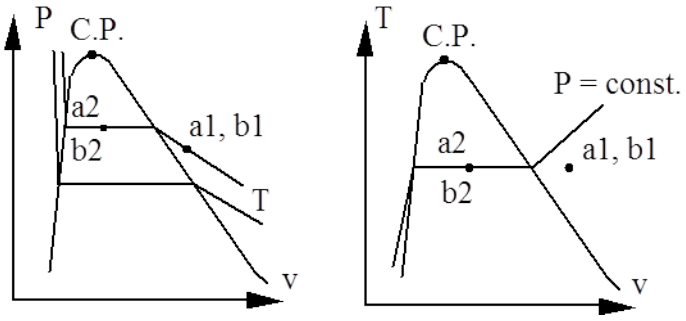
Interpolate between sat. vapor and superheated vapor B.6.2:

$$T \cong 103.73 + (120\text{-}103.73) \times \frac{0.03 - 0.02416}{0.03117 - 0.02416} = \mathbf{117\ K}$$

2) 100 K, 0.03 m^3/kg => sat. liquid + vapor as two-phase $v < v_g$

$v = 0.03 = 0.001452 + x \times 0.029764 \Rightarrow$ **x = 0.959**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.108

Give the phase and the missing properties of *P*, *T*, *v* and *x*.

Solution:

a. R-410A $T = 10^{\circ}C$ $v = 0.01\ m^3/kg$

Table B.4.1 $v < v_g = 0.02383\ m^3/kg$

sat. liquid + vapor. $P = P_{sat} = 1085.7$ kPa,

$x = (v - v_f)/v_{fg} = (0.01 - 0.000886)/0.02295 = 0.2713$

b. H_2O $T = 350^{\circ}C$ $v = 0.2\ m^3/kg$

Table B.1.1 at given T: $v > v_g = 0.00881\ m^3/kg$

sup. vapor $P \cong 1.40$ MPa, x = undefined

c. R-410A $T = -5\ ^{\circ}C$ $P = 600$ kPa

sup. vapor ($P < P_g = 678{,}9$ kPa at $-5^{\circ}C$)

Table B.4.2:

$v = 0.04351\ m^3/kg$ at $-8.67^{\circ}C$

$v = 0.04595\ m^3/kg$ at $0^{\circ}C$

=> $v = 0.04454\ m^3/kg$ at $-5^{\circ}C$

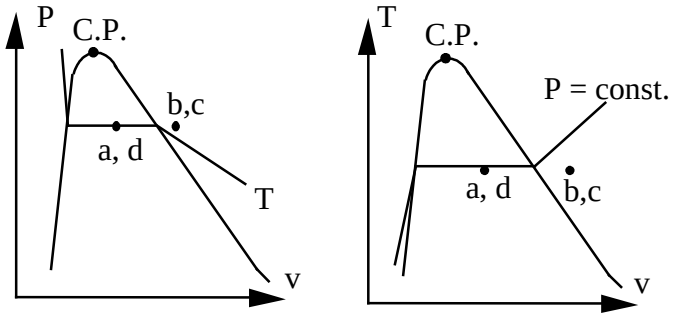
d. R-134a $P = 294$ kPa, $v = 0.05\ m^3/kg$

Table B.5.1: $v < v_g = 0.06919\ m^3/kg$

two-phase $T = T_{sat} = 0^{\circ}C$

$x = (v - v_f)/v_{fg} = (0.05 - 0.000773)/0.06842 = 0.7195$

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.109

Find the phase, quality *x* if applicable and the missing property *P* or *T*.

Solution:

a. H_2O $T = 120^\circ C$ $v = 0.5\ m^3/kg$

Table B.1.1 at given T: $v < v_g = 0.89186$

sat. liq. + vap. $P = P_{sat} =$ **198.5 kPa,**

$x = (v - v_f)/v_{fg} = (0.5 - 0.00106)/0.8908 =$ **0.56**

b. H_2O $P = 100$ kPa $v = 1.8\ m^3/kg$

Table B.1.2 at given P: $v > v_g = 1.694$

sup. vap., interpolate in Table B.1.3

$$T = \frac{1.8 - 1.694}{1.93636 - 1.694}(150 - 99.62) + 99.62 = \textbf{121.65 °C}$$

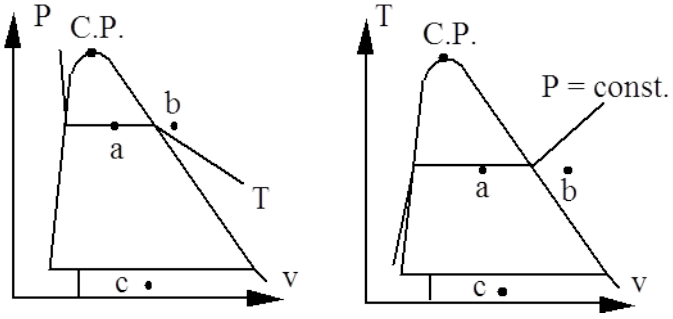
c. H_2O $T = 263$ K $v = 0.2\ m^3/kg$

Table B.1.5 at given T = -10 °C: $v < v_g = 466.757$

sat. solid + vap., $P = P_{sat} =$ **0.26 kPa**,

$x = (v - v_i)/v_{ig} = (200 - 0.001)/466.756 =$ **0.4285**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.110

Find the phase, quality *x* if applicable and the missing property *P* or *T*.

Solution:

a. NH_3 $P = 800$ kPa $v = 0.2$ m^3/kg;

Superheated Vapor ($v > v_g$ at 800 kPa)

Table B 2.2 interpolate between 70°C and 80°C

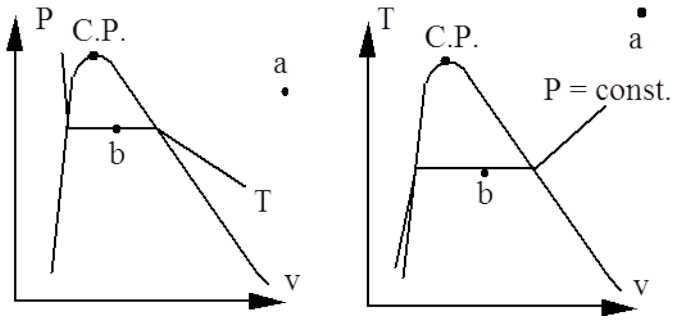
T = **71.4°C**

b. NH_3 $T = 20$°C $v = 0.1$ m^3/kg

Table B.2.1 at given T: $v < v_g = 0.14922$

sat. liq. + vap. , $P = P_{sat}$ = **857.5 kPa,**

$x = (v - v_f)/v_{fg} = (0.1 - 0.00164)/0.14758$ = **0.666**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.111

Give the phase and the missing properties of *P*, *T*, *v* and *x*. These may be a little more difficult if the appendix tables are used instead of the software.

a) R-410A at $T = 10°C$, $v = 0.02$ m^3/kg: Table B.4.1 $v > v_g$ at 10°C

=> **sup. vap.** Table B.4.2 interpolate between sat. and sup. both at 10°C

$$P = 680.7 + (600 - 680.7)\frac{0.036-0.03471}{0.04018-0.03471} = \mathbf{661.7\ kPa}$$

b) H_2O $v = 0.2$ m^3/kg , $x = 0.5$: Table B.1.1

sat. liq. + vap. $v = (1\text{-}x)\, v_f + x\, v_g$ => $v_f + v_g = 0.4$ m^3/kg

since v_f is so small we find it approximately where $v_g = 0.4$ m^3/kg.

$v_f + v_g = 0.39387$ at 150°C, $v_f + v_g = 0.4474$ at 145°C.

An interpolation gives $T \cong$ **149.4°C,** $P \cong$ **468.2 kPa**

c) H_2O $T = 60°C$, $v = 0.001016$ m^3/kg: Table B.1.1 $v < v_f = 0.001017$

=> **compr. liq.** see Table B.1.4

$v = 0.001015$ at 5 MPa so $P \cong 0.5(5000 + 19.9) =$ **2.51 MPa**

d) NH_3 $T = 30°C$, $P = 60$ kPa : Table B.2.1 $P < P_{sat}$

=> **sup. vapor** interpolate in Table B.2.2 (50 kPa to 100 kPa)

$$v = 2.9458 + (1.4657 - 2.9458)\frac{60 - 50}{100 - 50} = \mathbf{2.65\ m^3/kg}$$

v is not linearly proportional to P (more like 1/P) so the computer table gives a more accurate value of 2.45 m^3/kg

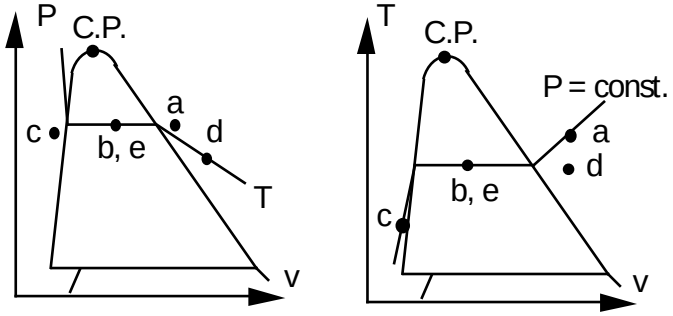
e) R-134a $v = 0.005$ m^3/kg , $x = 0.5$: **sat. liq. + vap.** Table B.5.1

$v = (1\text{-}x)\, v_f + x\, v_g$ => $v_f + v_g = 0.01$ m^3/kg

$v_f + v_g = 0.010946$ at 65°C, $v_f + v_g = 0.009665$ at 70°C.

An interpolation gives: $T \cong$ **68.7°C**, $P =$ **2.06 MPa**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.112

Refrigerant-410a in a piston/cylinder arrangement is initially at 50°C, $x = 1$. It is then expanded in a process so that $P = Cv^{-1}$ to a pressure of 100 kPa. Find the final temperature and specific volume.

Solution:

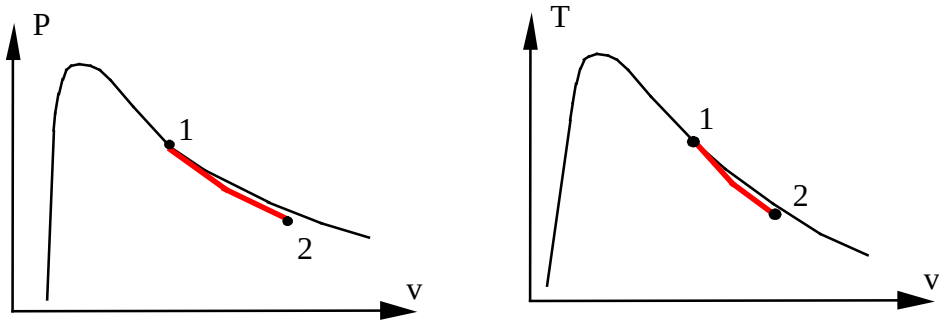
State 1: 50°C, x = 1 Table B.4.1: $P_1 = 3065.2$ kPa, $v_1 = 0.00707$ m^3/kg

Process: $Pv = C = P_1v_1$; => $P_2 = C/v_2 = P_1v_1/v_2$

State 2: 100 kPa and $v_2 = v_1P_1/P_2 =$ **0.2167 m^3/kg**

$v_2 < v_g$ at 100 kPa, $T_2 \cong$ **-51.65°C** from Table B.4.2

Notice T is **not** constant



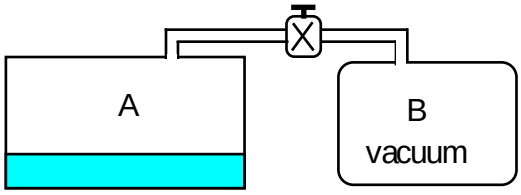
The first part of the process may be in the sup. vapor region.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.113

Consider two tanks, A and B, connected by a valve, as shown in Fig. P2.113. Each has a volume of 200 L and tank A has R-410A at 25°C, 10% liquid and 90% vapor by volume, while tank B is evacuated. The valve is now opened and saturated vapor flows from A to B until the pressure in B has reached that in A, at which point the valve is closed. This process occurs slowly such that all temperatures stay at 25°C throughout the process. How much has the quality changed in tank A during the process?

Solution:



State A1: Table B.4.1 $v_f = 0.000944$ m^3/kg, $v_g = 0.01514$ m^3/kg

$$m_{A1} = \frac{V_{liq1}}{v_{f\ 25°C}} + \frac{V_{vap1}}{v_{g\ 25°C}} = \frac{0.1 \times 0.2}{0.000944} + \frac{0.9 \times 0.2}{0.01514}$$

$$= 21.186 + 11.889 = 33.075 \text{ kg}$$

$$x_{A1} = \frac{11.889}{33.075} = 0.3594 \ ;$$

State B2: Assume A still two-phase so saturated P for given T

$$m_{B2} = \frac{V_B}{v_{g\ 25°C}} = \frac{0.2}{0.01514} = 13.210 \text{ kg}$$

State A2: mass left is $m_{A2} = 33.075 - 13.210 = 19.865$ kg

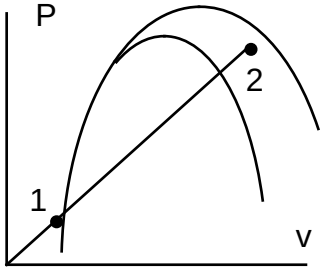
$$v_{A2} = \frac{0.2}{19.865} = 0.010068 = 0.000944 + x_{A2} \times 0.01420$$

$$x_{A2} = 0.6425 \qquad \Delta x = \mathbf{0.283}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.114

Water in a piston/cylinder is at 90°C, 100 kPa, and the piston loading is such that pressure is proportional to volume, $P = CV$. Heat is now added until the temperature reaches 200°C. Find the final pressure and also the quality if in the two-phase region.
Solution:



Final state: 200°C , on process line $P = CV$

State 1: Table B.1.1: $v_1 = 0.001036\ m^3/kg$

$P_2 = P_1 v_2 / v_1$ from process equation

Check state 2 in Table B.1.1

$v_g(T_2) = 0.12736$; $P_g(T_2) = 1.5538$ MPa

If $v_2 = v_g(T_2) \Rightarrow P_2 = 12.3$ MPa $> P_g$ not OK

If sat. $P_2 = P_g(T_2) = 1553.8$ kPa $\Rightarrow v_2 = 0.0161\ m^3kg < v_g$ sat. OK,

P_2 = 1553.8 kPa, $x_2 = (0.0161 - 0.001156) / 0.1262 =$ **0.118**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.115

A tank contains 2 kg of nitrogen at 100 K with a quality of 50%. Through a volume flowmeter and valve, 0.5 kg is now removed while the temperature remains constant. Find the final state inside the tank and the volume of nitrogen removed if the valve/meter is located at

a. The top of the tank
b. The bottom of the tank

Solution

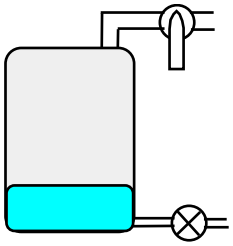


Table B.6.1:

$v_1 = 0.001452 + x_1 \times 0.029764 = 0.016334\ m^3/kg$

$V_{tank} = m_1 v_1 = 0.0327\ m^3$

$m_2 = m_1 - 0.5 = 1.5\ kg$

$v_2 = V_{tank}/m_2 = 0.0218 \ < \ v_g(T)$

$$x_2 = \frac{0.0218-0.001452}{0.031216-0.001452} = \mathbf{0.6836}$$

Top: flow out is sat. vap. $v_g = 0.031216\ m^3/kg$, $V_{out} = m_{out} v_g = \mathbf{0.0156\ m^3}$

Bottom: flow out is sat. liq. $v_f = 0.001452$ $V_{out} = m_{out} v_f = \mathbf{0.000726\ m^3}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.116

A spring-loaded piston/cylinder contains water at 500°C, 3 MPa. The setup is such that pressure is proportional to volume, $P = CV$. It is now cooled until the water becomes saturated vapor. Sketch the P-v diagram and find the final pressure.

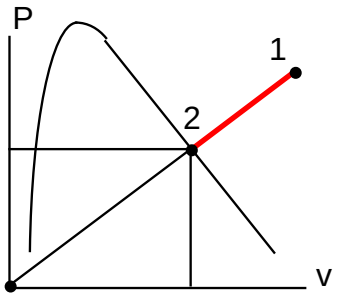
Solution:

State 1: Table B.1.3: $v_1 = 0.11619$ m^3/kg

Process: m is constant and $P = C_0 V = C_0 m\, v = C\, v$

$$P = Cv \Rightarrow C = P_1/v_1 = 3000/0.11619 = 25820 \text{ kPa kg/m}^3$$

State 2: $x_2 = 1$ & $P_2 = Cv_2$ (on process line)



Trial & error on T_{2sat} or P_{2sat}:

Here from B.1.2:

at 2 MPa $v_g = 0.09963 \Rightarrow C = 20074$ (low)

2.5 MPa $v_g = 0.07998 \Rightarrow C = 31258$ (high)

2.25 MPa $v_g = 0.08875 \Rightarrow C = 25352$ (low)

Interpolate to get the right C $\Rightarrow$ **P_2 = 2270 kPa**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.117

A container with liquid nitrogen at 100 K has a cross sectional area of 0.5 m^2. Due to heat transfer, some of the liquid evaporates and in one hour the liquid level drops 30 mm. The vapor leaving the container passes through a valve and a heater and exits at 500 kPa, 260 K. Calculate the volume rate of flow of nitrogen gas exiting the heater.

Solution:

Properties from table B.6.1 for volume change, exit flow from table B.6.2:

$$\Delta V = A \times \Delta h = 0.5 \times 0.03 = 0.015 \text{ m}^3$$

$$\Delta m_{liq} = -\Delta V / v_f = -0.015/0.001452 = -10.3306 \text{ kg}$$

$$\Delta m_{vap} = \Delta V / v_g = 0.015/0.0312 = 0.4808 \text{ kg}$$

$$m_{out} = 10.3306 - 0.4808 = 9.85 \text{ kg}$$

$$v_{exit} = 0.15385 \text{ m}^3/\text{kg}$$

$$\dot{V} = \dot{m} v_{exit} = (9.85 / 1\ h) \times 0.15385 \text{ m}^3/\text{kg}$$

$$= 1.5015 \text{ m}^3/\text{h} = \mathbf{0.02526\ m^3/min}$$

2.118

For a certain experiment, R-410A vapor is contained in a sealed glass tube at 20°C. It is desired to know the pressure at this condition, but there is no means of measuring it, since the tube is sealed. However, if the tube is cooled to –20°C small droplets of liquid are observed on the glass walls. What is the initial pressure?

Solution:

Control volume: R-410A fixed volume (V) & mass (m) at 20°C

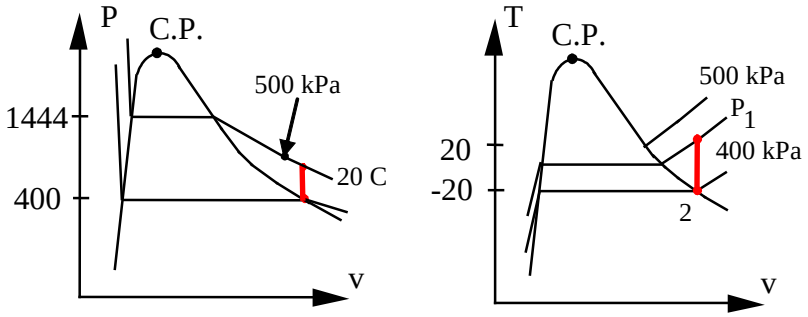
Process: cool to -20°C at constant v, so we assume saturated vapor

State 2: $v_2 = v_{g \text{ at } -20°C} = 0.06480 \text{ m}^3/\text{kg}$

State 1: 20°C, $v_1 = v_2 = 0.06480 \text{ m}^3/\text{kg}$

interpolate between 400 and 500 kPa in Table B.4.2

=> **P_1 = 485 kPa**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

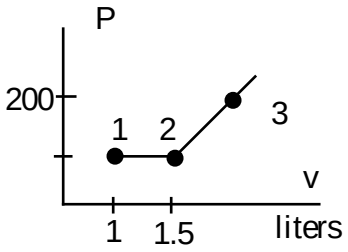
2.119

A cylinder/piston arrangement contains water at 105°C, 85% quality with a volume of 1 L. The system is heated, causing the piston to rise and encounter a linear spring as shown in Fig. P2.119. At this point the volume is 1.5 L, piston diameter is 150 mm, and the spring constant is 100 N/mm. The heating continues, so the piston compresses the spring. What is the cylinder temperature when the pressure reaches 200 kPa?

Solution:

$P_1 = 120.8$ kPa, $v_1 = v_f + x\, v_{fg} = 0.001047 + 0.85*1.41831 = 1.20661$

$$m = V_1/v_1 = \frac{0.001}{1.20661} = 8.288\times10^{-4} \text{ kg}$$



$v_2 = v_1 (V_2 / V_1) = 1.20661 \times 1.5 = 1.8099$

& $P = P_1 = 120.8$ kPa ($T_2 = 203.5$°C)

$P_3 = P_2 + (k_s/A_p^2)\, m(v_3 - v_2)$ linear spring

$A_p = (\pi/4) \times 0.15^2 = 0.01767$ m^2 ; $k_s = 100$ kN/m (matches P in kPa)

$200 = 120.8 + (100/0.01767^2) \times 8.288\times10^{-4}(v_3 - 1.8099)$

$200 = 120.8 + 265.446\ (v_3 - 1.8099)$ => $v_3 = 2.1083$ m^3/kg

$T_3 \cong 600 + 100 \times (2.1083 - 2.01297)/(2.2443 - 2.01297) \cong$ **641°C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.120

Determine the mass of methane gas stored in a 2 m^3 tank at –30°C, 2 MPa. Estimate the percent error in the mass determination if the ideal gas model is used.
Solution:

Table B.7

Methane Table B.7.1 at –30°C = 243.15 K > T_c = 190.6 K, so superheated vapor in Table B.7.2. Linear interpolation between 225 and 250 K at 2 MPa.

$$\Rightarrow \quad v \cong 0.05289 + \frac{243.15\text{-}225}{250\text{-}225} \times (0.06059 - 0.05289) = 0.05848 \ m^3/kg$$

$$m = V/v = 2/0.05848 = 34.2 \ kg$$

Ideal gas assumption

$$v = \frac{RT}{P} = \frac{0.51835 \times 243.15}{2000} = 0.06302 \ m^3/kg$$

$$m = \frac{V}{v} = \frac{2}{0.06302} = 31.74 \ kg$$

Error:

$$\Delta m = 2.46 \ kg \ ; \quad \text{ideal gas } \mathbf{7.2\% \ too \ small}$$

Comment: The compressibility of the methane Z = 0.93.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.121

A cylinder containing ammonia is fitted with a piston restrained by an external force that is proportional to cylinder volume squared. Initial conditions are 10°C, 90% quality and a volume of 5 L. A valve on the cylinder is opened and additional ammonia flows into the cylinder until the mass inside has doubled. If at this point the pressure is 1.2 MPa, what is the final temperature?

Solution:

State 1 Table B.2.1: $v_1 = 0.0016 + 0.9(0.205525 - 0.0016) = 0.18513$ m^3/kg

$P_1 = 615$ kPa; $V_1 = 5$ L $= 0.005$ m^3

$m_1 = V/v = 0.005/0.18513 = 0.027$ kg

State 2: $P_2 = 1.2$ MPa, Flow in so: $m_2 = 2\, m_1 = 0.054$ kg

Process: Piston $F_{ext} = KV^2 = PA \Rightarrow P = CV^2 \Rightarrow P_2 = P_1 (V_2/V_1)^2$

From the process equation we then get:

$$V_2 = V_1 (P_2/P_1)^{1/2} = 0.005 \left(\frac{1200}{615}\right)^{1/2} = 0.006984 \text{ m}^3$$

$$v_2 = V/m = \frac{0.006984}{0.054} = 0.12934 \text{ m}^3/\text{kg}$$

At P_2, v_2: $T_2 =$ **70.9°C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.122

A cylinder has a thick piston initially held by a pin as shown in Fig. P2.122. The cylinder contains carbon dioxide at 200 kPa and ambient temperature of 290 K. The metal piston has a density of 8000 kg/m^3 and the atmospheric pressure is 101 kPa. The pin is now removed, allowing the piston to move and after a while the gas returns to ambient temperature. Is the piston against the stops?

Solution:

Force balance on piston determines equilibrium float pressure.

Piston $m_p = A_p \times l \times \rho$ $\qquad \rho_{piston} = 8000$ kg/m^3

$$P_{ext\ on\ CO_2} = P_0 + \frac{m_p g}{A_p} = 101 + \frac{A_p \times 0.1 \times 9.807 \times 8000}{A_p \times 1000} = 108.8 \text{ kPa}$$

Pin released, as $P_1 > P_{ext}$ piston moves up, $T_2 = T_o$ & if piston at stops,

then $V_2 = V_1 \times H_2/H_1 = V_1 \times 150 / 100$

Ideal gas with $T_2 = T_1$ then gives

$$\Rightarrow \quad P_2 = P_1 \times V_1 / V_2 = 200 \times \frac{100}{150} = 133 \text{ kPa} > P_{ext}$$

$\Rightarrow$ **piston is at stops, and P_2 = 133 kPa**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.123

What is the percent error in pressure if the ideal gas model is used to represent the behavior of superheated vapor R-410A at 60°C, 0.03470 m^3/kg? What if the generalized compressibility chart, Fig. D.1, is used instead (iterations needed)?

Solution:

Real gas behavior: P = 1000 kPa from Table B.4.2

Ideal gas constant: $R = \bar{R}/M = 8.31451/72.585 = 0.1146$ kJ/kg K

$P = RT/v = 0.1146 \times (273.15 + 60) / 0.0347$

= **1100 kPa which is 10% too high**

Generalized chart Fig D.1 and critical properties from A.2:

$T_r = 333.2/(273.15 + 71.3) = 0.967$; $P_c = 4901$ kPa

Assume P = 1000 kPa => $P_r = 0.204$ => $Z \cong 0.92$

$v = ZRT/P = 0.92 \times 0.1146$ kJ/kg-K $\times$ 333.15 K /1000 kPa

= 0.03512 m^3/kg too high

Assume P = 1050 kPa => $P_r = 0.214$ => $Z \cong 0.915$

$v = ZRT/P = 0.915 \times 0.1146$ kJ/kg-K $\times$ 333.15 K / 1050 kPa

= 0.03327 m^3/kg too low

$$P \cong 1000 + (1050 - 1000) \times \frac{0.03470 - 0.03512}{0.03327 - 0.03512} = \textbf{1011 kPa 1.1 \% high}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.124

An initially deflated and flat balloon is connected by a valve to a 12 m^3 storage tank containing helium gas at 2 MPa and ambient temperature, 20°C. The valve is opened and the balloon is inflated at constant pressure, P_o = 100 kPa, equal to ambient pressure, until it becomes spherical at D_1 = 1 m. If the balloon is larger than this, the balloon material is stretched giving a pressure inside as

$$P = P_0 + C\left(1 - \frac{D_1}{D}\right)\frac{D_1}{D}$$

The balloon is inflated to a final diameter of 4 m, at which point the pressure inside is 400 kPa. The temperature remains constant at 20°C. What is the maximum pressure inside the balloon at any time during this inflation process? What is the pressure inside the helium storage tank at this time?

Solution:
At the end of the process we have D = 4 m so we can get the constant C as

$$P = 400 = P_0 + C\,(1 - \tfrac{1}{4})\,\tfrac{1}{4} = 100 + C \times 3/16 \quad \Rightarrow \quad C = 1600 \text{ kPa}$$

The pressure is: $P = 100 + 1600\,(1 - X^{-1})\,X^{-1}$; $X = D / D_1$

Differentiate to find max: $\frac{dP}{dD} = C\,(-X^{-2} + 2X^{-3})\,/\,D_1 = 0$

$$\Rightarrow \; -X^{-2} + 2X^{-3} = 0 \; \Rightarrow \quad X = 2$$

at max P => $D = 2D_1 = 2$ m; $V = \frac{\pi}{6} D^3 = 4.18 \text{ m}^3$

$$P_{max} = 100 + 1600\,(1 - \tfrac{1}{2})\,\tfrac{1}{2} = \mathbf{500 \text{ kPa}}$$

Helium is ideal gas A.5: $m = \frac{PV}{RT} = \frac{500 \times 4.189}{2.0771 \times 293.15} = 3.44$ kg

$$m_{TANK,\,1} = \frac{PV}{RT} = \frac{2000 \times 12}{2.0771 \times 293.15} = 39.416 \text{ kg}$$

$m_{TANK,\,2} = 39.416 - 3.44 = 35.976$ kg

$P_{T2} = m_{TANK,\,2}\,RT/V = (m_{TANK,\,1} / m_{TANK,\,2}) \times P_1 = \mathbf{1825.5 \text{ kPa}}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.125

A piston/cylinder arrangement, shown in Fig. P2.125, contains air at 250 kPa, 300°C. The 50-kg piston has a diameter of 0.1 m and initially pushes against the stops. The atmosphere is at 100 kPa and 20°C. The cylinder now cools as heat is transferred to the ambient.

a. At what temperature does the piston begin to move down?
b. How far has the piston dropped when the temperature reaches ambient?

Solution:

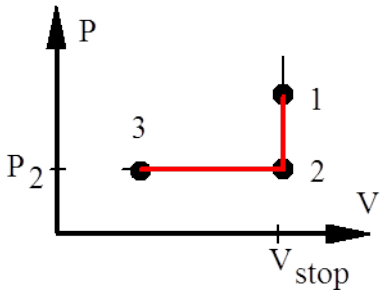
Piston $A_p = \frac{\pi}{4} \times 0.1^2 = 0.00785\ m^2$

Balance forces when piston floats:

$$P_{float} = P_o + \frac{m_p g}{A_p} = 100 + \frac{50 \times 9.807}{0.00785 \times 1000}$$

$$= 162.5\ kPa = P_2 = P_3$$

To find temperature at 2 assume ideal gas:



$$T_2 = T_1 \times \frac{P_2}{P_1} = 573.15 \times \frac{162.5}{250} = \mathbf{372.5\ K}$$

b) Process 2 -> 3 is constant pressure as piston floats to $T_3 = T_o = 293.15$ K

$$V_2 = V_1 = A_p \times H = 0.00785 \times 0.25 = 0.00196\ m^3 = 1.96\ L$$

Ideal gas and $P_2 = P_3$ => $V_3 = V_2 \times \frac{T_3}{T_2} = 1.96 \times \frac{293.15}{372.5} = \mathbf{1.54\ L}$

$\Delta H = (V_2 - V_3)/A = (1.96\text{-}1.54) \times 0.001/0.00785 = \mathbf{0.053\ m = 5.3\ cm}$

Linear Interpolation

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.126

Find the pressure and temperature for saturated vapor R-410A with v = 0.1 m^3/kg

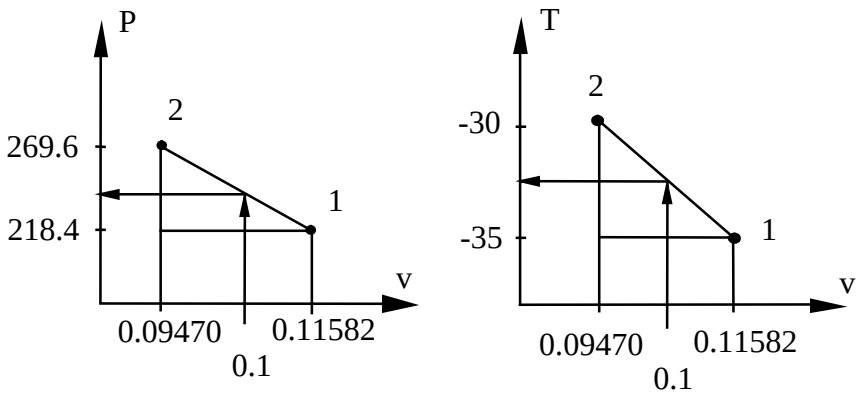
Solution:

Table B.4.1 Look at the saturated vapor column v_g and it is found between –35°C and –30°C. We must then do a linear interpolation between these values.

$$T = -35 + [\,-30 - (-35)]\,\frac{0.1 - 0.11582}{0.09470 - 0.11582}$$

$$= -35 + 5 \times 0.749 = \mathbf{-31.3^\circ C}$$

$$P = 218.4 + (269.6 - 218.4) \times 0.749 = \mathbf{256.7\ kPa}$$



To understand the interpolation equation look at the smaller and larger triangles formed in the figure. The ratio of the side of the small triangle in v as (0.11582 - 0.1) to the side of the large triangle (0.11582 – 0.09470) is equal to 0.749. This fraction of the total $\Delta P = 269.6 - 218.4$ or $\Delta T = -30 - (-35)$ is added to the lower value to get the desired interpolated result.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.127

Use a linear interpolation to estimate properties of ammonia to fill out the table below

	P [kPa]	T [°C]	v [m^3/kg]	x
a)	550			0.75
b)	80	20		
c)		10	0.4	

Solution:

a) Find the pressures in Table B.2.1 that brackets the given pressure.

$$T = 5 + (10 - 5)\frac{550 - 515.9}{615.2 - 515.9} = 5 + 5 \times 0.341 = \mathbf{6.7\ °C}$$

$$v_f = 0.001583 + (0.0016 - 0.001583)\ 0.341 = 0.001589\ m^3/kg$$

$$v_g = 0.24299 + (0.20541 - 0.24299)\ 0.341 = 0.230175\ m^3/kg$$

$$v = v_f + xv_{fg} = 0.001589 + 0.75(0.230175 - 0.001589)$$

$$= \mathbf{0.1729\ m^3/kg}$$

b) Interpolate between 50 and 100 kPa to get properties at 80 kPa

$$v = 2.8466 + (1.4153 - 2.8466)\frac{80 - 50}{100 - 50}$$

$$= 2.8466 + (-1.4313) \times 0.6 = \mathbf{1.9878\ m^3/kg}$$

x: Undefined

c) Table B.2.1: $v > v_g$ so the state is superheated vapor.

Table B.2.2 locate state between 300 and 400 kPa.

$$P = 300 + (400 - 300)\frac{0.4 - 0.44251}{0.32701 - 0.44251}$$

$$= 300 + 100 \times 0.368 = \mathbf{336.8\ kPa}$$

x: Undefined

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.128

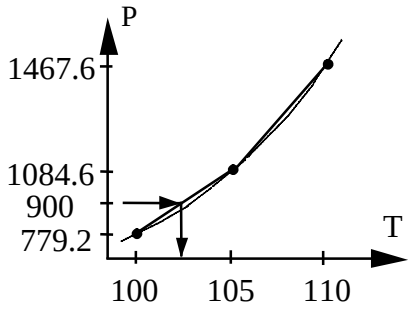
Use a linear interpolation to estimate Tsat at 900 kPa for nitrogen. Sketch by hand the curve Psat(T) by using a few table entries around 900 kPa from table B.6.1. Is your linear interpolation over or below the actual curve?

Solution:

The 900 kPa in Table B.6.1 is located between 100 and 105 K.

$$T = 100 + (105 - 100)\frac{900 - 779.2}{1084.6 - 779.2}$$
$$= 100 + 5 \times 0.3955 = \mathbf{102\ K}$$

The actual curve has a positive second derivative (it curves up) so T is slightly underestimated by use of the chord between the 100 K and the 105 K points, as the chord is above the curve.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.129

Use a double linear interpolation to find the pressure for superheated R-134a at 13°C with v = 0.3 m^3/kg.

Solution:

Table B.5.2: Superheated vapor

At 10°C, 0.3 m^3/kg

$$P = 50 + (100 - 50) \times \frac{0.3 - 0.45608}{0.22527 - 0.45608} = 83.8 \text{ kPa}$$

At 20°C, 0.3 m^3/kg

$$P = 50 + (100 - 50) \times \frac{0.3 - 0.47287}{0.23392 - 0.47287} = 86.2 \text{ kPa}$$

Interpolating to get 13°C between the 10°C and 20°C P's above,

$$P = 83.8 + (3/10) \times (86.2 - 83.8) = \mathbf{84.5\ kPa}$$

This could also be interpolated as following:

At 13°C, 50 kPa, $v = 0.45608 + (3/10) \times 0.0168 = 0.4611$ m^3/kg

At 13°C, 100 kPa, $v = 0.22527 + (3/10) \times 0.0087 = 0.2279$ m^3/kg

Interpolating at 0.3 m^3/kg.

$$P = 50 + (100 - 50) \times \frac{0.3 - 0.4611}{0.2279 - 0.4611} = \mathbf{84.5\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.130

Find the specific volume for CO_2 at 0^oC and 625 kPa.

Solution:

The state is superheated vapor in Table B.3.2 between 400 and 800 kPa.

$$v = 0.12552 + (0.06094 - 0.12552)\frac{625 - 400}{800 - 400}$$

$$= 0.12552 + (-0.06458) \times 0.5625 = \mathbf{0.0892\ m^3/kg}$$

b)	1 (T, P)	Sup. vapor, x = undefined, v = 1.773 m^3/kg
c)	2 (T, v)	Sup. vapor, x = undefined, P = 330.4 kPa

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.134

Find the value of the saturated temperature for nitrogen by linear interpolation in table B.6.1 for a pressure of 900 kPa. Compare this to the value given by the computer software.

The 900 kPa in Table B.6.1 is located between 100 and 105 K.

$$T = 100 + (105 - 100)\frac{900 - 779.2}{1084.6 - 779.2}$$

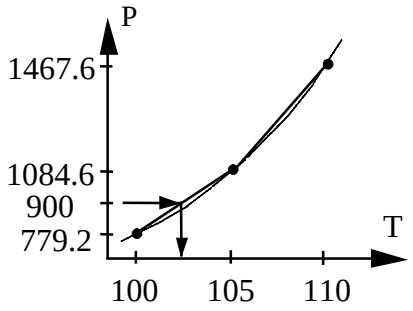
$$= 100 + 5 \times 0.3955 = 101.98 \text{ K}$$

The actual curve has a positive second derivative (it curves up) so T is slightly underestimated by use of the chord between the 100 K and the 105 K points, as the chord is above the curve.

From the computer software:

CASE: 8 (P,x) $T = -171^{\circ}C = 102.15$ K

So we notice that the curvature has only a minor effect.

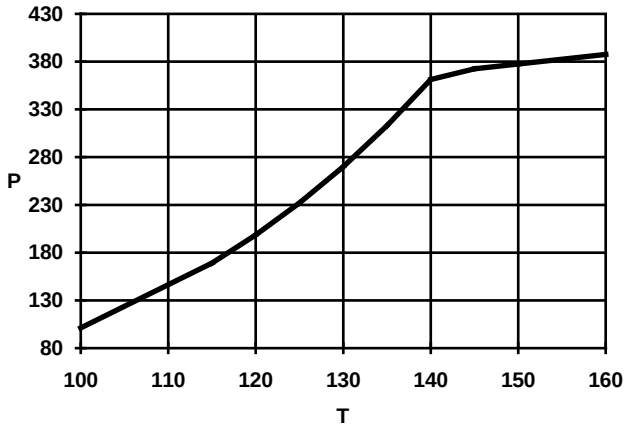


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.135

Use the computer software to sketch the variation of pressure with temperature in Problem 2.44. Extend the curve a little into the single-phase region.

P was found for a number of temperatures. A small table of (P, T) values were entered into a spreadsheet and a graph made as shown below. The superheated vapor region is reached at about 140°C and the graph shows a small kink at that point.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.136E

Cabbage needs to be cooked (boiled) at 250 F. What pressure should the pressure cooker be set for?

Solution:

If I need liquid water at 250 F, I must have a pressure that is at least the saturation pressure for this temperature.

Table F.7.1: 250 F P_{sat} = **29.823 psia.**

The pot must have a lid that can be fastened to hold the higher pressure, which is a pressure cooker.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.137E

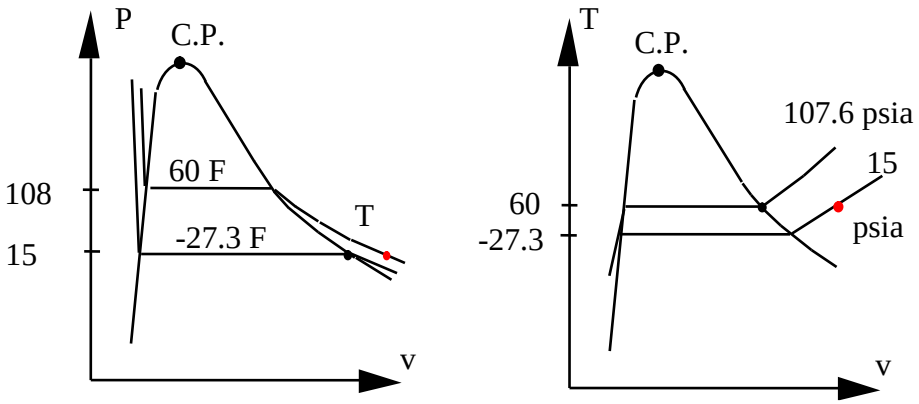
If I have 1 ft^3 of ammonia at 15 psia, 60 F how much mass is that?

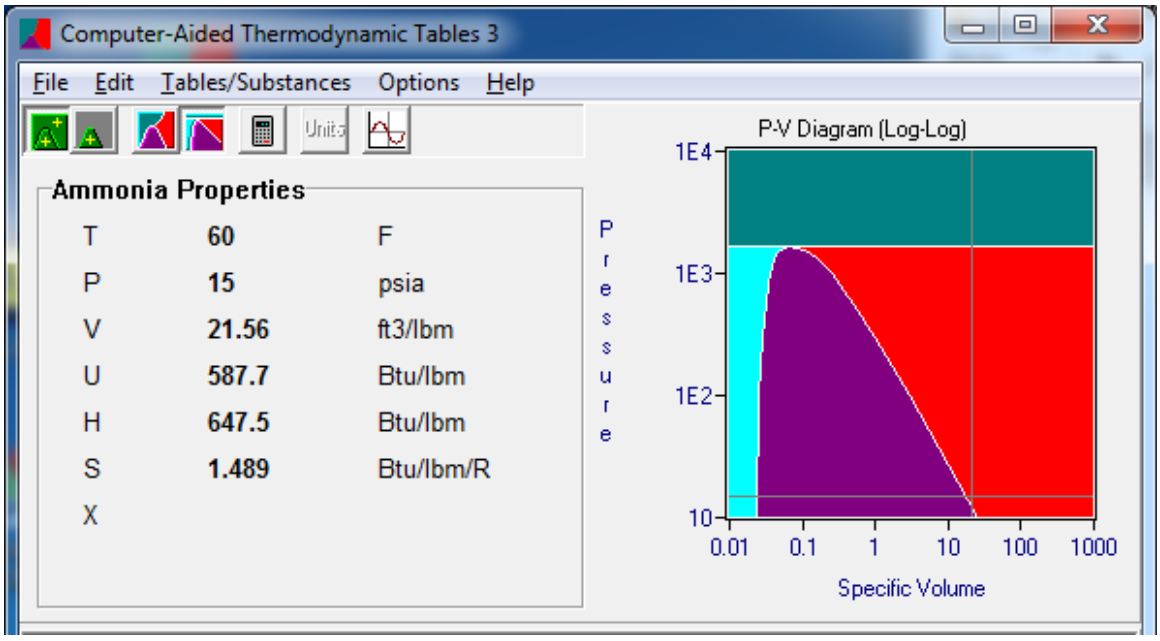
Ammonia Tables F.8:

F.8.1 P_{sat} = 107.64 psia at 60 F so superheated vapor.

F.8.2 v = 21.5641 ft^3/lbm under subheading 15 psia

$$m = \frac{V}{v} = \frac{1 \text{ ft}^3}{21.5641 \text{ ft}^3/\text{lbm}} = \mathbf{0.0464 \text{ lbm}}$$





The P-v (log-log) diagram from CATT3, P in psi and v in ft^3/lbm. Cross-hair indicates the state.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.138E

For water at 1 atm with a quality of 10% find the volume fraction of vapor.

This is a two-phase state at a given pressure:

Table F.7.2: $v_f = 0.01\ 672\ ft^3/lbm$, $v_g = 26.8032\ ft^3/lbm$

From the definition of quality we get the masses from total mass, m, as

$$m_f = (1 - x)\ m, \qquad m_g = x\ m$$

The volumes are

$$V_f = m_f\ v_f = (1 - x)\ m\ v_f, \qquad V_g = m_g\ v_g = x\ m\ v_g$$

So the volume fraction of vapor is

$$\text{Fraction} = \frac{V_g}{V} = \frac{V_g}{V_g + V_f} = \frac{x\ m\ v_g}{x\ m\ v_g + (1 - x) m\ v_f}$$

$$= \frac{0.1 \times 26.8032}{0.1 \times 26.8032 + 0.9 \times 0.016\ 72} = \frac{2.68032}{2.69537} = \mathbf{0.9944}$$

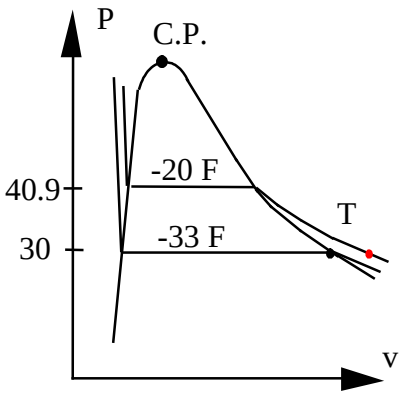
Notice that the liquid volume is only about 0.5% of the total. We could also have found the overall $v = v_f + x v_{fg}$ and then $V = m\ v$.

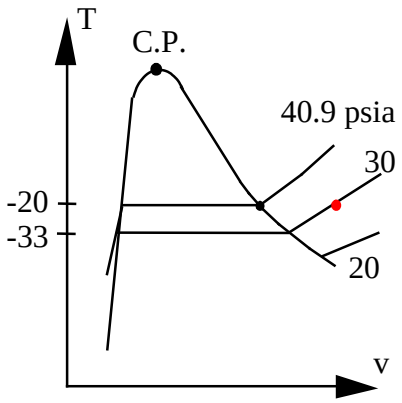
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

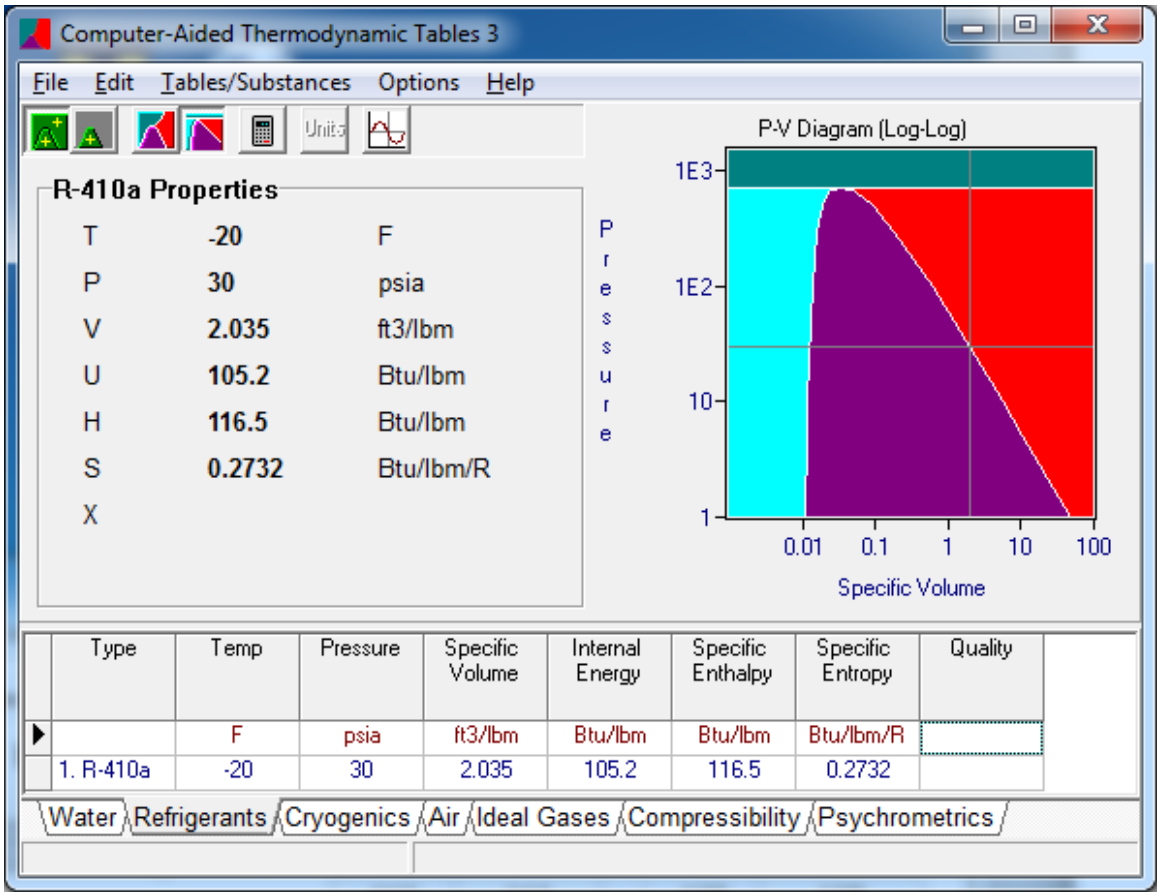
2.139E

Locate the state of R-410A at 30 psia, -20 F. Indicate in both the P-v and the T-v diagrams the location of the nearest states listed in the printed table F.9

From F.9: F.9.1 at -20 F, P_{sat} = 40.923 psi so we have superheated vapor.
F.9.2 at 30 psi we find the state for -20 F.







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.140E

Calculate the ideal gas constant for argon and hydrogen based on Table F.1 and verify the value with Table F.4

The gas constant for a substance can be found from the universal gas constant from table A.1 and the molecular weight from Table F.1

Argon: $$R = \frac{\bar{R}}{M} = \frac{1.98589}{39.948} = \mathbf{0.04971}\ \frac{\mathbf{Btu}}{\mathbf{lbm\ R}} = \mathbf{38.683}\ \frac{\mathbf{lbf\text{-}ft}}{\mathbf{lbm\ R}}$$

Hydrogen: $$R = \frac{\bar{R}}{M} = \frac{1.98589}{2.016} = \mathbf{0.98506}\ \frac{\mathbf{Btu}}{\mathbf{lbm\ R}} = \mathbf{766.5}\ \frac{\mathbf{lbf\text{-}ft}}{\mathbf{lbm\ R}}$$

Recall from Table A.1: 1 Btu = 778.1693 lbf-ft

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Phase Diagrams

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.141E

Water at 80 F can exist in different phases dependent on the pressure. Give the approximate pressure range in lbf/in^2 for water being in each one of the three phases, vapor, liquid or solid.

Solution:

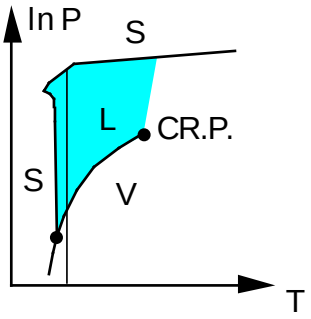
The phases can be seen in Fig. 2.4, a sketch of which is shown to the right.

T = 80 F = 540 R = 300 K

From Fig. 2.4:

$P_{VL} \approx 4 \times 10^{-3}$ MPa = 4 kPa = 0.58 psia,

$P_{LS} = 10^3$ MPa = 145 038 psia



0 < P < 0.58 psia VAPOR

0.58 psia < P < 145 038 psia LIQUID

P > 145 038 psia SOLID(ICE)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.142E

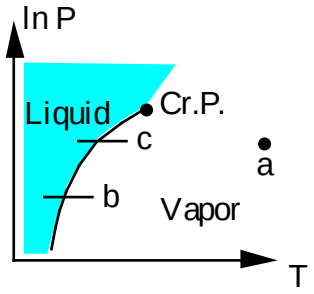
A substance is at 300 lbf/in.^{2}, 65 F in a rigid tank. Using only the critical properties can the phase of the mass be determined if the substance is oxygen, water or propane?

Solution: Find state relative to the critical point properties, Table F.1

a)	Oxygen	731 lbf/in.^{2}	278.3 R
b)	Water	3208 lbf/in.^{2}	1165.1 R
c)	Propane	616 lbf/in.^{2}	665.6 R

$P < P_c$ for all and $T = 65\ F = 65 + 459.67 = 525\ R$

a)	O_2	$T >> T_c$	Yes gas and $P < P_c$
b)	H_2O	$T << T_c$	$P << P_c$ so you cannot say
c)	C_3H_8	$T < T_c$	$P < P_c$ you cannot say



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

General Tables

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.143E

Determine the missing property (of P, T, v, and x if apllicable) for water at

a. 680 lbf/in.^{2}, 0.03 ft^3/lbm
b. 150 lbf/in.^{2}, 320 F
c. 400 F, 3 ft^3/lbm

Solution: All cases can be seen from Table F.7.1

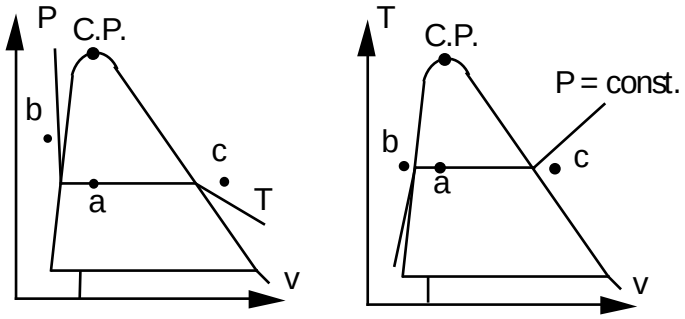
a. 680 lbf/in.^{2}, 0.03 ft^3/lbm

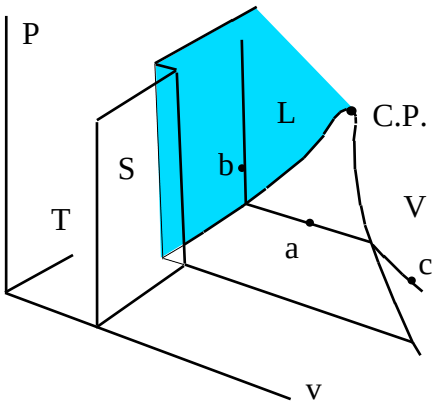
v_g = **0.2183,** v_f = **0.02472** ft^3/lbm, so **liquid + vapor mixture**

b. 150 lbf/in.^{2}, 320 F: **compressed liquid** $P > P_{sat}(T)$ = **89.6 lbf/in^2**

c. 400 F, 3 ft^3/lbm: **sup. vapor** $v > v_g(T)$ = **2.339** ft^3/lbm

States shown are placed relative to the two-phase region, not to each other.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.144E

Determine the phase of the substance at the given state using Appendix F Tables.

Solution:

a. water 200 F, 70 psia:

F.7.1 at 200 F $P > P_{sat}(T) =$ **11.53 psia** => **compressed liquid**

b. Ammonia 10 F, 20 lbf/in.^{2}:

F.8.1 at 10 F $P < P_{sat}(T) =$ **38.508 lbf/in^2** => **sup. vapor**

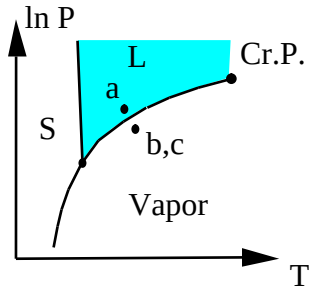
F.8.2: Superheated by (20 – (-16.63)) F = 36.6 F, v = 14.7635 ft^3/lbm

c. R-410A 30 F, 50 ft^3/lbm

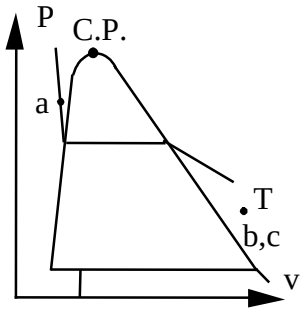
F.9.1 at 30 F: $P < P_{sat}(T) =$ **111.8 lbf/in^2** => **sup. vapor**,

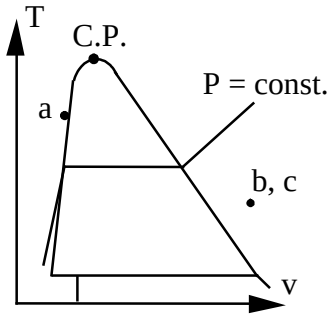
F.9.2: Interpolate to find v

The S-L fusion line goes slightly to the left for water. It tilts slightly to the right for most other substances.



States shown are placed relative to the two-phase region, not to each other.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.145E

Give the phase and the missing property of P, T, v and x for R-134a at

a. T = -10 F, P = 18 psia

b. P = 40 psia, v = 1.3 ft^3/lbm

Solution:

a. Look in Table F.10.1 at –10 F: P > P_{sat} = 16.76 psia

This state is **compressed liquid** so x is undefined and v = v_f = 0.01173 ft^3/lbm

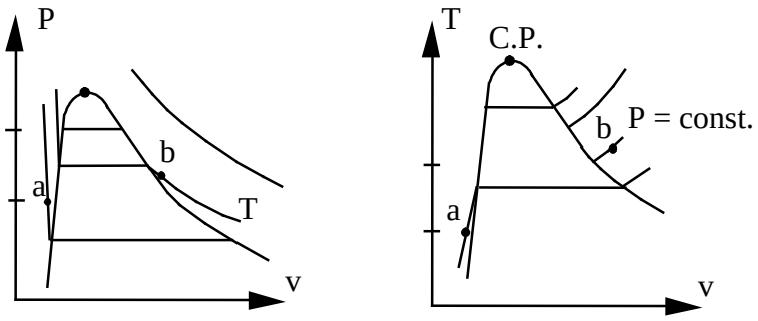
b. Look in Table F.10.1 close to 50 psia there we see

v > v_g = 0.95 ft^3/lbm so **superheated vapor**

Look then in Table F.10.2 under 40 psia and interpolate between the 60 F and 80 F.

(40 psia, 1.3 ft^3/lbm) : T = 66.6 F

For a better accuracy use the computer software CATT3 which gives T = 67.4 F.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.146E

Give the phase and the missing property of P, T, v and x for ammonia at

a. T = 120 F, v = 1.876 ft^3/lbm
b. T = 120 F, x = 0.5

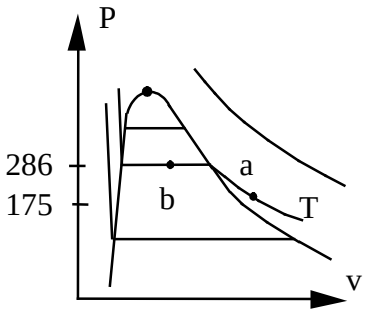
Solution:

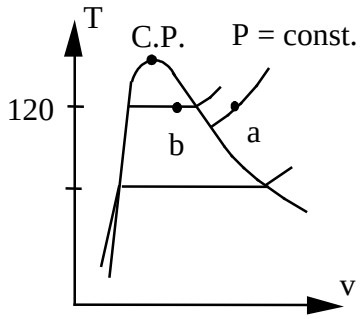
a. Look in Table F.8.1 at 120 F: $v > v_g = 1.0456$ ft^3/lbm so sup vap

x = undefined, F.8.2 P = 175 psia

b. Look in Table F.8.1 at 120 F:

$v = v_f + x\, v_{fg} = 0.02836 + 0.5 \times 1.0172 = 0.53696$ ft^3/lbm





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.147E

Give the phase and the specific volume.

Solution:

a. R-410A $T = -25$ F, $P = 30$ lbf/in.^{2} Table F.9.2 $T > T_{sat} = -33.24$ F

$\Rightarrow$ **sup.vap.** $v \cong 1.9534 + \frac{-25+33.24}{-20+33.24}(2.0347 - 1.9534) =$ **2.004 ft^3/lbm**

b. R-410A $T = -25$ F, $P = 40$ lbf/in.^{2} Table F.9.2 $T < T_{sat} = -21.0$ F

$P > P_{sat} \Rightarrow$ **compresssed Liquid** F.9.1: $v \cong v_f =$ **0.01246 ft^3/lbm**

c. H_2O $T = 280$ F, $P = 35$ lbf/in.^{2} Table F.7.1 $P < P_{sat} = 49.2$ psia

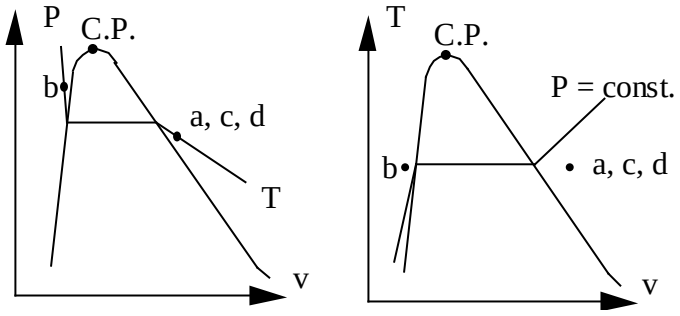
$\Rightarrow$ **superheated vapor**

$v \cong 21.734 + (10.711 - 21.734) \times (15/20) =$ **1.0669 ft^3/lbm**

d. NH_3 $T = 60$ F, $P = 15$ lbf/in.^{2} Table F.8.1 $P_{sat} = 107.6$ psia

$P < P_{sat} \Rightarrow$ **superheated vapor** $v \cong$ **21.564 ft^3/lbm**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.148E

Determine the specific volume for R-410A at these states:

a. 20 F, 70 psia
b. 70 F, 150 psia
c. 70 F, quality 25%

a. F.9.2 $P < P_{sat} = 93.13$ psia so sup vapor.

$$v = 1.0783 + \frac{70 - 60}{75 - 60}(0.8393 - 1.0783) = \mathbf{0.9190\ ft^3/lbm}$$

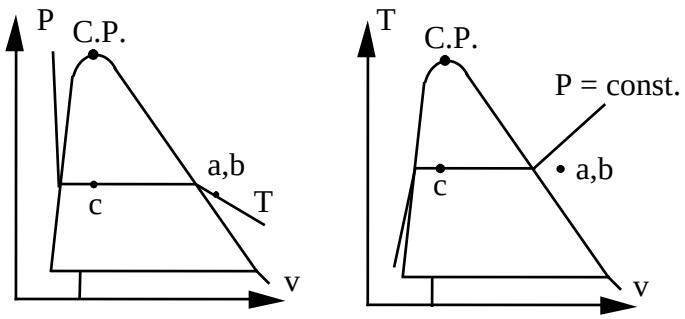
b. F.9.1 $P < P_{sat} = 215.95$ psia so superheated vapor

F.9.2: $$v = 0.4236 + \frac{70 - 60}{80 - 60}(0.4545 - 0.4236) = \mathbf{0.43905\ ft^3/lbm}$$

c. F.9.1 $v_f = 0.01486\ ft^3/lbm$, $v_{fg} = 0.2576\ ft^3/lbm$

$$v = v_f + x\, v_{fg} = 0.01486 + 0.25 \times 0.2576 = \mathbf{0.07926\ ft^3/lbm}$$

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.149E

Give the missing property of P, T, v and x for

a. R-410A at 80 F, v = 0.2 ft^3/lbm
b. R-410A at 60 psia, v = 1.1 ft^3/lbm
c. Ammonia at 60 F, v = 3.2 ft^3/lbm

a) Table F.9.1 at 80 F: $v < v_g = 0.2308$ ft^3/lbm so we have 2 phase L+V

$$x = \frac{v - v_f}{v_{fg}} = \frac{0.2 - 0.01525}{0.2156} = \mathbf{0.8569};\ P = P_{sat} = \mathbf{250.665\ psia}$$

b) Table F.9.2 at 60 psia: $v > v_g = 1.0038$ ft^3/lbm so we have superheated vapor so x is undefined.

F.9.2 between 20 and 40 F:

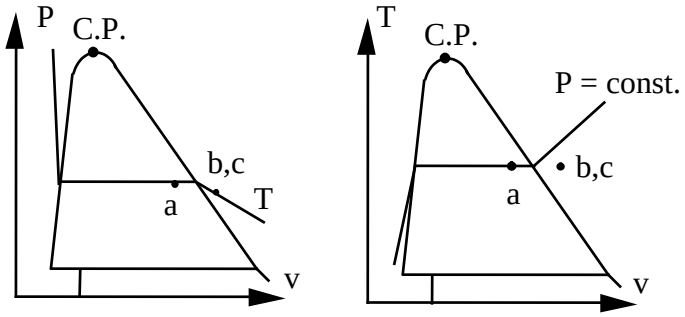
$$T = 20 + 20 \times \frac{1.1 - 1.0783}{1.1405 - 1.0783} = \mathbf{26.98\ F}$$

c) Table F.8.1 at 60 F: $v > v_g = 2.7481$ ft^3/lbm so we have superheated vapor.

F.8.2 between 90 and 100 psia:

$$P = 90 + 10 \times \frac{3.2 - 3.3503}{2.9831 - 3.3503} = \mathbf{94.09\ psia}$$

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.150E

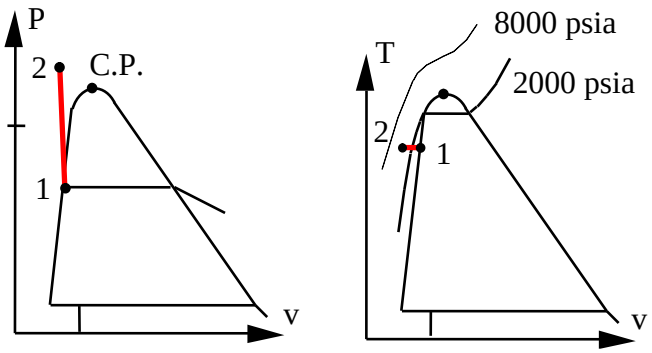
Saturated liquid water at 150 F is put under pressure to decrease the volume by 1% while keeping the temperature constant. To what pressure should it be compressed?

F.7.1: $v = v_f = 0.01634$ ft^3/lbm

New v: $v = 0.99\ v_f = 0.0161766$ ft^3/lbm

look in F.7.3: close to 2000 psia

interpolate between 2000 and 8000 psia P = **2610 psia**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.151E

A sealed rigid vessel has volume of 35 ft^3 and contains 2 lbm of water at 200 F. The vessel is now heated. If a safety pressure valve is installed, at what pressure should the valve be set to have a maximum temperature of 400 F?

Solution:

Process: v = V/m = constant

State 1: v_1 = 35/2 = 17.5 ft^3/lbm

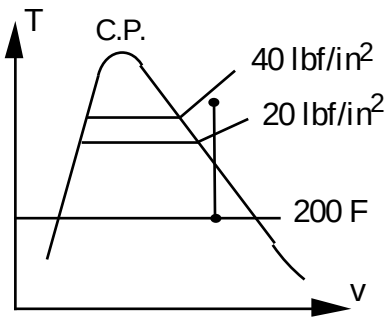
from Table F.7.1

it is 2-phase

State 2: 400°F, 17.5 ft^3/lbm

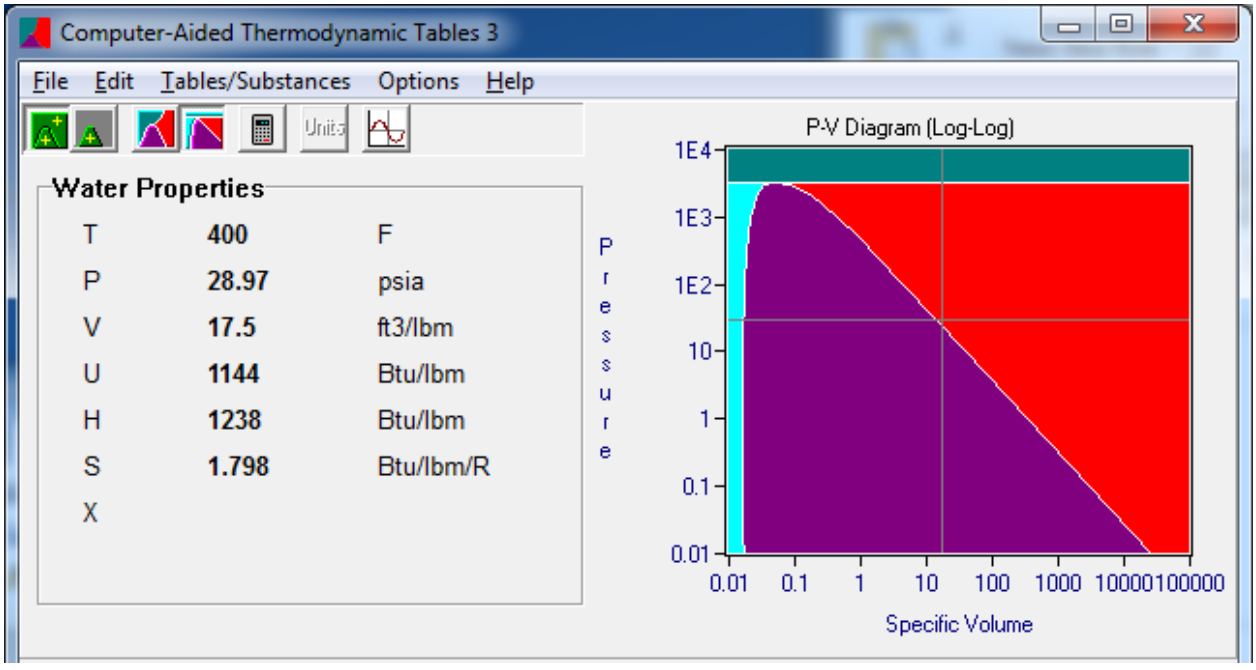
Table F.7.2 between 20

and 40 lbf/in^2 so interpolate



$$P \cong 20 + (40 - 20)\frac{17.5 - 25.427}{12.623 - 25.427} = \mathbf{32.4\ lbf/in^2}$$

(The result is 28.97 psia if found by the software, i.e. linear interpolation is not so accurate)



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.152E

You want a pot of water to boil at 220 F. How heavy a lid should you put on the 6 inch diameter pot when P_{atm} = 14.7 psia?

Solution:

Table F.7.1 at 220 F : P_{sat} = 17.189 psia

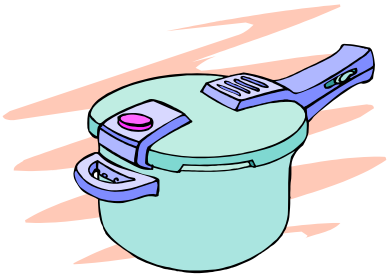
$$A = \frac{\pi}{4} D^2 = \frac{\pi}{4}\ 6^2 = 28.274 \text{ in}^2$$

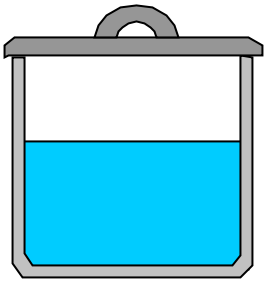
$$F_{net} = (P_{sat} - P_{atm})\ A = (17.189 - 14.7)\ (\text{lbf/ in}^2) \times 28.274 \text{ in}^2$$
$$= 70.374 \text{ lbf}$$

$$F_{net} = m_{lid}\ g$$

$$m_{lid} = F_{net}/g = \frac{70.374 \text{ lbf}}{32.174 \text{ ft/s}^2} = \frac{70.374 \times 32.174 \text{ lbm ft/s}^2}{32.174 \text{ ft/s}^2} = \mathbf{70.374 \text{ lbm}}$$

Some lids are clamped on, the problem deals with one that stays on due to its weight.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.153E

Saturated water vapor at 240 F has its pressure decreased to increase the volume by 10%, keeping the temperature constant. To what pressure should it be expanded?

Solution:

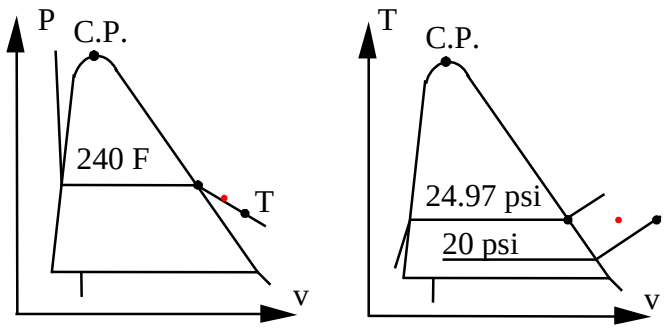
Initial state: $v = 16.3257$ ft^3/lbm from table F.7.1

Final state: $v = 1.1 \times v_g = 1.1 \times 16.3257 = 17.9583$ ft^3/lbm

Interpolate between sat. at 240 F, P = 24.968 lbf/in^2 and sup. vapor in Table F.7.2 at 240 F, 20 lbf/in^2

$$P = 24.968 + (20 - 24.968)\frac{17.9583 - 16.3257}{20.475 - 16.3257}$$

$$\cong \mathbf{23.0\ lbf/in^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.154E

A glass jar is filled with saturated water at 300 F and quality 25%, and a tight lid is put on. Now it is cooled to 10 F. What is the mass fraction of solid at this temperature?

Solution:

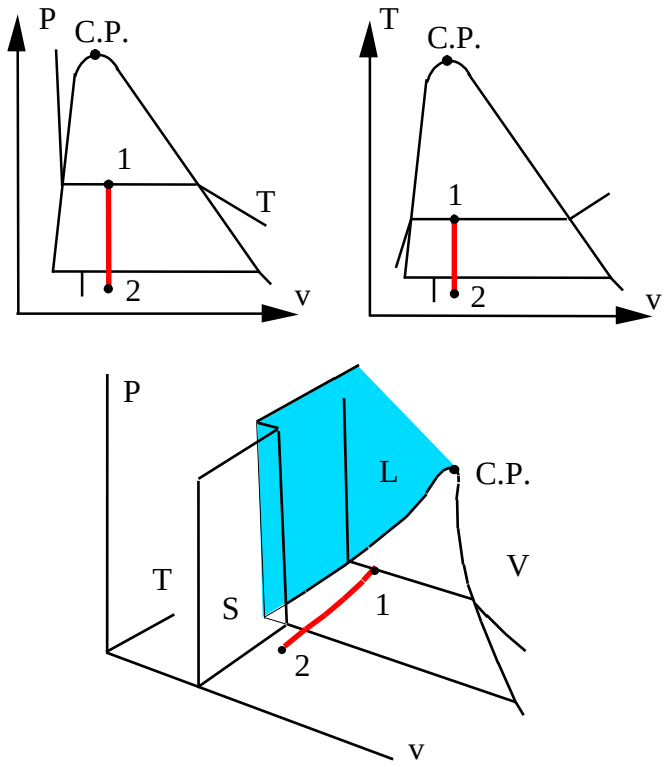
Constant volume and mass $\Rightarrow$ $v_1 = v_2 = V/m$

From Table F.7.1: $v_1 = 0.01745 + 0.25 \times 6.4537 = 1.630875$ ft^3/lbm

From Table F.7.4: $v_2 = 0.01744 + x_2 \times 9043 = v_1 = 1.630875$ ft^3/lbm

$\Rightarrow$ $x_2 = 0.000178$ mass fraction vapor

$x_{solid} = 1 - x_2 = 0.9998$ or **99.98 %**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.155E

A boiler feed pump delivers 100 ft^3/min of water at 400 F, 3000 lbf/in.^{2}. What is the mass flowrate (lbm/s)? What would be the percent error if the properties of saturated liquid at 400 F were used in the calculation? What if the properties of saturated liquid at 3000 lbf/in.^{2} were used?

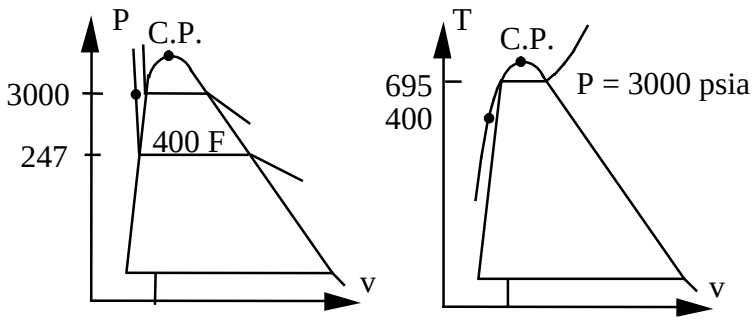
Solution:

Table F.7.3: $v = 0.0183$ ft^3/lbm (interpolate 2000-8000 psia)

$$\dot{m} = \frac{\dot{V}}{v} = \frac{100}{60 \times 0.018334} = 91.07 \text{ lbm/s}$$

$v_{f\ (400\ F)} = 0.01864$ ft^3/lbm $\Rightarrow$ $\dot{m} = 89.41$ lbm/s **error 1.8%**

$v_{f\ (3000\ \text{lbf/in}^2)} = 0.03475$ ft^3/lbm $\Rightarrow$ $\dot{m} = 47.96$ lbm/s **error 47%**



The constant T line is nearly vertical for the liquid phase in the P-v diagram. The state is at so high P, T that the saturated liquid line is not extremely steep.

2.156E

A pressure cooker has the lid screwed on tight. A small opening with A = 0.0075 in^2 is covered with a petcock that can be lifted to let steam escape. How much mass should the petcock have to allow boiling at 250 F with an outside atmosphere at 15 psia?

Solution:

Table F.7.1 at 250 F: $P_{sat} = 29.823$ psia

$$F_{net} = (P_{sat} - P_{atm})\, A = (29.823 - 15)\ \text{psia} \times 0.0075\ \text{in}^2$$
$$= 0.111\ \text{lbf}$$

$$F_{net} = m_{petcock}\, g$$

$$m_{petcock} = F_{net}/g = \frac{0.111\ \text{lbf}}{32.174\ \text{ft/s}^2} = \frac{0.111 \times 32.174\ \text{lbm ft/s}^2}{32.174\ \text{ft/s}^2} = \mathbf{0.111\ lbm}$$

Some petcocks are held down by a spring, the problem deals with one that stays on due to its weight.

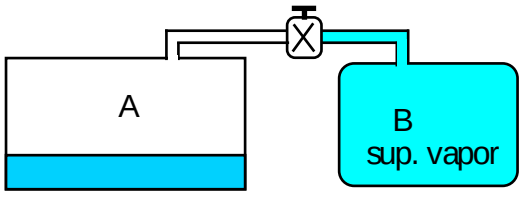
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.157E

Two tanks are connected together as shown in Fig. P2.52, both containing water. Tank A is at 30 lbf/in.^{2}, v = 8 ft^3/lbm, V = 40 ft^3 and tank B contains 8 lbm at 80 lbf/in. ^{2}, 750 F. The valve is now opened and the two come to a uniform state. Find the final specific volume.

Solution:

Control volume both tanks. Constant total volume and mass process.



State A1: (P, v) two-phase, $m_A = V_A/v_A$ = 40 ft^3 /8 ft^3/lbm = 5 lbm

State B1: (P, T) Table F.7.2: $v_B = (8.561 + 9.322)/2 = 8.9415$ ft^3/lbm

$\Rightarrow V_B = m_B v_B$ = 8 lbm × 8.9415 ft^3/lbm = 71.532 ft^3

Final state: $m_{tot} = m_A + m_B = 5 + 8 = 13$ lbm

$V_{tot} = V_A + V_B = 111.532$ ft^3

$v_2 = V_{tot}/m_{tot}$ = 111.532 ft^3/13 lbm = **8.579 ft^3/lbm**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.158E

Ammonia at 70 F with a quality of 50% and total mass 4.5 lbm is in a rigid tank with an outlet valve at the bottom. How much liquid (mass) can you take out through the valve assuming the temperature stays constant?

Solution:

The bottom has liquid until the state inside becomes saturated vapor.

$$V = m_1 v_1 = 4.5 \times 0.5\ (0.02631 + 2.3098) = 5.25625\ \text{ft}^3$$

$$m_2 = V/v_2 = 5.25625\ \text{ft}^3 / 2.3098\ \text{ft}^3/\text{lbm} = 2.2756\ \text{lbm}$$

$$m = m_1 - m_2 = 4.5 - 2.2756 = \mathbf{2.224\ lbm}$$

Ideal Gas

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.159E

Give the phase and the specific volume for each of the following.

Solution:

a. CO_2 $T = 510$ F $P = 75$ lbf/in.^{2} Table F.4

superheated vapor ideal gas

$$v = RT/P = \frac{35.1 \text{ ft-lbf/lbm-R} \times (510 + 459.7) \text{ R}}{75 \text{ lbf/in.}^2 \times 144 \text{ (ft/ in.)}^2}$$

$$= \mathbf{3.152\ ft^3/lbm}$$

b. Air $T = 68$ F $P = 2$ atm Table F.4

superheated vapor ideal gas

$$v = RT/P = \frac{53.34 \text{ ft-lbf/lbm-R} \times (68 + 459.7) \text{ R}}{2 \times 14.6 \text{ lbf/in.}^2 \times 144 \text{ (ft/ in.)}^2}$$

$$= \mathbf{6.6504\ ft^3/lbm}$$

c. Ar $T = 300$ F, $P = 30$ lbf/in.^{2} Table F.4

Ideal gas: $$v = RT/P = \frac{38.68 \text{ ft-lbf/lbm-R} \times (300 + 459.7) \text{ R}}{30 \text{ lbf/in.}^2 \times 144 \text{ (ft/ in.)}^2}$$

$$= \mathbf{6.802\ ft^3/lbm}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.160E

A cylindrical gas tank 3 ft long, inside diameter of 8 in., is evacuated and then filled with carbon dioxide gas at 77 F. To what pressure should it be charged if there should be 2.6 lbm of carbon dioxide?

Solution:

Assume CO_2 is an ideal gas table F.4: $P = mRT/V$

$$V_{cyl} = A \times L = \frac{\pi}{4}(8\text{ in})^2 \times 3 \times 12\text{ in} = 1809.6\text{ in}^3$$

$$P = \frac{2.6\text{ lbm} \times 35.1\text{ ft-lbm/lbm-R} \times (77 + 459.67)\text{ R} \times 12\text{ in/ft}}{1809.6\text{ in}^3}$$

$$= \mathbf{324.8\ lbf/in^2}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.161E

A spherical helium balloon of 30 ft in diameter is at ambient T and P, 60 F and 14.69 psia. How much helium does it contain? It can lift a total mass that equals the mass of displaced atmospheric air. How much mass of the balloon fabric and cage can then be lifted?

We need to find the masses and the balloon volume

$$V = \frac{\pi}{6} D^3 = \frac{\pi}{6} 30^3 = 14\ 137\ \text{ft}^3$$

$$m_{He} = \rho V = \frac{V}{v} = \frac{PV}{RT}$$

$$= \frac{14.69\ \text{psi} \times 14\ 137\ \text{ft}^3 \times 144\ (\text{in/ft})^2}{386.0\ \text{ft-lbf/lbmR} \times 520\ \text{R}}$$

$$= 148.99\ \text{lbm}$$

$$m_{air} = \frac{PV}{RT} = \frac{14.69\ \text{psi} \times 14\ 137\ \text{ft}^3 \times 144\ (\text{in/ft})^2}{53.34\ \text{ft-lbf/lbmR} \times 520\ \text{R}}$$

$$= 1078\ \text{lbm}$$

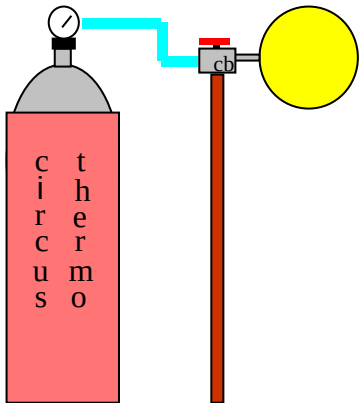
$$m_{lift} = m_{air} - m_{He} = 1078 - 149 = \mathbf{929\ lbm}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.162E

Helium in a steel tank is at 36 psia, 540 R with a volume of 4 ft^3. It is used to fill a balloon. When the pressure drops to 18 psia, the flow of helium stops by itself. If all the helium still is at 540 R, how big a balloon is produced?

Solution:



State 1: m = V/v assume ideal gas so

$$m = \frac{P_1 V_1}{RT_1} = \frac{36 \text{ psi} \times 4 \text{ ft}^3 \times 144 \text{ (in/ft)}^2}{386 \text{ ft-lbf/lbmR} \times 540 \text{ R}}$$

$$= 0.0995 \text{ lbm}$$

State 2: Same mass so then ($T_2 = T_1$)

$$V_2 = \frac{mRT_2}{P_2} = \frac{P_1 V_1 \, RT_2}{RT_1 \, P_2} = V_1 \frac{P_1}{P_2}$$

$$= 4 \frac{36}{18} = 8 \text{ ft}^3$$

The balloon volume is

$$V_{balloon} = V_2 - V_1 = 8 - 4 = \mathbf{4 \text{ ft}^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Review Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.163E

A 35 ft^3 rigid tank has propane at 15 psia, 540 R and connected by a valve to another tank of 20 ft^3 with propane at 40 psia, 720 R. The valve is opened and the two tanks come to a uniform state at 600 R. What is the final pressure?

Solution:
Propane is an ideal gas ($P << P_c$) with R = 35.04 ft-lbf/lbm R from Tbl. F.4

$$m_A = \frac{P_A V_A}{RT_A} = \frac{15 \times 35 \times 144}{35.04 \times 540} = 3.995 \text{ lbm}$$

$$m = \frac{P_B V_B}{RT_B} = \frac{40 \times 20 \times 144}{35.04 \times 720} = 4.566 \text{ lbm}$$

$$V_2 = V_A + V_B = 55 \text{ ft}^3$$

$$m_2 = m_A + m_B = 8.561 \text{ lbm}$$

$$P_2 = \frac{m_2 RT_2}{V_2} = \frac{8.561 \times 35.04 \times 600}{55 \times 144} = \mathbf{22.726 \text{ psia}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.164E

What is the percent error in specific volume if the ideal gas model is used to represent the behavior of superheated ammonia at 100 F, 80 lbf/in.^{2}? What if the generalized compressibility chart, Fig. D.1, is used instead?

Solution:

Ammonia Table F.8.2: $v = 4.186$ ft^3/lbm

Ideal gas $v = \dfrac{RT}{P} = \dfrac{90.72 \times 559.7}{80 \times 144} = 4.4076$ ft^3/lbm **5.3% error**

Generalized compressibility chart and Table D.4

$$T_r = 559.7/729.9 = 0.767, \quad P_r = 80/1646 = 0.0486$$

$$\Rightarrow \quad Z \cong 0.96$$

$$v = \frac{ZRT}{P} = 0.96 \times 4.4076 \text{ ft}^3/\text{lbm} = 4.231 \text{ ft}^3/\text{lbm}$$ **1.0% error**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.165E

Air in an internal combustion engine has 440 F, 150 psia with a volume of 2 ft^3. Now combustion heats it to 3000 R in a constant volume process. What is the mass of air and how high does the pressure become?

The mass comes from knowledge of state 1 and ideal gas law

$$m = \frac{P_1 V_1}{RT_1} = \frac{150 \text{ psia} \times 2 \text{ ft}^3 \times 144 \text{ (in/ft)}^2}{53.34 \text{ ft-lbf/lbm-R} \times (440 + 459.67) \text{ R}} = \mathbf{0.90 \text{ lbm}}$$

The final pressure is found from the ideal gas law written for state 1 and state 2 and then eliminate the mass, gas constant and volume ($V_2 = V_1$) between the equations

$$P_1 V_1 = m RT_1 \qquad \text{and} \qquad P_2 V_2 = m RT_2$$

$$P_2 = P_1 \times T_2/T_1 = 150 \text{ psia} \times \frac{3000}{440 + 459.67} = \mathbf{500.2 \text{ psia}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.166E

A 35 ft^3 rigid tank has air at 225 psia and ambient 600 R connected by a valve to a piston cylinder. The piston of area 1 ft^2 requires 40 psia below it to float, Fig. P2.166. The valve is opened and the piston moves slowly 7 ft up and the valve is closed. During the process air temperature remains at 600 R. What is the final pressure in the tank?

$$m_A = \frac{P_A V_A}{RT_A} = \frac{225 \text{ psia} \times 35 \text{ ft}^3 \times 144 \text{ (in/ft)}^2}{53.34 \text{ ft-lbf/lbm-R} \times 600 \text{ R}} = 35.433 \text{ lbm}$$

$$m_{B2} - m_{B1} = \frac{\Delta V_A}{v_B} = \frac{\Delta V_B P_B}{RT} = \frac{40 \text{ psia} \times (1 \times 7) \text{ ft}^3 \times 144 \text{ (in/ft)}^2}{53.34 \text{ ft-lbf/lbm-R} \times 600 \text{ R}}$$

$$= 1.26 \text{ lbm}$$

$$m_{A2} = m_A - (m_{B2} - m_{B1}) = 35.433 - 1.26 = 34.173 \text{ lbm}$$

$$P_{A2} = \frac{m_{A2} RT}{V_A} = \frac{34.173 \times 53.34 \times 600}{35 \times 144} = \mathbf{217 \text{ psia}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.167E

Give the phase and the missing properties of *P*, *T*, *v* and *x*. These may be a little more difficult if the appendix tables are used instead of the software.

Solution:

a. R-410A at $T = 50$ F, $v = 0.4$ ft^3/lbm: Table F.9.1: $v > v_g = 0.3818$ ft^3/lbm

sup. vap. F.9.2 interpolate between sat. and sup. vap at 50 F.

Find v at 150 psia, 50 F: v = 0.4066

Now interpolate between the sat vap 157.473 psia and the 150 psia.

$P \cong 150 + 7.473\ (0.4 - 0.4066)/(0.3818 - 0.4066) =$ **152 lbf/in^2**

b. H_2O $v = 2$ ft^3/lbm, $x = 0.5$: Table F.7.1

since v_f is so small we find it approximately where $v_g = 4$ ft^3/lbm.

$v_f + v_g = 4.3293$ at 330 F, $v_f + v_g = 3.80997$ at 340 F.

linear interpolation $T \cong$ **336 F,** $P \cong$ **113 lbf/in^2**

c. H_2O $T = 150$ F, $v = 0.01632$ ft^3/lbm: Table F.7.1, $v < v_f$

compr. liquid $P \cong$ **500 lbf/in^2**

d. NH_3 $T = 80$ F, $P = 13$ lbf/in.^{2} Table F.8.1 $P <$ Psat

sup. vap. interpolate between 10 and 15 psia: v = **26.97 ft^3/lbm**

v is not linear in P (more like 1/P) so computer table is more accurate.

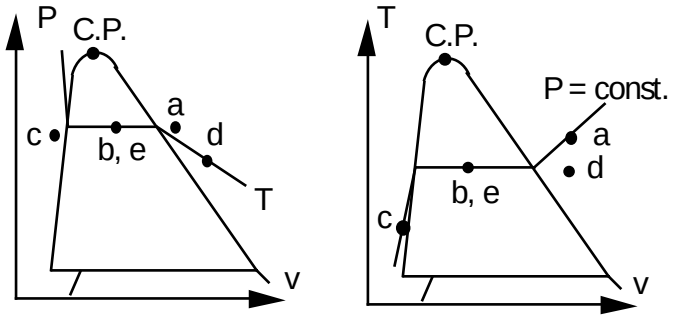
e. R-134a $v = 0.08$ ft^3/lbm, x = 0.5: Table F.10.1

since v_f is so small we find it approximately where $v_g = 0.16$ ft^3/lbm.

$v_f + v_g = 0.1729$ at 150 F, $v_f + v_g = 0.1505$ at 160 F.

linear interpolation $T \cong$ **156 F,** $P \cong$ **300 lbf/in^2**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.168E

A pressure cooker (closed tank) contains water at 200 F with the liquid volume being 1/10 of the vapor volume. It is heated until the pressure reaches 300 lbf/in.^{2}. Find the final temperature. Has the final state more or less vapor than the initial state?

Solution:

Process: Constant volume and mass.

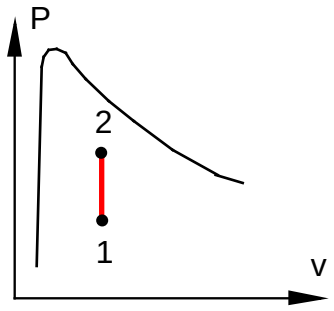
$V_f = m_f v_f = V_g/10 = m_g v_g/10;$

Table F.7.1: $v_f = 0.01663$ ft^3/lbm, $v_g = 33.631$ ft^3/lbm

$$x_1 = \frac{m_g}{m_g + m_f} = \frac{10\, m_f v_f / v_g}{m_f + 10\, m_f v_f / v_g} = \frac{10\, v_f}{10\, v_f + v_g} = \frac{0.1663}{0.1663 + 33.631} = 0.00492$$

$v_2 = v_1 = 0.01663 + x_1 \times 33.615 = 0.1820$ ft^3/lbm

$P_2, v_2 \Rightarrow \quad T_2 = T_{sat}(300 \text{ psia}) =$ **417.43 F**



At state 2: $v_2 = v_f + x_2 v_{fg}$

$0.1820 = 0.01890 + x_2 \times 1.5286$

$\Rightarrow \quad x_2 =$ **0.107**

More vapor at final state

Compressiblity Factor

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.170E

A substance is at 70 F, 300 lbf/in.^{2} in a 10 ft^3 tank. Estimate the mass from the compressibility chart if the substance is a) air, b) butane or c) propane.

Solution:

Use Fig. D.1 for compressibility Z and table F.1 for critical properties

$$m = \frac{PV}{ZRT} = \frac{300 \times 144 \times 10}{530\ ZR} = \frac{815.09}{ZR}$$

Air use nitrogen $P_c = 492$ lbf/in.^{2}; $T_c = 227.2$ R

$P_r = 0.61$; $T_r = 2.33$; $Z = 0.98$

$$m = \frac{PV}{ZRT} = \frac{815.09}{ZR} = \frac{815.09}{0.98 \times 55.15} = \mathbf{15.08\ lbm}$$

Butane $P_c = 551$ lbf/in.^{2}; $T_c = 765.4$ R

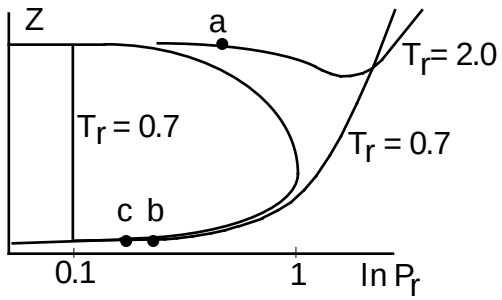
$P_r = 0.544$; $T_r = 0.692$; $Z = 0.09$

$$m = \frac{PV}{ZRT} = \frac{815.09}{ZR} = \frac{815.09}{0.09 \times 26.58} = \mathbf{340.7\ lbm}$$

Propane $P_c = 616$ lbf/in.^{2}; $T_c = 665.6$ R

$P_r = 0.487$; $T_r = 0.796$; $Z = 0.08$

$$m = \frac{PV}{ZRT} = \frac{815.09}{ZR} = \frac{815.09}{0.08 \times 35.04} = \mathbf{290.8\ lbm}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.171E

Determine the mass of an ethane gas stored in a 25 ft^3 tank at 250 F, 440 $lbf/in.^2$ using the compressibility chart. Estimate the error (%) if the ideal gas model is used.

Solution

Table F.1: $T_r = (250 + 460) / 549.7 = 1.29$ and $P_r = 440/708 = 0.621$

Figure D.1 $\Rightarrow$ $Z = 0.9$

$$m = \frac{PV}{ZRT} = \frac{440 \text{ psia} \times 25 \text{ ft}^3 \times 144 \text{ (in/ft)}^2}{0.9 \times 51.38 \text{ ft-lbf/lbm-R} \times 710 \text{ R}} = \mathbf{48.25 \text{ lbm}}$$

Ideal gas $Z = 1$

$\Rightarrow$ $m = PV/RT = 43.21$ lbm **10% error**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Equations of State

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.172E

Determine the pressure of R-410A at 100 F, v = 0.2 ft^3/lbm using ideal gas and the van der Waal Equation of State.

From F.1 for R-410A: M = 72.585, T_c = 620.1 R, P_c = 711 psia

For ideal gas we get:

$$R = \bar{R}/M = 1545.36 / 72.585 = 21.29 \text{ lbf-ft/lbm-R}$$

$$P = RT/v = \frac{21.29 \times (100 + 459.67)}{0.2 \times 144} \frac{\text{lbf-ft}}{\text{lbm-R}} \frac{\text{R}}{\text{ft}^3/\text{lbm} \times (\text{in./ft})^2}$$

$$= \mathbf{413.73 \text{ psi}}$$

For **van der Waal equation of state** from Table D.1 we have

$$b = \frac{1}{8}\frac{RT_c}{P_c} = 0.125 \times \frac{21.29 \times 620.1}{711 \times 144} = 0.016\,118 \text{ ft}^3/\text{lbm},$$

$$a = 27\, b^2 P_c = 27 \times (0.016\,118)^2 \times 711 = 4.987\,283 \text{ psi } (\text{ft}^3/\text{lbm})^2$$

The EOS is: $$P = \frac{RT}{v - b} - \frac{a}{v^2} = \frac{21.29 \times 559.67/144}{0.2 - 0.016\,118} - \frac{4.987\,283}{0.2^2} = \mathbf{325.3 \text{ psi}}$$

From Table F.9.2 we see it is around 300 psia.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

2.173E

Determine the pressure of R-410A at 100 F, v = 0.2 ft^3/lbm using ideal gas and the Redlich-Kwong Equation of State.

From F.1 for R-410A: M = 72.585, T_c = 620.1 R, P_c = 711 psia

For ideal gas we get:

$$R = \bar{R}/M = 1545.36 / 72.585 = 21.29 \text{ lbf-ft/lbm-R}$$

$$P = RT/v = \frac{21.29 \times (100 + 459.67)}{0.2 \times 144} \frac{\text{lbf-ft}}{\text{lbm-R}} \frac{\text{R}}{\text{ft}^3/\text{lbm} \times (\text{in./ft})^2}$$

$$= \mathbf{413.73 \text{ psi}}$$

For **Redlich-Kwong EOS** we have the parameters from Table D.1

$$T_r = T/T_c = (100 + 459.67) / 620.1 = 0.90255$$

$$b = 0.08664 \frac{RT_c}{P_c} = 0.08664 \times \frac{21.29 \times 620.1}{711 \times 144} = 0.011\,172 \text{ ft}^3/\text{lbm},$$

$$a = 0.42748\, T_r^{-1/2} \frac{R^2 T_c^2}{P_c} = 0.42748 \times \frac{21.29^2 \times 620.1^2}{0.90255^{1/2} \times 711 \times 144^2}$$

$$= 5.319\,372 \text{ psi } (\text{ft}^3/\text{lbm})^2$$

The equation is:

$$P = \frac{RT}{v - b} - \frac{a}{v^2 + bv}$$

$$= \frac{21.29 \times 559.67 / 144}{0.2 - 0.011\,172} - \frac{5.319\,372}{0.2^2 + 0.011\,172 \times 0.2}$$

$$= \mathbf{312 \text{ psia}}$$

From Table F.9.2 we see it is around 300 psia.

3.a

In a complete cycle what is the net change in energy and in volume?

For a complete cycle the substance has no change in energy and therefore no storage, so the net change in energy is zero.

For a complete cycle the substance returns to its beginning state, so it has no change in specific volume and therefore no change in total volume.

3.b

Explain in words what happens with the energy terms for the stone in Example 3.3. What would happen if it were a bouncing ball falling to a hard surface?

In the beginning all the energy is potential energy associated with the gravitational force. As the stone falls the potential energy is turned into kinetic energy and in the impact the kinetic energy is turned into internal energy of the stone and the water. Finally the higher temperature of the stone and water causes a heat transfer to the ambient until ambient temperature is reached.

With a hard ball instead of the stone the impact would be close to elastic transforming the kinetic energy into potential energy (the material acts as a spring) that is then turned into kinetic energy again as the ball bounces back up. Then the ball rises up transforming the kinetic energy into potential energy (mgZ) until zero velocity is reached and it starts to fall down again. The collision with the floor is not perfectly elastic so the ball does not rise exactly up to the original height losing a little energy into internal energy (higher temperature due to internal friction) with every bounce and finally the motion will die out. All the energy eventually is lost by heat transfer to the ambient or sits in lasting deformation (internal energy) of the substance.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.c

Make a list of at least 5 systems that store energy, explaining which form of energy.

A spring that is compressed. Potential energy $(1/2)\ kx^2$

A battery that is charged. Electrical potential energy. V Amp h

A raised mass (could be water pumped up higher) Potential energy mgH

A cylinder with compressed air. Potential (internal) energy like a spring.

A tank with hot water. Internal energy mu

A fly-wheel. Kinetic energy (rotation) $(1/2)\ I\omega^2$

A mass in motion. Kinetic energy (1/2) m$\mathbf{V}^2$

3.d

A constant mass goes through a process where 100 J of heat transfer comes in and 100 J of work leaves. Does the mass change state?

Yes it does.

As work leaves a control mass its volume must go up, v increases

As heat transfer comes in an amount equal to the work out means u is constant if there are no changes in kinetic or potential energy.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.e

The electric company charges the customers per kW-hour. What is that in SI units?

Solution:

The unit kW-hour is a rate multiplied with time. For the standard SI units the rate of energy is in W and the time is in seconds. The integration in Eq.3.4 and on page 135 becomes

$$1 \text{ kW- hour} = 1000 \text{ W} \times 60 \frac{\text{min}}{\text{hour}} \text{ hour} \times 60 \frac{\text{s}}{\text{min}} = 3\,600\,000 \text{ Ws}$$

$$= 3\,600\,000 \text{ J} = \mathbf{3.6\ MJ}$$

3.f

Torque and energy and work have the same units (N m). Explain the difference.

Solution:

Work = force × displacement, so units are N × m. Energy in transfer
Energy is stored, could be from work input 1 J = 1 N m
Torque = force × arm, static, no displacement needed

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.g

What is roughly the relative magnitude of the work in the process 1-2c versus the process 1-2a shown in figure 3.15?

By visual inspection the area below the curve 1-2c is roughly 50% of the rectangular area below the curve 1-2a. To see this better draw a straight line from state 1 to point f on the axis. This curve has exactly 50% of the area below it.

3.h

Helium gas expands from 125 kPa, 350 K and 0.25 m^3 to 100 kPa in a polytropic process with n = 1.667. Is the work positive, negative or zero?

The boundary work is: $W = \int P\, dV$

P drops but does V go up or down?

The process equation is: $PV^n = C$

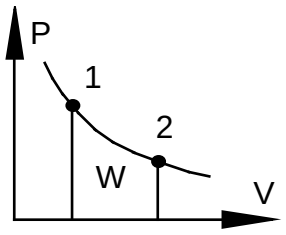
so we can solve for P to show it in a P-V diagram

$$P = CV^{-n}$$

as n = 1.667 the curve drops as V goes up we see

$$V_2 > V_1 \quad \text{giving} \quad dV > 0$$

and the work is then positive.



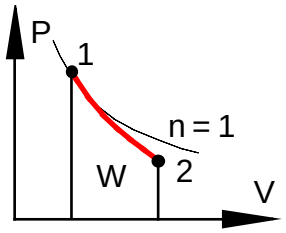
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.i

An ideal gas goes through an expansion process where the volume doubles. Which process will lead to the larger work output: an isothermal process or a polytropic process with $n = 1.25$?

The process equation is: $PV^n = C$

The polytropic process with n = 1.25 drops the pressure faster than the isothermal process with n = 1 and the area below the curve is then smaller.

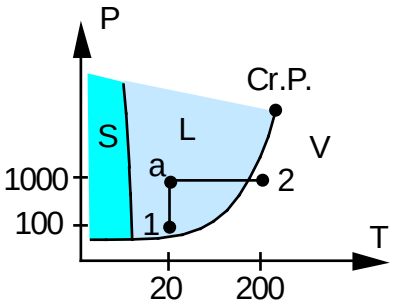


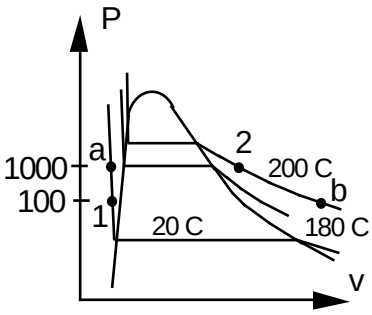
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

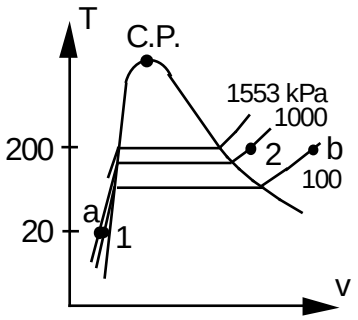
3.j

Water is heated from 100 kPa, 20°C to 1000 kPa, 200°C. In one case pressure is raised at T = C, then T is raised at P = C. In a second case the opposite order is done. Does that make a difference for $_1Q_2$ and $_1W_2$?

Yes it does. Both $_1Q_2$ and $_1W_2$ are process dependent. We can illustrate the work term in a P-v diagram.







In one case the process proceeds from 1 to state "a" along constant T then from "a" to state 2 along constant P.

The other case proceeds from 1 to state "b" along constant P and then from "b" to state 2 along constant T.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.k

A rigid insulated tank A contains water at 400 kPa, 800°C. A pipe and valve connect this to another rigid insulated tank B of equal volume having saturated water vapor at 100 kPa. The valve is opened and stays open while the water in the two tanks comes to a uniform final state. Which two properties determine the final state?

Continuity eq.: $m_2 - m_{1A} - m_{1B} = 0 \quad \Rightarrow \quad m_2 = m_{1A} + m_{1B}$

Energy eq.: $m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} = 0 - 0$

Process: Insulated: ${}_1Q_2 = 0$,

Rigid: $V_2 = C = V_A + V_B \quad \Rightarrow \quad {}_1W_2 = 0$

From continuity eq. and process: $v_2 = V_2/m_2 = \dfrac{m_{1A}}{m_2} v_{1A} + \dfrac{m_{1B}}{m_2} v_{1B}$

From energy eq.: $u_2 = \dfrac{m_{1A}}{m_2} u_{1A} + \dfrac{m_{1B}}{m_2} u_{1B}$

Final state 2: (v_2, u_2) both are the mass weighted average of the initial values.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.l

To determine v or u for some liquid or solid, is it more important that I know P or T?

T is more important, v and u are nearly independent of P in the liquid and solid phases.

3.m

To determine v or u for an ideal gas, is it more important that I know P or T?

For v they are equally important (v = RT/P), but for u only T is important. For an ideal gas u is a function of T only (independent of P).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.n

I heat 1 kg of substance at a constant pressure (200 kPa) 1 degree. How much heat is needed if the substance is water at 10^{o}C, steel at 25^{o}C, air at 325 K, or ice at -10^{o}C.

Heating at constant pressure gives (recall the analysis in Section 3.9, page 109)

$$_1Q_2 = H_2 - H_1 = m(h_2 - h_1) \approx m\, C_p\, (T_2 - T_1)$$

For all cases: $_1Q_2 = 1 \text{ kg} \times C \times 1 \text{ K}$

Water 10^{o}C, 200 kPa (liquid)	so A.4:	C = 4.18 kJ/kg-K,	$_1Q_2 = 4.18$ kJ
Steel 25^{o}C, 200 kPa (solid)	so A.3:	C = 0.46 kJ/kg-K	$_1Q_2 = 0.46$ kJ
Air 325 K, 200 kPa (gas)	so A.5:	$C_p = 1.004$ kJ/kg-K	$_1Q_2 = 1.004$ kJ
Ice -10^{o}C, 200 kPa (solid)	so A.3:	C = 2.04 kJ/kg-K	$_1Q_2 = 2.04$ kJ

Comment: For liquid water we could have interpolated $h_2 - h_1$ from Table B.1.1 and for ice we could have used Table B.1.5. For air we could have used Table A.7. If the temperature is very different from those given the tables will provide a more accurate answer.

Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.1

What is 1 cal in SI units and what is the name given to 1 N-m?

Look in the conversion factor table A.1 under energy:

$$1 \text{ cal (Int.)} = 4.1868 \text{ J} = 4.1868 \text{ Nm} = 4.1868 \text{ kg m}^2/\text{s}^2$$

This was historically defined as the heat transfer needed to bring 1 g of liquid water from 14.5^{o}C to 15.5^{o}C, notice the value of the heat capacity of water in Table A.4

1 N-m = 1 J or Force times displacement = energy in Joule

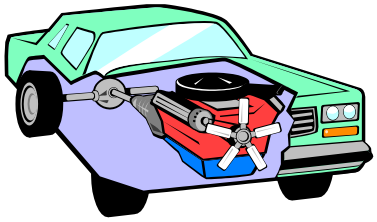
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.2

A car engine is rated at 110 kW. What is the power in hp?

Solution:

The horsepower is an older unit for power usually used for car engines. The conversion to standard SI units is given in Table A.1



1 hp = 0.7355 kW = 735.5 W

1 hp = 0.7457 kW for the UK horsepower

110 kW = 110 kW / 0.7457 (kW/hp) = **147.5 hp**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.3

Why do we write ΔE or $E_2 - E_1$ whereas we write ${}_1Q_2$ and ${}_1W_2$?

ΔE or $E_2 - E_1$ is the **change** in the stored energy from state 1 to state 2 and depends only on states 1 and 2 not upon the process between 1 and 2.

${}_1Q_2$ and ${}_1W_2$ are amounts of energy **transferred during the process** between 1 and 2 and depend on the process path. The quantities are associated with the process and they are not state properties.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.4

If a process in a control mass increases energy $E_2 - E_1 > 0$ can you say anything about the sign for ${}_1Q_2$ and ${}_1W_2$?

No.

The net balance of the heat transfer and work terms from the energy equation is

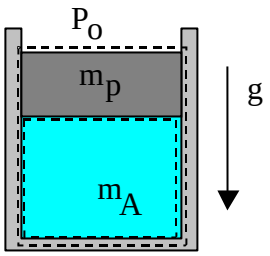
$$E_2 - E_1 = {}_1Q_2 - {}_1W_2 > 0$$

but that does not separate the effect of the two terms.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.5

In Fig. P3.5, CV A is the mass inside a piston-cylinder, CV B is that plus the piston, outside which is the standard atmosphere. Write the energy equation and work term for the two CVs assuming we have a non-zero Q between state 1 and state 2.



CV A: $E_2 - E_1 = m_A(e_2 - e_1) = m_A(u_2 - u_1) = {}_1Q_2 - {}_1WA_2$

${}_1WA_2 = \int P\, dV = P(V_2 - V_1)$

CV B: $E_2 - E_1 = m_A(e_2 - e_1) + m_{pist}(e_2 - e_1) = m_A(u_2 - u_1) + m_{pist}g(Z_2 - Z_1)$

$= {}_1Q_2 - {}_1WB_2$

${}_1WB_2 = \int P_o\, dV = P_o(V_2 - V_1)$

Notice how the P inside CV A is $P = P_o + m_{pist}g / A_{cyl}$ i.e. the first work term is larger than the second. The difference between the work terms is exactly equal to the potential energy of the piston sitting on the left hand side in the CV B energy Eq. The two equations are mathematically identical.

${}_1WA_2 = P(V_2 - V_1) = [P_o + m_{pist}g / A_{cyl}\,](V_2 - V_1)$

$= {}_1WB_2 + m_{pist}g(V_2 - V_1)/A_{cyl}$

$= {}_1WB_2 + m_{pist}g(Z_2 - Z_1)$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.6

A 500 W electric space heater with a small fan inside heats air by blowing it over a hot electrical wire. For each control volume: a) wire only b) all the room air and c) total room plus the heater, specify the storage, work and heat transfer terms as + 500W or -500W or 0 W, neglect any $\dot{Q}$ through the room walls or windows.

	Storage	Work	Heat transfer
Wire	0 W	-500 W	-500 W
Room air	500 W	0 W	500 W
Tot room	500 W	-500 W	0 W

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.7

Two engines provide the same amount of work to lift a hoist. One engine can provide 3 F in a cable and the other 1 F, What can you say about the motion of the point where the force F acts in the two engines?

Since the two work terms are the same we get

$$W = \int F\, dx = 3\, F\, x_1 = 1\, F\, x_2$$

$$x_2 = 3\, x_1$$

so the lower force has a larger displacement.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

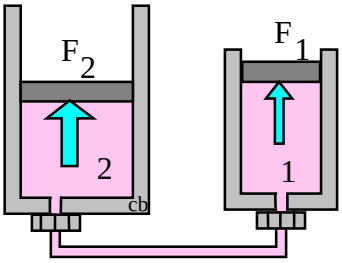
3.8

Two hydraulic piston/cylinders are connected through a hydraulic line so they have roughly the same pressure. If they have diameters of D_1 and $D_2 = 2D_1$ respectively, what can you say about the piston forces F_1 and F_2?

For each cylinder we have the total force as: $F = PA_{cyl} = P\,\pi\,D^2/4$

$$F_1 = PA_{cyl\ 1} = P\,\pi\,D_1^2/4$$

$$F_2 = PA_{cyl\ 2} = P\,\pi\,D_2^2/4 = P\,\pi\,4\,D_1^2/4 = 4\,F_1$$

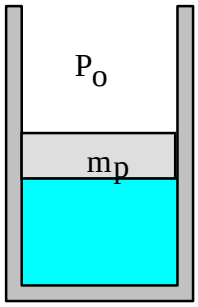


The forces are the total force acting up due to the cylinder pressure. There must be other forces on each piston to have a force balance so the pistons do not move.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.9

Assume a physical set-up as in Fig. P3.5. We now heat the cylinder. What happens to P, T and v (up, down or constant)? What transfers do we have for Q and W (pos., neg., or zero)?



Solution:

Process: $P = P_o + m_p g/A_{cyl} = C$

Heat in so T increases, v increases and Q is positive.

As the volume increases the work is positive. ${}_1W_2 = \int P\, dV$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.10

A drag force on an object moving through a medium (like a car through air or a submarine through water) is $F_d = 0.225\ A\ \rho \mathbf{V}^2$. Verify the unit becomes Newton.

Solution:

$$F_d = 0.225\ A\ \rho \mathbf{V}^2$$

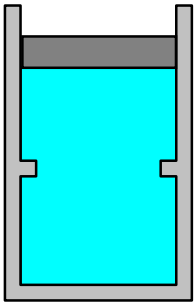
$$\text{Units} = m^2 \times (kg/m^3) \times (m^2/s^2) = kg\ m / s^2 = N$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

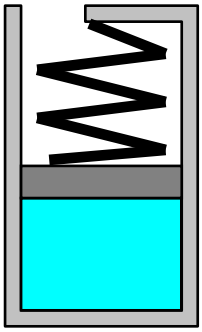
3.11

The sketch shows three physical situations, show the possible process in a P-v diagram.

a)



b)



c)

3.12

For the indicated physical set-up in a-b and c above write a process equation and the expression for work.

a) $P = P_1$ and $V \geq V_{stop}$ or $V = V_{stop}$ and $P \leq P_1$

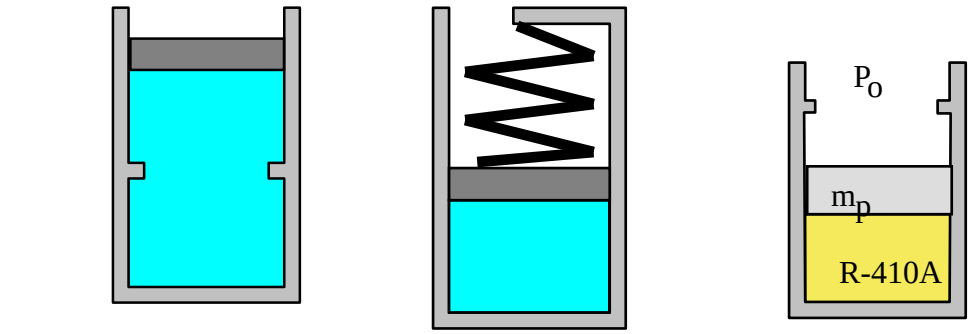
$_1W_2 = P_1(V_2 - V_1)$ [$P_1 = P_{float}$]

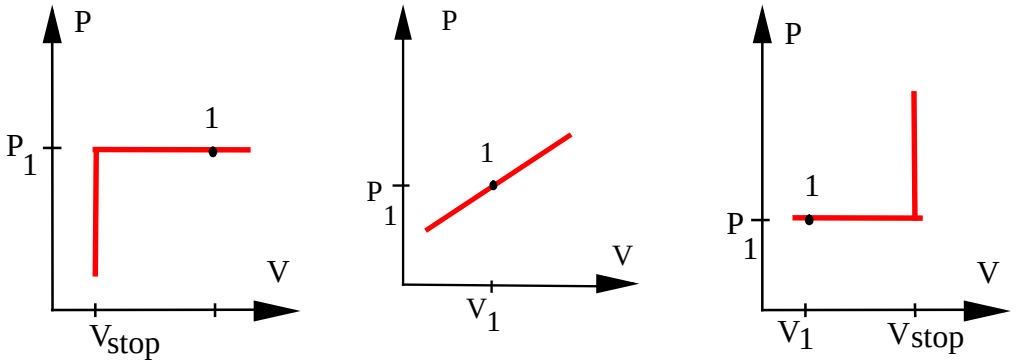
b) $P = A + BV$; $_1W_2 = \frac{1}{2}(P_1 + P_2)(V_2 - V_1)$

c) $P = P_1$ and $V \leq V_{stop}$ or $V = V_{stop}$ and $P \geq P_1$

$_1W_2 = P_1(V_2 - V_1)$ [$P_1 = P_{float}$]

a) b) c)

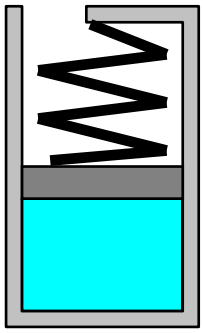




Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.13

Assume the physical situation as in Fig. P3.11b; what is the work term a, b, c or d?



a: ${}_1w_2 = P_1(v_2 - v_1)$ b: ${}_1w_2 = v_1(P_2 - P_1)$

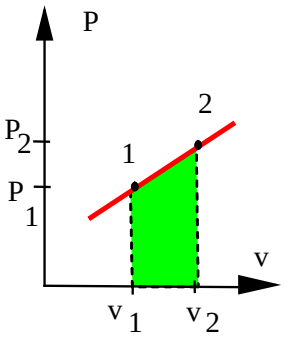
c: ${}_1w_2 = \frac{1}{2}(P_1 + P_2)(v_2 - v_1)$ d: ${}_1w_2 = \frac{1}{2}(P_1 - P_2)(v_2 + v_1)$

Solution:

work term is formula c, the area under the process curve in a P-v diagram.

The avg. height is $\frac{1}{2}(P_1 + P_2)$

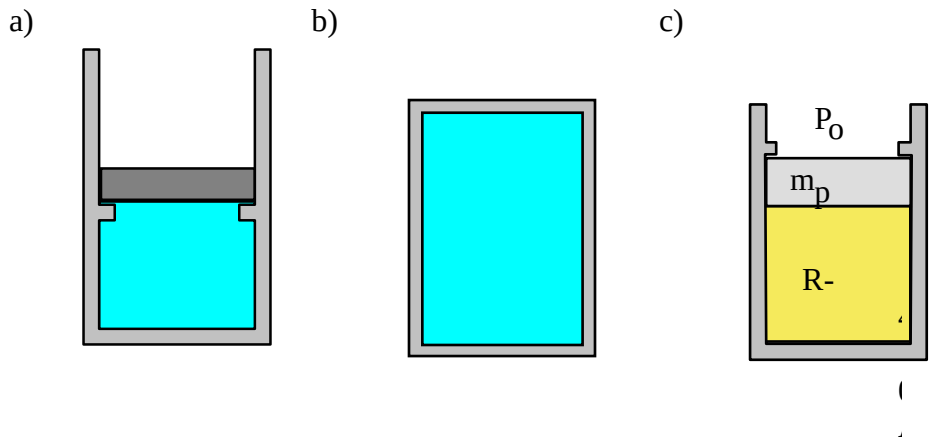
The base is $(v_2 - v_1)$



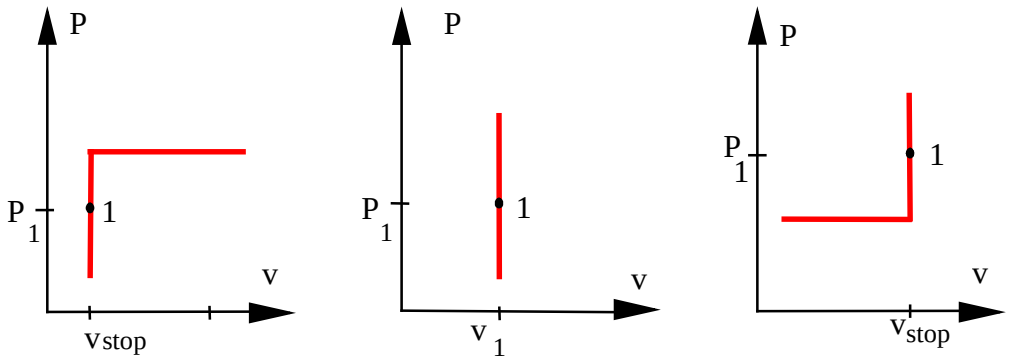
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.14

The sketch in Fig. P3.14 shows a physical situation; show the possible process in a P-v diagram.



Solution:



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.15

What can you say about the beginning state of the R-410A in Fig. P3.11 versus the case in Fig. P3.14 for the same piston-cylinder?

For the case where the piston floats as in Fig. P3.11 the pressure of the R-410A must equal the equilibrium pressure that floats (balance forces on) the piston.

The situation in Fig. P3.14 is possible if the R-410A pressure equals or exceeds the float pressure.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.16

A piece of steel has a conductivity of k = 15 W/mK and a brick has k = 1 W/mK. How thick a steel wall will provide the same insulation as a 10 cm thick brick?

The heat transfer due to conduction is from Eq. 3.23

$$\dot{Q} = - kA \frac{dT}{dx} \approx kA \frac{\Delta T}{\Delta x}$$

For the same area and temperature difference the heat transfers become the same for equal values of $(k / \Delta x)$ so

$$\left(\frac{k}{\Delta x}\right)_{brick} = \left(\frac{k}{\Delta x}\right)_{steel} \quad =>$$

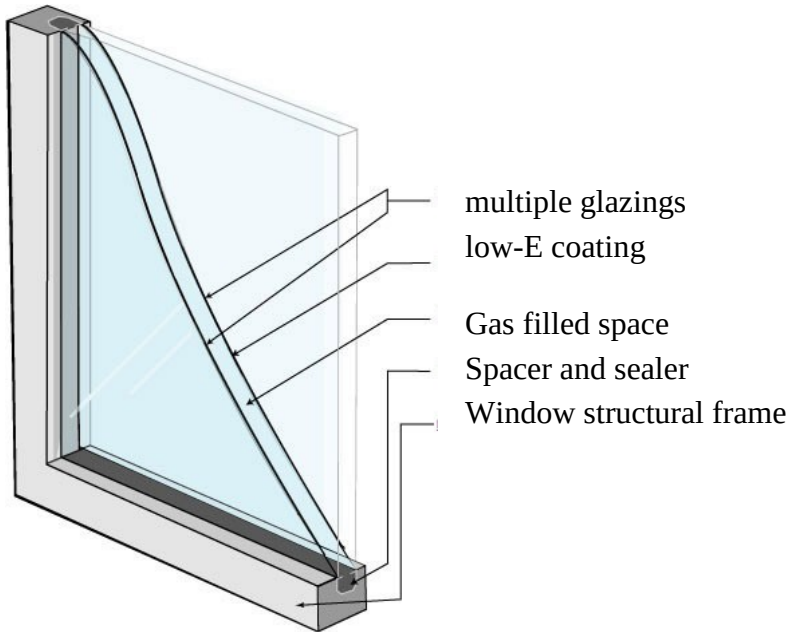
$$\Delta x_{steel} = \Delta x_{brick} \frac{k_{steel}}{k_{brick}} = 0.1 \text{ m} \times \frac{15}{1} = \mathbf{1.5\ m}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.17

A thermopane window, see Fig. 3.38, traps some gas between the two glass panes. Why is this beneficial?

The gas has a very low conductivity relative to a liquid or solid so the heat transfer for a given thickness becomes smaller. The gap is furthermore made so small that possible natural convection motion is reduced to a minimum. It becomes a trade off to minimize the overall heat transfer due to conduction and convection. Typically these windows can be manufactured with an E-glaze to reduce radiation loss (winter) or gain (summer).



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.18

On a chilly 10^{o}C fall day a house, 20^{o}C inside, loses 6 kW by heat transfer. What transfer happens on a 30^{o}C warm summer day assuming everything else is the same?

The heat transfer is $\dot{Q} = CA\ \Delta T$ where the details of the heat transfer is in the factor C. Assuming those details are the same then it is the temperature difference that changes the heat transfer so

$$\dot{Q} = CA\ \Delta T = 6\ \text{kW} = CA\ (20 - 10)\ \text{K} \Rightarrow CA = 0.6\ \frac{\text{kW}}{\text{K}}$$

Then

$$\dot{Q} = CA\ \Delta T = 0.6\ \frac{\text{kW}}{\text{K}} \times (20 - 30)\ \text{K} = -6\ \text{kW}$$ (it goes in)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.19

Verify that a surface tension $\mathcal{S}$ with units N/m also can be called a *surface energy* with units J/m^2. The latter is useful for consideration of a liquid drop or liquid in small pores (capillary).

Units: $N/m = Nm/m^2 = J/m^2$

This is like a potential energy associated with the surface. For water in small pores it tends to keep the water in the pores rather than in a drop on the surface.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.20

Some liquid water is heated so it becomes superheated vapor. Do I use u or h in the energy equation? Explain.

The energy equation for a control mass is: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

The storage of energy is a change in u (when we neglect kinetic and potential energy changes) and that is always so. To solve for the heat transfer we must know the work in the process and it is for a certain process (P = C) that the work term combines with the change in u to give a change in h. To avoid confusion you should always write the energy equation as shown above and substitute the appropriate expression for the work term when you know the process equation that allows you to evaluate work.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.21

Some liquid water is heated so it becomes superheated vapor. Can I use specific heat to find the heat transfer? Explain.

NO.

The specific heat cannot give any information about the energy required to do the phase change. The specific heat is useful for single phase state changes only.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.22

Look at the R-410A value for u_f at -50°C. Can the energy really be negative? Explain.

The absolute value of *u* and *h* are arbitrary. A constant can be added to all *u* and *h* values and the table is still valid. It is customary to select the reference such that *u* for saturated liquid water at the triple point is zero. The standard for refrigerants like R-410A is that *h* is set to zero as saturated liquid at -40°C, other substances as cryogenic substances like nitrogen, methane etc. may have different states at which *h* is set to zero. The ideal gas tables use a zero point for *h* as 25°C or at absolute zero, 0 K.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

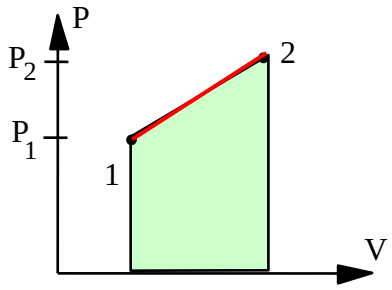
3.23

A rigid tank with pressurized air is used to a) increase the volume of a linear spring loaded piston cylinder (cylindrical geometry) arrangement and b) to blow up a spherical balloon. Assume that in both cases P = A + BV with the same A and B. What is the expression for the work term in each situation?

The expression is exactly the same; the geometry does not matter as long as we have the same relation between P and V then

$$
\begin{aligned}
{}_1W_2 &= \int P\, dV = \int (A + BV)\, dV \\
&= A(V_2 - V_1) + 0.5\, B\, (V_2^2 - V_1^2) \\
&= A(V_2 - V_1) + 0.5\, B\, (V_2 + V_1)\, (V_2 - V_1) \\
&= 0.5\, [\, A + B\, V_2 + A + B\, V_1]\, (V_2 - V_1) \\
&= 0.5\, (P_1 + P_2)\, (V_2 - V_1)
\end{aligned}
$$

Notice the last expression directly gives the area below the curve in the P-V diagram.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.24

An ideal gas in a piston-cylinder is heated with 2 kJ during an isothermal process. How much work is involved?

Energy Eq.: $u_2 - u_1 = {}_1q_2 - {}_1w_2 = 0$ since $u_2 = u_1$ (isothermal)

Then

$${}_1W_2 = m\ {}_1w_2 = {}_1Q_2 = m\ {}_1q_2 = \mathbf{2\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.25

An ideal gas in a piston-cylinder is heated with 2 kJ during an isobaric process. Is the work pos., neg., or zero?

As the gas is heated u and T increase and since PV = mRT it follows that the volume increase and thus work goes out.

w > 0

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.26

You heat a gas 10 K at P = C. Which one in Table A.5 requires most energy? Why?

A constant pressure process in a control mass gives (recall Section 3.9 and Eq.3.44)

$$ {}_1q_2 = u_2 - u_1 + {}_1w_2 = u_2 - u_1 + P_1(v_2 - v_1) $$
$$ = h_2 - h_1 \approx C_p \, \Delta T $$

The one with the highest specific heat is hydrogen, H_2. The hydrogen has the smallest mass, but the same kinetic energy per mol as other molecules and thus the most energy per unit mass is needed to increase the temperature.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.27

You mix 20^{o}C water with 50^{o}C water in an open container. What do you need to know to determine the final temperature?

The process will take place at constant pressure (atmospheric) and you can assume there will be minimal heat transfer if the process is reasonably fast. The energy equation then becomes

$$U_2 - U_1 = 0 - {}_1W_2 = - P(V_2 - V_1)$$

Which we can write as

$$H_2 - H_1 = 0 = m_2h_2 - (m_{1\ 20C}h_{1\ 20C} + m_{1\ 50C}h_{1\ 50C})$$

You need the amount of mass at each temperature $m_{1\ 20C}$ and $m_{1\ 50C}$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Kinetic and Potential Energy

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.28

A piston motion moves a 25 kg hammerhead vertically down 1 m from rest to a velocity of 50 m/s in a stamping machine. What is the change in total energy of the hammerhead?

Solution: C.V. Hammerhead

The hammerhead does not change internal energy (i.e. same P, T), but it does have a change in kinetic and potential energy.

$$E_2 - E_1 = m(u_2 - u_1) + m[(1/2)\mathbf{V}_2^{\,2} - 0] + mg\,(Z_2 - 0)$$

$$= 0 + 25\ \text{kg} \times (1/2) \times (50\ \text{m/s})^2 + 25\ \text{kg} \times 9.80665\ \text{m/s}^2 \times (-1)\ \text{m}$$

$$= 31\,250\ \text{J} - 245.17\ \text{J} = 31\,005\ \text{J} = \mathbf{31\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.29

A 1200 kg car is accelerated from 30 to 50 km/h in 5 s. How much work is that? If you continue from 50 to 70 km/h in 5 s; is that the same?

The work input is the increase in kinetic energy.

$$E_2 - E_1 = (1/2)m\left[\mathbf{V}_2^2 - \mathbf{V}_1^2\right] = {}_1W_2$$

$$= 0.5 \times 1200 \text{ kg } [50^2 - 30^2] \left(\frac{\text{km}}{\text{h}}\right)^2$$

$$= 600 \text{ kg} \times [\ 2500 - 900\ ] \left(\frac{1000 \text{ m}}{3600 \text{ s}}\right)^2 = 74\ 074 \text{ J} = \mathbf{74.1\ kJ}$$

The second set of conditions does not become the same

$$E_2 - E_1 = (1/2)m\left[\mathbf{V}_2^2 - \mathbf{V}_1^2\right] = 600 \text{ kg} \times [\ 70^2 - 50^2\ ] \left(\frac{1000 \text{ m}}{3600 \text{ s}}\right)^2 = \mathbf{111\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.30

The rolling resistance of a car depends on its weight as: F = 0.006 mg. How far will a car of 1200 kg roll if the gear is put in neutral when it drives at 90 km/h on a level road without air resistance?

Solution:

The car decreases its kinetic energy to zero due to the force (constant) acting over the distance.

$$m\,(1/2V_2^2 - 1/2V_1^2) = -{}_1W_2 = -\int F\,dx = -FL$$

$$V_2 = 0, \quad V_1 = 90\,\frac{km}{h} = \frac{90\times1000}{3600}\,ms^{-1} = 25\,ms^{-1}$$

$$-1/2\;mV_1^2 = -FL = -\,0.006\;mgL$$

$$\rightarrow \qquad L = \frac{0.5\;\mathbf{V}_1^2}{0.006\;g} = \frac{0.5\times25^2}{0.006\times9.807}\,\frac{m^2/s^2}{m/s^2} = 5311\;m$$

Remark: Over 5 km! The air resistance is much higher than the rolling resistance so this is not a realistic number by itself.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.31

A piston of mass 2 kg is lowered 0.5 m in the standard gravitational field. Find the required force and work involved in the process.

Solution:

$$F = ma = 2 \text{ kg} \times 9.80665 \text{ m/s}^2 = \mathbf{19.61\ N}$$

$$W = \int F\, dx = F \int dx = F\, \Delta x = 19.61 \text{ N} \times 0.5 \text{ m} = \mathbf{9.805\ J}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.32

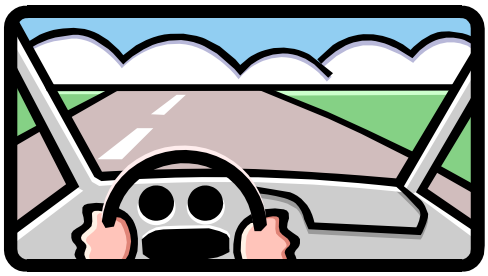
A 1200 kg car accelerates from zero to 100 km/h over a distance of 400 m. The road at the end of the 400 m is at 10 m higher elevation. What is the total increase in the car kinetic and potential energy?

Solution:

$$\Delta KE = \tfrac{1}{2}\, m\, (\mathbf{V}_2^2 - \mathbf{V}_1^2)$$

$$\mathbf{V}_2 = 100 \text{ km/h} = \frac{100 \times 1000}{3600} \text{ m/s}$$

$$= 27.78 \text{ m/s}$$



$$\Delta KE = \tfrac{1}{2} \times 1200 \text{ kg} \times (27.78^2 - 0^2) \text{ (m/s)}^2 = 463\,037 \text{ J} = \mathbf{463\ kJ}$$

$$\Delta PE = mg(Z_2 - Z_1) = 1200 \text{ kg} \times 9.807 \text{ m/s}^2 \text{ (10 - 0) m} = 117684 \text{ J}$$

$$= \mathbf{117.7\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.33

A hydraulic hoist raises a 1750 kg car 1.8 m in an auto repair shop. The hydraulic pump has a constant pressure of 800 kPa on its piston. What is the increase in potential energy of the car and how much volume should the pump displace to deliver that amount of work?

Solution: C.V. Car.

No change in kinetic or internal energy of the car, neglect hoist mass.

$$E_2 - E_1 = PE_2 - PE_1 = mg\,(Z_2 - Z_1)$$

$$= 1750 \text{ kg} \times 9.80665 \text{ m/s}^2 \times 1.8 \text{ m} = \mathbf{30\ 891\ J}$$

The increase in potential energy is work into car from pump at constant P.

$$W = E_2 - E_1 = \int P\, dV = P\, \Delta V \qquad \Rightarrow$$

$$\Delta V = \frac{E_2 - E_1}{P} = \frac{30891 \text{ J}}{800 \times 1000 \text{ Pa}} = \mathbf{0.0386\ m^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.34

Airplane takeoff from an aircraft carrier is assisted by a steam driven piston/cylinder device with an average pressure of 1250 kPa. A 17500 kg airplane should be accelerated from zero to a speed of 30 m/s with 30% of the energy coming from the steam piston. Find the needed piston displacement volume.

Solution: C.V. Airplane.

No change in internal or potential energy; only kinetic energy is changed.

$$E_2 - E_1 = m\,(1/2)\,(\mathbf{V}_2^2 - 0) = 17500 \text{ kg} \times (1/2) \times 30^2 \text{ (m/s)}^2$$

$$= 7\,875\,000 \text{ J} = 7875 \text{ kJ}$$

The work supplied by the piston is 30% of the energy increase.

$$W = \int P\,dV = P_{avg}\;\Delta V = 0.30\,(E_2 - E_1)$$

$$= 0.30 \times 7875 \text{ kJ} = 2362.5 \text{ kJ}$$

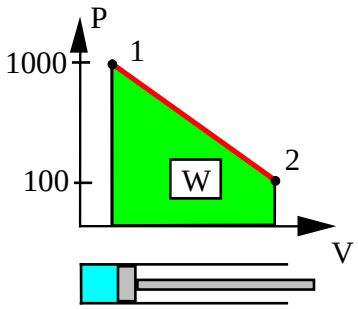
$$\Delta V = \frac{W}{P_{avg}} = \frac{2362.5}{1250}\,\frac{\text{kJ}}{\text{kPa}} = \mathbf{1.89\ m^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.35

Solve Problem 3.34, but assume the steam pressure in the cylinder starts at 1000 kPa, dropping linearly with volume to reach 100 kPa at the end of the process.

Solution: C.V. Airplane.



$$E_2 - E_1 = m\,(1/2)\,(\mathbf{V}_2^{\,2} - 0)$$

$$= 17\,500 \text{ kg} \times (1/2) \times 30^2 \text{ (m/s)}^2$$

$$= 7875\,000 \text{ J} = 7875 \text{ kJ}$$

$$W = 0.30(E_2 - E_1) = 0.30 \times 7875 = 2362.5 \text{ kJ}$$

$$W = \int P\, dV = (1/2)(P_{beg} + P_{end})\, \Delta V$$

$$\Delta V = \frac{W}{P_{avg}} = \frac{2362.5 \text{ kJ}}{1/2(1000 + 100) \text{ kPa}} = \mathbf{4.29\ m^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.36

A steel ball weighing 5 kg rolls horizontal with 10 m/s. If it rolls up an incline how high up will it be when it comes to rest assuming standard gravitation.

C.V. Steel ball.

Energy Eq.: $E_2 - E_1 = {}_1Q_2 - {}_1W_2 = 0 - 0 = 0$

$$E_1 = mu_1 + mgZ_1 + 0.5\ mV^2$$

$$E_2 = mu_2 + mgZ_2 + 0$$

We assume the steel ball does not change temperature ($u_2 = u_1$) so then the energy equation gives

$$mu_2 + mgZ_2 - mu_1 - mgZ_1 - 0.5\ mV^2 = 0$$

$$mg\ (Z_2 - Z_1) = 0.5\ mV^2$$

$$Z_2 - Z_1 = 0.5\ V^2/g = 0.5 \times 10^2\ (m^2/s^2) / (9.81\ m/s^2) = \mathbf{5.1\ m}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.37

A hydraulic cylinder of area 0.01 m^2 must push a 1000 kg arm and shovel 0.5 m straight up. What pressure is needed and how much work is done?

$F = mg = 1000\ kg \times 9.81\ m/s^2$
$= 9810\ N = PA$

$P = F/A = 9810\ N/\ 0.01\ m^2$
$= 981\ 000\ Pa =$ **981 kPa**

$W = \int F\ dx = F\ \Delta x = 9810\ N \times 0.5\ m =$ **4905 J**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.38

A hydraulic cylinder has a piston of cross sectional area 10 cm^2 and a fluid pressure of 2 MPa. If the piston is moved 0.25 m how much work is done?

Solution:

The work is a force with a displacement and force is constant: F = PA

$$W = \int F\, dx = \int PA\, dx = PA\, \Delta x$$

$$= 2000\ kPa \times 10 \times 10^{-4}\ m^2 \times 0.25\ m = \mathbf{0.5\ kJ}$$

Units: $kPa\ m^2\ m = kN\ m^{-2}\ m^2\ m = kN\ m = kJ$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.39

Two hydraulic piston/cylinders are connected with a line. The master cylinder has an area of 5 cm^2 creating a pressure of 1000 kPa. The slave cylinder has an area of 3 cm^2. If 25 J is the work input to the master cylinder what is the force and displacement of each piston and the work output of the slave cylinder piston?

Solution:

$$W = \int F_x \, dx = \int P \, dv = \int P \, A \, dx = P \, A \, \Delta x$$

$$\Delta x_{master} = \frac{W}{PA} = \frac{25}{1000 \times 5 \times 10^{-4}} \frac{J}{kPa \, m^2} = 0.05 \text{ m}$$

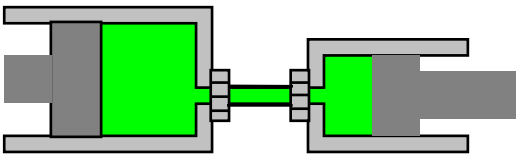
$$A\Delta x = \Delta V = 5 \times 10^{-4} \times 0.05 = 2.5 \times 10^{-5} \text{ m}^3 = \Delta V_{slave} = A \, \Delta x \rightarrow$$

$$\Delta x_{slave} = \Delta V / A = 2.5 \times 10^{-5} \text{ m}^3 / 3 \times 10^{-4} \text{ m}^2 = 0.0083\,33 \text{ m}$$

$$F_{master} = P \, A = 1000 \text{ kPa} \times 5 \times 10^{-4} \text{ m}^2 \times 10^3 \text{ Pa/kPa} = \mathbf{500\ N}$$

$$F_{slave} = P \, A = 1000 \text{ kPa} \times 10^3 \text{ Pa/kPa} \times 3 \times 10^{-4} \text{ m}^2 = \mathbf{300\ N}$$

$$W_{slave} = F \, \Delta x = 300 \text{ N} \times 0.08333 \text{ m} = \mathbf{25\ J}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.40

The air drag force on a car is 0.225 A $\rho \mathbf{V}^2$. Assume air at 290 K, 100 kPa and a car frontal area of 4 m^2 driving at 90 km/h. How much energy is used to overcome the air drag driving for 30 minutes?

The formula involves density and velocity and work involves distance so:

$$\rho = \frac{1}{v} = \frac{P}{RT} = \frac{100}{0.287 \times 290} = 1.2015 \frac{kg}{m^3}$$

$$\mathbf{V} = 90 \frac{km}{h} = 90 \times \frac{1000}{3600} \frac{m}{s} = 25 \text{ m/s}$$

$$\Delta x = \mathbf{V}\, \Delta t = 25 \text{ m/s} \times 30 \text{ min} \times 60 \text{ s/min} = 45\,000 \text{ m}$$

Now

$$F = 0.225 \text{ A } \rho\, \mathbf{V}^2 = 0.225 \times 4 \text{ m}^2 \times 1.2015 \frac{kg}{m^3} \times 25^2 \frac{m^2}{s^2}$$

$$= 675.8 \text{ m}^2 \frac{kg}{m^3} \times \frac{m^2}{s^2} = \mathbf{676\ N}$$

$$W = F\, \Delta x = 676 \text{ N} \times 45\,000 \text{ m} = 30\,420\,000 \text{ J} = \mathbf{30.42\ MJ}$$

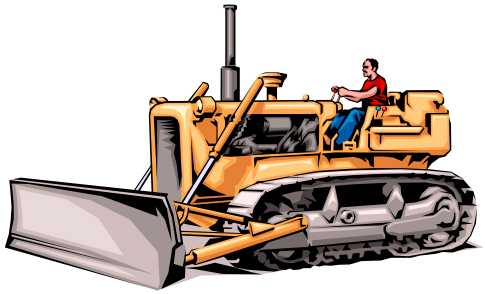
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.41

A bulldozer pushes 800 kg of dirt 100 m with a force of 1500 N. It then lifts the dirt 3 m up to put it in a dump truck. How much work did it do in each situation?

Solution:

$$W = \int F\,dx = F\,\Delta x$$
$$= 1500\ \text{N} \times 100\ \text{m}$$
$$= 150\ 000\ \text{J} = \mathbf{150\ kJ}$$



$$W = \int F\,dz = \int mg\,dz = mg\,\Delta Z$$
$$= 800\ \text{kg} \times 9.807\ \text{m/s}^2 \times 3\ \text{m}$$
$$= 23\ 537\ \text{J} = \mathbf{23.5\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.42

Two hydraulic cylinders maintain a pressure of 1200 kPa. One has a cross sectional area of 0.01 m^2 the other 0.03 m^2. To deliver a work of 1 kJ to the piston how large a displacement (V) and piston motion H is needed for each cylinder? Neglect P_{atm}.

Solution:

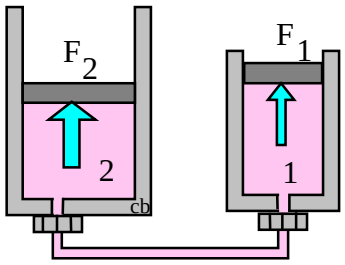
$$W = \int F\,dx = \int P\,dV = \int PA\,dx = PA^* H = P\Delta V$$

$$\Delta V = \frac{W}{P} = \frac{1\text{ kJ}}{1200\text{ kPa}} = \mathbf{0.000\ 833\ m^3}$$

Both cases the height is $H = \Delta V/A$

$$H_1 = \frac{0.000833}{0.01}\text{ m} = \mathbf{0.0833\ m}$$

$$H_2 = \frac{0.000833}{0.03}\text{ m} = \mathbf{0.0278\ m}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.43

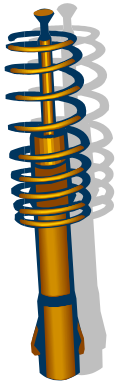
A linear spring, $F = k_S(x - x_0)$, with spring constant k_S = 500 N/m, is stretched until it is 100 mm longer. Find the required force and work input.

Solution:

$$F = k_S(x - x_0) = 500 \times 0.1 = \mathbf{50\ N}$$

$$W = \int F\,dx = \int k_S(x - x_0)d(x - x_0) = k_S(x - x_0)^2/2$$

$$= 500\,\frac{N}{m} \times (0.1^2/2)\ m^2 = \mathbf{2.5\ J}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.44

A piston of 2 kg is accelerated to 20 m/s from rest. What constant gas pressure is required if the area is 10 cm^2, the travel 10 cm and the outside pressure is 100 kPa?

C.V. Piston

$$(E_2 - E_1)_{PIST.} = m(u_2 - u_1) + m[(1/2)V_2^2 - 0] + mg\,(0 - 0)$$

$$= (1/2)\, m\, V_2^2 = 0.5 \times 2\ kg \times 20^2\ (m/s)^2 = 400\ J$$

Energy equation for the piston is:

$$(E_2 - E_1)_{PIST.} = W_{gas} - W_{atm} = P_{avg}\ \Delta V_{gas} - P_o\ \Delta V_{gas}$$

$$\Delta V_{gas} = A\ L = 10\ cm^2 \times 10\ cm = 0.0001\ m^3$$

$$P_{avg}\ \Delta V_{gas} = (E_2 - E_1)_{PIST.} + P_o\ \Delta V_{gas}$$

$$P_{avg} = (E_2 - E_1)_{PIST.} / \Delta V_{gas} + P_o$$

$$= 400\ J / 0.0001\ m^3 + 100\ kPa$$

$$= 4000\ kPa + 100\ kPa = \mathbf{4100\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Boundary work

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.45

A 25 kg piston is above a gas in a long vertical cylinder. Now the piston is released from rest and accelerates up in the cylinder reaching the end 5 m higher at a velocity of 25 m/s. The gas pressure drops during the process so the average is 600 kPa with an outside atmosphere at 100 kPa. Neglect the change in gas kinetic and potential energy, and find the needed change in the gas volume.

Solution:

C.V. Piston

$$(E_2 - E_1)_{PIST.} = m(u_2 - u_1) + m[(1/2)V_2^2 - 0] + mg\,(H_2 - 0)$$

$$= 0 + 25\ \text{kg} \times (1/2) \times 25^2 (\text{m/s})^2 + 25\ \text{kg} \times 9.80665\ \text{m/s}^2 \times 5\ \text{m}$$

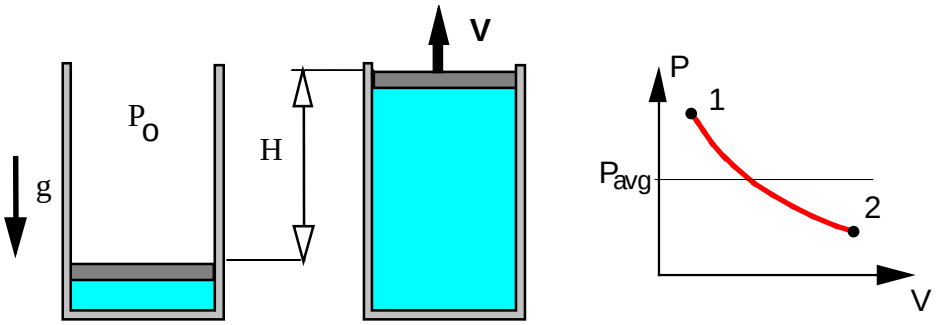
$$= 7812.5\ \text{J} + 1225.8\ \text{J} = 9038.3\ \text{J} = 9.038\ \text{kJ}$$

Energy equation for the piston is:

$$E_2 - E_1 = W_{gas} - W_{atm} = P_{avg}\ \Delta V_{gas} - P_o\ \Delta V_{gas}$$

(remark $\Delta V_{atm} = -\Delta V_{gas}$ so the two work terms are of opposite sign)

$$\Delta V_{gas} = \frac{9.038}{600 - 100}\ \frac{\text{kJ}}{\text{kPa}} = \mathbf{0.018\ m^3}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.46

The R-410A in Problem 3.14 c is at 1000 kPa, 50°C with mass 0.1 kg. It is cooled so the volume is reduced to half the initial volume . The piston mass and gravitation is such that a pressure of 400 kPa will float the piston. Find the work in the process.

If the volume is reduced the piston must drop and thus float with P = 400 kPa. The process therefore follows a process curve shown in the P-V diagram.

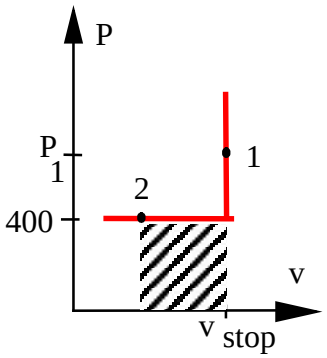
Table B.4.2: $v_1 = 0.03320$ m^3/kg

$$_1W_2 = \int PdV = \text{area}$$

$$= P_{float}\,(V_2 - V_1) = -P_{float}\,V_1/2$$

$$= -400 \text{ kPa} \times 0.1 \text{ kg} \times 0.0332 \text{ m}^3/\text{kg} /2$$

$$= \mathbf{-\ 0.664\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.47

A 400-L tank A, see figure P3.47, contains argon gas at 250 kPa, 30°C. Cylinder B, having a frictionless piston of such mass that a pressure of 150 kPa will float it, is initially empty. The valve is opened and argon flows into B and eventually reaches a uniform state of 150 kPa, 30°C throughout. What is the work done by the argon?

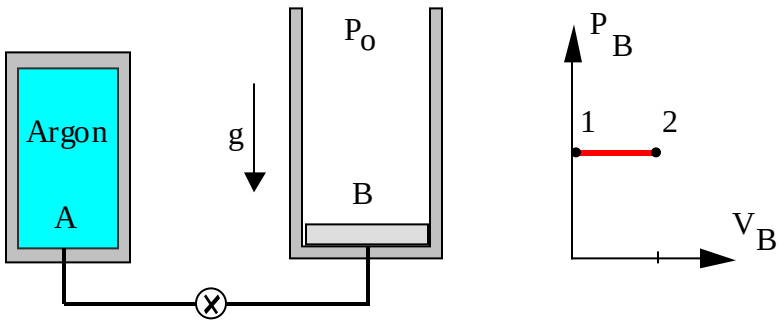
Solution:

Take C.V. as all the argon in both A and B. Boundary movement work done in cylinder B against constant external pressure of 150 kPa. Argon is an ideal gas, so write out that the mass and temperature at state 1 and 2 are the same

$$P_{A1}V_A = m_A RT_{A1} = m_A RT_2 = P_2(V_A + V_{B2})$$

$$\Rightarrow \quad V_{B2} = (P_{A1}/P_2)\,V_A - V_A = \frac{250 \times 0.4}{150} - 0.4 = 0.2667 \text{ m}^3$$

$$_1W_2 = \int_1^2 P_{ext}dV = P_{ext}(V_{B2} - V_{B1}) = 150 \text{ kPa} \times (0.2667 - 0)\text{ m}^3 = \mathbf{40\ kJ}$$



Notice there is a pressure loss in the valve so the pressure in B is always 150 kPa while the piston floats.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.48

A piston cylinder contains 2 kg of liquid water at 20°C and 300 kPa, as shown in Fig. P3.48. There is a linear spring mounted on the piston such that when the water is heated the pressure reaches 3 MPa with a volume of 0.1 m^3.

a) Find the final temperature

b) Plot the process in a P-v diagram.

c) Find the work in the process.

Solution:

Take CV as the water. This is a constant mass:

$$m_2 = m_1 = m ;$$

State 1: Compressed liquid, take saturated liquid at same temperature.

B.1.1: $v_1 = v_f(20) = 0.001002\ m^3/kg$,

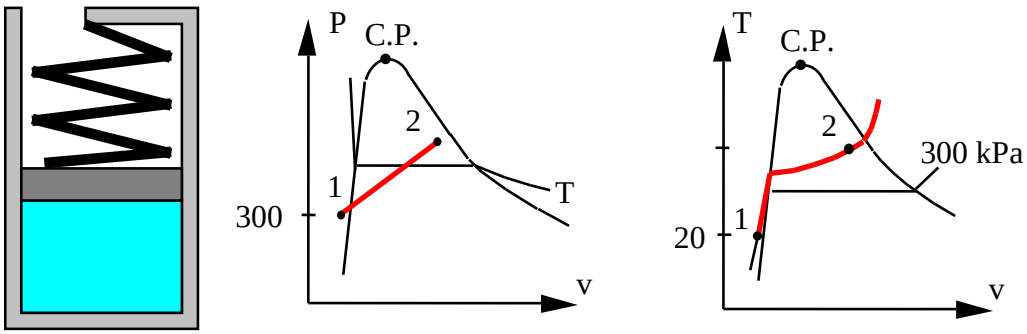
State 2: $v_2 = V_2/m = 0.1/2 = 0.05\ m^3/kg$ and P = 3000 kPa from B.1.2

=> Two-phase: $T_2 = \mathbf{233.9^oC}$

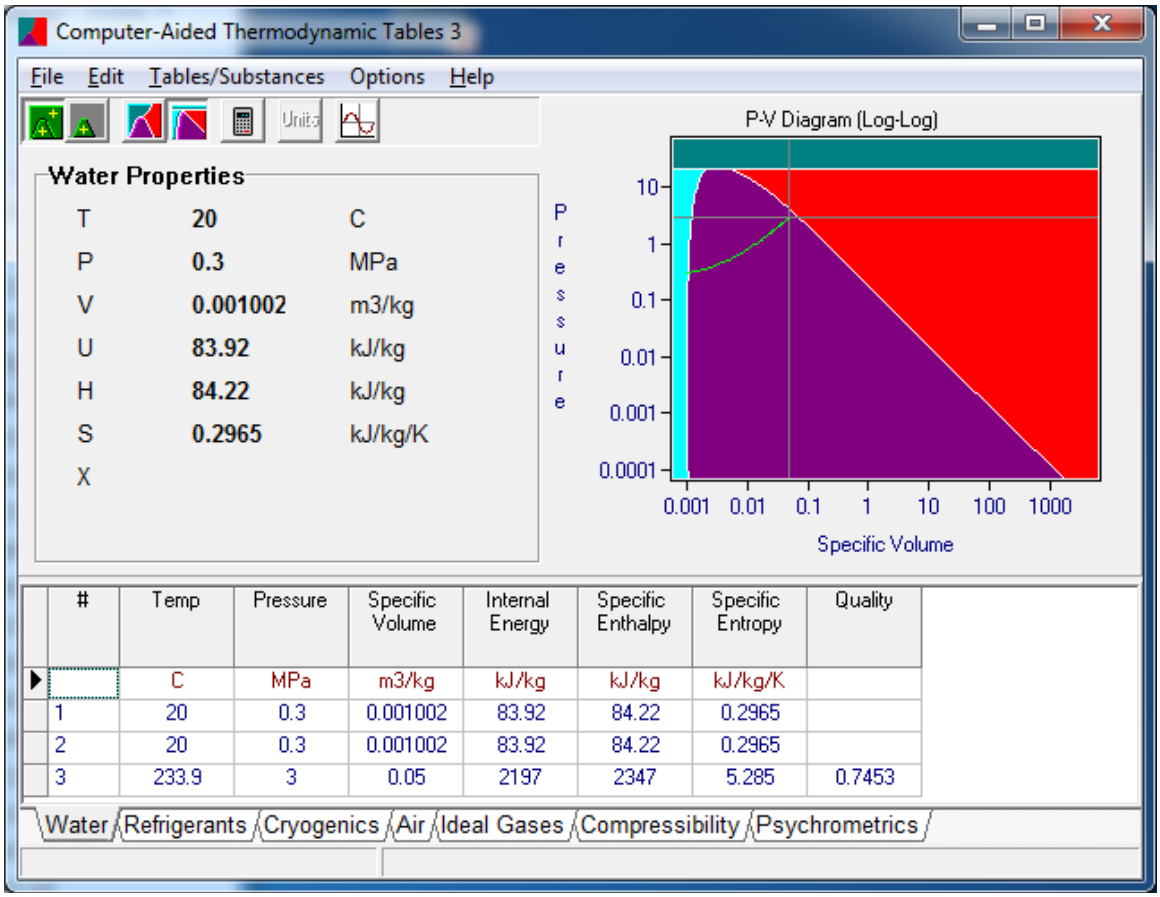
Work is done while piston moves at linearly varying pressure, so we get:

$$ {}_1W_2 = \int P\, dV = \text{area} = P_{avg}\,(V_2 - V_1) = \tfrac{1}{2}(P_1 + P_2)(V_2 - V_1)$$

$$= 0.5\,(300 + 3000)\ kPa \times (0.1 - 0.002)\ m^3 = \mathbf{161.7\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*



The process shown by CATT3 in a log-log diagram.

The linear relation P = A + Bv, has B = 55.1 MPa/(m^3/kg)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.49

Air in a spring loaded piston/cylinder has a pressure that is linear with volume, $P = A + BV$. With an initial state of P = 150 kPa, V = 1 L and a final state of 800 kPa and volume 1.5 L it is similar to the setup in Problem 3.48. Find the work done by the air.

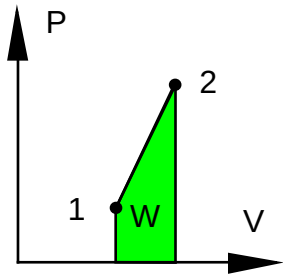
Solution:

Knowing the process equation: $P = A + BV$ giving a linear variation of pressure versus volume the straight line in the P-V diagram is fixed by the two points as state 1 and state 2. The work as the integral of PdV equals the area under the process curve in the P-V diagram.

State 1: $P_1 = 150$ kPa $V_1 = 1$ L $= 0.001$ m^3

State 2: $P_2 = 800$ kPa $V_2 = 1.5$ L $= 0.0015$ m^3

Process: $P = A + BV$ linear in V



$$\Rightarrow \quad {}_1W_2 = \int_1^2 PdV = \left(\frac{P_1 + P_2}{2}\right)(V_2 - V_1)$$

$$= \frac{1}{2}(150 + 800)\ \text{kPa} \times (1.5 - 1)\ \text{L} \times 0.001\ \text{m}^3/\text{L}$$

$$= \mathbf{0.2375\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.50

Heat transfer to a block of 1.5 kg ice at -10^{o}C melts it to liquid at 10^{o}C in a kitchen. How much work does the water gives out?

Work is done against the atmosphere due to volume change in the process. The pressure is 101 kPa so we approximate the states as saturated

State 1: Compressed solid, B.1.5, $v_1 = 0.0010891$ m^3/kg

State 2: Compressed liquid B.1.1 $v_2 = 0.001000$ m^3/kg

$$_1W_2 = \int PdV = P_o (V_2 - V_1) = P_o\, m\, (v_2 - v_1)$$

$$= 101.325 \text{ kPa} \times 1.5 \text{ kg} \times (0.001 - 0.0010891) \text{ m}^3/\text{kg}$$

$$= \mathbf{-\ 0.0135\ kJ}$$

Notice the work is negative, the volume is reduced!

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.51

A cylinder fitted with a frictionless piston contains 5 kg of superheated refrigerant R-134a vapor at 1000 kPa, 140°C. The setup is cooled at constant pressure until the R-134a reaches a quality of 25%. Calculate the work done in the process.

Solution:

Constant pressure process boundary work. State properties from Table B.5.2

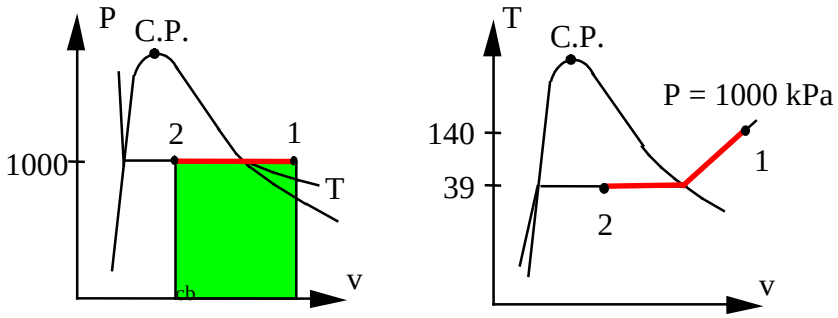
State 1: $v = 0.03150$ m^3/kg ,

State 2: $v = 0.000871 + 0.25 \times 0.01956 = 0.00576$ m^3/kg

Interpolated to be at 1000 kPa, numbers at 1017 kPa could have been used in which case: $v = 0.00566$ m^3/kg

$$_1W_2 = \int P\, dV = P\,(V_2 - V_1) = mP\,(v_2 - v_1)$$

$$= 5 \text{ kg} \times 1000 \text{ kPa} \times (0.00576 - 0.03150) \text{ m}^3/\text{kg} = \mathbf{-128.7\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.52

A piston/cylinder contains 2 kg water at 20°C with volume 0.1 m^3. By mistake someone locks the piston preventing it from moving while we heat the water to saturated vapor. Find the final temperature, volume and the process work.

Solution

1: $v_1 = V/m = 0.1\ m^3/2\ kg = 0.05\ m^3/kg$ (two-phase state)

2: Constant volume: $v_2 = v_g = v_1$

$$V_2 = V_1 = \mathbf{0.1\ m^3}$$

$$_1W_2 = \int P\ dV = \mathbf{0}$$

State 2: (v_2, $x_2 = 1$)

$$T_2 = T_{sat} = 250 + 5\,\frac{0.05 - 0.05013}{0.04598 - 0.05013} = \mathbf{250.2°C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Polytropic process

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.53

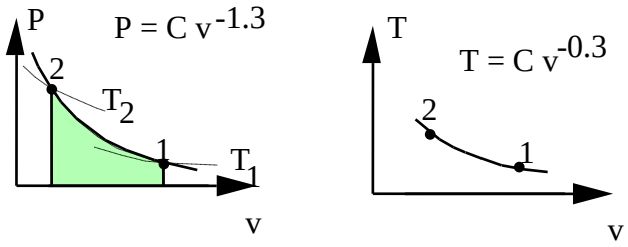
A nitrogen gas goes through a polytropic process with n = 1.3 in a piston/cylinder. It starts out at 600 K, 600 kPa and ends at 800 K. Is the work positive, negative or zero?

The work is a boundary work so it is

$$W = \int PdV = \int Pm\, dv = AREA$$

so the sign depends on the sign for dV (or dv). The process looks like the following

The actual process is on a steeper curve than n = 1.



As the temperature increases we notice the volume decreases so

$$dv < 0 \quad \Rightarrow \quad W < 0$$

Work is **negative** and goes into the nitrogen gas.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.54

Helium gas expands from 125 kPa, 350 K and 0.25 m^3 to 100 kPa in a polytropic process with n = 1.667. How much work does it give out?

Solution:

Process equation: $PV^n = \text{constant} = P_1V_1^n = P_2V_2^n$

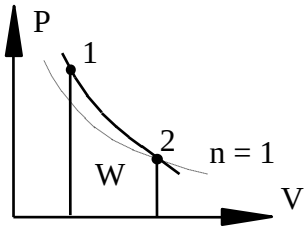
Solve for the volume at state 2

$$V_2 = V_1 (P_1/P_2)^{1/n} = 0.25 \times \left(\frac{125}{100}\right)^{0.6} = 0.2852 \text{ m}^3$$

Work from Eq.3.21

$$_1W_2 = \frac{P_2V_2 - P_1 V_1}{1-n} = \frac{100\times 0.2852 - 125\times 0.25}{1 - 1.667} \text{ kPa m}^3 = \mathbf{4.09\ kJ}$$

The actual process is on a steeper curve than n = 1.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.55

Air goes through a polytropic process from 125 kPa, 325 K to 300 kPa and 500 K. Find the polytropic exponent n and the specific work in the process.

Solution:

Process: $Pv^n = \text{Const} = P_1 v_1^n = P_2 v_2^n$

Ideal gas $Pv = RT$ so

$$v_1 = \frac{RT}{P} = \frac{0.287 \times 325}{125} = 0.7462 \text{ m}^3/\text{kg}$$

$$v_2 = \frac{RT}{P} = \frac{0.287 \times 500}{300} = 0.47833 \text{ m}^3/\text{kg}$$

From the process equation

$$(P_2/ P_1) = (v_1/ v_2)^n \quad => \quad \ln(P_2/ P_1) = n \ln(v_1/ v_2)$$

$$n = \ln(P_2/ P_1) \,/\, \ln(v_1/ v_2) = \frac{\ln 2.4}{\ln 1.56} = \mathbf{1.969}$$

The work is now from Eq.3.21 per unit mass and ideal gas law

$$_1w_2 = \frac{P_2v_2 - P_1v_1}{1\text{-}n} = \frac{R(T_2 - T_1)}{1\text{-}n} = \frac{0.287(500 - 325)}{1 - 1.969} \text{ (kJ/kg-K) K}$$

$$= \mathbf{-51.8 \text{ kJ/kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.56

A balloon behaves so the pressure is $P = C_2 V^{1/3}$, $C_2 = 100$ kPa/m. The balloon is blown up with air from a starting volume of 1 m^3 to a volume of 4 m^3. Find the final mass of air assuming it is at 25°C and the work done by the air.

Solution:

The process is polytropic with exponent $n = -1/3$.

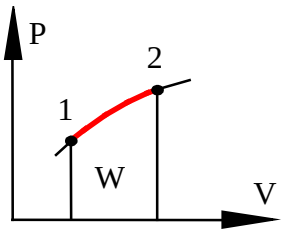
$$P_1 = C_2 V^{1/3} = 100 \times 1^{1/3} = 100 \text{ kPa}$$

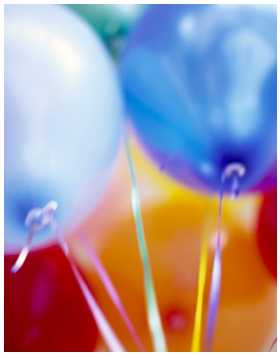
$$P_2 = C_2 V^{1/3} = 100 \times 4^{1/3} = 158.74 \text{ kPa}$$

$$_1W_2 = \int P\, dV = \frac{P_2V_2 - P_1V_1}{1 - n} \qquad \text{(Equation 3.18 and 3.21)}$$

$$= \frac{158.74 \times 4 - 100 \times 1}{1 - (-1/3)} \text{ kPa-m}^3 = \mathbf{401.2\ kJ}$$

$$m_2 = \frac{P_2V_2}{RT_2} = \frac{158.74 \times 4}{0.287 \times 298} \frac{\text{kPa-m}^3}{\text{kJ/kg}} = \mathbf{7.424\ kg}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.57

Consider a piston cylinder with 0.5 kg of R-134a as saturated vapor at -10°C. It is now compressed to a pressure of 500 kPa in a polytropic process with n = 1.5. Find the final volume and temperature, and determine the work done during the process.

Solution:

Take CV as the R-134a which is a control mass. $m_2 = m_1 = m$

Process: $Pv^{1.5} = \text{constant}$ until $P = 500$ kPa

1: (T, x) $v_1 = 0.09921$ m^3/kg, $P = P_{sat} = 201.7$ kPa from Table B.5.1

2: (P, process) $v_2 = v_1 (P_1/P_2)^{(1/1.5)}$

$= 0.09921 \times (201.7/500)^{2/3} =$ **0.05416** m^3/kg

Given (P, v) at state 2 from B.5.2 it is superheated vapor at $\mathbf{T_2 = 79°C}$

Process gives $P = C\, v^{-1.5}$, which is integrated for the work term, Eq.(3.21)

$$ {}_1W_2 = \int P\, dV = \frac{m}{1 - 1.5} (P_2v_2 - P_1v_1) $$

$$ = \frac{2}{-0.5} \text{ kg} \times (500 \times 0.05416 - 201.7 \times 0.09921) \text{ kPa-m}^3/\text{kg} $$

$$ = \mathbf{-7.07\ kJ} $$

Heat Transfer rates

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.58

The brake shoe and steel drum on a car continuously absorbs 75 W as the car slows down. Assume a total outside surface area of 0.1 m^2 with a convective heat transfer coefficient of 10 W/m^2 K to the air at 20°C. How hot does the outside brake and drum surface become when steady conditions are reached?

Solution :

Convection heat transfer, Eq.3.24

$$\dot{Q} = hA\Delta T \quad \Rightarrow \quad \Delta T = \frac{\dot{Q}}{hA}$$

$$\Delta T = (T_{BRAKE} - 20) = \frac{75 \text{ W}}{10 \text{ Wm}^{-2}\text{K}^{-1} \times 0.1 \text{ m}^2} = \mathbf{75\ °C}$$

$$T_{BRAKE} = 20 + 75 = \mathbf{95°C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.59

A water-heater is covered up with insulation boards over a total surface area of 3 m^2. The inside board surface is at 75°C and the outside surface is at 18°C and the board material has a conductivity of 0.08 W/m K. How thick a board should it be to limit the heat transfer loss to 200 W ?

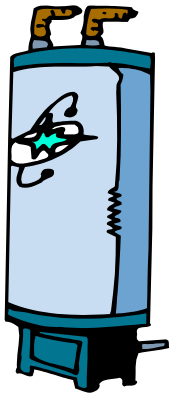
Solution :

Steady state conduction through a single layer board, Eq.3.23.

$$\dot{Q}_{cond} = k\ A\ \frac{\Delta T}{\Delta x} \quad \Rightarrow \quad \Delta x = k\ A\ \Delta T/\dot{Q}$$

$$\Delta x = 0.08\ \frac{W}{m\ K} \times 3\ m^2 \times \frac{75 - 18}{200}\ \frac{K}{W}$$

$$= \mathbf{0.068\ m}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.60

Find the rate of conduction heat transfer through a 1.5 cm thick hardwood board, k = 0.16 W/m K, with a temperature difference between the two sides of 20^{o}C.

One dimensional heat transfer by conduction, we do not know the area so we can find the flux (heat transfer per unit area W/m^2).

$$\dot{q} = \dot{Q}/A = k \frac{\Delta T}{\Delta x} = 0.16 \frac{W}{m\ K} \times \frac{20}{0.015} \frac{K}{m} = \mathbf{213\ W/m^2}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

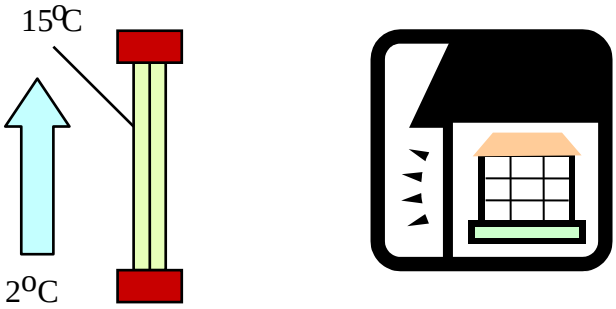
3.61

A 2 m^2 window has a surface temperature of 15°C and the outside wind is blowing air at 2°C across it with a convection heat transfer coefficient of h = 125 W/m^2K. What is the total heat transfer loss?

Solution:
Convection heat transfer, Eq.3.24

$$\dot{Q} = h\ A\ \Delta T = 125\ W/m^2K \times 2\ m^2 \times (15 - 2)\ K = \mathbf{3250\ W}$$

as a rate of heat transfer out.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.62

Due to a faulty door contact the small light bulb (25 W) inside a refrigerator is kept on and limited insulation lets 50 W of energy from the outside seep into the refrigerated space. How much of a temperature difference to the ambient at 20°C must the refrigerator have in its heat exchanger with an area of 1 m^2 and an average heat transfer coefficient of 15 W/m^2 K to reject the leaks of energy.

Solution :

$$\dot{Q}_{tot} = 25 + 50 = 75 \text{ W to go out}$$

Convection heat transfer, Eq.3.24

$$\dot{Q} = hA\,\Delta T = 15 \times 1 \times \Delta T = 75 \text{ W}$$

$$\Delta T = \frac{\dot{Q}}{hA} = \frac{75 \text{ W}}{15 \text{ W/(m}^2\text{K)} \times 1 \text{ m}^2} = \mathbf{5\ °C}$$

so T must be at least **25 °C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.63

A large condenser (heat exchanger) in a power plant must transfer a total of 100 MW from steam running in a pipe to sea water being pumped through the heat exchanger. Assume the wall separating the steam and seawater is 4 mm of steel, conductivity 15 W/m K and that a maximum of 5°C difference between the two fluids is allowed in the design. Find the required minimum area for the heat transfer neglecting any convective heat transfer in the flows.

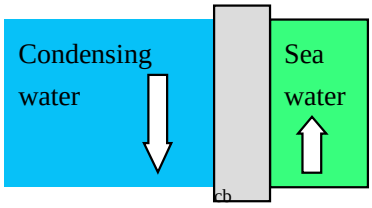
Solution :

Steady conduction through the 4 mm steel wall, Eq.3.23.

$$\dot{Q} = k\ A\ \frac{\Delta T}{\Delta x} \quad \Rightarrow \quad A = \dot{Q}\,\Delta x / k\Delta T$$

$$A = 100 \times 10^6\ \text{W} \times 0.004\ \text{m} / (15\ \text{W/mK} \times 5\ \text{K})$$

$$= \mathbf{480\ m^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.64

The black grille on the back of a refrigerator has a surface temperature of 35°C with a total surface area of 1 m^2. Heat transfer to the room air at 20°C takes place with an average convective heat transfer coefficient of 15 W/m^2 K. How much energy can be removed during 15 minutes of operation?

Solution :

Convection heat transfer, Eq.3.24

$$\dot{Q} = hA\ \Delta T; \quad Q = \dot{Q}\ \Delta t = hA\ \Delta T\ \Delta t$$

$$Q = 15\ W/m^2\ K \times 1\ m^2 \times (35\text{-}20)\ K \times 15\ min \times 60\ s/min$$
$$= 202\ 500\ J = \mathbf{202.5\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.65

A pot of steel, conductivity 50 W/m K, with a 5 mm thick bottom is filled with 15°C liquid water. The pot has a diameter of 20 cm and is now placed on an electric stove that delivers 500 W as heat transfer. Find the temperature on the outer pot bottom surface assuming the inner surface is at 15°C.

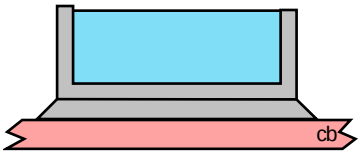
Solution :

Steady conduction, Eq.3.23, through the bottom of the steel pot. Assume the inside surface is at the liquid water temperature.

$$\dot{Q} = k\ A\ \frac{\Delta T}{\Delta x} \quad \Rightarrow \quad \Delta T = \dot{Q}\ \Delta x\ /\ kA$$

$$\Delta T = 500\ \text{W} \times 0.005\ \text{m}\ /(50\ \text{W/m-K} \times \frac{\pi}{4} \times 0.2^2\ \text{m}^2) = 1.59\ \text{K}$$

$$T = 15 + 1.59 \cong \mathbf{16.6°C}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.66

A log of burning wood in the fireplace has a surface temperature of 450°C. Assume the emissivity is 1 (perfect black body) and find the radiant emission of energy per unit surface area.

Solution :

Radiation heat transfer, Eq.3.25

$$\dot{Q}/A = 1 \times \sigma \; T^4$$

$$= 5.67 \times 10^{-8} \text{ W/m}^2\text{K}^4 \times (273.15 + 450)^4 \text{ K}^4$$

$$= 15\,505 \text{ W/m}^2$$

$$= \mathbf{15.5 \text{ kW/m}^2}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.67

A wall surface on a house is at 30°C with an emissivity of ε = 0.7. The surrounding ambient to the house is at 15°C, average emissivity of 0.9. Find the rate of radiation energy from each of those surfaces per unit area.

Solution :

Radiation heat transfer, Eq.3.25

$$\dot{Q}/A = \varepsilon\sigma A T^4, \quad \sigma = 5.67 \times 10^{-8} \ W/m^2K^4$$

a) $\dot{Q}/A = 0.7 \times 5.67 \times 10^{-8}\ W/m^2K^4 \times (273.15 + 30)^4\ K^4 = \mathbf{335\ W/m^2}$

b) $\dot{Q}/A = 0.9 \times 5.67 \times 10^{-8}\ W/m^2K^4 \times 288.15^4\ K^4 = \mathbf{352\ W/m^2}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.68

A radiant heat lamp is a rod, 0.5 m long and 0.5 cm in diameter, through which 400 W of electric energy is deposited. Assume the surface has an emissivity of 0.9 and neglect incoming radiation. What will the rod surface temperature be ?

Solution :

For constant surface temperature outgoing power equals electric power.

Radiation heat transfer, Eq.3.25

$$\dot{Q}_{rad} = \varepsilon\sigma A T^4 = \dot{Q}_{el} \quad \Rightarrow$$

$$T^4 = \dot{Q}_{el} / \varepsilon\sigma A$$

$$= 400 \text{ W} / (0.9 \times 5.67 \times 10^{-8} \text{ W/m}^2\text{K}^4 \times 0.5 \times \pi \times 0.005 \text{ m}^2)$$

$$= 9.9803 \times 10^{11} \text{ K}^4$$

$$\Rightarrow \quad T \cong \mathbf{1000\ K \quad OR \quad 725\ °C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.69

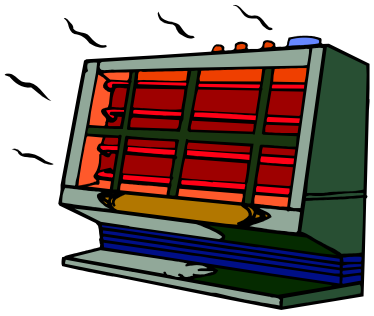
A radiant heating lamp has a surface temperature of 1000 K with $\varepsilon = 0.8$. How large a surface area is needed to provide 250 W of radiation heat transfer?

Radiation heat transfer, Eq.3.25. We do not know the ambient so let us find the area for an emitted radiation of 250 W from the surface

$$\dot{Q} = \varepsilon \sigma A T^4$$

$$A = \frac{\dot{Q}}{\varepsilon \sigma T^4} = \frac{250}{0.8 \times 5.67 \times 10^{-8} \times 1000^4} \frac{W}{W/m^2}$$

$$= \mathbf{0.0055 \ \ m^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Properties (u, h) from General Tables

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.70

Determine the phase of the following substances and find the values of the unknown quantities.

a. Nitrogen, P = 2000 kPa, 120 K, v = ?, Z = ?
b. Nitrogen 120 K, v = 0.0050 m^3/kg, Z = ?
c. Air, T = 100 C, v = 0.500 m^3/kg, P = ?
d. R-410A, T = 25°C, v = 0.01 m^3/kg, P = ?, h = ?

Solution:

a. B.6.2 at 2000 kPa, 120 K: v = 0.0126 m^3/kg; A.5: R = 0.2968 kJ/kgK

$$Z = \frac{Pv}{RT} = \frac{2000 \times 0.0126}{0.2968 \times 120} \frac{\text{kPa m}^3/\text{kg}}{(\text{kJ/kgK})\ \text{K}} = \mathbf{0.7075}$$

b. Table B.6.1: $v_f < v < v_g = 0.00799$ m^3/kg so two-phase L + V

$$P = P_{sat} = \mathbf{2513\ kPa}$$

$$x = (v - v_f)/v_{fg} = \frac{0.005 - 0.001915}{0.00608} = 0.5074$$

$$Z = \frac{Pv}{RT} = \frac{2513 \times 0.005}{0.2968 \times 120} \frac{\text{kPa m}^3/\text{kg}}{(\text{kJ/kgK})\ \text{K}} = \mathbf{0.353}$$

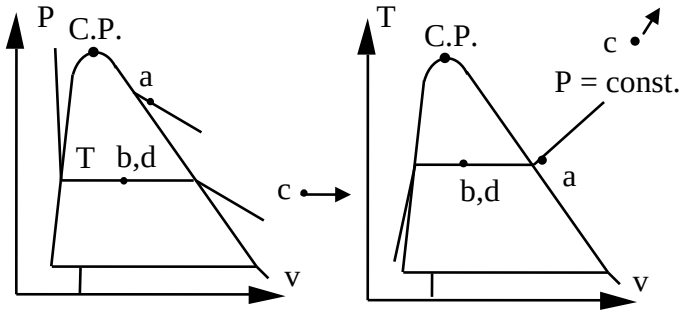
c. Ideal gas, P = RT/v = 0.287 kJ/kgK × 373.15 K / 0.5 m^3/kg = **214 kPa**

d. B.4.1 at 25°C, $v_f = 0.000944$, $v_g = 0.01514$, $v_f < v < v_g$: saturated.

$$P = \mathbf{1653.6\ kPa}, \qquad x = \frac{v - v_f}{v_{fg}} = \frac{0.01 - 0.000944}{0.0142} = 0.63775,$$

$$h = h_f + x\, h_{fg} = 97.59 + 0.63775 \times 186.43 = \mathbf{216.486\ kJ/kg}$$

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.71

Find the phase and the missing properties of T, P, v, u and x for water at:

a. 500 kPa, 100°C b. 5000 kPa, u = 800 kJ/kg

c. 5000 kPa, v = 0.06 m^3/kg d. -6°C, v = 1 m^3/kg

Solution:

a) Look in Table B.1.2 at 500 kPa

$T < T_{sat} = 151^oC$ => compressed liquid

Table B.1.4: $v = 0.001043\ m^3/kg$, $u = 418.8$ kJ/kg

b) Look in Table B.1.2 at 5000 kPa

$u < u_f = 1147.78$ kJ/kg => compressed liquid

Table B.1.4: between 180°C and 200°C

$$T = 180 + (200 - 180)\frac{800 - 759.62}{848.08 - 759.62} = 180 + 20 \times 0.4567 = 189.1^oC$$

$$v = 0.001124 + 0.4567\ (0.001153 - 0.001124) = 0.001137\ m^3/kg$$

c) Look in Table B.1.2 at 5000 kPa

$v > v_g = 0.03944\ m^3/kg$ => superheated vapor

Table B.1.3: between 400°C and 450°C.

$$T = 400 + 50 \times \frac{0.06 - 0.05781}{0.0633 - 0.05781} = 400 + 50 \times 0.3989 = 419.95^oC$$

$$u = 2906.58 + 0.3989 \times (2999.64 - 2906.58) = 2943.7\ kJ/kg$$

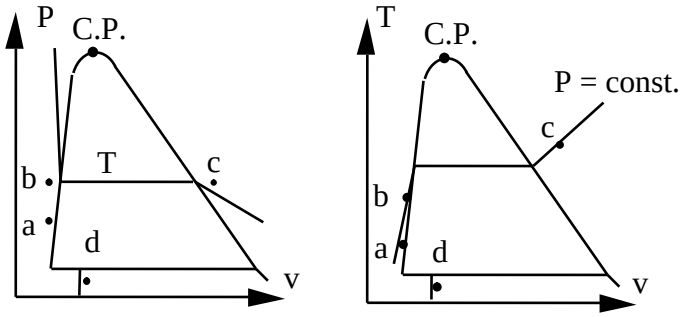
d) B.1.5: $v_i < v < v_g = 334.14\ m^3/kg$ => 2-phase, $P = P_{sat} = 887.6$ kPa,

$x = (v - v_i) / v_{fg} = (1 - 0.0010898)/334.138 = 0.0029895$

$u = u_i + x\ u_{fg} = -345.91 + 0.0029895 \times 2712.9 = -337.8$ kJ/kg

3.72

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.73

Find the missing properties and give the phase of the ammonia, NH_3.

a. T = 65°C, P = 600 kPa u = ? v = ?

b. T = 20°C, P = 100 kPa u = ? v = ? x = ?

c. T = 50°C, v = 0.1185 m^3/kg u = ? P = ? x = ?

Solution:

a) Table B.2.1 P < Psat => superheated vapor Table B.2.2:

v = 0.5 × 0.25981 + 0.5 × 0.26888 = **0.2645 m^3/kg**

u = 0.5 × 1425.7 + 0.5 × 1444.3 = **1435 kJ/kg**

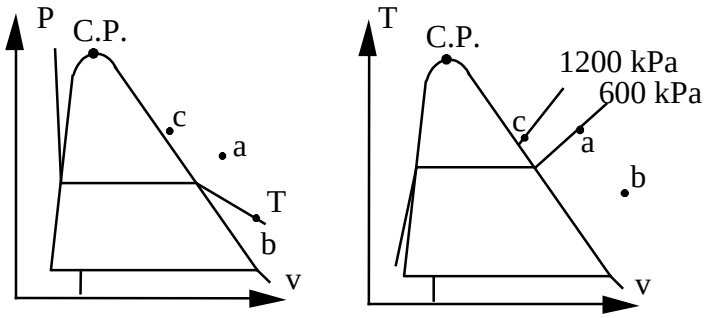
b) Table B.2.1: P < Psat => x = **undefined**, **superheated vapor**, from B.2.2:

v = **1.4153 m^3/kg** ; u = **1374.5 kJ/kg**

c) Sup. vap. ($v > v_g$) Table B.2.2. P = **1200 kPa**, x = **undefined**

u = **1383 kJ/kg**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.74

Find the missing properties of (P, T, v, u, h and x) and indicate the states in a P-v and T-v diagram for

a. Water at 5000 kPa, u = 1000 kJ/kg (Table B.1 reference)

b. R-134a at 20^{o}C, u = 300 kJ/kg

c. Nitrogen at 250 K, 200 kPa

Solution:

a) Compressed liquid: B.1.4 interpolate between 220^{o}C and 240^{o}C.

T = **233.3^{o}C**, v = **0.001213 m^3/kg**, x = **undefined**

b) Table B.5.1: $u < u_g$ => two-phase liquid and vapor

$x = (u - u_f)/u_{fg} = (300 - 227.03)/162.16 = 0.449988$ = **0.45**

v = 0.000817 + 0.45 × 0.03524 = **0.01667 m^3/kg**

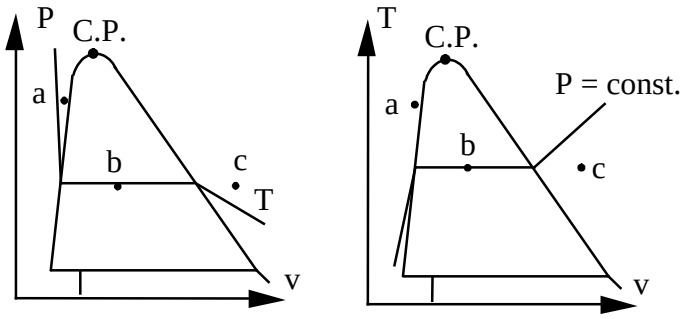
c) Table B.6.1: $T > T_{sat}$ (200 kPa) so superheated vapor in Table B.6.2

x = **undefined**

v = 0.5(0.35546 + 0.38535) = **0.3704 m^3/kg**,

u = 0.5(177.23 + 192.14) = **184.7 kJ/kg**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.75

Determine the phase and the missing properties

a. H_2O 20°C, v = 0.001000 m^3/kg P = ? u = ?
b. R-410A 400 kPa, v = 0.075 m^3/kg T = ?, u = ?
c. NH_3 10°C, v = 0.1 m^3/kg P = ? u = ?
d. N_2 101.3 kPa, h = 60 kJ/kg T = ? v = ?

a) Enter Table B.1.1 with T and we see at 20°C, $v < v_f$ so compressed liquid and Table B.1.4: **P = 5000 kPa and u = 83.64 kJ/kg**.

b) Table B.4.2: P = 400 kPa $v > v_g$ so superheated, interpolate

$$T = 0 + 20 \frac{0.075 - 0.07227}{0.07916 - 0.7227} = 20 \times 0.3962 = \mathbf{7.9°C}$$

$$u = 261.51 + (276.44 - 261.51) \times 0.3962 = \mathbf{267.43\ kJ/kg},$$

c) Table B.2.1 at 10°C, $v_f = 0.0016\ m^3/kg$, $v_g = 0.20541\ m^3/kg$
so two-phase $P = P_{sat} = \mathbf{615.2\ kPa}$

$$x = \frac{v - v_f}{v_{fg}} = \frac{0.1 - 0.0016}{0.20381} = 0.4828$$

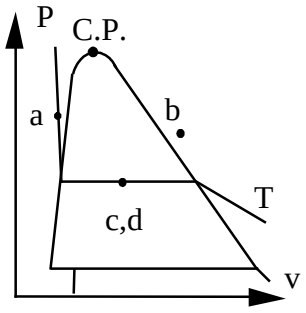
$$u = u_f + x\, u_{fg} = 225.99 + x \times 1099.7 = \mathbf{756.93\ kJ/kg}$$

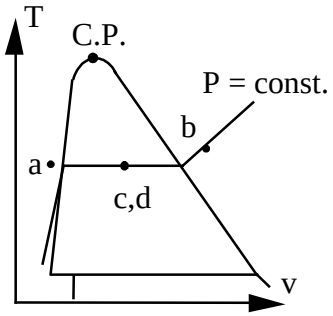
d) Table B.6.1 shows that at 101.3 kPa, $h_f < h < h_g = 76.69$ kJ/kg,
so saturated two-phase **T = 77.3 K**

$$x = (h - h_f) / h_{fg} = (60 + 122.15)/198.84 = 0.916$$

$$v = v_f + x\, v_{fg} = 0.001240 + 0.916 \times 0.21515 = \mathbf{0.1983\ m^3/kg}$$

States shown are placed relative to the two-phase region, not to each other.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.76

Find the missing properties of (u, h, and x)

a. H_2O $T = 120°C$, $v = 0.5$ m^3/kg

b. H_2O $T = 100°C$, $P = 10$ MPa

c. N_2 $T = 100$ K, $x = 0.75$

d. N_2 $T = 200$ K, $P = 200$ kPa

e. NH_3 $T = 100°C$, $v = 0.1$ m^3/kg

Solution:

a) Table B.1.1: $v_f < v < v_g$ => L+V mixture, P = **198.5 kPa**,

x = (0.5 - 0.00106)/0.8908 = **0.56**,

u = 503.48 + 0.56 × 2025.76 = **1637.9 kJ/kg**

b) Table B.1.4: compressed liquid, v = 0**.001039 m^3/kg**, u = **416.1 kJ/kg**

c) Table B.6.1: 100 K, x = 0.75

v = 0.001452 + 0.75 × 0.02975 = **0.023765 m^3/kg**

u = -74.33 + 0.75 ×137.5 = **28.8 kJ/kg**

d) Table B.6.2: 200 K, 200 kPa

v = **0.29551 m^3/kg ; u = 147.37 kJ/kg**

e) Table B.2.1: $v > v_g$ => superheated vapor, x = **undefined**

B.2.2: $P = 1600 + 400 \times \frac{0.1 - 0.10539}{0.08248 - 0.10539} =$ **1694 kPa**

States shown are placed relative to the two-phase region, not to each other.

3.77

Determine the phase of the following substances and find the values of the unknown quantities.

a. R-410A, T = –20°C, u = 220 kJ/kg, P = ?, x = ?
b. Ammonia, T = –20°C, v = 0.35 m^3/kg, P = ?, u = ?
c. Water, P = 400 kPa, h = 2800 kJ/kg, T = ?, v = ?

a. At –20°C in B.4.1 $u < u_g = 245.99$ kJ/kg so,

$x = (u - u_f)/u_{fg} = (220 - 27.92)/218.07 =$ **0.8808**

$P = P_{sat} =$ **399.6 kPa**

b. At –20°C, $v_f = 0.001504$, $v_g = 0.62334$ m^3/kg, $v_f < v < v_g$: saturated.

P = **190.2 kPa**,

$$x = \frac{v - v_f}{v_{fg}} = \frac{0.35 - 0.001504}{0.62184} = 0.56043,$$

$u = u_f + x\, u_{fg} = 88.76 + 0.56043 \times 1210.7 = 767.27$ kJ/kg

c. B.1.2 at 400 kPa: $h > h_g = 2738.5$ kJ/kg so superheated vapor.

we locate it between 150 and 200°C and interpolate

$y = (2800 - 2752.82)/(2860.51 - 2752.82) = 0.43811$

T = 150 + y (200 – 150) = **171.9°C**

v = 0.47084 + y (0.53422 – 0.47084) = **0.4986 m^3/kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.78

Find the missing properties for CO_2 at:

a) 20^oC, 2 MPa v = ? and h = ?

b) 10^oC, x = 0.5 P = ?, u = ?

c) 1 MPa, v = 0.05 m^3/kg, T = ?, h = ?

Solution:

a) Table B.3.1 $P < P_{sat} = 5729$ kPa so superheated vapor.

Table B.3.2: v = 0.0245 m^3/kg, h = 368.42 kJ/kg

b) Table B.3.1 since x given it is two-phase

$P = P_{sat} = 4502$ kPa

$u = u_f + x\, u_{fg} = 107.6 + 0.5 \times 169.07 = 192.14$ kJ/kg

c) Table B.3.1 $v > v_g \approx 0.0383$ m^3/kg so superheated vapor

Table B.3.2: Between 0 and 20^oC so interpolate.

$$T = 0 + 20 \times \frac{0.05 - 0.048}{0.0524 - 0.048} = 20 \times 0.4545 = 9.09^oC$$

$h = 361.14 + (379.63 - 361.14) \times 0.4545 = 369.54$ kJ/kg

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.79

Find the missing properties among (T, P, v, u, h and x if applicable) and indicate the states in a P-v and a T-v diagram for

a. R-410A P = 500 kPa, h = 300 kJ/kg

b. R-410A T = 10°C, u = 200 kJ/kg

c. R-134a T = 40°C, h = 400 kJ/kg

Solution:

a) Table B.4.1: $h > h_g$ => **superheated vapor**, look in section 500 kPa and interpolate

$$T = 0 + 20 \times \frac{300 - 287.84}{306.18 - 287.84} = 20 \times 0.66303 = \mathbf{13.26°C},$$

$v = 0.05651 + 0.66303 \times (0.06231\text{-}0.05651) = \mathbf{0.06036\ m^3/kg}$,

$u = 259.59 + 0.66303 \times (275.02 - 259.59) = \mathbf{269.82\ kJ/kg}$

b) Table B.4.1: $u < u_g = 255.9$ kJ/kg => L+V mixture, P = **1085.7 kPa**

$$x = \frac{u - u_f}{u_{fg}} = \frac{200 - 72.24}{183.66} = \mathbf{0.6956},$$

$v = 0.000886 + 0.6956 \times 0.02295 = \mathbf{0.01685\ m^3/kg}$,

$h = 73.21 + 0.6956 \times 208.57 = \mathbf{218.3\ kJ/kg}$

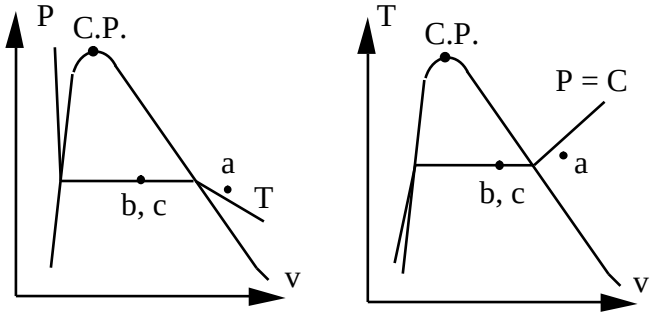
c) Table B.5.1: $h < h_g$ => **two-phase L + V,** look in B.5.1 at 40°C:

$$x = \frac{h - h_f}{h_{fg}} = \frac{400 - 256.5}{163.3} = 0.87875, \qquad P = P_{sat} = \mathbf{1017\ kPa},$$

$v = 0.000\,873 + 0.87875 \times 0.01915 = \mathbf{0.0177\ m^3/kg}$

$u = 255.7 + 0.87875 \times 143.8 = \mathbf{382.1\ kJ/kg}$

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.80

Saturated liquid water at 20°C is compressed to a higher pressure with constant temperature. Find the changes in u and h from the initial state when the final pressure is a) 500 kPa, b) 2000 kPa

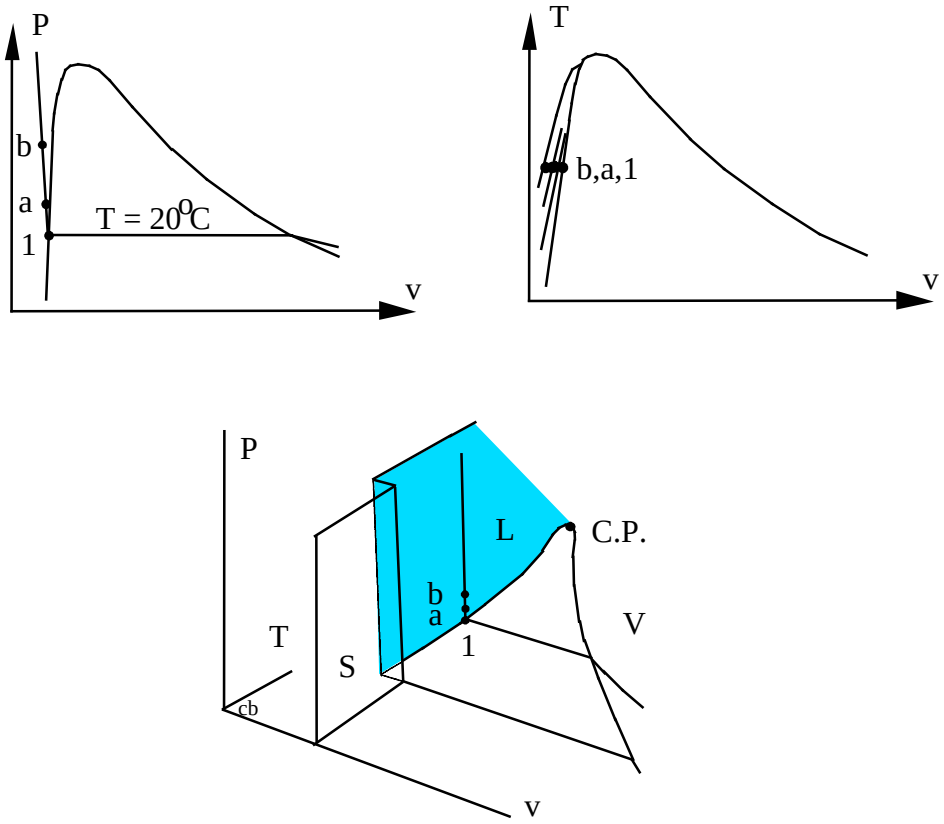
Solution:

State 1 is located in Table B.1.1 and the states a-c are from Table B.1.4

State	u [kJ/kg]	h [kJ/kg]	$\Delta u = u - u_1$	$\Delta h = h - h_1$	$\Delta(Pv)$
1	83.94	83.94			
a	83.91	84.41	-0.03	0.47	0.5
b	83.82	85.82	-0.12	1.88	2

For these states u stays nearly constant, dropping slightly as P goes up.

h varies with Pv changes.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.81

Determine the phase of the following substances and find the values of the unknown quantities.

a. Water, P = 500 kPa, u = 2850 kJ/kg, T = ?, v = ?

b. R-134a, T = –10°C, v = 0.08 m^3/kg, P = ?, u = ?

c. Ammonia, T = –20°C, u = 1000 kJ/kg, P = ?, x = ?

a. B.1.2 at 500 kPa: $u > u_g = 2561$ kJ/kg so superheated vapor.
we locate it between 300 and 350°C and interpolate

$x = (2850 - 2802.9)/(2882.6 - 2802.9) = 0.590966$

$T = 300 + x\,(350 - 300) = 329.55°C$

$v = 0.52256 + x\,(0.57012 - 0.52256) = 0.5507\ m^3/kg$

b. B.5.1 at –10°C, $v_f = 0.000755\ m^3/kg$, $v_g = 0.09921\ m^3/kg$, $v_f < v < v_g$:

saturated, P = 201.7 kPa,

$x = (v - v_f)/v_{fg} = (0.08\text{-}0.000755)/0.09845 = 0.805$,

$u = u_f + x\,u_{fg} = 186.57 + 0.805 \times 185.7 = 336$ kJ/kg

c. B.2.1 at –20°C: $u < u_g = 1299.5$ kJ/kg so, $P = P_{sat} = 190.2$ kPa

$x = (u - u_f)/u_{fg} = (1000 - 88.76)/1210.7 = 0.7526$

Problem Analysis

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.82

Consider Problem 3.101. Take the whole room as a C.V. and write both conservation of mass and energy equations. Write some equations for the process (two are needed) and use those in the conservation equations. Now specify the four properties that determines initial (2) and final state (2), do you have them all? Count unknowns and match with equations to determine those.

C.V.: Containment room and reactor.

Mass: $m_2 - m_1 = 0$; $m_2 = m_1 = V_{reactor}/v_1$

Energy: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: Room volume constant $V = C \Rightarrow {}_1W_2 = 0$

Room insulated $\Rightarrow {}_1Q_2 = 0$

Using these in the equation for mass and energy gives:

$m_2 = V_2/v_2 = m_1$; $m(u_2 - u_1) = 0 - 0 = 0$

State 1: P_1, T_1 so Table B.1.4 gives $v_1, u_1 \Rightarrow m_1$

State 2: P_2, ?

We do not know **one** state 2 property and the total room volume

Energy equation then gives $u_2 = u_1$ (a state 2 property)

State 2: $P_2, u_2 \Rightarrow v_2$

Now we have the room volume as

Continuity Eq.: $m_2 = V/v_2 = m_1$ so $V = m_1 v_2$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.83

Consider a steel bottle as a CV. It contains carbon dioxide at –20 ^{o}C, quality 20%. It has a safety valve that opens at 6 MPa. The bottle is now accidentially heated until the safety valve opens. Write the process equation that is valid until the valve opens and plot the P-v diagram for the process.

Solution:

C.V. carbon dioxide, which is a control mass of constant volume.

Energy Eq.3.5 (3.26): $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Process: V = constant and m = constant

=> **v = constant** ; ${}_1w_2 = 0$

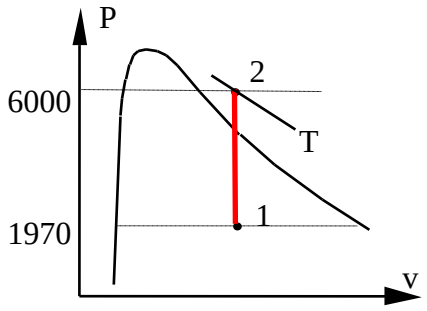
State 1: Table B.3.1, $P_1 = P_{sat} = 1970$ kPa

$v_1 = v_f + x\, v_{fg} = \ldots\ldots$

State 2: 6000 kPa, $v_1 = v_2 = \ldots..$ => Table B.3.1 or B.3.2

$T_2 = \ldots$, $u_2 = \ldots\ldots$

${}_1q_2 = (u_2 - u_1) = \ldots\ldots$



State 2 could also be in the two-phase region if

$v_1 = v_2 < v_g$ at 6 MPa

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.84

A piston/cylinder contains water with quality 75% at 200 kPa. Slow expansion is performed while there is heat transfer and the water is at constant pressure. The process stops when the volume has doubled. How do you determine the final state and the heat transfer?

CV. Water, this is a control mass, we do not know size so do all per unit mass.

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Process: P = C; ${}_1w_2 = \int Pdv = P(v_2 - v_1)$

State 1: x_1, P_1 Table B.1.2 gives T_1, u_1

State 2: $v_2 = 2v_1 = \ldots$ & $P_2 = P_1$

Compare v_2 to v_g to determine if sup. vapor or not.

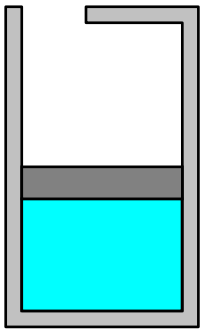
Either find x_2 or interpolate to get T_2 and u_2 in B.1.3

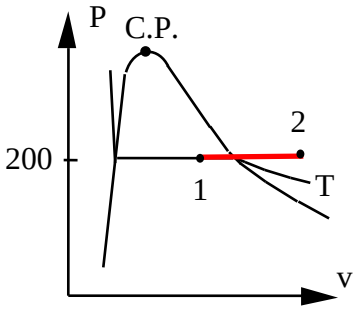
Process: P = C so the work term integral is

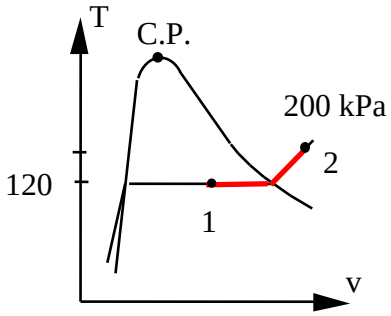
${}_1w_2 = \int Pdv = P(v_2 - v_1) = \ldots\ldots$

From the energy equation

${}_1q_2 = (u_2 - u_1) + {}_1w_2 = \ldots\ldots..$







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.85

Consider Problem 3.173 with the final state given but that you were not told the piston hits the stops and only told $V_{stop} = 2\ V_1$. Sketch the possible P-v diagram for the process and determine which number(s) you need to uniquely place state 2 in the diagram. There is a kink in the process curve what are the coordinates for that state? Write an expression for the work term.

C.V. R-410A. Control mass goes through process: 1 -> 2 -> 3

As piston floats pressure is constant (1 -> 2) and the volume is constant for the second part (2 -> 3). So we have: $v_3 = v_2 = 2 \times v_1$

State 2: $V_2 = V_{stop} \Rightarrow v_2 = 2 \times v_1 = v_3$ and $P_2 = P_1 \Rightarrow T_2 = \ldots$

State 3: Table B.4.2 (P,T) $v_3 = 0.02249$ m^3/kg, $u_3 = 287.91$ kJ/kg

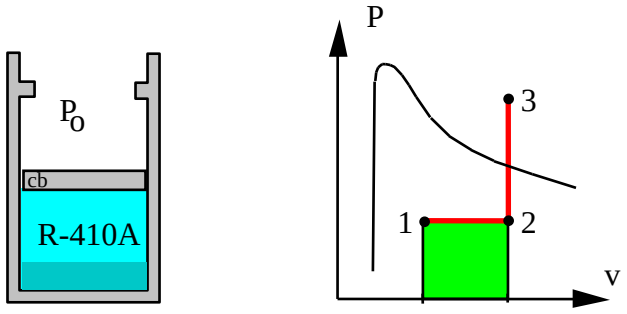
Now we can find state 1 (T_1, $v_1 = v_3/2 = 0.011245$ m^3/kg) two-phase

Then state 2 (the kink)

$v_2 = v_3 = 0.02249$ m^3/kg

$P_2 = P_1 = 1085.7$ kPa $= P_{sat}$

$$W = \int P\, dV = P(V_2 - V_1) = Pm\,(v_2 - v_1)$$

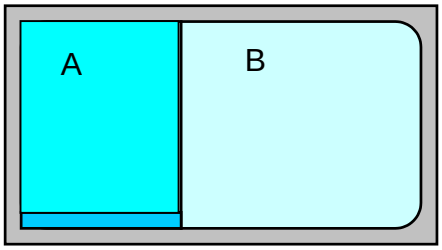


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.86

Take problem 3.210 and write the left hand side (storage change) of the conservation equations for mass and energy. How do you write m_1 and Eq. 3.5?

C.V.: Both rooms A and B in tank.



Continuity Eq.: $m_2 - m_{A1} - m_{B1} = 0$;

Energy Eq.: $m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} = {}_1Q_2 - {}_1W_2$

Notice how the state 1 term split into two terms

$$m_1 = \int \rho \, dV = \int (1/v) \, dV = V_A/v_{A1} + V_B/v_{B1} = m_{A1} + m_{B1}$$

and for energy as

$$m_1u_1 = \int \rho u \, dV = \int (u/v) \, dV = (u_{A1}/v_{A1})V_A + (u_{B1}/v_{B1})V_B$$
$$= m_{A1}u_{A1} + m_{B1}u_{B1}$$

Formulation continues as:

Process constant total volume: $V_{tot} = V_A + V_B$ and ${}_1W_2 = \emptyset$

$$m_2 = m_{A1} + m_{B1} \Rightarrow v_2 = V_{tot}/m_2$$

etc.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.87

Two rigid insulated tanks are connected with a pipe and valve. One tank has 0.5 kg air at 200 kPa, 300 K and the other has 0.75 kg air at 100 kPa, 400 K. The valve is opened and the air comes to a single uniform state without any heat transfer. How do you determine the final temperature and pressure?

Solution:

C.V. Total tank. Control mass of constant volume.

Mass and volume: $m_2 = m_A + m_B$; $V = V_A + V_B$

Energy Eq.: $U_2 - U_1 = m_2 u_2 - m_A u_{A1} - m_B u_{B1} = {}_1Q_2 - {}_1W_2 = 0$

Process Eq.: V = constant $\Rightarrow {}_1W_2 = 0$; Insulated $\Rightarrow {}_1Q_2 = 0$

Ideal gas at A1: $V_A = m_A RT_{A1}/P_{A1} = \ldots..$

$u_{A1} = \ldots\ldots$ from Table A.7

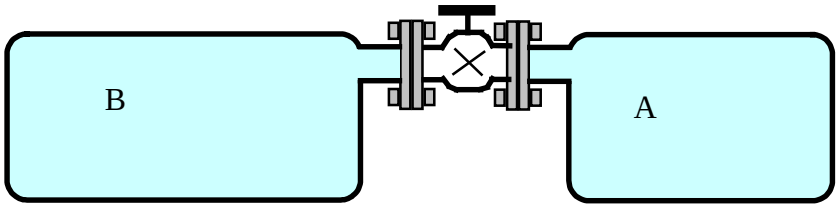
Ideal gas at B1: $V_B = m_B RT_{B1}/ P_{B1} = \ldots\ldots.$

$u_{B1} = \ldots\ldots.$ from Table A.7

State 2: $m_2 = m_A + m_B$; => $v_2 = V/ m_2 = \ldots..$

Energy Eq.: $u_2 = \dfrac{m_A u_{A1} + m_B u_{B1}}{m_2} = \ldots..$ => Table A.7.1: $\mathbf{T_2}$

$P_2 = m_2 RT_2 /V = \ldots\ldots..$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.88

Look at problem 3.183 and plot the P-v diagram for the process. Only T_2 is given, how do you determine the 2nd property of the final state? What do you need to check and does it have an influence on the work term?

Process: $P = \text{constant} = F/A = P_1$ if $V > V_{min}$

$V = \text{constant} = V_{1a} = V_{min}$ if $P < P_1$

State 1: (P, T) $V_1 = mRT_1/P_1 = 0.5 \times 0.287 \times 1000/2000 = 0.07175\ m^3$

The only possible P-V combinations for this system are shown in the diagram so both state 1 and 2 must be on the two lines. For state 2 we need to know if it is on the horizontal P line segment or the vertical V segment. Let us check state 1a:

State 1a: $P_{1a} = P_1$, $V_{1a} = V_{min}$, Ideal gas so $T_{1a} = T_1 \dfrac{V_{1a}}{V_1}$

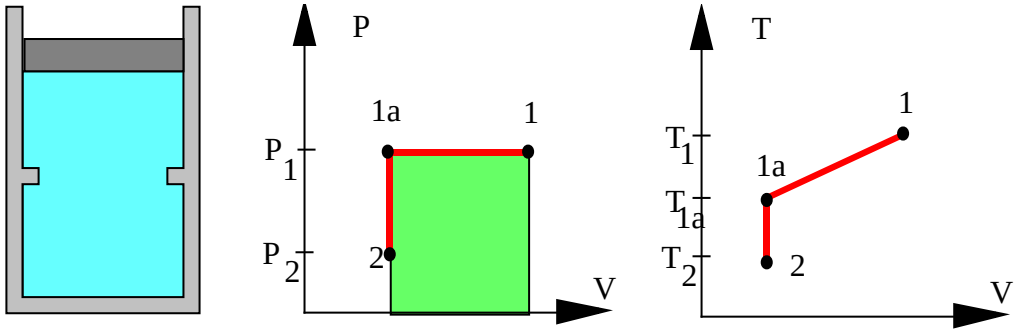
We see if $T_2 < T_{1a}$ then state 2 must have $V_2 = V_{1a} = V_{min} = 0.03\ m^3$. So state 2 is known by (T_2, v_2) and $P_2 = P_1 \times \dfrac{T_2}{T_1} \times \dfrac{V_1}{V_2}$

If it was that $T_2 > T_{1a}$ then we know state 2 as: T_2, $P_2 = P_1$ and we then have

$$V_2 = V_1 \times \frac{T_2}{T_1}$$

The work is the area under the process curve in the P-V diagram and so it does make a difference where state 2 is relative to state 1a. For the part of the process that proceeds along the constant volume V_{min} the work is zero, there is only work when the volume changes.

$$_1W_2 = \int_1^2 P\, dV = P_1 (V_{1a} - V_1)$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Simple processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.89

A 100-L rigid tank contains nitrogen (N_2) at 900 K, 3 MPa. The tank is now cooled to 100 K. What are the work and heat transfer for this process?

Solution:

C.V.: Nitrogen in tank. $m_2 = m_1$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: V = constant, $v_2 = v_1 = V/m$ => $\mathbf{{}_1W_2 = 0}$

Table B.6.2: State 1: $v_1 = 0.0900\ m^3/kg$ => $m = V/v_1 = 1.111$ kg

$u_1 = 691.7$ kJ/kg

State 2: 100 K, $v_2 = v_1 = V/m$, look in Table B.6.2 at 100 K

200 kPa: $v = 0.1425\ m^3/kg$; $u = 71.7$ kJ/kg

400 kPa: $v = 0.0681\ m^3/kg$; $u = 69.3$ kJ/kg

so a linear interpolation gives:

$$P_2 = 200 + 200\ (0.09 - 0.1425)/(0.0681 - 0.1425) = 341 \text{ kPa}$$

$$u_2 = 71.7 + (69.3 - 71.7)\ \frac{0.09 - 0.1425}{0.0681 - 0.1425} = 70.0 \text{ kJ/kg},$$

$${}_1Q_2 = m(u_2 - u_1) = 1.111 \text{ kg } (70.0 - 691.7) \text{ kJ/kg} = \mathbf{-690.7\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.90

A constant pressure piston/cylinder aasembly contains 0.2 kg water as saturated vapor at 400 kPa. It is now cooled so the water occupies half the original volume. Find the work and the heat transfer in the process.

Solution:

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: P = C; ${}_1W_2 = \int PdV = P(V_2 - V_1)$

Table B.1.2

State 1: $v_1 = 0.46246\ m^3/kg;\ u_1 = 2553.55\ kJ/kg$

State 2: $v_2 = v_1/2 = 0.23123\ m^3/kg = v_f + x\ v_{fg}$;

$$x_2 = \frac{v_2 - v_{f2}}{v_{fg2}} = \frac{0.23123 - 0.001084}{0.46138} = 0.4988$$

$$u_2 = u_{f2} + x_2\ u_{fg2} = 604.29 + x_2 \times 1949.26 = 1576.58\ kJ/kg$$

Process: P = C so the work term integral is

$${}_1W_2 = P(V_2 - V_1) = 400\ kPa \times 0.2 \times (0.23123 - 0.46246)\ m^3$$

$$= \mathbf{-18.5\ kJ}$$

From the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.2\ (1576.58 - 2553.55) - 18.5$$

$$= \mathbf{-213.9\ kJ}$$

3.91

Saturated vapor R-410A at 0°C in a rigid tank is cooled to -20°C. Find the specific heat transfer.

Solution:

C.V.: R-410A in tank. $m_2 = m_1$;

Energy Eq.3.5: $(u_2 - u_1) = {}_1q_2 - {}_1w_2$

Process: V = constant, $v_2 = v_1 = V/m$ => $\mathbf{{}_1w_2 = 0}$

Table B.4.1: State 1: $u_1 = 253.0$ kJ/kg

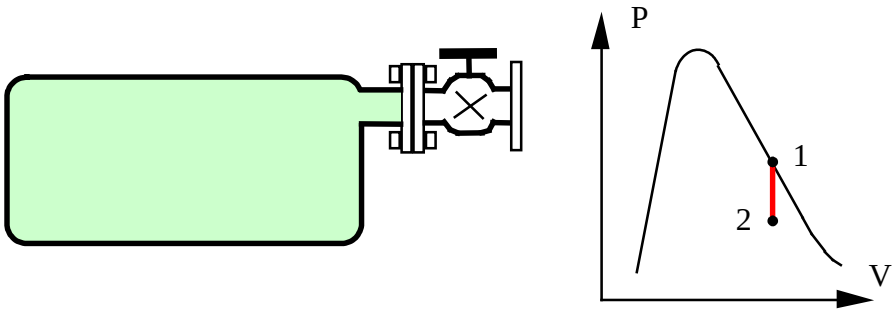
State 2: -20°C, $v_2 = v_1 = V/m$, look in Table B.4.1 at -20°C

$$x_2 = \frac{v_2 - v_{f2}}{v_{fg2}} = \frac{0.03267 - 0.000803}{0.06400} = 0.4979$$

$$u_2 = u_{f2} + x_2\, u_{fg2} = 27.92 + x_2 \times 218.07 = 136.5 \text{ kJ/kg}$$

From the energy equation

$${}_1q_2 = (u_2 - u_1) = (136.5 - 253.0) = \mathbf{-116.5\ kJ/kg}$$



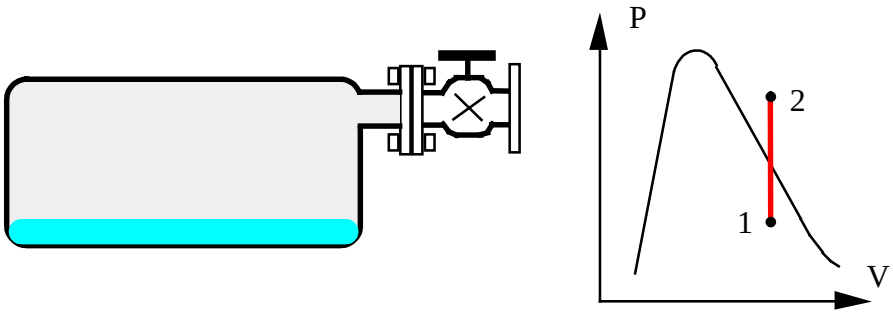
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.92

Ammonia at 0°C, quality 60% is contained in a rigid 200-L tank. The tank and ammonia is now heated to a final pressure of 1 MPa. Determine the heat transfer for the process.

Solution:

C.V.: NH_3



Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: Constant volume $\Rightarrow$ $v_2 = v_1$ & ${}_1W_2 = 0$

State 1: Table B.2.1 two-phase state.

$v_1 = 0.001566 + x_1 \times 0.28763 = 0.17414\ m^3/kg$

$u_1 = 179.69 + 0.6 \times 1138.3 = 862.67\ kJ/kg$

$m = V/v_1 = 0.2\ m^3/0.17414\ m^3/kg = 1.148\ kg$

State 2: P_2 , $v_2 = v_1$ superheated vapor Table B.2.2

$\Rightarrow T_2 \cong 100°C$, $u_2 \cong 1490.5\ kJ/kg$

So solve for heat transfer in the energy equation

${}_1Q_2 = m(u_2 - u_1) = 1.148\ kg\ (1490.5 - 862.67)\ kJ/kg =$ **720.75 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.93

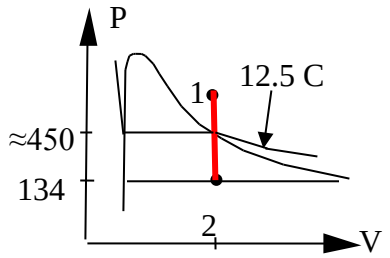
A rigid tank contains 1.5 kg of R-134a at 40°C, 500 kPa. The tank is placed in a refrigerator that brings it to -20°C. Find the process heat transfer and show the process in a *P-v* diagram.

CV the R-134a.

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2 = {}_1Q_2$,
Process: Rigid tank V = C => v = constant & ${}_1W_2 = \int_1^2 PdV = 0$

State 1: $v_1 = 0.04656$ m^3/kg,
$u_1 = 407.44$ kJ/kg

State 2: **T, v** => two-phase (straight down in P-v diagram from state 1)



$x_2 = (v - v_f)/v_{fg} = (0.04656 - 0.000738)/0.14576 = 0.31437$
$u_2 = u_f + x_2\, u_{fg} = 173.65 + 0.31437 \times 192.85 = 234.28$ kJ/kg

From the energy equation

${}_1Q_2 = m(u_2 - u_1) = 1.5$ kg (234.28 – 407.44) kJ/kg = **-259.7 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.94

A piston cylinder contains air at 600 kPa, 290 K and a volume of 0.01 m^3. A constant pressure process gives 54 kJ of work out. Find the final volume, the temperature of the air and the heat transfer.

C.V AIR control mass

Continuity Eq.: $m_2 - m_1 = 0$

Energy Eq.: $m\,(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = C$ so ${}_1W_2 = \int P\,dV = P(V_2 - V_1)$

State 1 : P_1 , T_1,V_1 State 2 : $P_1 = P_2$, ?

$$m_1 = P_1V_1/RT_1 = \frac{600\ \text{kPa} \times 0.01\ \text{m}^3}{0.287\ \text{kJ/kg-K} \times 290\ \text{K}} = 0.0721\ \text{kg}$$

${}_1W_2 = P(V_2 - V_1) = 54\ \text{kJ} \rightarrow$

$V_2 - V_1 = {}_1W_2 / P = 54\ \text{kJ} / 600\ \text{kPa} = 0.09\ \text{m}^3$

$V_2 = V_1 + {}_1W_2 / P = 0.01 + 0.09 = 0.1\ \text{m}^3$

Ideal gas law : $P_2V_2 = mRT_2$

$$T_2 = P_2V_2 / mR = \frac{P_2V_2}{P_1V_1} T_1 = \frac{0.10}{0.01} \times 290\ \text{K} = \mathbf{2900\ K}$$

Energy equation with u's from table A.7.1

$${}_1Q_2 = m\,(u_2 - u_1) + {}_1W_2$$

$$= 0.0721\ \text{kg} \times (2563.8 - 207.19)\ \text{kJ/kg} + 54\ \text{kJ}$$

$$= \mathbf{223.9\ kJ}$$

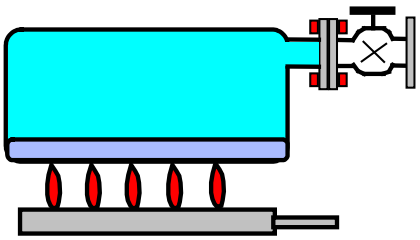
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.95

Two kg water at 120°C with a quality of 25% has its temperature raised 20°C in a constant volume process as in Fig. P3.95. What are the heat transfer and work in the process?

Solution:

C.V. Water. This is a control mass



Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : V = constant

$\rightarrow \quad {}_1W_2 = \int P\, dV = \mathbf{0}$

State 1: T, x_1 from Table B.1.1

$v_1 = v_f + x_1 v_{fg} = 0.00106 + 0.25 \times 0.8908 = 0.22376\ m^3/kg$

$u_1 = u_f + x_1 u_{fg} = 503.48 + 0.25 \times 2025.76 = 1009.92\ kJ/kg$

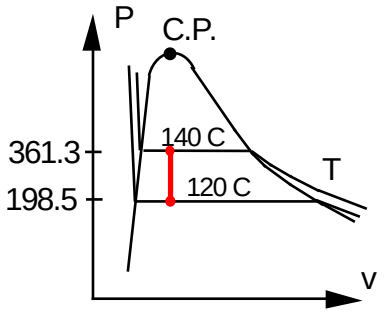
State 2: $T_2, v_2 = v_1 < v_{g2} = 0.50885\ m^3/kg$ so two-phase

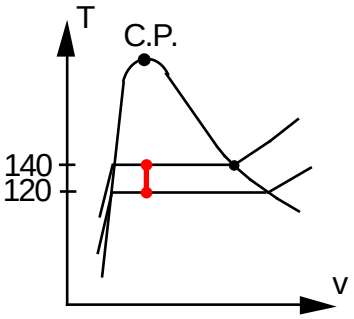
$$x_2 = \frac{v_2 - v_{f2}}{v_{fg2}} = \frac{0.22376 - 0.00108}{0.50777} = 0.43855$$

$u_2 = u_{f2} + x_2 u_{fg2} = 588.72 + x_2 \times 1961.3 = 1448.84\ kJ/kg$

From the energy equation

${}_1Q_2 = m(u_2 - u_1) = 2\ kg \times (1448.84 - 1009.92)\ kJ/kg = \mathbf{877.8\ kJ}$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.96

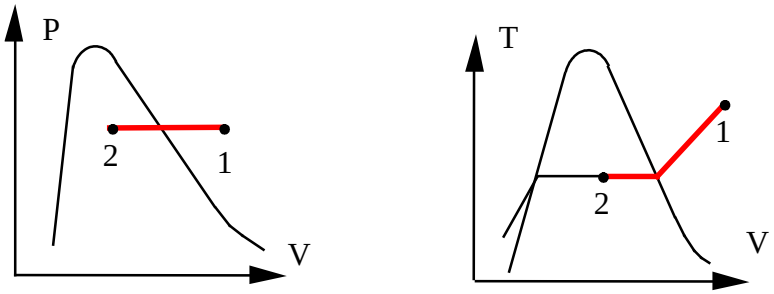
A cylinder fitted with a frictionless piston contains 2 kg of superheated refrigerant R-134a vapor at 350 kPa, 100°C. The cylinder is now cooled so the R-134a remains at constant pressure until it reaches a quality of 75%. Calculate the heat transfer in the process.

Solution:

C.V.: R-134a $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: P = const. $\Rightarrow {}_1W_2 = \int PdV = P\Delta V = P(V_2 - V_1) = Pm(v_2 - v_1)$



State 1: Table B.5.2 $h_1 = (490.48 + 489.52)/2 = 490$ kJ/kg

State 2: Table B.5.1 $h_2 = 206.75 + 0.75 \times 194.57 = 352.7$ kJ/kg (350.9 kPa)

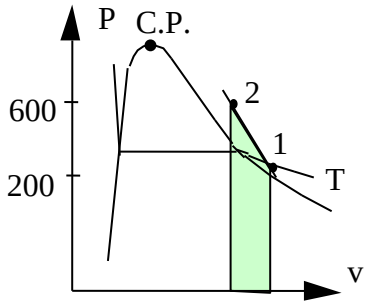
${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(u_2 - u_1) + Pm(v_2 - v_1) = m(h_2 - h_1)$

${}_1Q_2 = 2$ kg × (352.7 - 490) kJ/kg = **-274.6 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.97

A piston cylinder contains 1.5 kg water at 200 kPa, 150°C. It is now heated in a process where pressure is linearly related to volume to a state of 600 kPa, 350°C. Find the final volume, the work and the heat transfer in the process.



Take as CV the 1.5 kg of water.

$m_2 = m_1 = m$;

Process Eq.: $P = A + BV$ (linearly in V)

State 1: (P, T) => $v_1 = 0.95964$ m^3/kg,

$u_1 = 2576.87$ kJ/kg

State 2: (P, T) => $v_2 = 0.47424$ m^3/kg, $u_2 = 2881.12$ kJ/kg

$V_2 = mv_2 =$ **0.7114 m^3**

From process eq.:

$$_1W_2 = \int P\, dV = \text{area} = \frac{m}{2}(P_1 + P_2)(v_2 - v_1)$$

$$= \frac{1.5}{2}\text{ kg } (200 + 600)\text{ kPa } (0.47424 - 0.95964)\text{ m}^3/\text{kg} = -\mathbf{291.24\ kJ}$$

Notice volume is reduced so work is negative.

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$$

$$= 1.5 \text{ kg } (2881.12 - 2576.87)\text{ kJ/kg} - 291.24\text{ kJ}$$

$$= \mathbf{165.1\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.98

A piston/cylinder contains 50 kg of water at 200 kPa with a volume of 0.1 m^3. Stops in the cylinder are placed to restrict the enclosed volume to a maximum of 0.5 m^3. The water is now heated until the piston reaches the stops. Find the necessary heat transfer.

Solution:

C.V. H_2O m = constant

Energy Eq.3.5: $m(e_2 - e_1) = m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : P = constant (forces on piston constant)

$$\Rightarrow {}_1W_2 = \int P\, dV = P_1 (V_2 - V_1)$$

Properties from Table B.1.1

State 1: $v_1 = 0.1/50 = 0.002$ m^3/kg => 2-phase as $v_1 < v_g$

$$x_1 = \frac{v_1 - v_f}{v_{fg}} = \frac{0.002 - 0.001061}{0.88467} = 0.001061$$

$$h_1 = 504.68 + 0.001061 \times 2201.96 = 507.02 \text{ kJ/kg}$$

State 2: $v_2 = 0.5/50 = 0.01$ m^3/kg also 2-phase same P

$$x_2 = \frac{v_2 - v_f}{v_{fg}} = \frac{0.01 - 0.001061}{0.88467} = 0.01010$$

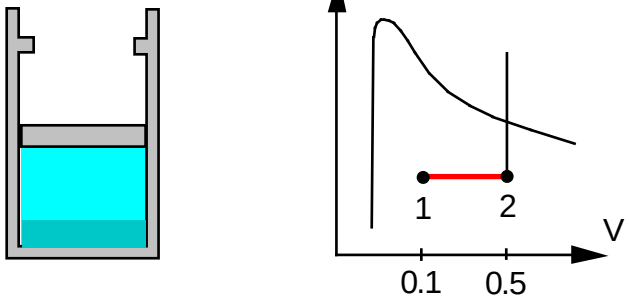
$$h_2 = 504.68 + 0.01010 \times 2201.96 = 526.92 \text{ kJ/kg}$$

Find the heat transfer from the energy equation as

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$$

$${}_1Q_2 = 50 \text{ kg} \times (526.92 - 507.02) \text{ kJ/kg} = \mathbf{995\ kJ}$$

[Notice that ${}_1W_2 = P_1 (V_2 - V_1) = 200 \text{ kPa} \times (0.5 - 0.1)\ m^3 = 80 \text{ kJ}$]



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.99

Ammonia (0.5 kg) is in a piston cylinder at 200 kPa, -10^{o}C is heated in a process where the pressure varies linear with the volume to a state of 120^{o}C, 300 kPa. Find the work and the heat transfer for the ammonia in the process.

Solution:

Take CV as the Ammonia, constant mass.

Continuity Eq.: $m_2 = m_1 = m$;

Process: $P = A + BV$ (linear in V)

State 1: Superheated vapor $v_1 = 0.6193$ m^3/kg, $u_1 = 1316.7$ kJ/kg

State 2: Superheated vapor $v_2 = 0.63276$ m^3/kg, $u_2 = 1542.0$ kJ/kg

Work is done while piston moves at increasing pressure, so we get

$$_1W_2 = \int P\, dV = \text{area} = P_{avg}\,(V_2 - V_1) = \tfrac{1}{2}(P_1 + P_2)m(v_2 - v_1)$$

$$= ½(200 + 300)\ \text{kPa} \times 0.5\ \text{kg}\ (0.63276 - 0.6193)\ \text{m}^3/\text{kg}$$

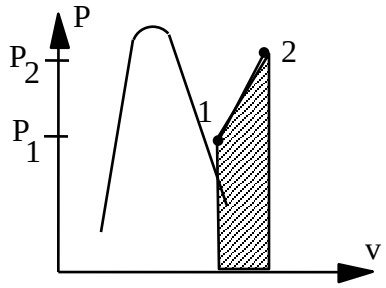
$$= \mathbf{1.683\ kJ}$$

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

$$_1Q_2 = m(u_2 - u_1) + {}_1W_2$$

$$= 0.5\ \text{kg}\ (1542.0 - 1316.7)\ \text{kJ/kg} + 1.683\ \text{kJ}$$

$$= \mathbf{114.3\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.100

A piston/cylinder contains 1 kg water at 20°C with volume 0.1 m^3. By mistake someone locks the piston preventing it from moving while we heat the water to saturated vapor. Find the final temperature and the amount of heat transfer in the process.

Solution:

C.V. Water. This is a control mass

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : V = constant $\rightarrow$ ${}_1W_2 = 0$

State 1: T, $v_1 = V_1/m = 0.1\ m^3/kg > v_f$ so two-phase

$$x_1 = \frac{v_1 - v_f}{v_{fg}} = \frac{0.1-0.001002}{57.7887} = 0.0017131$$

$$u_1 = u_f + x_1\, u_{fg} = 83.94 + x_1 \times 2318.98 = 87.913\ kJ/kg$$

State 2: $v_2 = v_1 = 0.1$ & $x_2 = 1$

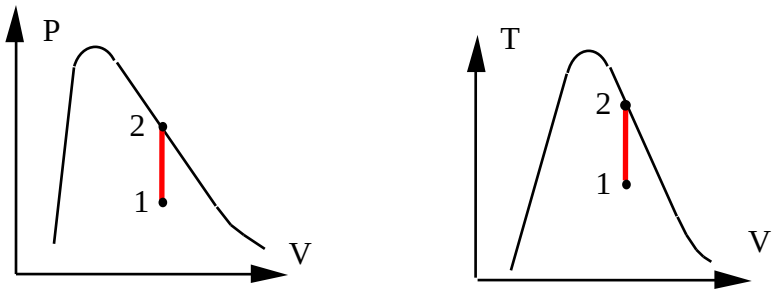
$\rightarrow$ found in Table B.1.1 between 210°C and 215° C

$$T_2 = 210 + 5 \times \frac{0.1-0.10441}{0.09479-0.10441} = 210 + 5 \times 0.4584 = 212.3°C$$

$$u_2 = 2599.44 + 0.4584\,(2601.06 - 2599.44) = 2600.2\ kJ/kg$$

From the energy equation

$${}_1Q_2 = m(u_2 - u_1) = 1\ kg\ (2600.2 - 87.913)\ kJ/kg = \mathbf{2512.3\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.101

A water-filled reactor with volume of 1 m^3 is at 20 MPa, 360°C and placed inside a containment room as shown in Fig. P3.101. The room is well insulated and initially evacuated. Due to a failure, the reactor ruptures and the water fills the containment room. Find the minimum room volume so the final pressure does not exceed 200 kPa.

Solution:

C.V.: Containment room and reactor.

Mass: $m_2 = m_1 = V_{reactor}/v_1 = 1/0.001823 = 548.5$ kg

Energy: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = 0 - 0 = 0$

State 1: Table B.1.4 $v_1 = 0.001823$ m^3/kg, $u_1 = 1702.8$ kJ/kg

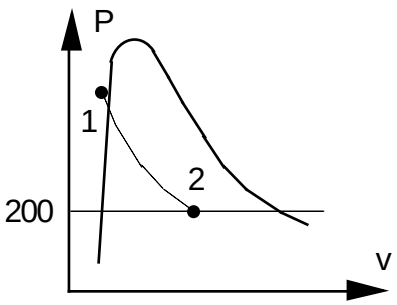
Energy equation then gives $u_2 = u_1 = 1702.8$ kJ/kg

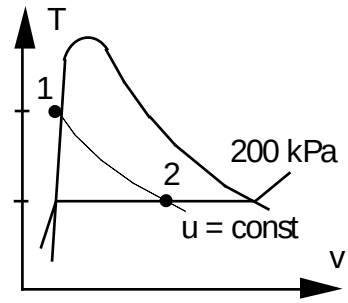
State 2: $P_2 = 200$ kPa, $u_2 < u_g$ => Two-phase Table B.1.2

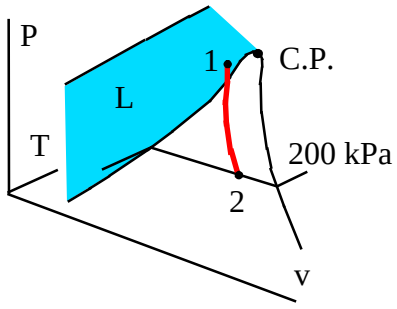
$x_2 = (u_2 - u_f)/ u_{fg} = (1702.8 – 504.47)/2025.02 = 0.59176$

$v_2 = 0.001061 + 0.59176 \times 0.88467 = 0.52457$ m^3/kg

$V_2 = m_2 v_2 = 548.5$ kg $\times$ 0.52457 m^3/kg = **287.7 m^3**







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.102

A rigid tank holds 0.75 kg ammonia at 70°C as saturated vapor. The tank is now cooled to 20°C by heat transfer to the ambient. Which two properties determine the final state. Determine the amount of work and heat transfer during the process.

C.V. The ammonia, this is a control mass.

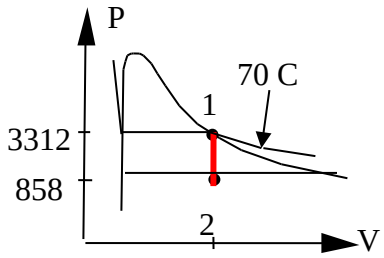
Process: Rigid tank V = C => v = constant & $_1W_2 = \int_1^2 PdV = \mathbf{0}$

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2 = {}_1Q_2$,

State 1: $v_1 = 0.03787$ m^3/kg,

$u_1 = 1338.9$ kJ/kg

State 2: **T, v** => two-phase (straight down in P-v diagram from state 1)



$x_2 = (v - v_f)/v_{fg} = (0.03787 - 0.001638)/0.14758 = 0.2455$

$u_2 = u_f + x_2\, u_{fg} = 272.89 + 0.2455 \times 1059.3 = 532.95$ kJ/kg

$_1Q_2 = m(u_2 - u_1) = 0.75$ kg (532.95 – 1338.9) kJ/kg = **-604.5 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.103

Water in a 150-L closed, rigid tank is at 100°C, 90% quality. The tank is then cooled to –10°C. Calculate the heat transfer during the process.

Solution:

C.V.: Water in tank. $m_2 = m_1$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: V = constant, $v_2 = v_1$, ${}_1W_2 = 0$

State 1: Two-phase L + V look in Table B.1.1

$v_1 = 0.001044 + 0.9 \times 1.6719 = 1.5057\ m^3/kg$

$u_1 = 418.94 + 0.9 \times 2087.6 = 2297.8\ kJ/kg$

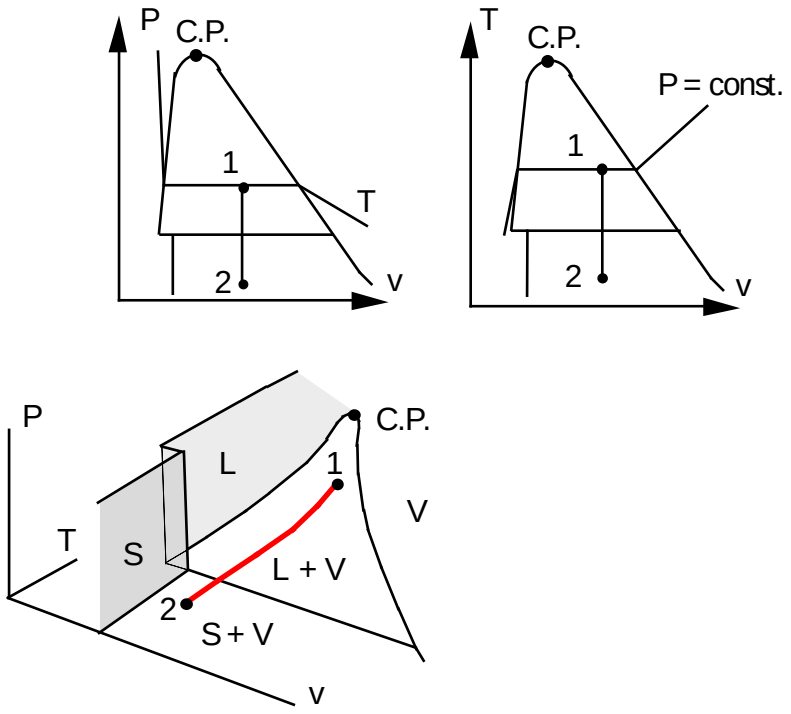
State 2: T_2, $v_2 = v_1$ $\Rightarrow$ mix of saturated solid + vapor Table B.1.5

$v_2 = 1.5057 = 0.0010891 + x_2 \times 466.7$ => $x_2 = 0.003224$

$u_2 = -354.09 + 0.003224 \times 2715.5 = -345.34\ kJ/kg$

$m = V/v_1 = 0.15/1.5057 = 0.09962\ kg$

${}_1Q_2 = m(u_2 - u_1) = 0.09962\ kg\ (-345.34 - 2297.8)\ kJ/kg =$ **-263.3 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.104

A 25 kg mass moves with 25 m/s. Now a brake system brings the mass to a complete stop with a constant deceleration over a period of 5 seconds. The brake energy is absorbed by 0.5 kg water initially at 20°C, 100 kPa. Assume the mass is at constant P and T. Find the energy the brake removes from the mass and the temperature increase of the water, assuming P = C.

Solution:

C.V. The mass in motion.

$$E_2 - E_1 = \Delta E = 0.5\ m\mathbf{V}^2 = 0.5 \times 25 \times 25^2/1000 = \mathbf{7.8125\ kJ}$$

C.V. The mass of water.

$$m(u_2 - u_1)_{H_2O} = \Delta E = 7.8125\ kJ$$

$$\Rightarrow \quad u_2 - u_1 = 7.8125\ kJ/\ 0.5\ kg = 15.63\ kJ/kg$$

$$u_2 = u_1 + 15.63 = 83.94 + 15.63 = 99.565\ kJ/kg$$

Assume $u_2 = u_f$ then from Table B.1.1: $T_2 \cong 23.7°C$, $\Delta T = \mathbf{3.7°C}$

We could have used $u_2 - u_1 = C\Delta T$ with C from Table A.4: C = 4.18 kJ/kg K giving $\Delta T = 15.63/4.18 = \mathbf{3.7°C}$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.105

A cylinder having a piston restrained by a linear spring (of spring constant 15 kN/m) contains 0.5 kg of saturated vapor water at 120°C, as shown in Fig. P3.105. Heat is transferred to the water, causing the piston to rise. If the piston cross-sectional area is 0.05 m^2, and the pressure varies linearly with volume until a final pressure of 500 kPa is reached. Find the final temperature in the cylinder and the heat transfer for the process.

Solution:

C.V. Water in cylinder.

Continuity: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

State 1: (T, x) Table B.1.1 => $v_1 = 0.89186\ m^3/kg$, $u_1 = 2529.2\ kJ/kg$

Process: $P_2 = P_1 + \dfrac{k_s m}{A_p{}^2}(v_2 - v_1) = 198.5 + \dfrac{15 \times 0.5}{(0.05)^2}(v_2 - 0.89186)$

State 2: $P_2 = 500$ kPa and on the process curve (see above equation).

=> $v_2 = 0.89186 + (500 - 198.5) \times (0.05^2/7.5) = 0.9924\ m^3/kg$

(P, v) Table B.1.3 => $T_2 =$ **803°C**; $u_2 = 3668\ kJ/kg$

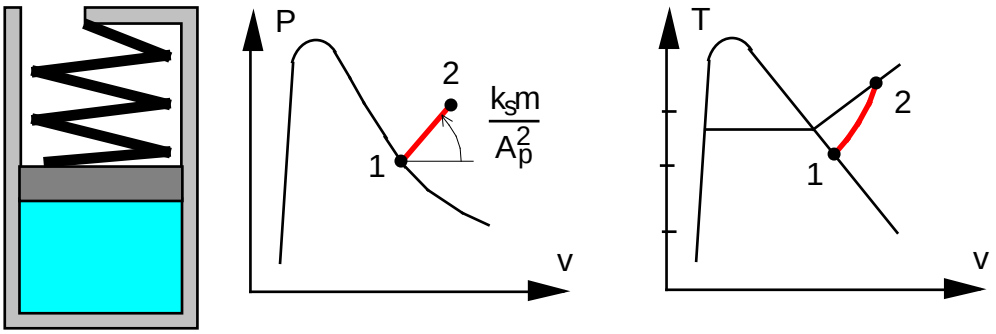
The process equation allows us to evaluate the work

$${}_1W_2 = \int P dV = \left(\frac{P_1 + P_2}{2}\right) m(v_2 - v_1)$$

$$= \left(\frac{198.5 + 500}{2}\right) \text{kPa} \times 0.5\ \text{kg} \times (0.9924 - 0.89186)\ m^3/kg = 17.56\ \text{kJ}$$

Substitute the work into the energy equation and solve for the heat transfer

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.5\ \text{kg} \times (3668 - 2529.2)\ \text{kJ/kg} + 17.56\ \text{kJ} = \mathbf{587\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.106

A piston cylinder arrangement with a linear spring similar to Fig. P3.105 contains R-134a at 15°C, x = 0.4 and a volume of 0.02 m^3. It is heated to 60°C at which point the specific volume is 0.03002 m^3/kg. Find the final pressure, the work and the heat transfer in the process.

Take CV as the R-134a.

$$m_2 = m_1 = m \quad ; \qquad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$$

State 1: T_1, x_1 => Two phase so Table B.5.1: $P_1 = P_{sat} = 489.5$ kPa

$v_1 = v_f + x_1 v_{fg} = 0.000805 + 0.4 \times 0.04133 = 0.01734$ m^3/kg

$u_1 = u_f + x_1 u_{fg} = 220.1 + 0.4 \times 166.35 = 286.64$ kJ/kg

$m = V_1/v_1 = 0.02\ m^3 / 0.01734\ m^3/kg = 1.1534$ kg

State 2: (T, v) Superheated vapor, Table B.5.2.

$P_2 = 800$ kPa, $v_2 = 0.03002\ m^3/kg$, $u_2 = 421.2$ kJ/kg

$V_2 = m\ v_2 = 1.1534\ kg \times 0.03002\ m^3/kg = 0.03463\ m^3$

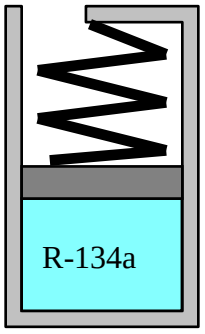
Work is done while piston moves at linearly varying pressure, so we get

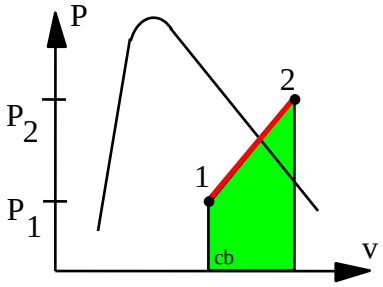
$${}_1W_2 = \int P\, dV = \text{area} = P_{avg}(V_2 - V_1) = 0.5(P_2 + P_1)(V_2 - V_1)$$

$$= 0.5 \times (489.5 + 800)\ \text{kPa}\ (0.03463 - 0.02)\ m^3 = \mathbf{9.433\ kJ}$$

Heat transfer is found from the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1.1534 \times (421.2 - 286.64) + 9.43 = \mathbf{164.6\ kJ}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.107

A 10-m high open cylinder, $A_{cyl} = 0.1$ m^2, contains 20°C water above and 2 kg of 20°C water below a 198.5-kg thin insulated floating piston, shown in Fig. P3.107. Assume standard *g*, *Po*. Now heat is added to the water below the piston so that it expands, pushing the piston up, causing the water on top to spill over the edge. This process continues until the piston reaches the top of the cylinder. Find the final state of the water below the piston (*T*, *P*, *v*) and the heat added during the process.

Solution:

C.V. Water below the piston.

Piston force balance at initial state: $F\uparrow = F\downarrow = P_A A = m_p g + m_B g + P_0 A$

State $1_{A,B}$: Comp. Liq. $\Rightarrow$ $v \cong v_f = 0.001002$ m^3/kg; $u_{1A} = 83.95$ kJ/kg

$V_{A1} = m_A v_{A1} = 0.002$ m^3; $m_{tot} = V_{tot}/v = 1/0.001002 = 998$ kg

mass above the piston $m_{B1} = m_{tot} - m_A =$ **996 kg**

$$P_{A1} = P_0 + (m_p + m_B)g/A = 101.325 + \frac{(198.5 + 996) \times 9.807}{0.1 \times 1000} = \textbf{218.5 kPa}$$

State 2_A: $P_{A2} = P_0 + \frac{m_p g}{A} =$ **120.8 kPa** ; $v_{A2} = V_{tot}/m_A =$ **0.5 m^3/kg**

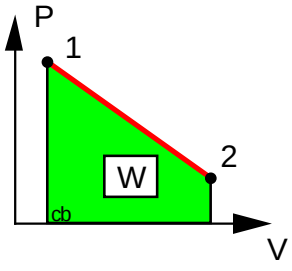
$x_{A2} = (0.5 - 0.001047)/1.4183 = 0.352$; $T_2 =$ **105°C**

$u_{A2} = 440.0 + 0.352 \times 2072.34 = 1169.5$ kJ/kg

Continuity eq. in A: $m_{A2} = m_{A1}$

Energy: $m_A(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: P linear in V as m_B is linear with V



$${}_1W_2 = \int P dV = \frac{1}{2}(218.5 + 120.82)\text{ kPa } (1 - 0.002)\text{ m}^3$$

$=$ **169.32 kJ**

${}_1Q_2 = m_A(u_2 - u_1) + {}_1W_2 = 2170.1 + 169.3 =$ **2340.4 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.108

Assume the same setup as in Problem 3.101, but the room has a volume of 100 m^3. Show that the final state is two-phase and find the final pressure by trial and error.

C.V.: Containment room and reactor.

Mass: $m_2 = m_1 = V_{reactor}/v_1 = 1/0.001823 = 548.5$ kg

Energy: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = 0 - 0 = 0 \Rightarrow u_2 = u_1 = 1702.8$ kJ/kg

Total volume and mass => $v_2 = V_{room}/m_2 = 0.1823$ m^3/kg

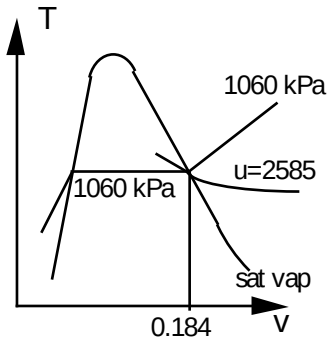
State 2: u_2 , v_2 Table B.1.1 see Figure.

Note that in the vicinity of $v = 0.1823$ m^3/kg crossing the saturated vapor line the internal energy is about 2585 kJ/kg. However, at the actual state 2, u = 1702.8 kJ/kg. Therefore state 2 must be in the two-phase region.

Trial & error $v = v_f + xv_{fg}$; $u = u_f + xu_{fg}$

$$\Rightarrow u_2 = 1702.8 = u_f + \frac{v_2 - v_f}{v_{fg}} u_{fg}$$

Compute RHS for a guessed pressure P_2:



$P_2 = 600$ kPa: RHS = $669.88 + \frac{0.1823-0.001101}{0.31457} \times 1897.52 = 1762.9$ too large

$P_2 = 550$ kPa: RHS = $655.30 + \frac{0.1823-0.001097}{0.34159} \times 1909.17 = 1668.1$ too small

Linear interpolation to match u = 1702.8 gives $P_2 \cong$ **568.5 kPa**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.109

A piston cylinder contains carbon dioxide at -20°C and quality 75%. It is compressed in a process where pressure is linear in volume to a state of 3 MPa and 20°C. Find the specific heat transfer.

CV Carbon dioxide out to the source, both $_1Q_2$ and $_1W_2$

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = A + BV \Rightarrow {}_1W_2 = \int P\, dV = ½\, m(P_1 + P_2)(v_2 - v_1)$

State 1: Table B.3.1 $P = 1969.6$ kPa

$v_1 = 0.000969 + 0.75 \times 0.01837 = 0.01475$ m^3/kg,

$u_1 = 39.64 + 0.75 \times 246.25 = 224.33$ kJ/kg,

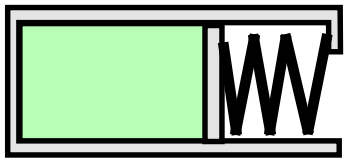
State 2: Table B.3 $v_2 = 0.01512$ m^3/kg, $u_2 = 310.21$ kJ/kg,

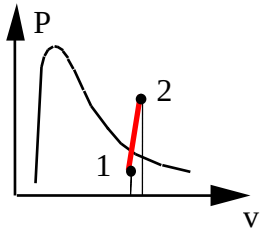
$_1w_2 = ½ (P_1 + P_2)(v_2 - v_1)$

$= ½ \times (1969.6 + 3000)$ kPa $\times$ (0.01512 – 0.01475) m^3/kg

$=$ **0.92 kJ/kg**

$_1q_2 = u_2 - u_1 + {}_1w_2 = 310.21 - 224.33 + 0.92$ **= 86.8 kJ/kg**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.110

A rigid steel tank of mass 2.5 kg contains 0.5 kg R-410A at 0°C with specific volume 0.01m/kg. The whole system is now heated to to a room temperature of 25°C.

a. Find the volume of the tank.
b. Find the final P.
c. Find the process heat transfer.

C.V. R-410A and steel tank. Control mass goes through process: 1 -> 2

Continuity Eq.: $m_2 - m_{R410a} - m_{st} = 0$

Energy Eq.: $m_{R410a}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $V = C$ so ${}_1W_2 = 0$

State 1: $T_1 = 0°C$, $v_1 = 0.01\ m^3/kg$,

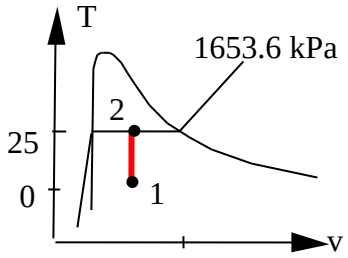
$V = mv_1 = 0.005\ m^3$

$x_1 = (v - v_f)/v_{fg} = (0.01 - 0.000855)/0.03182$

$= 0.28758$

$u_1 = u_f + x_1\, u_{fg} = 57.07 + x_1\ 195.95$

$= 113.42$ kJ/kg



State 2: **(T, v)** => sup-vapor (straight up in T-v diagram from state 1)

B.4.1 at 25°C, $v_f = 0.000944\ m^3/kg$, $v_g = 0.01514\ m^3/kg$, $v_f < v < v_g$: saturated.

$$P = 1653.6\ kPa, \qquad x = \frac{v - v_f}{v_{fg}} = \frac{0.01 - 0.000944}{0.01420} = 0.63775,$$

$u_2 = u_f + x_2\, u_{fg} = 96.03 + x_2\ 162.95 = 199.95$ kJ/kg

From the energy Eq.:

${}_1Q_2 = m_{R410a}(u_2 - u_1) + m_{st}\, C_{st}(T_2 - T_1)$

$= 0.5\ kg \times (199.95 - 113.42)\ kJ/kg + 2.5\ kg \times 0.46\ kJ/kgK \times (25 - 0)\ K$

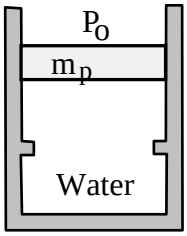
$=$ **72.0 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.111

The piston/cylinder in Fig.P3.111 contains 0.1 kg water at 500°C, 1000 kPa. The piston has a stop at half the original volume. The water now cools to room temperature 25°C

(a) Sketch the possible water states in a P-v diagram.
(b) Find the final pressure and volume
(c) Find the heat transfer and work in the process



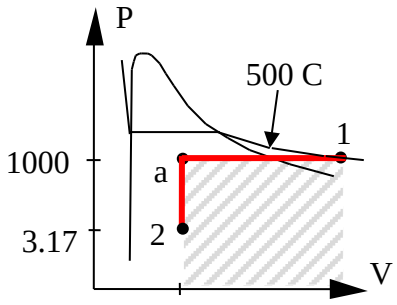
Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq: $P = C$ if $v > v_{stop}$; $V = C$ if $P < P_{float}$

State 1: $v_1 = 0.35411\ m^3/kg$, $u_1 = 3124.34\ kJ/kg$

State a: $v_a = v_1/2 = 0.177055\ m^3/kg < v_{g\ 1000\ kPa}$ so $T_a = T_{sat\ 1000\ kPa} = 179.9°C$

The possible state 2 (P,V) combinations are shown. State "a" is (1000 kPa, v_a) so it is two-phase with $T_a = 180°C > T_2$



$P_2 = P_{sat\ 25\ C} =$ **3.169 kPa** and $v_2 = v_a$

$x_2 = (v_2 - v_f)/v_{fg} = (0.177 - 0.001003)/43.358$
$= 0.0040604$

$u_2 = u_f + x_2\ u_{fg} = 104.86 + x_2\ 2304.9 = 114.219\ kJ/kg$

$V_2 = mv_2 = 0.1\ kg \times 0.177055\ m^3/kg =$ **0.0177 m^3**

${}_1W_2 = m \int P\ dv = m\ P_1\ (v_2 - v_1)$ [see area below process curve in figure]
$= 0.1\ kg \times 1000\ kPa \times (0.177055 - 0.35411)\ m^3/kg =$ **– 17.706 kJ**

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.1\ kg\ (114.219 - 3124.34)\ kJ/kg - 17.706\ kJ$
$=$ **–318.72 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.112

A spring loaded piston/cylinder assembly contains 1 kg water at 500°C, 3 MPa. The setup is such that the pressure is proportional to volume, P = CV. It is now cooled until the water becomes saturated vapor. Sketch the P-v diagram and find the final state, the work and heat transfer in the process.

Solution :

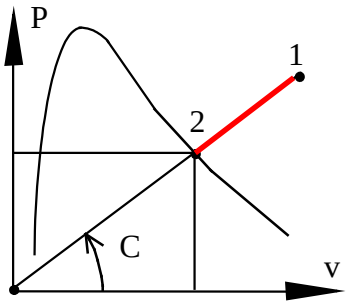
State 1: Table B.1.3: $v_1 = 0.11619$ m^3/kg, $u_1 = 3107.92$ kJ/kg

Process: m is constant and $P = C_0 V = C_0 m\, v = C\, v$

polytropic process with n = –1

$P = Cv \quad \Rightarrow \quad C = P_1/v_1 = 3000/0.11619 = 25\,820$ kPa kg/m^3

State 2: $x_2 = 1$ & $P_2 = Cv_2$ (on process line)



Trial & error on T_{2sat} or P_{2sat}:

Here from B.1.2:

at 2 MPa $v_g = 0.09963 \Rightarrow C = P/v_g = 20074$ (low)

2.5 MPa $v_g = 0.07998 \Rightarrow C = P/v_g = 31258$ (high)

2.25 MPa $v_g = 0.08875 \Rightarrow C = P/v_g = 25352$ (low)

Now interpolate to match the right slope C:

$$P_2 = 2250 + 250\,\frac{25\,820 - 25\,352}{31\,258 - 25\,352} = 2270 \text{ kPa},$$

$v_2 = P_2/C = 2270/25820 = 0.0879$ m^3/kg, $u_2 = 2602.07$ kJ/kg

P is linear in V so the work becomes (area in P-v diagram)

$$_1W_2 = \int P\, dv = m\,\frac{1}{2}(P_1 + P_2)(v_2 - v_1)$$

$$= 1 \text{ kg} \times \frac{1}{2}(3000 + 2270) \text{ kPa } (0.0879 - 0.11619) \text{ m}^3 = \mathbf{-\ 74.5\ kJ}$$

From the energy Eq.:

$$_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1\ (2602.07 - 3107.92) - 74.5$$

$$= \mathbf{-1250.85\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.113

A piston cylinder contains 1.5 kg water at 600 kPa, 350°C. It is now cooled in a process where pressure is linearly related to volume to a state of 200 kPa, 150°C. Plot the P-v diagram for the process and find both the work and the heat transfer in the process.

Take as CV the 1.5 kg of water.

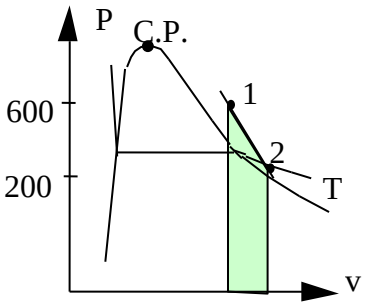
$m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $P = A + BV$ (linearly in V)

State 1: (P, T) => $v_1 = 0.47424$ m^3/kg,

$u_1 = 2881.12$ kJ/kg



State 2: (P, T) => $v_2 = 0.95964$ m^3/kg, $u_2 = 2576.87$ kJ/kg

From process eq.: ${}_1W_2 = \int P\, dV$ = area = $\frac{m}{2}(P_1 + P_2)(v_2 - v_1)$

$= \frac{1.5}{2}$ kg (200 + 600) kPa (0.95964 – 0.47424) m^3/kg

= **291.24 kJ**

From energy eq.: ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$

= 1.5 kg (2576.87 – 2881.12) kJ/kg + 291.24 kJ

= **-165.14 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.114

Superheated refrigerant R-134a at 20°C, 0.5 MPa is cooled in a piston/cylinder arrangement at constant temperature to a final two-phase state with quality of 50%. The refrigerant mass is 5 kg, and during this process 500 kJ of heat is removed. Find the initial and final volumes and the necessary work.

Solution:

C.V. R-134a, this is a control mass.

Continuity: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = -500 \text{ kJ} - {}_1W_2$

State 1: T_1 , P_1 Table B.5.2, $v_1 = 0.04226 \text{ m}^3/\text{kg}$; $u_1 = 390.52 \text{ kJ/kg}$

$\Rightarrow V_1 = mv_1 = \mathbf{0.211\ m^3}$

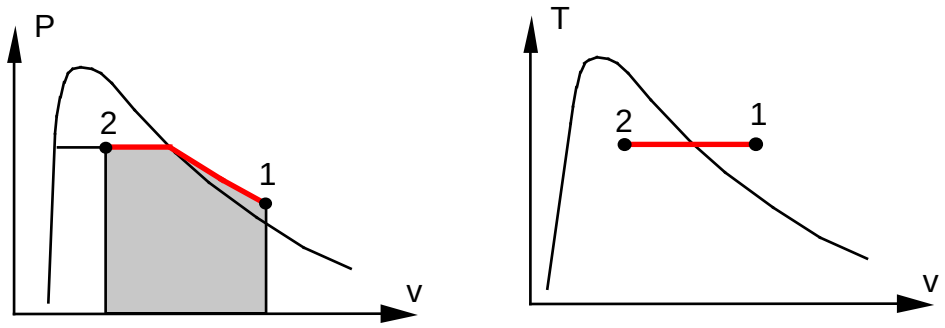
State 2: T_2 , x_2 $\Rightarrow$ Table B.5.1

$u_2 = 227.03 + 0.5 \times 162.16 = 308.11 \text{ kJ/kg}$,

$v_2 = 0.000817 + 0.5 \times 0.03524 = 0.018437 \text{ m}^3/\text{kg} \Rightarrow V_2 = mv_2 = \mathbf{0.0922\ m^3}$

${}_1W_2 = -500 \text{ kJ} - m(u_2 - u_1) = -500 \text{ kJ} - 5 \text{ kg} \times (308.11 - 390.52) \text{ kJ/kg}$

$= \mathbf{-87.9\ kJ}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.115

Two kilograms of nitrogen at 100 K, $x = 0.5$ is heated in a constant pressure process to 300 K in a piston/cylinder arrangement. Find the initial and final volumes and the total heat transfer required.

Solution:

Take CV as the nitrogen.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: P = constant $\Rightarrow$ ${}_1W_2 = \int PdV = Pm(v_2 - v_1)$

State 1: Table B.6.1

$v_1 = 0.001452 + 0.5 \times 0.02975 = 0.01633$ m^3/kg, $V_1 =$ **0.0327 m^3**

$h_1 = -73.20 + 0.5 \times 160.68 = 7.14$ kJ/kg

State 2: (P = 779.2 kPa , 300 K) => sup. vapor interpolate in Table B.6.2

$v_2 = 0.14824 + (0.11115\text{-}0.14824) \times 179.2/200 = 0.115$ m^3/kg, $V_2 =$ **0.23 m^3**

$h_2 = 310.06 + (309.62\text{-}310.06) \times 179.2/200 = 309.66$ kJ/kg

Now solve for the heat transfer from the energy equation

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1) = 2$ kg $\times$ (309.66 - 7.14) kJ/kg = **605 kJ**

3.116

In a sink 5 liters of water at 70°C is combined with 1 kg aluminum pots, 1 kg of flatware (steel) and 1 kg of glass all put in at 20°C. What is the final uniform temperature neglecting any heat loss and work?

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2 = 0$

For the water: $v_f = 0.001023\ m^3/kg$, $V = 5\ L = 0.005\ m^3$; $m = V/v = 4.8876\ kg$

For the liquid and the metal masses we will use the specific heats (Tbl A.3, A.4) so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i}\,(T_2 - T_1)_i = T_2 \sum m_i C_{v\,i} - \sum m_i C_{v\,i} T_{1\,i}$$

noticing that all masses have the same T_2 but not same initial T.

$$\sum m_i C_{v\,i} = 4.8876 \times 4.18 + 1 \times 0.9 + 1 \times 0.46 + 1 \times 0.8 = 22.59\ kJ/K$$

Energy Eq.: $22.59\ T_2 = 4.8876 \times 4.18 \times 70 + (1 \times 0.9 + 1 \times 0.46 + 1 \times 0.8) \times 20$

$$= 1430.11 + 43.2 = 1473.3\ kJ$$

$$T_2 = \mathbf{65.2^oC}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.117

A computer CPU chip consists of 50 g silicon, 20 g copper, 50 g polyvinyl chloride (plastic). It heats from 15°C to 70°C as the computer is turned on. How much energy does the heating require?

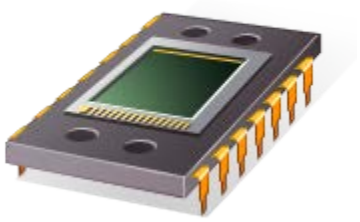
Energy Eq.: $U_2 - U_1 = \sum m_i (u_2 - u_1)_i = {}_1Q_2 - {}_1W_2$

For the solid masses we will use the specific heats, Table A.3, and they all have the same temperature so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i} (T_2 - T_1)_i = (T_2 - T_1)\sum m_i C_{v\,i}$$

$$\sum m_i C_{v\,i} = 0.05 \times 0.7 + 0.02 \times 0.42 + 0.05 \times 0.96 = 0.0914 \text{ kJ/K}$$

$$U_2 - U_1 = 0.0914 \text{ kJ/K} \times (70 - 15) \text{ K} = \mathbf{5.03\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.118

A copper block of volume 1 L is heat treated at 500°C and now cooled in a 200-L oil bath initially at 20°C, shown in Fig. P3.118. Assuming no heat transfer with the surroundings, what is the final temperature?

Solution:

C.V. Copper block and the oil bath.

Also assume no change in volume so the work will be zero.

Energy Eq.: $U_2 - U_1 = m_{met}(u_2 - u_1)_{met} + m_{oil}(u_2 - u_1)_{oil} = {}_1Q_2 - {}_1W_2 = 0$

Properties from Table A.3 and A.4

$m_{met} = V\rho = 0.001\ m^3 \times 8300\ kg/m^3 = 8.3\ kg,$

$m_{oil} = V\rho = 0.2\ m^3 \times 910\ kg/m^3 = 182\ kg$

Solid and liquid Eq.3.32: $\Delta u \cong C_V\, \Delta T,$

Table A.3 and A.4: $C_{V\,met} = 0.42\ \frac{kJ}{kg\ K},\ C_{V\,oil} = 1.8\ \frac{kJ}{kg\ K}$

The energy equation for the C.V. becomes

$$m_{met}C_{V\,met}(T_2 - T_{1,met}) + m_{oil}C_{V\,oil}(T_2 - T_{1,oil}) = 0$$

$$8.3\ kg \times 0.42\ \frac{kJ}{kg\ K}(T_2 - 500\ C) + 182\ kg \times 1.8\ \frac{kJ}{kg\ K}(T_2 - 20\ C) = 0$$

$$331.09\ T_2 - 1743 - 6552 = 0$$

$$\Rightarrow\ T_2 = \mathbf{25\ °C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.119

A 1 kg steel pot contains 1 kg liquid water both at 15°C. It is now put on the stove where it is heated to the boiling point of the water. Neglect any air being heated and find the total amount of energy needed.

Solution:

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

The steel does not change volume and the change for the liquid is minimal, so ${}_1W_2 \cong 0$.

State 2: $T_2 = T_{sat}\,(1\text{atm}) = 100^{o}\text{C}$

Tbl B.1.1 : $u_1 = 62.98$ kJ/kg, $u_2 = 418.91$ kJ/kg

Tbl A.3 : $C_{st} = 0.46$ kJ/kg K

Solve for the heat transfer from the energy equation

$${}_1Q_2 = U_2 - U_1 = m_{st}\,(u_2 - u_1)_{st} + m_{H2O}\,(u_2 - u_1)_{H2O}$$

$$= m_{st}C_{st}\,(T_2 - T_1) + m_{H2O}\,(u_2 - u_1)_{H2O}$$

$${}_1Q_2 = 1\text{ kg} \times 0.46\,\frac{\text{kJ}}{\text{kg K}} \times (100 - 15)\text{ K} + 1\text{ kg} \times (418.91 - 62.98)\text{ kJ/kg}$$

$$= 39.1 + 355.93 = \mathbf{395\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.120

I have 2 kg of liquid water at 20°C, 100 kPa. I now add 20 kJ of energy at a constant pressure. How hot does it get if it is heated? How fast does it move if it is pushed by a constant horizontal force? How high does it go if it is raised straight up?

a) Heat at 100 kPa.

Energy equation:

$$E_2 - E_1 = {}_1Q_2 - {}_1W_2 = {}_1Q_2 - P(V_2 - V_1) = H_2 - H_1 = m(h_2 - h_1)$$

$$h_2 = h_1 + {}_1Q_2/m = 83.94 + 20/2 = 94.04 \text{ kJ/kg}$$

Back interpolate in Table B.1.1: $T_2 = \mathbf{22.5^oC}$

[We could also have used $\Delta T = {}_1Q_2/mC = 20 / (2*4.18) = 2.4^oC$]

b) Push at constant P. It gains kinetic energy.

$$0.5 \text{ m } \mathbf{V}_2^2 = {}_1W_2$$

$$\mathbf{V}_2 = \sqrt{2\ {}_1W_2/m} = \sqrt{2 \times 20 \times 1000 \text{ J}/2 \text{ kg}} = \mathbf{141.4 \text{ m/s}}$$

c) Raised in gravitational field

$$m\ g\ Z_2 = {}_1W_2$$

$$Z_2 = {}_1W_2/m\ g = \frac{20\ 000 \text{ J}}{2 \text{ kg} \times 9.807 \text{ m/s}^2} = \mathbf{1019 \text{ m}}$$

Comment: Notice how fast (500 km/h) and how high it should be to have the same energy as raising the temperature just 2 degrees. I.e. in most applications we can disregard the kinetic and potential energies unless we have very high **V** or Z.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

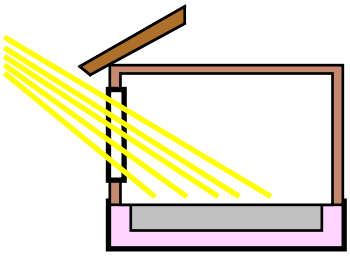
3.121

A house is being designed to use a thick concrete floor mass as thermal storage material for solar energy heating. The concrete is 30 cm thick and the area exposed to the sun during the daytime is 4 m × 6 m. It is expected that this mass will undergo an average temperature rise of about 3°C during the day. How much energy will be available for heating during the nighttime hours?

Solution:

C.V.: Control mass concrete.

$V = 4\ m \times 6\ m \times 0.3\ m = 7.2\ m^3$



Concrete is a solid with some properties listed in Table A.3

$$m = \rho V = 2200\ kg/m^3 \times 7.2\ m^3 = 15\ 840\ kg$$

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

The available heat transfer is the change in U. From Eq.3.33 and C from table A.3

$$\Delta U = m\ C\ \Delta T = 15\ 840\ kg \times 0.88 \frac{kJ}{kg\ K} \times 3\ K = 41\ 818\ kJ = \mathbf{41.82\ MJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.122

Because a hot water supply must also heat some pipe mass as it is turned on so it does not come out hot right away. Assume 80°C liquid water at 100 kPa is cooled to 45°C as it heats 15 kg of copper pipe from 20 to 45°C. How much mass (kg) of water is needed?

Solution:

C.V. Water and copper pipe. No external heat transfer, no work.

Energy Eq.3.5: $U_2 - U_1 = \Delta U_{cu} + \Delta U_{H_2O} = 0 - 0$

From Eq.3.33 and Table A.3:

$$\Delta U_{cu} = mC\,\Delta T = 15\ \text{kg} \times 0.42 \frac{\text{kJ}}{\text{kg K}} \times (45 - 20)\ \text{K} = 157.5\ \text{kJ}$$

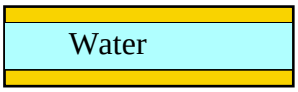
From the energy equation

$$m_{H_2O} = -\Delta U_{cu} / \Delta u_{H_2O}$$

$$m_{H_2O} = \Delta U_{cu} / C_{H_2O}(-\Delta T_{H_2O}) = \frac{157.5}{4.18 \times 35} = \mathbf{1.076\ kg}$$

or using Table B.1.1 for water

$$m_{H_2O} = \Delta U_{cu} / (u_1 - u_2) = \frac{157.5}{334.84 - 188.41} \frac{\text{kJ}}{\text{kJ/kg}} = \mathbf{1.076\ kg}$$



The real problem involves a flow and is not analyzed by this simple process.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.123

A car with mass 1275 kg drives at 60 km/h when the brakes are applied quickly to decrease its speed to 20 km/h. Assume the brake pads are 0.5 kg mass with heat capacity of 1.1 kJ/kg K and the brake discs/drums are 4.0 kg steel. Further assume both masses are heated uniformly. Find the temperature increase in the brake assembly.

Solution:

C.V. Car. Car loses kinetic energy and brake system gains internal u.

No heat transfer (short time) and no work term.

m = constant;

Energy Eq.3.5: $E_2 - E_1 = 0 - 0 = m_{car} \frac{1}{2}(V_2^2 - V_1^2) + m_{brake}(u_2 - u_1)$

The brake system mass is two different kinds so split it, also use C_v from Table A.3 since we do not have a u table for steel or brake pad material.

$$m_{steel} C_v \Delta T + m_{pad} C_v \Delta T = m_{car}\, 0.5\, (60^2 - 20^2) \left(\frac{1000}{3600}\right)^2 \text{ m}^2/\text{s}^2$$

$$(4 \times 0.46 + 0.5 \times 1.1) \frac{\text{kJ}}{\text{K}} \Delta T = 1275 \text{ kg} \times 0.5 \times (3200 \times 0.077\,16) \text{ m}^2/\text{s}^2$$

$$= 157\,406 \text{ J} = 157.4 \text{ kJ}$$

$$\Rightarrow \Delta T = \mathbf{65.9\ °C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.124

A piston cylinder (0.5 kg steel altogether) maintaining a constant pressure has 0.2 kg R-134a as saturated vapor at 150 kPa. It is heated to 40°C and the steel is at the same temperature as the R-134a at any time. Find the work and heat transfer for the process.

C.V. The R-134a plus the steel. Constant total mass

$m_2 = m_1 = m$;

$U_2 - U_1 = m_{R134a}(u_2 - u_1)_{R134a} + m_{steel}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

State 1: B.5.2 sat. vapor $v_1 = 0.13139$ m^3/kg, $u_1 = 368.06$ kJ/kg

State 2: B.5.2 sup. vapor $v_2 = 0.16592$ m^3/kg, $u_2 = 411.59$ kJ/kg

$V_1 = mv_1 = 0.2 \times 0.13139 = 0.02628$ m^3

$V_2 = mv_2 = 0.2 \times 0.16592 = 0.03318$ m^3

Steel: A.3, $C_{steel} = 0.46$ kJ/kg-K

Process: P = C for the R134a and constant volume for the steel =>

${}_1W_2 = \int P\, dV = P_1(V_2 - V_1) = 150$ kPa $\times$ (0.03318 – 0.02628) m^3

= **1.035 kJ**

${}_1Q_2 = m_{R134a}\,(u_2 - u_1) + m_{steel}\,(u_2 - u_1) + {}_1W_2$

$= m_{R134a}\,(u_2 - u_1) + m_{steel}C_{steel}\,(T_2 - T_1) + {}_1W_2$

$= 0.2 \times (411.59 - 368.06) + 0.5 \times 0.46 \times [40 - (-17.29)] + 1.035$

$= 8.706 + 13.177 + 1.035 =$ **22.92 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.125

A 25 kg steel tank initially at –10^{o}C is filled up with 100 kg of milk (assume properties as water) at 30^{o}C. The milk and the steel come to a uniform temperature of +5 ^{o}C in a storage room. How much heat transfer is needed for this process?

Solution:

C.V. Steel + Milk. This is a control mass.

Energy Eq.3.5: $U_2 - U_1 = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

Process: V = constant, so there is no work

${}_1W_2 = 0$.

Use Eq.3.33 and values from A.3 and A.4 to evaluate changes in u

$${}_1Q_2 = m_{steel}\,(u_2 - u_1)_{steel} + m_{milk}(u_2 - u_1)_{milk}$$

$$= 25\ \text{kg} \times 0.46\ \frac{\text{kJ}}{\text{kg K}} \times [5 - (-10)]\ \text{K} + 100\ \text{kg} \times 4.18\ \frac{\text{kJ}}{\text{kg K}} \times (5 - 30)\ \text{K}$$

$$= 172.5 - 10450 = \mathbf{-10277\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.126

An engine consists of a 100 kg cast iron block with a 20 kg aluminum head, 20 kg steel parts, 5 kg engine oil and 6 kg glycerine (antifreeze). Everything begins at 5^{o} C and as the engine starts we want to know how hot it becomes if it absorbs a net of 7000 kJ before it reaches a steady uniform temperature.

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

Process: The steel does not change volume and the change for the liquid is minimal, so ${}_1W_2 \cong 0$.

So sum over the various parts of the left hand side in the energy equation

$$m_{Fe}(u_2 - u_1) + m_{Al}(u_2 - u_1)_{Al} + m_{st}(u - u_1)_{st} + m_{oil}(u_2 - u_1)_{oil} + m_{gly}(u_2 - u_1)_{gly} = {}_1Q_2$$

Table A.3 : $C_{Fe} = 0.42$, $C_{Al} = 0.9$, $C_{st} = 0.46$ all units of kJ/kg K

Table A.4 : $C_{oil} = 1.9$, $C_{gly} = 2.42$ all units of kJ/kg K

So now we factor out $T_2 - T_1$ as $u_2 - u_1 = C(T_2 - T_1)$ for each term

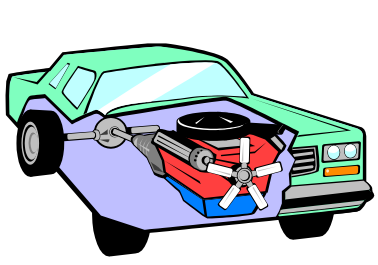
$$[\, m_{Fe}C_{Fe} + m_{Al}C_{Al} + m_{st}C_{st} + m_{oil}C_{oil} + m_{gly}C_{gly} \,](T_2 - T_1) = {}_1Q_2$$

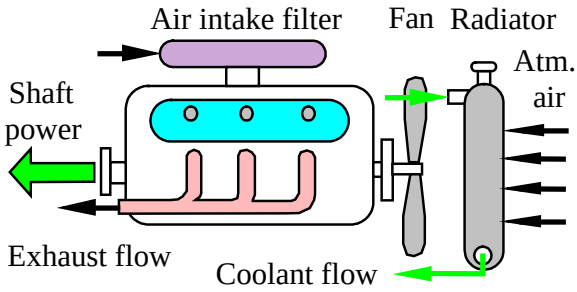
$$T_2 - T_1 = {}_1Q_2 / \Sigma m_i C_i$$

$$= \frac{7000}{100\times 0.42 + 20\times 0.9 + 20\times 0.46 + 5\times 1.9 + 6\times 2.42} \frac{\text{kJ}}{\text{kJ/K}}$$

$$= \frac{7000}{93.22}\,\text{K} = 75\ \text{K}$$

$$T_2 = T_1 + 75^{o}\text{C} = 5 + 75 = \mathbf{80^{o}C}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Properties (u, h, C_V and C_p), Ideal Gas

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.127

An ideal gas is heated from 500 to 1500 K. Find the change in enthalpy using constant specific heat from Table A.5 (room temperature value) and discuss the accuracy of the result if the gas is

a. Argon b. Oxygen c. Carbon dioxide

Solution:

$T_1 = 500$ K, $T_2 = 1500$ K, $\Delta h = C_{P0}(T_2 - T_1)$

a) Ar : $\Delta h = 0.520$ kJ/kg-K $\times$ (1500-500) K = 520 kJ/kg

Monatomic inert gas very good approximation.

b) O_2 : $\Delta h = 0.922$ kJ/kg-K $\times$ (1500-500) K = 922 kJ/kg

Diatomic gas approximation is OK with some error.

c) CO_2: $\Delta h = 0.842$ kJ/kg-K $\times$ (1500-500) K = 842 kJ/kg

Polyatomic gas heat capacity changes, see figure 3.26

See also appendix C for more explanation.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.128

Use the ideal gas air table A.7 to evaluate the heat capacity C_p at 300 K as a slope of the curve h(T) by $\Delta h/\Delta T$. How much larger is it at 1000 K and 1500 K.

Solution :

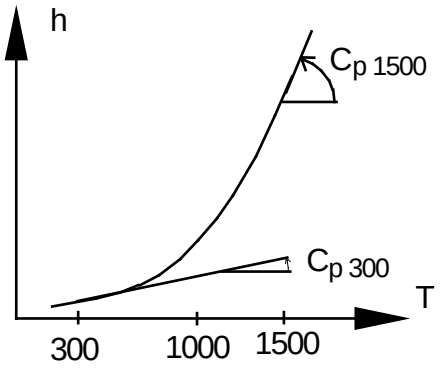
From Eq.3.39:

$$C_p = \frac{dh}{dT} = \frac{\Delta h}{\Delta T} = \frac{h_{320} - h_{290}}{320 - 290} = \mathbf{1.005\ kJ/kg\ K}$$

1000 K $$C_p = \frac{\Delta h}{\Delta T} = \frac{h_{1050} - h_{950}}{1050 - 950} = \frac{1103.48 - 989.44}{100} = \mathbf{1.140\ kJ/kg\ K}$$

1500 K $$C_p = \frac{\Delta h}{\Delta T} = \frac{h_{1550} - h_{1450}}{1550 - 1450} = \frac{1696.45 - 1575.4}{100} = \mathbf{1.21\ kJ/kg\ K}$$

Notice an increase of 14%, 21% respectively.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.129

Estimate the constant specific heats for R-134a from Table B.5.2 at 100 kPa and 125^{o}C. Compare this to table A.5 and explain the difference.

Solution:

Using values at 100 kPa for h and u at 120^{o}C and 130^{o}C from Table B5.2, the approximate specific heats at 125^{o}C are

$$C_p \approx \frac{\Delta h}{\Delta T} = \frac{521.98 - 511.95}{130 - 120} = 1.003 \text{ kJ/kg K}$$

compared with 0.852 kJ/kg K for the ideal-gas value at 25^{o}C from Table A.5.

$$C_v \approx \frac{\Delta u}{\Delta T} = \frac{489.36 - 480.16}{130 - 120} = 0.920 \text{ kJ/kg K}$$

compared with 0.771 kJ/kg K for the ideal-gas value at 25^{o}C from Table A.5.

There are two reasons for the differences. First, R-134a is not exactly an ideal gas at the given state, 125^{o}C and 100 kPa. Second and by far the biggest reason for the differences is that R-134a, chemically CF_3CH_2 , is a polyatomic molecule with multiple vibrational mode contributions to the specific heats (see Appendix C), such that they are strongly dependent on temperature. Note that if we repeat the above approximation for C_p in Table B.5.2 at 25^{o}C, the resulting value is 0.851 kJ/kg K.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.130

We want to find the change in u for carbon dioxide between 600 K and 1200 K.

a) Find it from a constant C_{vo} from table A.5

b) Find it from a C_{vo} evaluated from equation in A.6 at the average T.

c) Find it from the values of u listed in table A.8

Solution :

a) $\Delta u \cong C_{vo}\,\Delta T = 0.653$ kJ/kg-K × (1200 – 600) K = **391.8 kJ/kg**

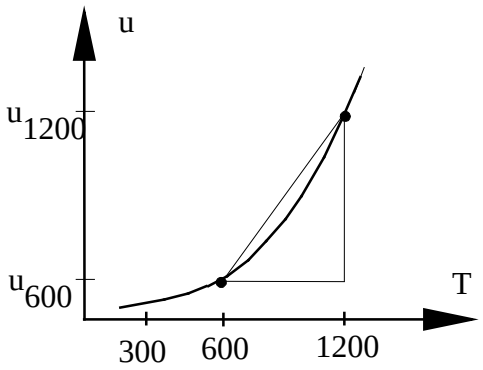
b) $T_{avg} = \frac{1}{2}(1200 + 600) = 900, \qquad \theta = \frac{T}{1000} = \frac{900}{1000} = 0.9$

$C_{po} = 0.45 + 1.67 \times 0.9 - 1.27 \times 0.9^2 + 0.39 \times 0.9^3 = 1.2086$ kJ/kg K

$C_{vo} = C_{po} - R = 1.2086 - 0.1889 = 1.0197$ kJ/kg K

$\Delta u = 1.0197 \times (1200 - 600) =$ **611.8 kJ/kg**

c) $\Delta u = 996.64 - 392.72 =$ **603.92 kJ/kg**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.131

Nitrogen at 300 K, 3 MPa is heated to 500 K. Find the change in enthalpy using a) Table B.6, b) Table A.8, and c) Table A.5.

B.6.2 $h_2 - h_1 = 519.29 - 304.94 = 214.35$ kJ/kg

A.8 $h_2 - h_1 = 520.75 - 311.67 = 209.08$ kJ/kg

A.5 $h_2 - h_1 = C_{po}\,(T_2 - T_1) = 1.042$ kJ/kg-K × (500 – 300) K

$= 208.4$ kJ/kg

Comment: The results are listed in order of accuracy (B.6.2 best).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.132

We want to find the change in u for carbon dioxide between 50°C and 200°C at a pressure of 10 MPa. Find it using ideal gas and Table A.5 and repeat using the B section table.

Solution:

Using the value of C_{vo} for CO_2 from Table A.5,

$$\Delta u = C_{vo} \Delta T = 0.653 \text{ kJ/kg-K} \times (200 - 50) \text{ K} = \mathbf{97.95 \text{ kJ/kg}}$$

Using values of u from Table B3.2 at 10 000 kPa, with linear interpolation between 40°C and 60°C for the 50°C value,

$$\Delta u = u_{200} - u_{50} = 437.6 - 230.9 = \mathbf{206.7 \text{ kJ/kg}}$$

Note: Since the state 50°C, 10 000 kPa is in the dense-fluid supercritical region, a linear interpolation is quite inaccurate. The proper value for u at this state is found from the CATT software to be 245.1 instead of 230.9. This results is

$$\Delta u = u_{200} - u_{50} = 437.6 - 245.1 = \mathbf{192.5 \text{ kJ/kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.133

We want to find the change in u for oxygen gas between 600 K and 1200 K.

a) Find it from a constant C_{vo} from table A.5

b) Find it from a C_{vo} evaluated from equation in A.6 at the average T.

c) Find it from the values of u listed in table A.8

Solution:

a) $\Delta u \cong C_{vo}\,\Delta T = 0.662$ kJ/kg-K × (1200 – 600) K = **397.2 kJ/kg**

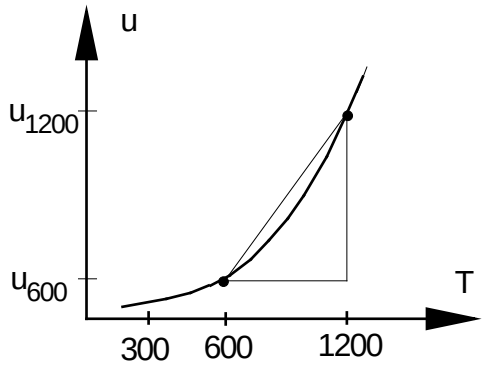
b) $T_{avg} = \frac{1}{2}(1200 + 600) = 900$ K, $\quad \theta = \frac{T}{1000} = \frac{900}{1000} = 0.9$

$C_{po} = 0.88 - 0.0001 \times 0.9 + 0.54 \times 0.9^2 - 0.33 \times 0.9^3 = 1.0767$ kJ/kgK

$C_{vo} = C_{po} - R = 1.0767 - 0.2598 = 0.8169$ kJ/kg-K

$\Delta u = 0.8169 \times (1200 - 600) =$ **490.1 kJ/kg**

c) $\Delta u = 889.72 - 404.46 =$ **485.3 kJ/kg**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.134

For a special application we need to evaluate the change in enthalpy for carbon dioxide from 30^{o}C to 1500^{o}C at 100 kPa. Do this using constant specific heat from Table A.5 and repeat using Table A.8. Which is the more accurate one?

Solution:

Using constant specific heat:

$$\Delta h = C_{po}\Delta T = 0.842\ (1500 - 30) = \mathbf{1237.7\ kJ/kg}$$

Using Table A.8:

$$30°C = 303.15\ K \Rightarrow \quad h = 214.38 + \frac{3.15}{50}(257.9 - 214.38) = 217.12\ kJ/kg$$

$$1500°C = 1773.15\ K \Rightarrow$$

$$h = 1882.43 + \frac{73.15}{100}(2017.67 - 1882.43) = 1981.36\ kJ/kg$$

$$\Delta h = 1981.36 - 217.12 = \mathbf{1764.2\ kJ/kg}$$

The result from A.8 is best. For large ΔT or small ΔT at high T_{avg}, constant specific heat is poor approximation or it must be evaluated at a higher T (A.5 is at 25^{o}C).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.135

Water at 150°C, 400 kPa, is brought to 1200°C in a constant pressure process. Find the change in the specific internal energy, using a) the steam tables, b) the ideal gas water table A.8, and c) the specific heat from A.5.

Solution:

a)

State 1: Table B.1.3 Superheated vapor $u_1 = 2564.48$ kJ/kg

State 2: Table B.1.3 $u_2 = 4467.23$ kJ/kg

$$u_2 - u_1 = 4467.23 - 2564.48 = \mathbf{1902.75\ kJ/kg}$$

b)

Table A.8 at 423.15 K: $u_1 = 591.41$ kJ/kg

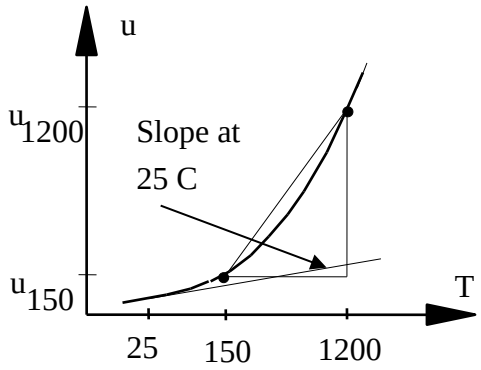
Table A.8 at 1473.15 K: $u_2 = 2474.25$ kJ/kg

$$u_2 - u_1 = 2474.25 - 591.41 = \mathbf{1882.8\ kJ/kg}$$

c) Table A.5 : $C_{vo} = 1.41$ kJ/kgK

$$u_2 - u_1 = 1.41\ \text{kJ/kgK} \times (1200 - 150)\ \text{K} = \mathbf{1480.5\ kJ/kg}$$

Notice how the average slope from 150°C to 1200 °C is higher than the one at 25°C (= C_{vo})



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.136

Repeat the previous problem but use a constant specific heat at the average temperature from equation in Table A.6 and also integrate the equation in Table A.6 to get the change in enthalpy.

$$T_{ave} = \frac{1}{2}(30 + 1500) + 273.15 = 1038.15 \text{ K}; \quad \theta = T/1000 = 1.0382$$

Table A.6 $\Rightarrow$ $C_{po} = 1.2513$ kJ/kg-K

$$\Delta h = C_{po,ave}\,\Delta T = 1.2513 \text{ kJ/kg-K} \times 1470 \text{ K} = \mathbf{1839 \text{ kJ/kg}}$$

For the entry to Table A.6:

$30°C = 303.15$ K => $\theta_1 = 0.30315$

$1500°C = 1773.15$ K => $\theta_2 = 1.77315$

$$\Delta h = h_2 - h_1 = \int C_{po}\, dT$$

$$= [0.45(\theta_2 - \theta_1) + 1.67 \times \frac{1}{2}(\theta_2^2 - \theta_1^2)$$

$$-1.27 \times \frac{1}{3}(\theta_2^3 - \theta_1^3) + 0.39 \times \frac{1}{4}(\theta_2^4 - \theta_1^4)]$$

$$= \mathbf{1762.8 \text{ kJ/kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.137

Water at 20°C, 100 kPa, is brought to 200 kPa, 1500°C. Find the change in the specific internal energy, using the water table and the ideal gas water table in combination.

Solution:

State 1: Table B.1.1 $u_1 \cong u_f = 83.95$ kJ/kg

State 2: Highest T in Table B.1.3 is 1300°C

Using a Δu from the ideal gas tables, A.8, we get

$u_{1500} = 3139$ kJ/kg $\qquad u_{1300} = 2690.72$ kJ/kg

$u_{1500} - u_{1300} = 448.26$ kJ/kg

We now add the ideal gas change at low P to the steam tables, B.1.3, $u_X = 4683.23$ kJ/kg as the reference.

$$u_2 - u_1 = (u_2 - u_X)_{ID.G.} + (u_X - u_1)$$

$$= 448.28 + 4683.23 - 83.95 = \mathbf{5048\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.138

Reconsider Problem 3.134 and examine if also using Table B.3 would be more accurate and explain.

Table B.3 does include non-ideal gas effects, however at 100 kPa these effects are extremely small so the answer from Table A.8 is accurate.

Table B.3. does not cover the 100 kPa superheated vapor states as the saturation pressure is below the triple point pressure. Secondly Table B.3 does not go up to the high temperatures covered by Table A.8 and A.9 at which states you do have ideal gas behavior. Table B.3 covers the region of states where the carbon dioxide is close to the two-phase region and above the critical point (dense fluid) which are all states where you cannot assume ideal gas.

3.139

Air is heated from 300 to 350 K at V = C. Find $_1q_2$. What if from 1300 to 1350 K?

Process: V = C $\rightarrow$ $_1W_2 = Ø$

Energy Eq.: $u_2 - u_1 = {}_1q_2 - 0 \rightarrow {}_1q_2 = u_2 - u_1$

Read the u-values from Table A.7.1

a) $_1q_2 = u_2 - u_1 = 250.32 - 214.36 =$ **36.0 kJ/kg**

b) $_1q_2 = u_2 - u_1 = 1067.94 - 1022.75 =$ **45.2 kJ/kg**

case a) $C_v \approx 36/50 = 0.72$ kJ/kg K , see A.5

case b) $C_v \approx 45.2/50 = 0.904$ kJ/kg K (25 % higher)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.140

A rigid container has 2 kg of carbon dioxide gas at 100 kPa, 1200 K that is heated to 1400 K. Solve for the heat transfer using a. the heat capacity from Table A.5 and b. properties from Table A.8

Solution:

C.V. Carbon dioxide, which is a control mass.

Energy Eq.3.5: $U_2 - U_1 = m\,(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

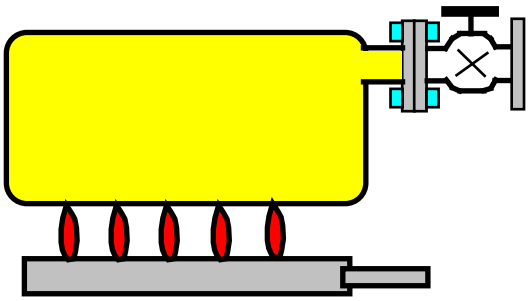
Process: $\Delta V = 0 \quad \Rightarrow {}_1W_2 = 0$

a) For constant heat capacity we have: $u_2 - u_1 = C_{vo}\,(T_2 - T_1)$ so

$${}_1Q_2 \cong mC_{vo}\,(T_2 - T_1) = 2\ \text{kg} \times 0.653\ \text{kJ/kg-K} \times (1400 - 1200)\ \text{K} = \mathbf{261.2\ kJ}$$

b) Taking the u values from Table A.8 we get

$${}_1Q_2 = m\,(u_2 - u_1) = 2\ \text{kg} \times (1218.38 - 996.64)\ \text{kJ/kg} = \mathbf{443.5\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.141

Do the previous problem for nitrogen, N_2, gas.

A rigid container has 2 kg of carbon dioxide gas at 100 kPa, 1200 K that is heated to 1400 K. Solve for the heat transfer using a. the heat capacity from Table A.5 and b. properties from Table A.8

Solution:

C.V. Nitrogen gas, which is a control mass.

Energy Eq.3.5: $U_2 - U_1 = m\,(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

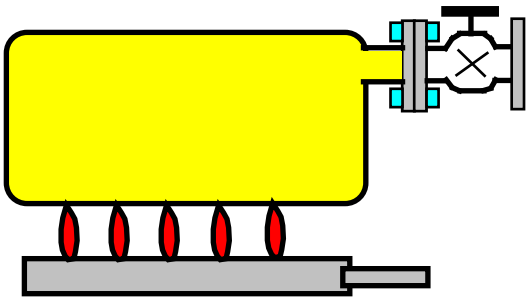
Process: $\Delta V = 0 \quad \Rightarrow {}_1W_2 = 0$

a) For constant heat capacity we have: $u_2 - u_1 = C_{vo}\,(T_2 - T_1)$ so

$${}_1Q_2 \cong mC_{vo}\,(T_2 - T_1) = 2\ \text{kg} \times 0.745\ \text{kJ/kg-K} \times (1400 - 1200)\ \text{K} = \mathbf{298\ kJ}$$

b) Taking the u values from Table A.8, we get

$${}_1Q_2 = m\,(u_2 - u_1) = 2\ \text{kg} \times (1141.35 - 957)\ \text{kJ/kg} = \mathbf{368.7\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.142

Air, 3 kg, is in a piston/cylinder similar to Fig. P.3.5 at 27°C, 300 kPa. It is now heated to 500 K. Plot the process path in a P-v diagram, and find the work and heat transfer in the process.

Solution:

CV Air, so this is a control mass.

Energy Eq.3.5: $U_2 - U_1 = m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = C$ so ${}_1W_2 = \int PdV = P_1(V_2 - V_1)$

State 1: T_1, P_1 ideal gas so $P_1V_1 = mRT_1$

$V_1 = mR\,T_1 / P_1 = 3\text{ kg} \times 0.287\text{ kJ/kg-K} \times 300.15\text{ K} / 300\text{ kPa}$

$= 0.86143\text{ m}^3$

State 2: $T_2, P_2 = P_1$ and ideal gas so $P_2V_2 = mRT_2$

$V_2 = mR\,T_2 / P_2 = 3 \times 0.287 \times 500/300 = 1.435\text{ m}^3$

From the process

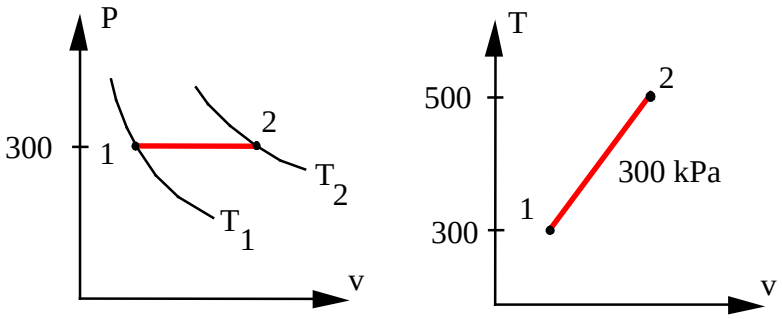
${}_1W_2 = \int PdV = P(V_2 - V_1) = 300\text{ kPa}(1.435 - 0.86143)\text{ m}^3 =$ **172.1 kJ**

From the energy equation

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = mC_{vo}(T_2 - T_1) + {}_1W_2$

$= 3\text{ kg} \times 0.717\text{ kJ/kg-K} \times (500 - 300)\text{ K} + 172.1\text{ kJ}$

$=$ **602.3 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.143

A closed rigid container is filled with 1.5 kg water at 100 kPa, 55^{o}C, 1 kg of stainless steel and 0.5 kg of PVC (polyvinyl chloride) both at 20^{o}C and 0.1 kg of air at 400 K, 100 kPa. It is now left alone with no external heat transfer and no water vaporizes. Find the final temperature and air pressure.

CV. Container.

Process: V = constant => $_1W_2 = 0$ and also given $_1Q_2 = 0$

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2 = 0$

For the liquid and the metal masses we will use the specific heats (Tbl A.3, A.4) so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i} (T_2 - T_1)_i = T_2 \sum m_i C_{v\,i} - \sum m_i C_{v\,i} T_{1\,i}$$

noticing that all masses have the same T_2 but not same initial T.

$$\sum m_i C_{v\,i} = 1.5 \times 4.18 + 1 \times 0.46 + 0.5 \times 0.96 + 0.1 \times 0.717 = 7.282 \text{ kJ/K}$$

The T for air must be converted to ^{o}C like the others.

Energy Eq.: $T_2 \sum m_i C_{v\,i} = \sum m_i C_{v\,i} T_{1\,i}$

$$7.282\, T_2 = 1.5 \times 4.18 \times 55 + (1 \times 0.46 + 0.5 \times 0.96) \times 20$$
$$+ 0.1 \times 0.717 \times (400\text{-}273.15) = 372.745 \text{ kJ}$$
$$T_2 = \mathbf{51.2^{o}C}$$

The volume of the air is constant so from PV = mRT it follows that P varies with T

$$P_2 = P_1\, T_2/T_{1\,air} = 100 \text{ kPa} \times 324.34 \text{ K}/ 400 \text{ K} = \mathbf{81 \text{ kPa}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.144

A 250 L rigid tank contains methane at 500 K, 1500 kPa. It is now cooled down to 300 K. Find the mass of methane and the heat transfer using ideal gas.

Solution:

C.V. Methane gas, which is a control mass.

Energy Eq.3.5: $U_2 - U_1 = m\,(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $\Delta V = 0 \quad \Rightarrow {}_1W_2 = 0$

State 1: Ideal gas so

$$m = P_1V/RT_1 = \frac{1500 \times 0.25}{0.5183 \times 500}\,\frac{\text{kPa m}^3}{\text{(kJ/kg-K)} \times \text{K}} = \mathbf{1.447\ kg}$$

For constant heat capacity A.5, we have: $u_2 - u_1 = C_{vo}\,(T_2 - T_1)$ so

$$u_2 - u_1 = C_v\,(T_2 - T_1) = 1.736\ \text{kJ/kg-K} \times (300 - 500)\ \text{K} = -347.2\ \text{kJ/kg}$$

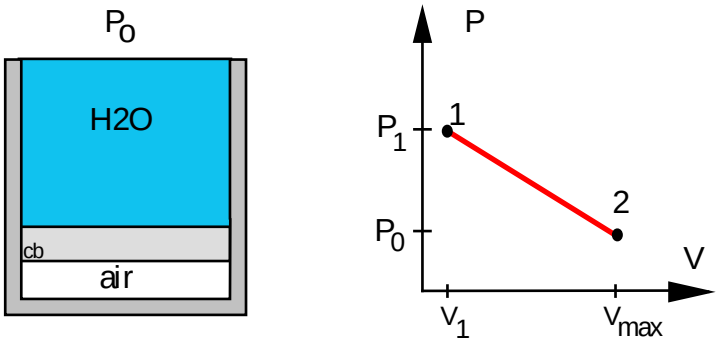
$${}_1Q_2 = m(u_2 - u_1) = 1.447\ \text{kg}\ (-347.2)\ \text{kJ/kg} = \mathbf{-502.4\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.145

A 10-m high cylinder, cross-sectional area 0.1 m^2, has a massless piston at the bottom with water at 20°C on top of it, shown in Fig. P3.145. Air at 300 K, volume 0.3 m^3, under the piston is heated so that the piston moves up, spilling the water out over the side. Find the total heat transfer to the air when all the water has been pushed out.

Solution:



The water on top is compressed liquid and has volume and mass

$$V_{H_2O} = V_{tot} - V_{air} = 10 \times 0.1 - 0.3 = 0.7 \text{ m}^3$$

$$m_{H_2O} = V_{H_2O}/v_f = 0.7 \text{ m}^3 / 0.001002 \text{ m}^3/\text{kg} = 698.6 \text{ kg}$$

The initial air pressure is then

$$P_1 = P_0 + m_{H_2O}g/A = 101.325 + \frac{698.6 \times 9.807}{0.1 \times 1000} = \mathbf{169.84\ kPa}$$

and then $$m_{air} = PV/RT = \frac{169.84 \times 0.3}{0.287 \times 300} \frac{\text{kPa m}^3}{\text{(kJ/kg-K)} \times \text{K}} = 0.592 \text{ kg}$$

State 2: No liquid over piston: $P_2 = P_0 = 101.325$ kPa, $V_2 = 10 \times 0.1 = 1\ m^3$

State 2: $P_2, V_2 \quad \Rightarrow \quad T_2 = \frac{T_1 P_2 V_2}{P_1 V_1} = \frac{300 \times 101.325 \times 1}{169.84 \times 0.3} = 596.59$ K

The process line shows the work as an area

$$_1W_2 = \int PdV = \tfrac{1}{2}(P_1 + P_2)(V_2 - V_1) = \frac{1}{2}(169.84 + 101.325)(1 - 0.3) = 94.91 \text{ kJ}$$

The energy equation solved for the heat transfer becomes

$$_1Q_2 = m(u_2 - u_1) + {}_1W_2 \cong mC_V(T_2 - T_1) + {}_1W_2$$

$$= 0.592 \text{ kg} \times 0.717 \text{ kJ/kg-K} \times (596.59 - 300) \text{ K} + 94.91 \text{ kJ} = \mathbf{220.7\ kJ}$$

Remark: we could have used u values from Table A.7:

$u_2 - u_1 = 432.5 - 214.36 = 218.14$ kJ/kg versus 212.5 kJ/kg with C_V.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.146

A cylinder with a piston restrained by a linear spring contains 2 kg of carbon dioxide at 500 kPa, 400°C. It is cooled to 40°C, at which point the pressure is 300 kPa. Calculate the heat transfer for the process.

Solution:

C.V. The carbon dioxide, which is a control mass.

Continuity Eq.: $m_2 - m_1 = 0$

Energy Eq.: $m\,(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $P = A + BV$ (linear spring)

$${}_1W_2 = \int P dV = \tfrac{1}{2}(P_1 + P_2)(V_2 - V_1)$$

Equation of state: $PV = mRT$ (ideal gas)

State 1: $V_1 = mRT_1/P_1 = 2 \times 0.18892 \times 673.15 / 500 = 0.5087\ m^3$

State 2: $V_2 = mRT_2/P_2 = 2 \times 0.18892 \times 313.15 / 300 = 0.3944\ m^3$

$${}_1W_2 = \tfrac{1}{2}(500 + 300)(0.3944 - 0.5087) = -45.72\ kJ$$

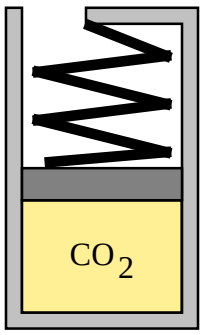
To evaluate $u_2 - u_1$ we will use the specific heat at the average temperature.

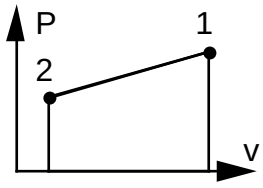
From Figure 3.26: $C_{po}(T_{avg}) \approx 5.4\ R = 1.02 \Rightarrow C_{vo} = 0.83 = C_{po} - R$

For comparison the value from Table A.5 at 300 K is $C_{vo} = 0.653$ kJ/kg K

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = mC_{vo}(T_2 - T_1) + {}_1W_2$$

$$= 2 \times 0.83(40 - 400) - 45.72 = \mathbf{-643.3\ kJ}$$





Remark: We could also have used the ideal gas table in A.8 to get $u_2 - u_1$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.147

Water at 100 kPa, 400 K is heated electrically adding 700 kJ/kg in a constant pressure process. Find the final temperature using

a) The water tables B.1 b) The ideal gas tables A.8

c) Constant specific heat from A.5

Solution :

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Process: P = constant => ${}_1w_2 = P (v_2 - v_1)$

Substitute this into the energy equation to get

$${}_1q_2 = h_2 - h_1$$

Table B.1:

$$h_1 \cong 2675.46 + \frac{126.85 - 99.62}{150 - 99.62} \times (2776.38 - 2675.46) = 2730.0 \text{ kJ/kg}$$

$$h_2 = h_1 + {}_1q_2 = 2730 + 700 = 3430 \text{ kJ/kg}$$

$$T_2 = 400 + (500 - 400) \times \frac{3430 - 3278.11}{3488.09 - 3278.11} = \mathbf{472.3°C}$$

Table A.8:

$$h_2 = h_1 + {}_1q_2 = 742.4 + 700 = 1442.4 \text{ kJ/kg}$$

$$T_2 = 700 + (750 - 700) \times \frac{1442.4 - 1338.56}{1443.43 - 1338.56} = 749.5 \text{ K} = \mathbf{476.3°C}$$

Table A.5

$$h_2 - h_1 \cong C_{po} (T_2 - T_1)$$

$$T_2 = T_1 + {}_1q_2 / C_{po} = 400 + 700 / 1.872 = 773.9\text{K} = \mathbf{500.8°C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.148

A constant pressure container is filled with 1.5 kg water at 100 kPa, 55^{o}C, 1 kg of stainless steel and 0.5 kg of PVC (polyvinyl chloride) both at 20^{o}C and 0.1 kg of air at 400 K, 100 kPa. It is now left alone with no external heat transfer and no water vaporizes. Find the final temperature and process work.

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2 = 0$

Process: P = constant => ${}_1W_2 = P(V_2 - V_1)$ and given ${}_1Q_2 = 0$

For the liquid and the metal masses we will use the specific heats (Tbl A.3, A.4) so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i} (T_2 - T_1)_i = T_2 \sum m_i C_{v\,i} - \sum m_i C_{v\,i} T_{1\,i}$$

noticing that all masses have the same T_2 but not same initial T. Since it is only the air that changes volume then the work term and internal energy change for air combines to give changes in enthalpy as

$$m_{air}\,(u_2 - u_1) + {}_1W_2 = m_{air}\,(h_2 - h_1) = m_{air} C_p\,(T_2 - T_1)$$

$$\sum m_i C_{v\,i} = 1.5 \times 4.18 + 1 \times 0.46 + 0.5 \times 0.96 + 0.1 \times 1.004 = 7.3104 \text{ kJ/K}$$

Energy Eq.: $7.3104\, T_2 = 1.5 \times 4.18 \times 55 + (1 \times 0.46 + 0.5 \times 0.96) \times 20$

$$+ 0.1 \times 1.004 \times (400 - 273.15) = 376.386 \text{ kJ}$$

$$T_2 = \mathbf{51.48^{o}C}$$

$$V_1 = mRT_1/P_1 = 0.1 \text{ kg} \times 0.287 \text{ kJ/kgK} \times 400 \text{ K} / 100 \text{ kPa} = 0.1148 \text{ m}^3$$

$$V_2 = V_1 \times T_2/T_{1air} = 0.1148 \;\; 324.63 / 400 = 0.09317 \text{ m}^3$$

$${}_1W_2 = P(V_2 - V_1) = 100 \text{ kPa } (0.09317 - 0.1148) \text{ m}^3 = \mathbf{-2.16\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.149

A spring loaded piston/cylinder contains 1.5 kg of air at 27C and 160 kPa. It is now heated to 900 K in a process where the pressure is linear in volume to a final volume of twice the initial volume. Plot the process in a P-v diagram and find the work and heat transfer.

Take CV as the air.

$m_2 = m_1 = m$; $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = A + BV$ => ${}_1W_2 = \int P\, dV$ = area = $0.5(P_1 + P_2)(V_2 - V_1)$

State 1: Ideal gas. $V_1 = mRT_1/P_1 = 1.5 \times 0.287 \times 300/160 = 0.8072\ m^3$

Table A.7 $u_1 = u(300) = 214.36$ kJ/kg

State 2: $P_2V_2 = mRT_2$ so ratio it to the initial state properties

$P_2V_2 /P_1V_1 = P_2 2 /P_1 = mRT_2 /mRT_1 = T_2 /T_1$ =>

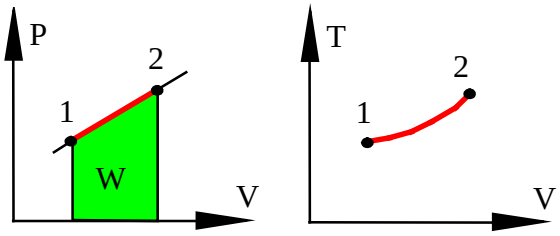
$P_2 = P_1 (T_2 /T_1)(1/2) = 160 \times (900/300) \times (1/2) = 240$ kPa

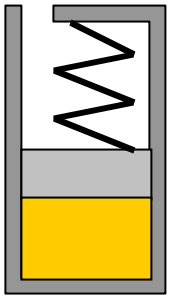
Work is done while piston moves at linearly varying pressure, so we get

${}_1W_2 = 0.5(P_1 + P_2)(V_2 - V_1) = 0.5 \times (160 + 240)$ kPa $\times\ 0.8072\ m^3$ = **161.4 kJ**

Heat transfer is found from energy equation

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1.5 \times (674.824 - 214.36) + 161.4$ = **852.1 kJ**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.150

A constant pressure piston cylinder contains 0.5 kg air at 300 K, 400 kPa. Assume the piston cylinder has a total mass of 1 kg steel and is at the same temperature as the air at any time. The system is now heated to 1600 K by heat transfer.

(a) Find the heat transfer using constant specific heats for air.
(b) Find the heat transfer **NOT** using constant specific heats for air.

C.V. Air and Steel.

Energy Eq.: $U_2 - U_1 = m_{air}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = C \Rightarrow {}_1W_2 = \int_1^2 PdV = P\,(V_2 - V_1) = P\, m_{air}\,(v_2 - v_1)$

$${}_1Q_2 = m_{air}(u_2 - u_1)_{air} + m_{st}(u_2 - u_1)_{st} + {}_1W_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$$

Use A.3: $(u_2 - u_1)_{st} = C\,(T_2 - T_1) = 0.46\ \text{kJ/kgK} \times (1600 - 300)\ \text{K} = 598\ \text{kJ/kg}$

Use A.5: $(h_2 - h_1)_{air} = C_p(T_2 - T_1) = 1.004\ \text{kJ/kgK} \times (1600 - 300)\ \text{K} = 1305.2\ \text{kJ/kg}$

$${}_1Q_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$$
$$= 0.5\ \text{kg} \times 1305\ \text{kJ/kg} + 1\ \text{kg} \times 598\ \text{kJ/kg} = \mathbf{1250.6\ kJ}$$

Use air tables A.7: $(h_2 - h_1)_{air} = 1757.33 - 300.47 = 1456.86\ \text{kJ/kg}$

$${}_1Q_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$$
$$= 0.5\ \text{kg} \times 1456.86\ \text{kJ/kg} + 1\ \text{kg} \times 598\ \text{kJ/kg} = \mathbf{1326.43\ kJ}$$

Comment: we could also have computed the work explicitly

$${}_1W_2 = P\, m_{air}\,(v_2 - v_1) = m_{air}\, R(T_2 - T_1)$$
$$= 0.5\ \text{kg} \times 0.287\ \text{kJ/kgK} \times (1600 - 300)\ \text{K} = 186.55\ \text{kJ}$$
$$(u_2 - u_1)_{air} = 1298.08 - 214.36 = 1083.72\ \text{kJ/kg}$$
$${}_1Q_2 = m_{air}(u_2 - u_1)_{air} + m_{st}(u_2 - u_1)_{st} + {}_1W_2$$
$$= 0.5 \times 1083.72 + 598 + 186.55 = 1139.86 + 186.55 = 1326.4\ \text{kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.151

An insulated cylinder is divided into two parts of 1 m^3 each by an initially locked piston, as shown in Fig. P3.151. Side A has air at 200 kPa, 300 K, and side B has air at 1.0 MPa, 1000 K. The piston is now unlocked so it is free to move, and it conducts heat so the air comes to a uniform temperature $T_A = T_B$. Find the mass in both A and B, and the final T and P.

C.V. A + B Force balance on piston: $P_A A = P_B A$

So the final state in A and B is the same.

State 1A: Table A.7 $u_{A1} = 214.364$ kJ/kg,

$m_A = P_{A1}V_{A1}/RT_{A1} = 200 \text{ kPa} \times 1 \text{ m}^3/(0.287 \text{ kJ/kg-K} \times 300 \text{ K}) =$ **2.323 kg**

State 1B: Table A.7 $u_{B1} = 759.189$ kJ/kg,

$m_B = P_{B1}V_{B1}/RT_{B1} = 1000 \text{ kPa} \times 1 \text{ m}^3/(0.287 \text{ kJ/kg-K} \times 1000 \text{ K}) =$ **3.484 kg**

For chosen C.V. ${}_1Q_2 = 0$, ${}_1W_2 = 0$ so the energy equation becomes

$$m_A(u_2 - u_1)_A + m_B(u_2 - u_1)_B = 0$$

$$(m_A + m_B)u_2 = m_A u_{A1} + m_B u_{B1}$$

$$= 2.323 \times 214.364 + 3.484 \times 759.189 = 3143 \text{ kJ}$$

$$u_2 = 3143 \text{ kJ} / (3.484 + 2.323) \text{ kg} = 541.24 \text{ kJ/kg}$$

From interpolation in Table A.7: $\Rightarrow$ **T_2 = 736 K**

$$P = (m_A + m_B)RT_2/V_{tot} = 5.807 \text{ kg} \times 0.287 \frac{\text{kJ}}{\text{kg K}} \times 736 \text{ K}/ 2 \text{ m}^3 =$$ **613 kPa**

3.152

Air in a piston cylinder is at 1800 K, 7 MPa and expands in a polytropic process with n = 1.5 to a volume 8 times larger. Find the specific work and the specific heat transfer in the process and draw the P-v diagram. Use constant specific heat to solve the problem.

C.V. Air of constant mass $m_2 = m_1 = m$.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $Pv^{1.50} = \text{constant}, \quad v_2/v_1 = 8$

State 1: $P_1 = 7$ MPa, $T_1 = 1800$ K

State 2: ($v_2 = 8v_1$, ?) Must be on process curve so

$$P_2 = P_1 (v_1/v_2)^n = 7000\ (1/8)^{1.50} = 309.36 \text{ kPa}$$

$$T_2 = T_1 \frac{P_2 v_2}{P_1 v_1} = T_1 (v_1/v_2)^{n-1} = 1800\ (1/8)^{0.5} = 636.4 \text{ K}$$

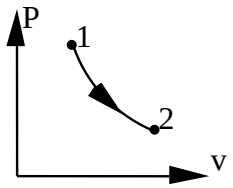
Work from the process expressed in Eq.3.21

$${}_1w_2 = \int P dv = \frac{P_2 v_2 - P_1 v_1}{1 - n} = \frac{R}{1 - n}(T_2 - T_1) = \frac{0.287\ (636.4 - 1800)}{1 - 1.5}$$

$$= \mathbf{667.9\ kJ/kg}$$

Heat transfer from the energy equation

$${}_1q_2 = (u_2 - u_1) + {}_1w_2 = 0.717\ (636.4 - 1800) + 667.9 = -\mathbf{166.4\ kJ/kg}$$



Notice:
n = 1.5, k = 1.4

n > k

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.153

Do the previous problem but do **not** use constant specific heats.
Air in a piston cylinder is at 1800 K, 7 MPa and expands in a polytropic process with n = 1.5 to a volume 8 times larger. Find the specific work and the specific heat transfer in the process and draw the P-v diagram.

C.V. Air of constant mass $m_2 = m_1 = m$.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $Pv^{1.50} = \text{constant}, \quad v_2/v_1 = 8$

State 1: $P_1 = 7$ MPa, $T_1 = 1800$ K

State 2: ($v_2 = 8v_1$, ?) Must be on process curve so

$$P_2 = P_1 (v_1/v_2)^n = 7000\ (1/8)^{1.50} = 309.36 \text{ kPa}$$

$$T_2 = T_1 \frac{P_2 v_2}{P_1 v_1} = T_1 (v_1/v_2)^{n-1} = 1800\ (1/8)^{0.5} = 636.4 \text{ K}$$

Table A.7: $u_1 = 1486.33$ kJ/kg and interpolate $u_2 = 463.06$ kJ/kg

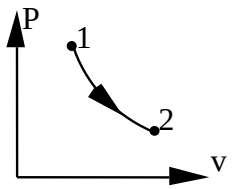
Work from the process expressed in Eq.3.21

$${}_1w_2 = \int P dv = \frac{P_2 v_2 - P_1 v_1}{1 - n} = \frac{R}{1 - n}(T_2 - T_1) = \frac{0.287\ (636.4 - 1800)}{1 - 1.5}$$

$$= \mathbf{667.9\ kJ/kg}$$

Heat transfer from the energy equation

$${}_1q_2 = (u_2 - u_1) + {}_1w_2 = (463.06 - 1486.33) + 667.9 = \mathbf{-355.4\ kJ/kg}$$



Notice:
n = 1.5, k = 1.4

n > k

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.154

Helium gas expands from 125 kPa, 350 K and 0.25 m^3 to 100 kPa in a polytropic process with n = 1.667. How much heat transfer is involved?

Solution:

C.V. Helium gas, this is a control mass.

Energy equation: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process equation: $PV^n = \text{constant} = P_1V_1^n = P_2V_2^n$

Ideal gas (A.5): $m = PV/RT = \dfrac{125 \times 0.25}{2.0771 \times 350} = 0.043$ kg

Solve for the volume at state 2

$$V_2 = V_1 (P_1/P_2)^{1/n} = 0.25 \times \left(\frac{125}{100}\right)^{0.6} = 0.2852 \text{ m}^3$$

$$T_2 = T_1 P_2V_2/(P_1V_1) = 350 \text{ K} \frac{100 \times 0.2852}{125 \times 0.25} = 319.4 \text{ K}$$

Work from Eq.3.21

$${}_1W_2 = \frac{P_2V_2 - P_1 V_1}{1-n} = \frac{100\times 0.2852 - 125\times 0.25}{1 - 1.667} \text{ kPa m}^3 = 4.09 \text{ kJ}$$

Use specific heat from Table A.5 to evaluate $u_2 - u_1$, $C_v = 3.116$ kJ/kg K

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m\, C_v\, (T_2 - T_1) + {}_1W_2$$

$$= 0.043 \text{ kg} \times 3.116 \text{ kJ/kg-K} \times (319.4 - 350) \text{ K} + 4.09 \text{ kJ} = \mathbf{-0.01\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.155

A piston cylinder contains 0.1 kg air at 300 K and 100 kPa. The air is now slowly compressed in an isothermal (T = C) process to a final pressure of 250 kPa. Show the process in a P-V diagram and find both the work and heat transfer in the process.

Solution :

Process: T = C & ideal gas $\Rightarrow$ PV = mRT = constant

The work was found as in Eq.3.22

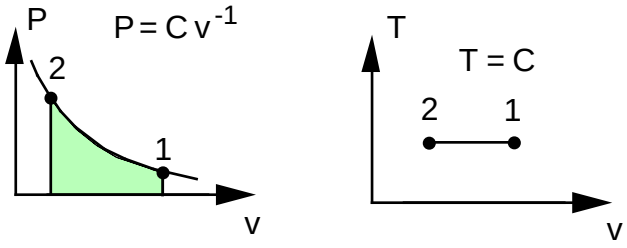
$$_1W_2 = \int PdV = \int \frac{mRT}{V} dV = mRT \ln \frac{V_2}{V_1} = mRT \ln \frac{P_1}{P_2}$$

$$= 0.1 \text{ kg} \times 0.287 \text{ kJ/kg-K} \times 300 \text{ K} \times \ln (100 / 250) = \mathbf{-7.89\ kJ}$$

since $T_1 = T_2 \Rightarrow u_2 = u_1$

The energy equation thus becomes

$$_1Q_2 = m \times (u_2 - u_1) + {}_1W_2 = {}_1W_2 = \mathbf{-7.89\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.156

A gasoline engine has a piston/cylinder with 0.1 kg air at 4 MPa, 1527°C after combustion and this is expanded in a polytropic process with n = 1.5 to a volume 10 times larger. Find the expansion work and heat transfer using Table A.5 heat capacity.

Take CV as the air. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $Pv^n = \text{Constant}$ (polytropic)

From the ideal gas law and the process equation we can get:

State 2: $P_2 = P_1 \left(v_2 / v_1\right)^{-n} = 4000 \times 10^{-1.5} = 126.5 \text{ kPa}$

$$T_2 = T_1 \ (P_2v_2 / P_1v_1) = (1527 + 273) \frac{126.5 \times 10}{4000} = 569.3 \text{ K}$$

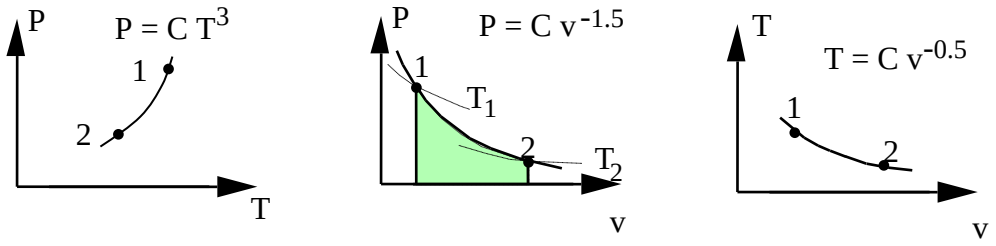
From process eq.: ${}_1W_2 = \int P\, dV = \frac{m}{1-n}(P_2v_2 - P_1v_1) = \frac{mR}{1-n}(T_2 - T_1)$

$$= \frac{0.1 \times 0.287}{1 - 1.5}(569.3 - 1800) = \mathbf{70.64\ kJ}$$

From energy eq.: ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = mC_v(T_2 - T_1) + {}_1W_2$

$= 0.1 \text{ kg} \times 0.717 \text{ kJ/kg-K} \times (569.3 - 1800) \text{ K} + 70.64 \text{ kJ}$

$= \mathbf{-17.6\ kJ}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.157

Solve the previous problem using Table A.7

Take CV as the air. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $Pv^n = \text{Constant}$ (polytropic)

From the ideal gas law and the process equation we can get:

State 2: $P_2 = P_1 \left(v_2 / v_1\right)^{-n} = 4000 \times 10^{-1.5} = 126.5 \text{ kPa}$

$$T_2 = T_1 \ (P_2v_2 / P_1v_1) = (1527 + 273) \frac{126.5 \times 10}{4000} = 569.3 \text{ K}$$

From process eq.: ${}_1W_2 = \int P \, dV = \frac{m}{1-n} (P_2v_2 - P_1v_1) = \frac{mR}{1-n} (T_2 - T_1)$

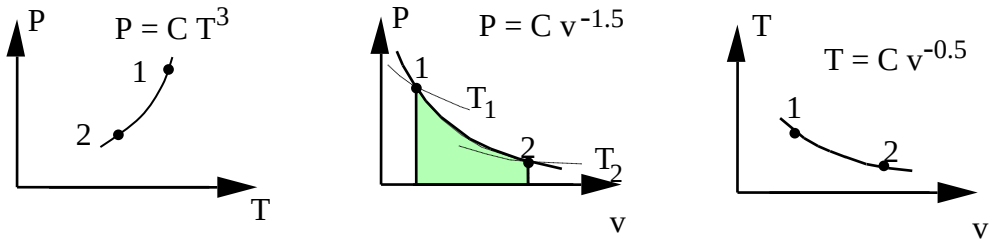
$$= \frac{0.1 \times 0.287}{1 - 1.5} (569.3 - 1800) = \mathbf{70.64 \text{ kJ}}$$

From energy eq.: ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$

$= 0.1 \text{ kg } (411.78 - 1486.33) \text{ kJ/kg} + 70.64 \text{ kJ}$

$= \mathbf{-36.8 \text{ kJ}}$

The only place where Table A.7 comes in is for values of u_1 and u_2



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.158

Find the specific heat transfer in Problem 3.55.

Air goes through a polytropic process from 125 kPa, 325 K to 300 kPa and 500 K. Find the polytropic exponent n and the specific work in the process.

Solution:

Energy Eq.: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Process: $Pv^n = \text{Const} = P_1v_1^n = P_2\, v_2^n$

Ideal gas $Pv = RT$ so

$$v_1 = \frac{RT}{P} = \frac{0.287 \times 325}{125} = 0.7462 \text{ m}^3/\text{kg}$$

$$v_2 = \frac{RT}{P} = \frac{0.287 \times 500}{300} = 0.47833 \text{ m}^3/\text{kg}$$

From the process equation

$$(P_2/ P_1) = (v_1/ v_2)^n \quad => \quad \ln(P_2/ P_1) = n \ln(v_1/ v_2)$$

$$n = \ln(P_2/ P_1) \,/\, \ln(v_1/ v_2) = \frac{\ln 2.4}{\ln 1.56} = \mathbf{1.969}$$

The work is now from Eq.3.21 per unit mass and ideal gas law

$${}_1w_2 = \frac{P_2v_2 - P_1v_1}{1-n} = \frac{R(T_2 - T_1)}{1-n} = \frac{0.287(500 - 325)}{1-1.969} \text{ (kJ/kg-K) K}$$

$$= \mathbf{-51.8 \text{ kJ/kg}}$$

From the energy equation

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v\,(T_2 - T_1) + {}_1w_2$$

$$= 0.717 \text{ kJ/kg-K } (500 - 325) \text{ K} - 51.5 \text{ kJ/kg}$$

$$= \mathbf{73.98 \text{ kJ/kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.159

A piston/cylinder has nitrogen gas at 750 K and 1500 kPa. Now it is expanded in a polytropic process with n = 1.2 to P = 750 kPa. Find the final temperature, the specific work and specific heat transfer in the process.

C.V. Nitrogen. This is a control mass going through a polytropic process.

Continuty: $m_2 = m_1$

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $Pv^n = \text{constant}$

Substance ideal gas: $Pv = RT$

$$T_2 = T_1 (P_2/P_1)^{\frac{n-1}{n}} = 750 \left(\frac{750}{1500}\right)^{\frac{0.2}{1.2}} = 750 \times 0.8909 = \mathbf{668\ K}$$

The work is integrated as in Eq.3.21

$${}_1w_2 = \int P dv = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$$

$$= \frac{0.2968}{1-1.2}\ \text{kJ/kg-K}\ (668 - 750)\ \text{K} = \mathbf{121.7\ kJ/kg}$$

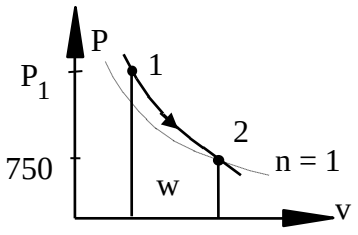
The energy equation with values of u from Table A.8 is

${}_1q_2 = u_2 - u_1 + {}_1w_2 = 502.8 - 568.45 + 121.7 = \mathbf{56.0\ kJ/kg}$

If constant specific heat is used from Table A.5

${}_1q_2 = C_V(T_2 - T_1) + {}_1w_2 = 0.745(668 - 750) + 121.7 = \mathbf{60.6\ kJ/kg}$

The actual process is on a steeper curve than n = 1.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.160

A piston/cylinder has 1 kg propane gas at 700 kPa, 40°C. The piston cross-sectional area is 0.5 m^2, and the total external force restraining the piston is directly proportional to the cylinder volume squared. Heat is transferred to the propane until its temperature reaches 700°C. Determine the final pressure inside the cylinder, the work done by the propane, and the heat transfer during the process.

Solution:

C.V. The 1 kg of propane.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = P_{ext} = CV^2 \Rightarrow PV^{-2} = \text{constant}$, polytropic $n = -2$

Ideal gas: $PV = mRT$, and process yields

$$P_2 = P_1(T_2/T_1)^{\frac{n}{n-1}} = 700 \left(\frac{700+273.15}{40+273.15}\right)^{2/3} = \mathbf{1490.7\ kPa}$$

The work is integrated as Eq.3.21

$${}_1W_2 = \int_1^2 PdV = \frac{P_2V_2 - P_1V_1}{1 - n} = \frac{mR(T_2 - T_1)}{1 - n}$$

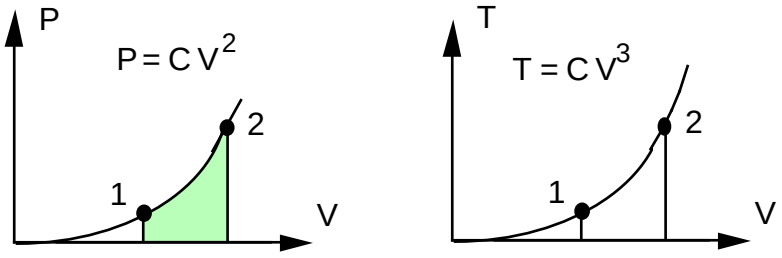
$$= \frac{1 \times 0.18855 \times (700 - 40)}{1 - (-2)} = \mathbf{41.48\ kJ}$$

The energy equation with specific heat from Table A.5 becomes

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = mC_V(T_2 - T_1) + {}_1W_2$$

$$= 1\ \text{kg} \times 1.490\ \text{kJ/kg-K} \times (700 - 40)\ \text{K} + 41.48\ \text{kJ}$$

$$= \mathbf{1024.9\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.161

A piston/cylinder arrangement of initial volume 0.025 m^3 contains saturated water vapor at 180°C. The steam now expands in a polytropic process with exponent $n = 1$ to a final pressure of 200 kPa, while it does work against the piston. Determine the heat transfer in this process.

Solution:

C.V. Water. This is a control mass.

State 1: Table B.1.1 $P = 1002.2$ kPa, $v_1 = 0.19405\ m^3/kg$, $u_1 = 2583.7$ kJ/kg ,

$$m = V/v_1 = 0.025/0.19405 = 0.129 \text{ kg}$$

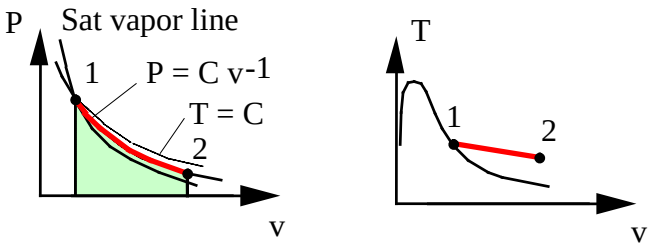
Process: $Pv = \text{const.} = P_1v_1 = P_2v_2$; polytropic process $n = 1$.

$$\Rightarrow v_2 = v_1P_1/P_2 = 0.19405 \times 1002.1/200 = 0.9723\ m^3/kg$$

State 2: $P_2, v_2 \Rightarrow$ Table B.1.3 $T_2 \cong 155$°C , $u_2 = 2585$ kJ/kg

$$_1W_2 = \int PdV = P_1V_1 \ln \frac{v_2}{v_1} = 1002.2 \text{ kPa} \times 0.025\ m^3 \ln \frac{0.9723}{0.19405} = 40.37 \text{ kJ}$$

$$_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.129(2585 - 2583.7) + 40.37 = \mathbf{40.54\ kJ}$$



Notice T drops, it is not an ideal gas.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.162

A piston cylinder contains pure oxygen at ambient conditions 20°C, 100 kPa. The piston is moved to a volume that is 7 times smaller than the initial volume in a polytropic process with exponent n = 1.25. Use constant heat capacity to find the final pressure and temperature, the specific work and the specific heat transfer.

Energy Eq.: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Process Eq: $Pv^n = C$; $P_2 = P_1 (v_1/v_2)^n = 100 (7)^{1.25} = 1138.6$ kPa

From the ideal gas law and state 2 (P, v) we get

$$T_2 = T_1(P_2/P_1)(v_1/v_2) = 293 \times \frac{1138.6}{100} \times (1/7) = 476.8 \text{ K}$$

We could also combine process eq. and gas law to give: $T_2 = T_1 (v_1/v_2)^{n-1}$

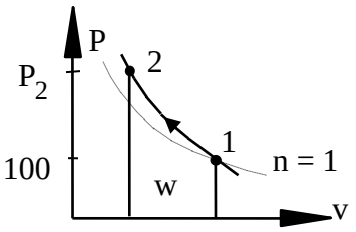
Polytropic work Eq. 3.21: ${}_1w_2 = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$

$${}_1w_2 = \frac{0.2598}{1 - 1.25} \frac{\text{kJ}}{\text{kg K}} \times (476.8 - 293.2) \text{ K} = \mathbf{-190.88 \text{ kJ/kg}}$$

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v (T_2 - T_1) + {}_1w_2$$

$$= 0.662 (476.8 - 293.2) - 190.88 = \mathbf{-69.3 \text{ kJ/kg}}$$

The actual process is on a steeper curve than n = 1.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.163

A piston/cylinder in a car contains 0.2 L of air at 90 kPa, 20°C, shown in Fig. P3.163. The air is compressed in a quasi-equilibrium polytropic process with polytropic exponent $n = 1.25$ to a final volume six times smaller. Determine the final pressure, temperature, and the heat transfer for the process.

Solution:

C.V. Air. This is a control mass going through a polytropic process.

Continuty: $m_2 = m_1$

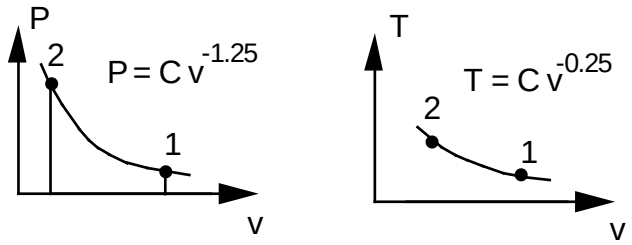
Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $Pv^n = \text{const.}$

$P_1v_1^n = P_2v_2^n \Rightarrow P_2 = P_1(v_1/v_2)^n = 90 \text{ kPa} \times 6^{1.25} =$ **845.15 kPa**

Substance ideal gas: $Pv = RT$

$T_2 = T_1(P_2v_2/P_1v_1) = 293.15 \text{ K } (845.15/90 \times 6) =$ **458.8 K**



$$m = \frac{PV}{RT} = \frac{90 \times 0.2\times10^{-3}}{0.287 \times 293.15} = 2.14\times10^{-4} \text{ kg}$$

The work is integrated as in Eq.3.21

$${}_1w_2 = \int P dv = \frac{1}{1 - n}(P_2v_2 - P_1v_1) = \frac{R}{1 - n}(T_2 - T_1)$$

$$= \frac{0.287}{1 - 1.25} \text{ kJ/kg-K } (458.8 - 293.15) \text{ K} = -190.17 \text{ kJ/kg}$$

The energy equation with values of u from Table A.7 is

${}_1q_2 = u_2 - u_1 + {}_1w_2 = 329.4 - 208.03 - 190.17 = -68.8 \text{ kJ/kg}$

${}_1Q_2 = m\ {}_1q_2 =$ **-0.0147 kJ** (i.e a heat loss)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.164

An air pistol contains compressed air in a small cylinder, shown in Fig. P3.164. Assume that the volume is 1 cm^3, pressure is 1 MPa, and the temperature is 27°C when armed. A bullet, m = 15 g, acts as a piston initially held by a pin (trigger); when released, the air expands in an isothermal process (T = constant). If the air pressure is 0.1 MPa in the cylinder as the bullet leaves the gun, find

a. The final volume and the mass of air.

b. The work done by the air and work done on the atmosphere.

c. The work to the bullet and the bullet exit velocity.

Solution:

C.V. Air.

Air ideal gas: $m_{air} = P_1V_1/RT_1 = 1000 \times 10^{-6}/(0.287 \times 300) =$ **1.17×10^{-5} kg**

Process: $PV = \text{const} = P_1V_1 = P_2V_2 \Rightarrow V_2 = V_1P_1/P_2 =$ **10 cm^3**

$$ {}_1W_2 = \int PdV = \int \frac{P_1V_1}{V}\, dV = P_1V_1 \ln (V_2/V_1) = \textbf{2.303 J} $$

$${}_1W_{2,ATM} = P_0(V_2 - V_1) = 101 \times (10 - 1) \times 10^{-6}\ \text{kJ} = \textbf{0.909 J}$$

$$W_{bullet} = {}_1W_2 - {}_1W_{2,ATM} = 1.394\ \text{J} = \frac{1}{2} m_{bullet}(V_{exit})^2$$

$$V_{exit} = (2W_{bullet}/m_B)^{1/2} = (2 \times 1.394/0.015)^{1/2} = \textbf{13.63 m/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.165

Air goes through a polytropic process with n = 1.3 in a piston/cylinder setup. It starts at 200 kPa, 300 K and ends with a pressure of 2200 kPa. Find the expansion ratio (v_2/v_1), the specific work, and the specific heat transfer.

Take CV as the air. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $Pv^n = \text{Constant}$ (polytropic)

From the ideal gas law and the process equation we can get:

State 2: $(v_2/v_1) = (P_2/P_1)^{-1/n}$ and $Pv = RT \Rightarrow T_2/T_1 = (v_2 / v_1)^{1 - n}$

$$(v_2/v_1) = (P_2/P_1)^{-1/n} = (2200 / 200)^{-1/1.3} = \mathbf{0.1581}$$

$$T_2 = T_1 (P_2/P_1)^{(n-1)/n} = 300 \left(\frac{2200}{200}\right)^{0.3/1.3} = \mathbf{521.7\ K}$$

From process eq.:

$${}_1w_2 = \int P\, dv = \text{area} = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$$

$$= \frac{0.287}{1-1.3}\ \text{kJ/kg-K} \times (521.7 - 300)\ \text{K} = \mathbf{-212.09\ kJ/kg}$$

From the energy equation and constant specific heat from Table A.5

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v (T_2 - T_1) + {}_1w_2$$

$$= 0.717\ \text{kJ/kg-K} \times (521.7 - 300)\ \text{K} - 212.09\ \text{kJ/kg} = \mathbf{-53.13\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.166

Nitrogen gas goes through a polytropic process with n = 1.3 in a piston/cylinder arrangement. It starts out at 600 K and 600 kPa and ends with 800 K. Find the final pressure, the process specific work and heat transfer.

Take CV as the nitrogen. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $Pv^n = \text{Constant}$ (polytropic)

From the ideal gas law and the process equation we can get:

State 2: $P_2 = P_1 \left(v_2 / v_1\right)^{-n}$ and $Pv = RT \Rightarrow T_2/T_1 = (v_2 / v_1)^{1-n}$

$$P_2 = P_1 \left(T_2 / T_1\right)^{n/(n-1)} = 600 \left(\frac{800}{600}\right)^{1.3/0.3} = \mathbf{2087\ kPa}$$

From process eq.:

$${}_1w_2 = \int P\, dv = \text{area} = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$$

$$= \frac{0.2968}{1-1.3}(800 - 600) = \mathbf{-197.9\ kJ/kg}$$

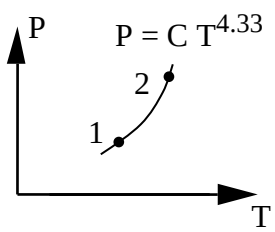
From the energy equation and Table A.8

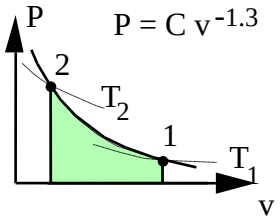
${}_1q_2 = u_2 - u_1 + {}_1w_2 = (609.41 - 449.16 - 197.9)$ kJ/kg = **-37.65 kJ/kg**

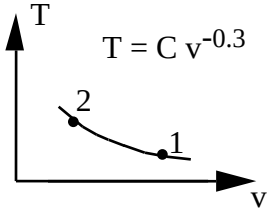
From the energy equation and constant specific heat from Table A.5

${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v (T_2 - T_1) + {}_1w_2$

$= 0.745$ kJ/kg-K $\times$ (800 – 600) K – 197.9 kJ/kg = -48.9 kJ/kg







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.167

A piston/cylinder contains pure oxygen at 500 K, 600 kPa. The piston is moved to a volume such that the final temperature is 700 K in a polytropic process with exponent n = 1.25. Use ideal gas approximation and constant heat capacity to find the final pressure, the specific work and heat transfer.

Energy Eq.: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Process Eq: $Pv^n = C$ and ideal gas $Pv = RT$ gives

$$P_2 = P_1(v_1/v_2)^n = P_1(T_2/T_1)^{n/(n-1)} = 600(7/5)^5 = \mathbf{3227\ kPa}$$

Reversible work Eq. 3.21: ${}_1w_2 = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$

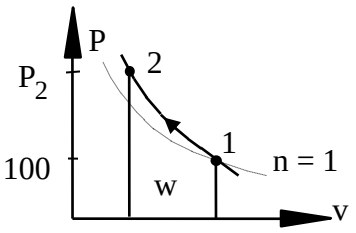
$${}_1w_2 = \frac{0.2598}{1 - 1.25}\ \frac{\text{kJ}}{\text{kg K}} \times (700 - 500)\ \text{K} = -\mathbf{207.84\ kJ/kg}$$

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v(T_2 - T_1) + {}_1w_2$$

$$= 0.662\ \text{kJ/kg-K} \times (700 - 500)\ \text{K} - 207.84\ \text{kJ/kg}$$

$$= -\mathbf{69.3\ kJ/kg}$$

The actual process is on a steeper curve than n = 1.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.168

Calculate the heat transfer for the process described in Problem 3.57.

Consider a piston cylinder with 0.5 kg of R-134a as saturated vapor at -10°C. It is now compressed to a pressure of 500 kPa in a polytropic process with n = 1.5. Find the final volume and temperature, and determine the work done during the process.

Solution:

Take CV as the R-134a which is a control mass

Continuity: $m_2 = m_1 = m$; Energy: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $Pv^{1.5}$ = constant. Polytropic process with n = 1.5

1: (T, x) P = Psat = 201.7 kPa from Table B.5.1

$v_1 = 0.09921\ m^3/kg$, $u_1 = 372.27\ kJ/kg$

2: (P, process)

$$v_2 = v_1 (P_1/P_2)^{(1/1.5)} = 0.09921 \times (201.7/500)^{0.667} = 0.05416\ m^3/kg$$

=> Table B.5.2 superheated vapor, $T_2 = 79°C$, $V_2 = mv_2 = 0.027\ m^3$

$u_2 = 440.9\ kJ/kg$

Process gives $P = C\ v^{(-1.5)}$, which is integrated for the work term, Eq.3.21

$${}_1W_2 = \int P\ dV = m(P_2v_2 - P_1v_1)/(1-1.5)$$

$$= -2 \times 0.5\ kg \times (500 \times 0.05416 - 201.7 \times 0.09921)\ kJ/kg = -7.07\ kJ$$

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.5(440.9 - 372.27) + (-7.07) = \mathbf{27.25\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.169

A piston cylinder shown in Fig. P3.169 contains 0.5 m^3 of R-410A at 2 MPa, 150°C. The piston mass and atmosphere gives a pressure of 450 kPa that will float the piston. The whole setup cools in a freezer maintained at -20°C. Find the heat transfer and show the P-v diagram for the process when T_2 = -20°C.

C.V.: R-410A. Control mass.

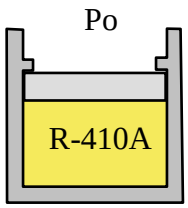
Continuity: m = constant,

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $F\downarrow = F\uparrow = P\,A = P_{air}A + F_{stop}$

$$\text{if } V < V_{stop} \Rightarrow F_{stop} = \emptyset$$

This is illustrated in the P-v diagram shown below.



State 1: v_1 = 0.02247 m^3/kg, u_1 = 373.49 kJ/kg

$\Rightarrow$ m = V/v = 22.252 kg

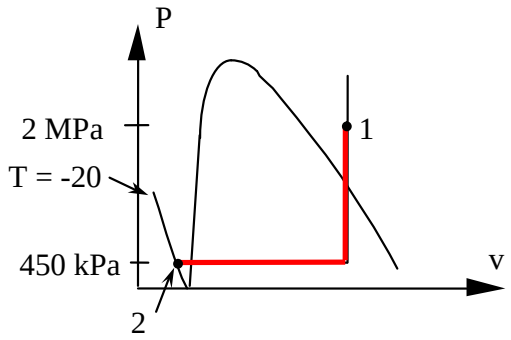
State 2: T_2 and on line $\Rightarrow$ compressed liquid, see figure below.

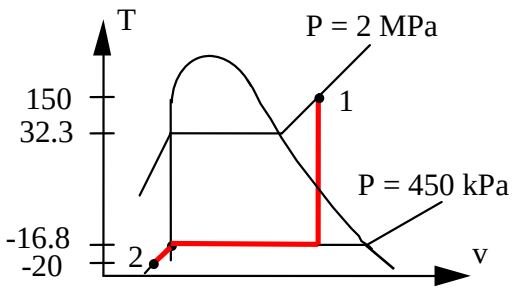
$v_2 \cong v_f$ = 0.000 803 m^3/kg $\Rightarrow V_2$ = 0.01787 m^3; $u_2 = u_f$ = 27.92 kJ/kg

${}_1W_2 = \int PdV = P_{lift}(V_2 - V_1)$ = 450 kPa (0.01787 - 0.5) m^3 = -217.0 kJ ;

Energy eq. $\Rightarrow$

${}_1Q_2$ = 22.252 kg × (27.92 – 373.49) kJ/kg – 217.9 kJ = **-7906.6 kJ**



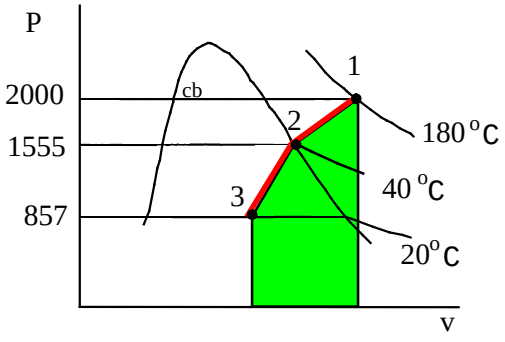


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.170

A cylinder containing 1 kg of ammonia has an externally loaded piston. Initially the ammonia is at 2 MPa, 180°C and is now cooled to saturated vapor at 40°C, and then further cooled to 20°C, at which point the quality is 50%. Find the total work and the heat transfer for the process, assuming a piecewise linear variation of *P* versus *V*.

Solution:



State 1: (T, P) Table B.2.2

$v_1 = 0.10571$ m^3/kg

$u_1 = 1630.6$ kJ/kg

State 2: (T, x) Table B.2.1 sat. vap.

$P_2 = 1555$ kPa,

$v_2 = 0.08313$ m^3/kg

$u_2 = 1341.0$ kJ/kg

State 3: (T, x) $P_3 = 857$ kPa, $v_3 = (0.001638 + 0.14922)/2 = 0.07543$ m^3/kg

$u_3 = (272.89 + 1332.2)/2 = 802.55$ kJ/kg

Sum the work as two integrals each evaluated by the area in the P-v diagram.

$$ {}_1W_3 = \int_1^3 PdV \approx \left(\frac{P_1 + P_2}{2}\right) m(v_2 - v_1) + \left(\frac{P_2 + P_3}{2}\right) m(v_3 - v_2) $$

$$ = \frac{2000 + 1555}{2} \text{ kPa} \times 1 \text{ kg} \times (0.08313 - 0.10571) \text{ m}^3/\text{kg} $$

$$ + \frac{1555 + 857}{2} \text{ kPa} \times 1 \text{ kg} \times (0.07543 - 0.08313) \text{ m}^3/\text{kg} $$

$$ = \mathbf{-49.4\ kJ} $$

From the energy equation

$$ {}_1Q_3 = m(u_3 - u_1) + {}_1W_3 = 1 \text{ kg} \times (802.55 - 1630.6) \text{ kJ/kg} - 49.4 \text{ kJ} $$

$$ = \mathbf{-877.5\ kJ} $$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.171

10 kg of water in a piston cylinder arrangement exists as saturated liquid/vapor at 100 kPa, with a quality of 50%. It is now heated so the volume triples. The mass of the piston is such that a cylinder pressure of 200 kPa will float it, as in Fig. 3.171. Find the final temperature and the heat transfer in the process.

Solution:

Take CV as the water.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: v = constant until $P = P_{lift}$, then P is constant.

State 1: Two-phase so look in Table B.1.2 at 100 kPa

$u_1 = 417.33 + 0.5 \times 2088.72 = 1461.7$ kJ/kg,

$v_1 = 0.001043 + 0.5 \times 1.69296 = 0.8475$ m^3/kg

State 2: v_2, $\mathbf{P_2 \le P_{lift}}$ => $v_2 = 3 \times 0.8475 = 2.5425$ m^3/kg ;

Interpolate: $\mathbf{T_2 = 829°C}$, $u_2 = 3718.76$ kJ/kg

=> $V_2 = mv_2 = 25.425$ m^3

From the process equation (see P-V diagram) we get the work as

${}_1W_2 = P_{lift}(V_2 - V_1) = 200$ kPa $\times$ 10 kg (2.5425 – 0.8475) m^3/kg = 3390 kJ

From the energy equation we solve for the heat transfer

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 10$ kg $\times$(3718.76 – 1461.7) kJ/kg + 3390 kJ

= **25 961 kJ**

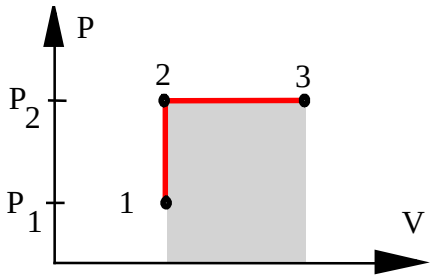
3.172

A helium gas is heated at constant volume from a state of 100 kPa, 300 K to 500 K. A following process expands the gas at constant pressure to three times the initial volume. What are the specific work and the specific heat transfer in the combined process?

The two processes are:

1 -> 2: Constant volume $V_2 = V_1$

2 -> 3: Constant pressure $P_3 = P_2$



Use ideal gas approximation for helium.

State 1: T, P => $v_1 = RT_1/P_1$

State 2: $V_2 = V_1$ => $P_2 = P_1 (T_2/T_1)$

State 3: $P_3 = P_2$ => $V_3 = 3V_2$; $T_3 = T_2\, v_3/v_2 = 500 \times 3 = 1500$ K

We find the work by summing along the process path.

$$_1w_3 = {}_1w_2 + {}_2w_3 = {}_2w_3 = P_3(v_3 - v_2) = R(T_3 - T_2)$$

$$= 2.0771 \text{ kJ/kg-K} \times (1500 - 500) \text{ K} = \mathbf{2077 \text{ kJ/kg}}$$

$$_1q_3 = u_3 - u_1 + {}_1w_3 = C_v\,(T_3 - T_1) + {}_1w_3$$

$$= 3.116 \text{ kJ/kg-K} \times (1500 - 300) \text{ K} + 2077 \text{ kJ/kg} = \mathbf{5816 \text{ kJ/kg}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.173

A vertical cylinder fitted with a piston contains 5 kg of R-410A at 10°C, shown in Fig. P3.173. Heat is transferred to the system, causing the piston to rise until it reaches a set of stops at which point the volume has doubled. Additional heat is transferred until the temperature inside reaches 50°C, at which point the pressure inside the cylinder is 1.4 MPa.

a. What is the quality at the initial state?

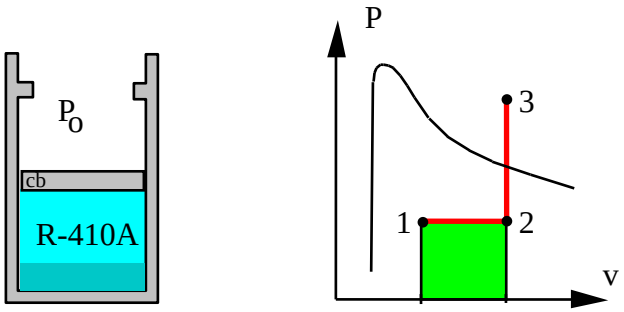
b. Calculate the heat transfer for the overall process.

Solution:

C.V. R-410A. Control mass goes through process: 1 -> 2 -> 3

As piston floats pressure is constant (1 -> 2) and the volume is constant for the second part (2 -> 3). So we have: $v_3 = v_2 = 2 \times v_1$

State 3: Table B.4.2 (P,T) $v_3 = 0.02249$ m^3/kg, $u_3 = 287.91$ kJ/kg



So we can then determine state 1 and 2 Table B.4.1:

$v_1 = 0.011245 = 0.000886 + x_1 \times 0.02295$ => $x_1 =$ **0.4514**

b) $u_1 = 72.24 + 0.4514 \times 183.66 = 155.14$ kJ/kg

State 2: $v_2 = 0.02249$ m^3/kg, $P_2 = P_1 = 1086$ kPa this is still 2-phase.

We get the work from the process equation (see P-V diagram)

$$_1W_3 = {}_1W_2 = \int_1^2 PdV = P_1(V_2 - V_1) = 1086 \text{ kPa} \times 5 \text{ kg} \times 0.011245 \text{ m}^3/\text{kg}$$

$$= 61.1 \text{ kJ}$$

The heat transfer from the energy equation becomes

$$_1Q_3 = m(u_3-u_1) + {}_1W_3 = 5 \text{ kg} \times (287.91 - 155.14) \text{ kJ/kg} + 61.1 \text{ kJ}$$

$$= \mathbf{725.0 \text{ kJ}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.174

Water in a piston/cylinder (Fig. P3.174) is at 101 kPa, 25°C, and mass 0.5 kg. The piston rests on some stops, and the pressure should be 1000 kPa to float the piston. We now heat the water, so the piston just reaches the end of the cylinder. Find the total heat transfer.

Solution:

Take CV as the water.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: v = constant until $P = P_{float}$, then P is constant.

Volume does go up so we get $v_2 = 5\ v_1$

State 1: $v_1 = 0.001003\ m^3/kg$, $u_1 = 104.86\ kJ/kg$

State 2: v_2, $P_2 = P_{float}$ so $v_2 = 5 \times 0.001003 = 0.005015\ m^3/kg$;

$x_2 = (v_2 - v_f)/v_{fg} = (0.005015 - 0.001127)/0.19332 = 0.02011$,

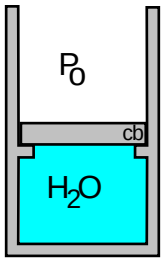
$u_2 = 761.67 + x_2 \times 1821.97 = 798.31\ kJ/kg$

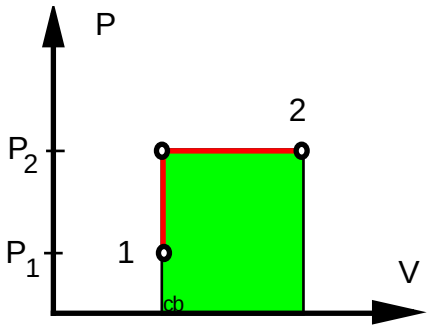
From the process equation (see P-V diagram) we get the work as

${}_1w_2 = P_{float}(v_2 - v_1) = 1000\ kPa\ (0.005015 - 0.001003)\ m^3/kg = 4.012\ kJ/kg$

From the energy equation we solve for the heat transfer

${}_1Q_2 = m[u_2 - u_1 + {}_1w_2] = 0.5 \times [798.31 - 104.86 + 4.012] =$ **348.7 kJ**

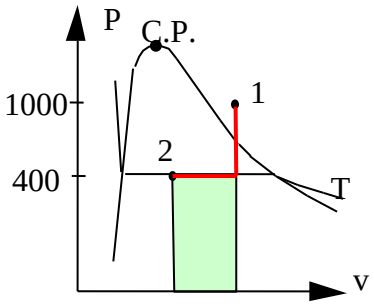




Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.175

A setup as in Fig. P3.169 has the R-410A initially at 1000 kPa, 50°C of mass 0.1 kg. The balancing equilibrium pressure is 400 kPa and it is now cooled so the volume is reduced to half the starting volume. Find the work and heat transfer for the process.



Take as CV the 0.1 kg of R-410A.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $P = P_{float}$ or $v = C = v_1$,

State 1: (P, T) => $v_1 = 0.0332$ m^3/kg,

$u_1 = 292.695$ kJ/kg

State 2: (P, v) => $v_2 = v_1/2 = 0.0166$ m^3/kg < v_g, so it is two-phase.

$x_2 = (v_2 - v_f)/v_{fg} = (0.0166 - 0.000803)/0.064 = 0.2468$

$u_2 = u_f + x_2\, u_{fg} = 27.92 + x_2\, 218.07 = 81.746$ kJ/kg

From process eq.: ${}_1W_2 = \int P\, dV$ = area = $mP_2\,(v_2 - v_1)$

= 0.1 kg × 400 kPa (0.0166 – 0.0332) m^3/kg = -0.**664 kJ**

From energy eq.: ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.1 \times (81.746 - 292.695) - 0.664$

= **-21.8 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.176

A piston/cylinder contains 1 kg of liquid water at 20°C and 300 kPa. Initially the piston floats, similar to the setup in Problem 3.173, with a maximum enclosed volume of 0.002 m^3 if the piston touches the stops. Now heat is added so a final pressure of 600 kPa is reached. Find the final volume and the heat transfer in the process.

Solution:

Take CV as the water which is a control mass: $m_2 = m_1 = m$;

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Table B.1.1: 20°C => $P_{sat} = 2.34$ kPa

State 1: Compressed liquid $v = v_f(20) = 0.001002$ m^3/kg, $u = 83.94$ kJ/kg

State 1a: $v_{stop} = 0.002$ m^3/kg , 300 kPa

State 2: Since $P_2 = 600$ kPa $> P_{lift}$ then piston is pressed against the stops

$$v_2 = v_{stop} = 0.002 \ m^3/kg \ \text{and} \ V = \mathbf{0.002\ m^3}$$

For the given P : $v_f < v < v_g$ so 2-phase $T = T_{sat} = 158.85$ °C

$$x = (v - v)/v = (0.002 - 0.001101)/0.31457 = 0.002858$$

$$u = 669.88 + x\ 1897.52 = 675.3 \text{ kJ/kg}$$

Work is done while piston moves at P_{lift} = constant = 300 kPa so we get

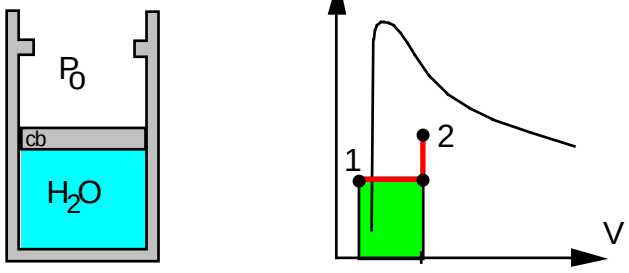
$${}_1W_2 = \int P\, dV = m\, P_{lift}(v_2 - v_1) = 1 \text{ kg} \times 300 \text{ kPa} \times (0.002 - 0.001002)\ m^3$$

$$= 0.30 \text{ kJ}$$

The heat transfer is from the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1 \text{ kg} \times (675.3 - 83.94) \text{ kJ/kg} + 0.30 \text{ kJ}$$

$$= \mathbf{591.7\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.177

A cylinder/piston arrangement contains 5 kg of water at 100°C with x = 20% and the piston, m_P = 75 kg, resting on some stops, similar to Fig. P3.171. The outside pressure is 100 kPa, and the cylinder area is A = 24.5 cm^2. Heat is now added until the water reaches a saturated vapor state. Find the initial volume, final pressure, work, and heat transfer terms and show the P–v diagram.

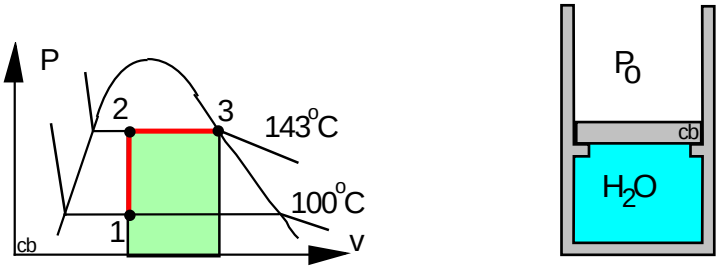
Solution:

C.V. The 5 kg water.

Continuty: $m_2 = m_1 = m$; Energy: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: V = constant if $P < P_{lift}$ otherwise $P = P_{lift}$ see P-v diagram.

$$P_3 = P_2 = P_{lift} = P_0 + m_p\, g / A_p = 100 + \frac{75 \times 9.807}{0.00245 \times 1000} = \mathbf{400\ kPa}$$



State 1: (T,x) Table B.1.1

$v_1 = 0.001044 + 0.2 \times 1.6719$ m^3/kg, $V_1 = mv_1 = 5 \times 0.3354 = \mathbf{1.677\ m^3}$

$u_1 = 418.91 + 0.2 \times 2087.58 = 836.4$ kJ/kg

State 3: (P, x = 1) Table B.1.2 => $v_3 = 0.4625 > v_1$, $u_3 = 2553.6$ kJ/kg

Work is seen in the P-V diagram (if volume changes then $P = P_{lift}$)

${}_1W_3 = {}_2W_3 = P_{ext}m(v_3 - v_2) = 400$ kPa × 5 kg (0.46246 - 0.3354) m^3/kg

$= \mathbf{254.1\ kJ}$

Heat transfer is from the energy equation

${}_1Q_3 = 5$ kg × (2553.6 - 836.4) kJ/kg + 254.1 kJ = **8840 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.178

A piston cylinder setup similar to Problem 3.171 contains 0.1 kg saturated liquid and vapor water at 100 kPa with quality 25%. The mass of the piston is such that a pressure of 500 kPa will float it. The water is heated to 300°C. Find the final pressure, volume, work, $_1W_2$ and $_1Q_2$.

Solution:

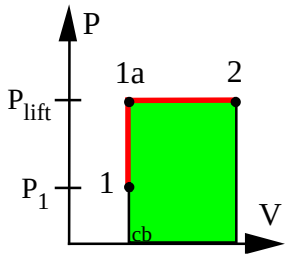
Take CV as the water: $m_2 = m_1 = m$

Process: v = constant until $P = P_{lift}$

To locate state 1: Table B.1.2

$v_1 = 0.001043 + 0.25 \times 1.69296 = 0.42428$ m^3/kg

$u_1 = 417.33 + 0.25 \times 2088.72 = 939.51$ kJ/kg



1a: $v_{1a} = v_1 = 0.42428$ m^3/kg $> v_g$ at 500 kPa,

state 1a is superheated vapor $T_{1a} = 200$°C

State 2 is 300°C so heating continues after state 1a to 2 at constant P =>

2: T_2, $P_2 = P_{lift} =$ **500 kPa** =>

Table B.1.3 $v_2 = 0.52256$ m^3/kg; $u_2 = 2802.91$ kJ/kg

$V_2 = mv_2 =$ **0.05226 m^3**

$_1W_2 = P_{lift}(V_2 - V_1) = 500$ kPa $\times$ (0.05226 - 0.04243) m^3 = **4.91 kJ**

The heat transfer is from the energy equation

$_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.1$ kg $\times$ (2802.91 – 939.51) kJ/kg + 4.91 kJ

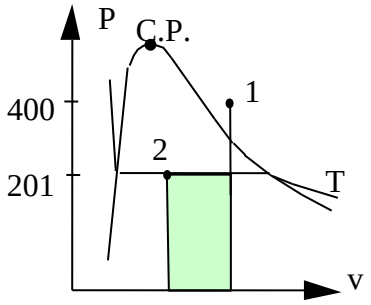
= **191.25 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.179

A piston/cylinder contains 0.1 kg R-410A at 600 kPa, 60°C. It is now cooled, so the volume is reduced to half the initial volume. The piston has upper stops mounted and the piston mass and gravitation is such that a floating pressure is 400 kPa.

a) Find the final temperature
b) How much work is involved.
c) What is the heat transfer in the process.
d) Show the process path in a P-v diagram.



Take as CV the 0.1 kg of R-410A. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $P = P_{float}$ or $v = C = v_1$,

State 1: (P, T) => $v_1 = 0.06023\ m^3/kg$,

$u_1 = 304.91\ kJ/kg$

State 2: (P, v) => $v_2 = v_1/2 = 0.030115\ m^3/kg < v_g$, so it is two-phase.

$x_2 = (v_2 - v_f)/v_{fg} = (0.030115 - 0.000803)/0.064 = 0.458$

$u_2 = u_f + x_2\, u_{fg} = 27.92 + x_2\, 218.07 = 127.8\ kJ/kg$

From process eq.: ${}_1W_2 = \int P\, dV$ = area = $mP_2\,(v_2 - v_1)$

= 0.1 kg × 400 kPa (0.030115 – 0.06023) m^3/kg = **- 1.2046 kJ**

From energy eq.: ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$

= 0.1 kg × (127.8 – 304.91) kJ/kg - 1.2046 kJ

= **-18.9 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.180

A piston cylinder contains air at 1000 kPa, 800 K with a volume of 0.05 m^3. The piston is pressed against the upper stops, see Fig. P3.14c and it will float at a pressure of 750 kPa. Now the air is cooled to 400 K. What is the process work and heat transfer?

CV. Air, this is a control mass

Energy Eq.3.5 $\quad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $\quad P = P_{float}$ or $v = C = v_1$,

State 1: u = 592.58 kJ/kg, m = PV/RT = 1000 × 0.05 /(0.287 × 800) = 0.2178 kg

We need to find state 2. Let us see if we proceed past state 1a during the cooling.

$$T_{1a} = T_1 \, P_{float} / P_1 = 800 \times 750 / 100 = 600 \text{ K}$$

so we do cool below T_{1a}. That means the piston is floating. Write the ideal gas law for state 1 and 2 to get

$$V_2 = \frac{mRT_2}{P_2} = \frac{P_1V_1T_2}{P_2T_1} = \frac{1000 \times 0.05 \times 400}{750 \times 800} \text{ m}^3 = 0.0333 \text{ m}^3$$

$${}_1W_2 = {}_{1a}W_2 = \int P \, dV = P_2 (V_2 - V_1)$$

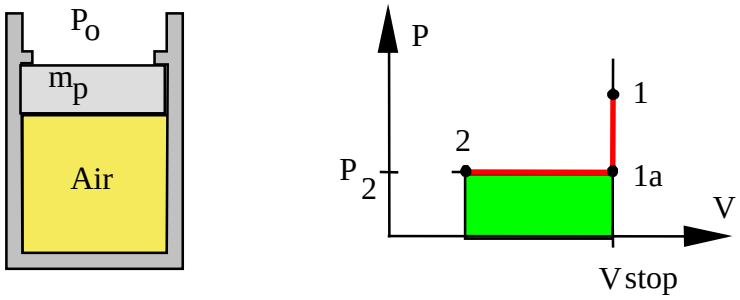
$$= 750 \text{ kPa} \times (0.0333 - 0.05) \text{ m}^3 = \mathbf{-12.5 \text{ kJ}}$$

From energy eq.:

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$$

$$= 0.2178 \text{ kg} \times (286.49 - 592.58) \text{ kJ/kg} - 12.5 \text{ kJ}$$

$$= \mathbf{-79.2 \text{ kJ}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.181

The piston/cylinder arrangement in Fig. P3.181 contains 10 g ammonia at 20°C with a volume of 1 L. There are some stops so if the piston is at the stops the volume is 1.4 L. The ammonia is now heated to 200°C. The piston and cylinder is made of 0.5 kg aluminum. Assume that the mass has the same temperature as the ammonia at any time. Find the final volume and the total heat transfer and plot the P-V diagram for the process.

C.V. NH3. Control mass goes through process: 1 -> 2 -> 3

Energy Eq.: $U_3 - U_1 = m_{NH3}(u_3 - u_1) + m_{Alu}(u_3 - u_1) = {}_1Q_3 - {}_1W_3$

As piston floats pressure is constant (1 -> 2) and the volume is constant for the second part (2 -> 3) if we go this far. So we have at stop: $v_3 = v_2 = 1.4 \times v_1$

State 1: B.2.1 $v_1 = V/m = 0.001 / 0.01 = 0.1\ m^3/kg < v$ so 2-phase $P = 857.5$ kPa

$x_1 = (v - v_f)/ v_{fg} = (0.1 - 0.001638)/ 0.14758 = 0.6665$

$u_1 = u_f + x_1 u_{fg} = 272.89 + x_1 \times 1059.3 = 978.91$ kJ/kg

State 2: $v_2 = 1.4 \times v_1 = 0.14\ m^3/kg$ & $P = 857.5$ kPa still 2-phase so $T_2 = 20^oC$

State 3: 200^oC & $v_3 = v_2 = 0.14\ m^3/kg$, => $P = 1600$ kPa, $V =$ **1.4 L**, $u_3 = 1676.5$ kJ/kg

We get the work from the process equation (see P-V diagram)

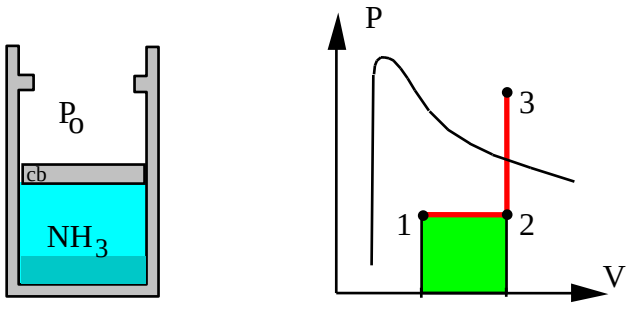
$${}_1W_3 = {}_1W_2 = \int_1^2 PdV = P_1(V_2 - V_1) = 857.5\ kPa \times (0.0014 - 0.001)\ m^3 = 0.343\ kJ$$

The heat transfer from the energy equation becomes

$${}_1Q_3 = m_{NH3}(u_3 - u_1) + m_{Alu}C_{Alu}(T_3 - T_1) + {}_1W_3$$

$= 0.01\ kg\ (1676.5 - 978.91)\ kJ/kg + 0.5\ kg \times 0.9\ kJ/kg\text{-}K\ (200 - 20)\ K + 0.343\ kJ$

$=$ **88.32 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.182

Air in a piston/cylinder at 200 kPa, 600 K, is expanded in a constant-pressure process to twice the initial volume (state 2), shown in Fig. P3.182. The piston is then locked with a pin and heat is transferred to a final temperature of 600 K. Find *P*, *T*, and *h* for states 2 and 3, and find the work and heat transfer in both processes.

Solution:

C.V. Air. Control mass $m_2 = m_3 = m_1$

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$;

Process 1 to 2: P = constant => ${}_1w_2 = \int P\, dv = P_1(v_2 - v_1) = R(T_2 - T_1)$

Ideal gas $Pv = RT \Rightarrow T_2 = T_1 v_2/v_1 = 2T_1 =$ **1200 K**

$P_2 = P_1 = 200$ kPa, ${}_1w_2 = RT_1 =$ **172.2 kJ/kg**

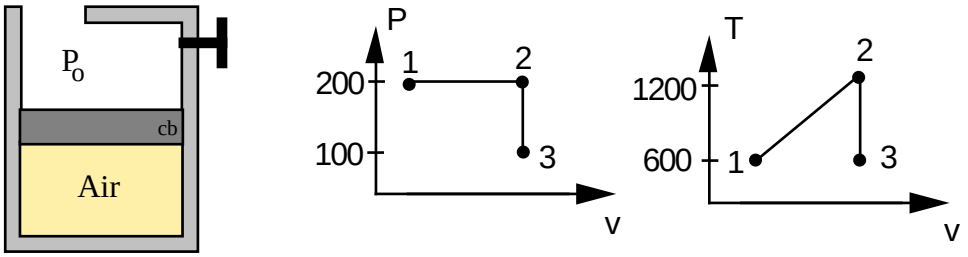
Table A.7 **h_2 = 1277.8 kJ/kg, $h_3 = h_1$ = 607.3 kJ/kg**

${}_1q_2 = u_2 - u_1 + {}_1w_2 = h_2 - h_1 = 1277.8 - 607.3 =$ **670.5 kJ/kg**

Process 2→3: $v_3 = v_2 = 2v_1 \Rightarrow$ **${}_2w_3 = 0$,**

$P_3 = P_2T_3/T_2 = P_1T_1/2T_1 = P_1/2 =$ **100 kPa**

${}_2q_3 = u_3 - u_2 = 435.1 - 933.4 =$ **-498.3 kJ/kg**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.183

A piston/cylinder has 0.5 kg air at 2000 kPa, 1000 K as shown in Fig P3.183. The cylinder has stops so $V_{min} = 0.03$ m^3. The air now cools to 400 K by heat transfer to the ambient. Find the final volume and pressure of the air (does it hit the stops?) and the work and heat transfer in the process.

We recognize this is a possible two-step process, one of constant P and one of constant V. This behavior is dictated by the construction of the device.

Continuity Eq.: $m_2 - m_1 = 0$

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = \text{constant} = F/A = P_1$ if $V > V_{min}$

$V = \text{constant} = V_{1a} = V_{min}$ if $P < P_1$

State 1: (P, T) $V_1 = mRT_1/P_1 = 0.5 \times 0.287 \times 1000/2000 = 0.07175$ m^3

The only possible P-V combinations for this system is shown in the diagram so both state 1 and 2 must be on the two lines. For state 2 we need to know if it is on the horizontal P line segment or the vertical V segment. Let us check state 1a:

State 1a: $P_{1a} = P_1$, $V_{1a} = V_{min}$

$$\text{Ideal gas so } T_{1a} = T_1 \frac{V_{1a}}{V_1} = 1000 \times \frac{0.03}{0.07175} = 418 \text{ K}$$

We see that $T_2 < T_{1a}$ and state 2 must have $V_2 = V_{1a} = V_{min} = 0.03$ m^3.

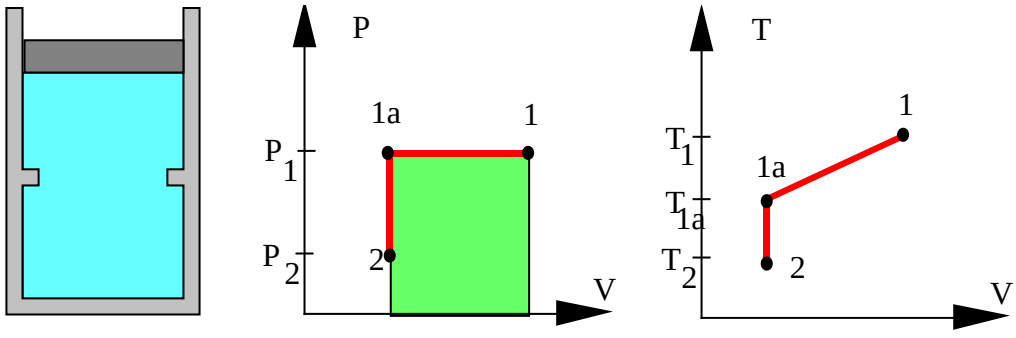
$$P_2 = P_1 \times \frac{T_2}{T_1} \times \frac{V_1}{V_2} = 2000 \times \frac{400}{1000} \times \frac{0.07175}{0.03} = 1913.3 \text{ kPa}$$

The work is the area under the process curve in the P-V diagram

${}_1W_2 = \int_1^2 P\, dV = P_1 (V_{1a} - V_1) = 2000 \text{ kPa } (0.03 - 0.07175) \text{ m}^3 = \mathbf{-83.5\ kJ}$

Now the heat transfer is found from the energy equation, u's from Table A.7.1,

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.5\ (286.49 - 759.19) - 83.5 = \mathbf{-319.85\ kJ}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.184

Air in a rigid tank is at 100 kPa, 300 K with a volume of 0.75 m^3. The tank is heated to 400 K, state 2. Now one side of the tank acts as a piston letting the air expand slowly at constant temperature to state 3 with a volume of 1.5 m^3. Find the pressures at states 2 and 3, Find the total work and total heat transfer.

State 1: $m = P_1V_1 / RT_1 = \dfrac{100 \times 0.75}{0.287 \times 300} \dfrac{\text{kPa m}^3}{\text{kJ/kg}} = 0.871$ kg

Process 1 to 2: Constant volume heating, $dV = 0 \Rightarrow {}_1W_2 = 0$

$P_2 = P_1 T_2 / T_1 = 100 \times 400 / 300 =$ **133.3 kPa**

Process 2 to 3: Isothermal expansion, $dT = 0 \Rightarrow u_3 = u_2$ and

$P_3 = P_2 V_2 / V_3 = 133.3 \times 0.75 / 1.5 =$ **66.67 kPa**

$${}_2W_3 = \int_2^3 P\, dV = P_2V_2 \ln\left(\frac{V_3}{V_2}\right) = 133.3 \times 0.75 \ln(2) = 69.3 \text{ kJ}$$

The overall process:

${}_1W_3 = {}_1W_2 + {}_2W_3 = {}_2W_3 =$ **69.3 kJ**

From the energy equation

$${}_1Q_3 = m(u_3 - u_1) + {}_1W_3 = m\, C_v\, (T_3 - T_1) + {}_1W_3$$

$= 0.871 \text{ kg} \times 0.717 \text{ kJ/kg-K} \times (400 - 300) \text{ K} + 69.3 \text{ kJ}$

$=$ **131.8 kJ**

3.185

A 100 hp car engine has a drive shaft rotating at 2000 RPM. How much torque is on the shaft for 25% of full power?

Solution:

Power = 0.25 × 100 hp = 0.25 × 73.5 kW (if SI hp) = 18.375 kW = Tω

ω = angular velocity (rad/s) = RPM 2 π /60

$$T = \text{Power}/\omega = \frac{\text{power} \times 60}{\text{RPM} \times 2\pi} = \frac{18.375 \text{ kW} \times 60 \text{ s/min}}{2000 \times 2\pi \text{ rad/min}} = \mathbf{87.73 \text{ Nm}}$$

We could also have used UK hp to get 0.25 × 74.6 kW. then T = 89 Nm.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.186

A crane use 2 kW to raise a 100 kg box 20 m. How much time does it take?

$$\text{Power} = \dot{W} = F\mathbf{V} = mg\mathbf{V} = mg\frac{L}{t}$$

$$t = \frac{mgL}{\dot{W}} = \frac{100 \text{ kg } 9.807 \text{ m/s}^2 \text{ } 20 \text{ m}}{2000 \text{ W}} = \mathbf{9.81 \text{ s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.187

An escalator raises a 100 kg bucket of sand 10 m in 1 minute. Determine the rate of work done during the process.

Solution:

The work is a force with a displacement and force is constant: F = mg

$$W = \int F\,dx = F\int dx = F\,\Delta x = 100\ \text{kg} \times 9.80665\ \text{m/s}^2 \times 10\ \text{m} = 9807\ \text{J}$$

The rate of work is work per unit time

$$\dot{W} = \frac{W}{\Delta t} = \frac{9807\ \text{J}}{60\ \text{s}} = \mathbf{163\ W}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.188

A piston/cylinder of cross sectional area 0.01 m^2 maintains constant pressure. It contains 1 kg water with a quality of 5% at 150°C. If we heat so 1 g/s liquid turns into vapor what is the rate of work out?

$$V_{vapor} = m_{vapor}\, v_g\,, \quad V_{liq} = m_{liq}\, v_f$$

$$m_{tot} = \text{constant} = m_{vapor}\, m_{liq}$$

$$V_{tot} = V_{vapor} + V_{liq}$$

$$\dot{m}_{tot} = 0 = \dot{m}_{vapor} + \dot{m}_{liq} \quad \Rightarrow \quad \dot{m}_{liq} = -\dot{m}_{vapor}$$

$$\dot{V}_{tot} = \dot{V}_{vapor} + \dot{V}_{liq} = \dot{m}_{vapor} v_g + \dot{m}_{liq} v_f$$

$$= \dot{m}_{vapor}\,(v_g - v_f) = \dot{m}_{vapor}\, v_{fg}$$

$$\dot{W} = P\dot{V} = P\, \dot{m}_{vapor}\, v_{fg}$$

$$= 475.9 \text{ kPa} \times 0.001 \text{ kg/s} \times 0.39169 \text{ m}^3/\text{kg} = \mathbf{0.1864\ kW}$$

$$= \mathbf{186\ W}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.189

A pot of water is boiling on a stove supplying 325 W to the water. What is the rate of mass (kg/s) vaporizing assuming a constant pressure process?

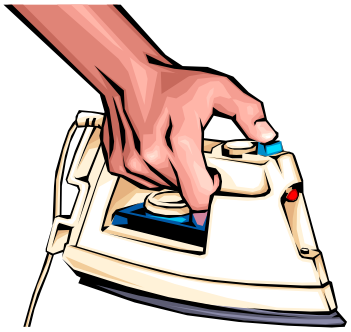
To answer this we must assume all the power goes into the water and that the process takes place at atmospheric pressure 101 kPa, so T = 100^{o}C.

Energy equation

$$dQ = dE + dW = dU + PdV = dH = h_{fg}\, dm$$

$$\frac{dQ}{dt} = h_{fg}\frac{dm}{dt}$$

$$\frac{dm}{dt} = \frac{\dot{Q}}{h_{fg}} = \frac{325\ \text{W}}{2257\ \text{kJ/kg}} = \mathbf{0.144\ g/s}$$



The volume rate of increase is

$$\frac{dV}{dt} = \frac{dm}{dt} v_{fg} = 0.144\ \text{g/s} \times 1.67185\ \text{m}^3/\text{kg}$$

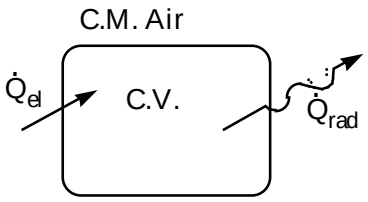
$$= 0.24 \times 10^{-3}\ \text{m}^3/\text{s} = 0.24\ \text{L/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.190

The heaters in a spacecraft suddenly fail. Heat is lost by radiation at the rate of 100 kJ/h, and the electric instruments generate 75 kJ/h. Initially, the air is at 100 kPa, 25°C with a volume of 10 m^3. How long will it take to reach an air temperature of –20°C?

Solution:



Continuity Eq: $\frac{dM}{dt} = 0$ $\quad \dot{W} = 0$

Energy Eq: $\frac{dE}{dt} = \dot{Q}_{el} - \dot{Q}_{rad}$ $\quad \dot{K}E = 0$, $\dot{P}E = 0$

$$\dot{E} = \dot{U} = \dot{Q}_{el} - \dot{Q}_{rad} = \dot{Q}_{net} \Rightarrow \quad U_2 - U_1 = m(u_2 - u_1) = \dot{Q}_{net}(t_2 - t_1)$$

$$\text{Ideal gas: } m = \frac{P_1 V_1}{RT_1} = \frac{100 \times 10}{0.287 \times 298.15} = 11.688 \text{ kg}$$

$$m(u_2 - u_1) = m\, C_{v0}(T_2 - T_1) = 11.688 \times 0.717\ (-20 - 25) = -377.1 \text{ kJ}$$

$$t_2 - t_1 = m\,(u_2 - u_1)/\dot{Q}_{net} = (-377.1 \text{ kJ})\ /(-25 \text{ kJ/h}) = \mathbf{15.08\ h}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.191

As fresh poured concrete hardens, the chemical transformation releases energy at a rate of 2 W/kg. Assume the center of a poured layer does not have any heat loss and that it has an average specific heat of 0.9 kJ/kg-K. Find the temperature rise during 1 hour of the hardening (curing) process.

Solution:

$$\dot{U} = (\dot{m}u) = mC_V\dot{T} = \dot{Q} = m\dot{q}$$

$$\dot{T} = \dot{q}/C_V = 2\times10^{-3}\ \text{kW/ 0.9 kJ/kg-K}$$

$$= 2.222 \times 10^{-3}\ \ ^\circ\text{C/sec}$$

$$\Delta T = \dot{T}\Delta t = 2.222 \times 10^{-3} \times 3600 = \mathbf{8\ ^\circ C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.192

A pot of 1.2 kg water at 20°C is put on a stove supplying 1250 W to the water. After how long time can I expect it to come to a boil (100°C)?

Energy Equation on a rate form: $\frac{dE_{water}}{dt} = \frac{dU_{water}}{dt} = \dot{Q} - \dot{W} = \dot{Q} - P\dot{V}$

$$\dot{Q} = \frac{dU_{water}}{dt} + P\dot{V} = \frac{dH_{water}}{dt} = m_{water}C_p \frac{dT_{water}}{dt}$$

Integrate over time

$$Q = \dot{Q}\,\Delta t = \Delta H = m_{water}\,(h_2 - h_1) \approx m_{water}C_p\,(T_2 - T_1)$$

$$\Delta t = m_{water}\,(h_2 - h_1)/\dot{Q} \approx m_{water}C_p\,(T_2 - T_1)/\dot{Q}$$
$$= 1.2\,(419.02 - 83.94)/1.25 \approx 1.2 \times 4.18\,(100 - 20)/1.25$$
$$= \mathbf{321.7\ s} \approx 5.5\ \text{min}$$

Comment: Notice how close the two results are, i.e. use of constant C_p is OK.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.193

A computer in a closed room of volume 200 m^3 dissipates energy at a rate of 10 kW. The room has 50 kg wood, 25 kg steel and air, with all material at 300 K, 100 kPa. Assuming all the mass heats up uniformly, how long will it take to increase the temperature 10°C?

Solution:

C.V. Air, wood and steel. $m_2 = m_1$; no work

Energy Eq.3.5: $U_2 - U_1 = {}_1Q_2 = \dot{Q}\Delta t$

The total volume is nearly all air, but we can find volume of the solids.

$V_{wood} = m/\rho = 50/510 = 0.098\ m^3$; $V_{steel} = 25/7820 = 0.003\ m^3$

$V_{air} = 200 - 0.098 - 0.003 = 199.899\ m^3$

$m_{air} = PV/RT = 101.325 \times 199.899/(0.287 \times 300) = 235.25$ kg

We do not have a u table for steel or wood so use heat capacity from A.3.

$\Delta U = [m_{air}\, C_v + m_{wood}\, C_v + m_{steel}\, C_v\,]\Delta T$

$= (235.25 \times 0.717 + 50 \times 1.38 + 25 \times 0.46)$ kJ/K $\times 10$ K

$= 1686.7 + 690 + 115 = 2492$ kJ $= \dot{Q} \times \Delta t = 10$ kW $\times \Delta t$

=> $\Delta t = 2492$ kJ/10 kW = **249.2 sec = 4.2 minutes**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.194

The rate of heat transfer to the surroundings from a person at rest is about 400 kJ/h. Suppose that the ventilation system fails in an auditorium containing 100 people. Assume the energy goes into the air of volume 1500 m^3 initially at 300 K and 101 kPa. Find the rate (degrees per minute) of the air temperature change.

Solution:

$$\dot{Q} = n\,\dot{q} = 100 \times 400 = 40\,000 \text{ kJ/h} = 666.7 \text{ kJ/min}$$

$$\frac{dE_{air}}{dt} = \dot{Q} = m_{air} C_v \frac{dT_{air}}{dt}$$

$$m_{air} = PV/RT = 101 \text{ kPa} \times 1500 \text{ m}^3 / (0.287 \text{ kJ/kg-K} \times 300 \text{ K}) = 1759.6 \text{ kg}$$

$$\frac{dT_{air}}{dt} = \dot{Q}/mC_v = 666.7 \text{ kJ/min} / (1759.6 \text{ kg} \times 0.717 \text{ kJ/kg-K})$$

$$= \mathbf{0.53°C/min}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.195

A steam generating unit heats saturated liquid water at constant pressure of 800 kPa in a piston cylinder. If 1.5 kW of power is added by heat transfer find the rate (kg/s) of saturated vapor that is made.

Solution:

Energy equation on a rate form making saturated vapor from saturated liquid

$$\dot{U} = (\dot{m}u) = \dot{m}\Delta u = \dot{Q} - \dot{W} = \dot{Q} - P\dot{V} = \dot{Q} - P\,\dot{m}\Delta v$$

Rearrange to solve for heat transfer rate

$$\dot{Q} = \dot{m}(\Delta u + \Delta vP) = \dot{m}\,\Delta h = \dot{m}\,h_{fg}$$

So now

$$\dot{m} = \dot{Q}/\,h_{fg} = 1.5 \text{ kW}/\ 2048.04 \text{ kJ/kg} = \mathbf{0.732\ g/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.196

A 500 Watt heater is used to melt 2 kg of solid ice at –10°C to liquid at +5°C at a constant pressure of 150 kPa.

a) Find the change in the total volume of the water.

b) Find the energy the heater must provide to the water.

c) Find the time the process will take assuming uniform T in the water.

Solution:

Take CV as the 2 kg of water. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

State 1: Compressed solid, take saturated solid at same temperature.

$v = v_i(-10) = 0.0010891\ m^3/kg$, $h = h_i = -354.09\ kJ/kg$

State 2: Compressed liquid, take saturated liquid at same temperature

$v = v_f = 0.001$, $h = h_f = 20.98\ kJ/kg$

Change in volume:

$$V_2 - V_1 = m(v_2 - v_1) = 2(0.001 - 0.0010891) = \mathbf{-0.000178\ m^3}$$

Work is done while piston moves at constant pressure, so we get

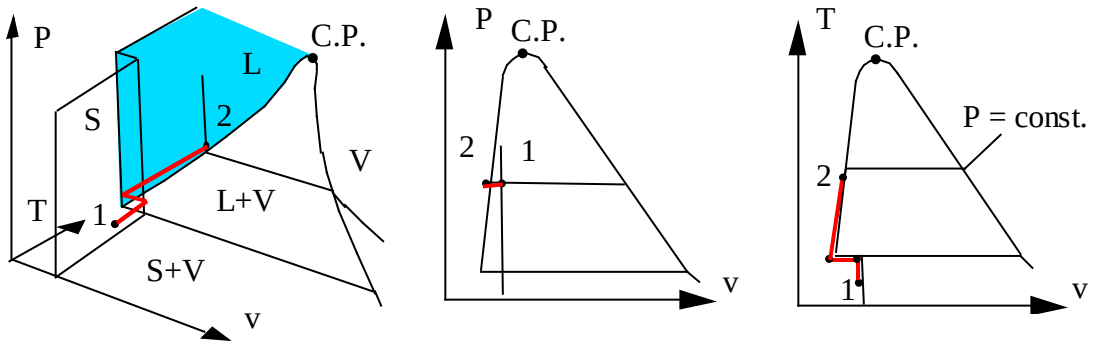
$${}_1W_2 = \int P\,dV = \text{area} = P(V_2 - V_1) = -150 \times 0.000178 = -0.027\ kJ = -27\ J$$

Heat transfer is found from energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1) = 2 \times [20.98 - (-354.09)] = \mathbf{750\ kJ}$$

The elapsed time is found from the heat transfer and the rate of heat transfer

$$t = {}_1Q_2/\dot{Q} = (750\ kJ\ /500\ W) \times 1000\ J/kJ = 1500\ s = \mathbf{25\ min}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.197

A drag force on a car, with frontal area A = 2 m^2, driving at 80 km/h in air at 20^o C is $F_d = 0.225\ A\ \rho_{air} \mathbf{V}^2$. How much power is needed and what is the traction force?

$$\dot{W} = F\mathbf{V}$$

$$\mathbf{V} = 80\ \frac{km}{h} = 80 \times \frac{1000}{3600}\ ms^{-1} = 22.22\ ms^{-1}$$

$$\rho_{AIR} = \frac{P}{RT} = \frac{101}{0.287 \times 293} = 1.20\ kg/m^3$$

$$F_d = 0.225\ A\rho\mathbf{V}^2 = 0.225 \times 2 \times 1.2 \times 22.22^2 = \mathbf{266.61\ N}$$

$$\dot{W} = F\mathbf{V} = 266.61\ N \times 22.22\ m/s = 5924\ W = \mathbf{5.92\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.198

A mass of 3 kg nitrogen gas at 2000 K, V = C, cools with 500 W. What is dT/dt?

Process: V = C → $_1W_2 = 0$

$$\frac{dE}{dt} = \frac{dU}{dt} = m\frac{dU}{dt} = mC_v \frac{dT}{dt} = \dot{Q} - W = \dot{Q} = -500 \text{ W}$$

$$C_{v\,2000} = \frac{du}{dT} = \frac{\Delta u}{\Delta T} = \frac{u_{2100} - u_{1900}}{2100\text{-}1900} = \frac{1819.08 - 1621.66}{200} = 0.987 \text{ kJ/kg K}$$

$$\frac{dT}{dt} = \frac{\dot{Q}}{mC_V} = \frac{-500 \text{ W}}{3 \times 0.987 \text{ kJ/K}} = \mathbf{-0.17 \frac{K}{s}}$$

Remark: Specific heat from Table A.5 has $C_{v\,300} = 0.745$ kJ/kg K which is nearly 25% lower and thus would over-estimate the rate with 25%.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.199

Consider the pot in Problem 3.119. Assume the stove supplies 1 kW of heat. How much time does the process take?

A 1 kg steel pot contains 1 kg liquid water both at 15°C. It is now put on the stove where it is heated to the boiling point of the water. Neglect any air being heated and find the total amount of energy needed.

Solution:

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

The steel does not change volume and the change for the liquid is minimal, so ${}_1W_2 \cong 0$.

State 2: $T_2 = T_{sat}$ (1atm) = 100°C

Tbl B.1.1 : $u_1 = 62.98$ kJ/kg, $u_2 = 418.91$ kJ/kg

Tbl A.3 : $C_{st} = 0.46$ kJ/kg K

Solve for the heat transfer from the energy equation

$${}_1Q_2 = U_2 - U_1 = m_{st}(u_2 - u_1)_{st} + m_{H2O}(u_2 - u_1)_{H2O}$$

$$= m_{st}C_{st}(T_2 - T_1) + m_{H2O}(u_2 - u_1)_{H2O}$$

$${}_1Q_2 = 1 \text{ kg} \times 0.46 \frac{\text{kJ}}{\text{kg K}} \times (100 - 15) \text{ K} + 1 \text{ kg} \times (418.91 - 62.98) \text{ kJ/kg}$$

$$= 39.1 + 355.93 = 395 \text{ kJ}$$

To transfer that amount of heat with a rate of 1 kW we get the relation

$${}_1Q_2 = \int \dot{Q}\, dt = \dot{Q}\, \Delta t \quad \Rightarrow \quad \Delta t = {}_1Q_2 / \dot{Q} = 395 \text{ kJ} / 1 \text{ (kJ/s)} = \mathbf{395\ s}$$

3.200

Electric power is volts times ampere (P = V i). When a car battery at 12 V is charged with 6 amp for 3 hours how much energy is delivered?

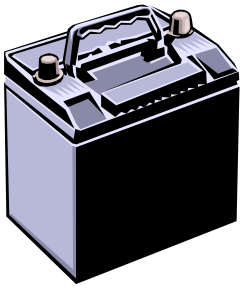
Solution:

Work term integrated as

$$W = \int \dot{W}\, dt = \dot{W}\, \Delta t = V\, i\, \Delta t$$

$$= 12\ V \times 6\ Amp \times 3 \times 3600\ s$$

$$= 777\ 600\ J = \mathbf{777.6\ kJ}$$



Remark: Volt times ampere is also watts, 1 W = 1 V × 1 Amp. = 1 J/s

3.201

A copper wire of diameter 2 mm is 10 m long and stretched out between two posts. The normal stress (pressure) $\sigma = E(L - L_o)/L_o$, depends on the length L versus the un-stretched length L_o and Young's modulus $E = 1.1 \times 10^6$ kPa. The force is $F = A\sigma$ and measured to be 110 N. How much longer is the wire and how much work was put in?

Solution:

$F = As = AE\ \Delta L/ L_o$ and $\Delta L = FL_o /AE$

$$A = \frac{\pi}{4}D^2 = \frac{\pi}{4} \times 0.002^2 = 3.142 \times 10^{-6}\ m^2$$

$$\Delta L = \frac{110\ N \times 10\ m}{3.142 \times 10^{-6}\ m^2 \times 1.1 \times 10^6 \times 10^3\ Pa} = \mathbf{0.318\ m}$$

$$_1W_2 = \int F\ dx = \int A\ s\ dx = \int AE \frac{x}{L_o} dx$$

$$= \frac{AE}{L_o} \tfrac{1}{2}\ x^2 \qquad \text{where } x = L - L_o$$

$$= \frac{3.142 \times 10^{-6} \times 1.1 \times 10^6 \times 10^3}{10} \times \tfrac{1}{2} \times 0.318^2 = \mathbf{17.47\ J}$$

3.202

A film of ethanol at 20°C has a surface tension of 22.3 mN/m and is maintained on a wire frame as shown in Fig. P3.202. Consider the film with two surfaces as a control mass and find the work done when the wire is moved 10 mm to make the film 20 × 40 mm.

Solution :

Assume a free surface on both sides of the frame, i.e., there are two surfaces 20 × 30 mm

$$W = -\int S \, dA = -22.3\times10^{-3} \text{ N/m} \times 2\,(800 - 600) \times10^{-6} \text{ m}^2$$

$$= -8.92\times10^{-6} \text{ J} = \mathbf{-8.92\ \mu J}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.203

A 10-L rigid tank contains R-410A at –10°C, 80% quality. A 10-A electric current (from a 6-V battery) is passed through a resistor inside the tank for 10 min, after which the R-410A temperature is 40°C. What was the heat transfer to or from the tank during this process?

Solution:

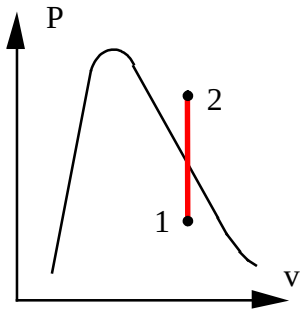
C.V. R-410A in tank. Control mass at constant V.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: Constant V $\Rightarrow$ $v_2 = v_1$

=> no boundary work, but electrical work



State 1 from table B.4.1

$v_1 = 0.000827 + 0.8 \times 0.04470 = 0.03659\ m^3/kg$

$u_1 = 42.32 + 0.8 \times 207.36 = 208.21\ kJ/kg$

$m = V/v = 0.010\ m^3 / 0.03659\ m^3/kg = 0.2733\ kg$

State 2: Table B.4.2 at 40°C and $v_2 = v_1 = 0.03659\ m^3/kg$

=> superheated vapor, so use linear interpolation to get

$P_2 = 800 + 200 \times (0.03659 - 0.04074)/(0.03170 - 0.04074)$

$= 800 + 200 \times 0.45907 = 892\ kPa$

$u_2 = 286.83 + 0.45907 \times (284.35 - 286.83) = 285.69\ kJ/kg$

${}_1W_{2\ elec} = -\text{power} \times \Delta t = -\text{Amp} \times \text{volts} \times \Delta t = -\dfrac{10 \times 6 \times 10 \times 60}{1000} = -36\ kJ$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.2733\ kg\ (285.69 - 208.21)\ kJ/kg - 36\ kJ$

$= \mathbf{-14.8\ kJ}$

3.204

A battery is well insulated while being charged by 12.3 V at a current of 6 A. Take the battery as a control mass and find the instantaneous rate of work and the total work done over 4 hours.

Solution :

Battery thermally insulated $\Rightarrow$ Q = 0

For constant voltage *E* and current i,

Power = *E* i = 12.3 × 6 = **73.8 W** [Units V × A = W]

$$W = \int \text{power } dt = \text{power } \Delta t$$

= 73.8 W × 4 h × 3600 (s/h) = 1 062 720 J = **1062.7 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.205

A sheet of rubber is stretched out over a ring of radius 0.25 m. I pour liquid water at 20^{o}C on it, as in Fig. P3.205, so the rubber forms a half sphere (cup). Neglect the rubber mass and find the surface tension near the ring?

Solution:

$F\uparrow = F\downarrow$; $F\uparrow = SL$

The length is the perimeter, $2\pi r$, and there is two surfaces

$$S \times 2 \times 2\pi r = m_{H2o}\, g = \rho_{H2o}\, Vg = \rho_{H2o} \times \frac{1}{12}\, \pi\, (2r)^{3} g = \rho_{H2o} \times \pi\, \frac{2}{3}\, r^{3}$$

$$S = \rho_{H2o}\, \frac{1}{6}\, r^{2}\, g$$

$$= 997\ \text{kg/m}^3 \times \frac{1}{6} \times 0.25^2\ \text{m}^2 \times 9.81\ \text{m/s}^2$$

$$= \mathbf{101.9\ N/m}$$

3.206

Assume we fill a spherical balloon from a bottle of helium gas. The helium gas provides work $\int$ PdV that stretches the balloon material $\int$ S dA and pushes back the atmosphere $\int P_o$ dV. Write the incremental balance for $dW_{helium} = dW_{stretch} + dW_{atm}$ to establish the connection between the helium pressure, the surface tension S and P_o as a function of radius.

$$W_{He} = \int P\, dV = \int S\, dA + \int P_o\, dV$$

$$dW_{He} = P\, dV = S\, dA + P_o\, dV$$

$$dV = d\left(\frac{\pi}{6} D^3\right) = \frac{\pi}{6} \times 3D^2\, dD$$

$$dA = d\left(2 \times \pi \times D^2\right) = 2\pi\,(2D)\, dD$$

$$P \frac{\pi}{2} D^2\, dD = S\,(4\pi) D\, dD + P_o \frac{\pi}{2} D^2\, dD$$

Divide by $\frac{\pi}{2} D^2$ to recognize

$$\mathbf{P_{He} = P_o + 8 \frac{S}{D} = P_o + 4 \frac{S}{r}}$$

3.207

Assume a balloon material with a constant surface tension of S = 2 N/m. What is the work required to stretch a spherical balloon up to a radius of r = 0.5 m? Neglect any effect from atmospheric pressure.

Assume the initial area is small, and that we have 2 surfaces inside and out

$$W = -\int S\, dA = -S\,(A_2 - A_1)$$

$$= -\,S(A_2) = -S(\,2\times \pi\, \mathbf{D}_2^2\,)$$

$$= -2\ \text{N/m} \times 2 \times \pi \times 1\ \text{m}^2 = -12.57\ \text{J}$$

$$W_{in} = -W = \mathbf{12.57\ J}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.208

A soap bubble has a surface tension of S = 3×10^{-4} N/cm as it sits flat on a rigid ring of diameter 5 cm. You now blow on the film to create a half sphere surface of diameter 5 cm. How much work was done?

$$_1W_2 = \int F\ dx = \int S\ dA = S\ \Delta A$$

$$= 2 \times S \times \left(\frac{\pi}{2} D^2 - \frac{\pi}{4} D^2 \right)$$

$$= 2 \times 3 \times 10^{-4}\ \text{N/cm} \times 100\ \text{cm/m} \times \frac{\pi}{2} 0.05^2\ \text{m}^2\ (1 - 0.5)$$

$$= \mathbf{1.18 \times 10^{-4}\ J}$$

Notice the bubble has 2 surfaces.

$$A_1 = \frac{\pi}{4} D^2,$$

$$A_2 = \tfrac{1}{2} \pi D^2$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.209

A 0.5-m-long steel rod with a 1-cm diameter is stretched in a tensile test. What is the required work to obtain a relative strain of 0.1%? The modulus of elasticity of steel is 2×10^8 kPa.

Solution :

$$-_1W_2 = \frac{AEL_0}{2}(e)^2, \quad A = \frac{\pi}{4}(0.01)^2 = 78.54 \times 10^{-6}\ m^2$$

$$-_1W_2 = \frac{1}{2} \times 78.54 \times 10^{-6}\ m^2 \times 2 \times 10^8\ kPa \times 0.5\ m\ (10^{-3})^2$$

$$= \mathbf{3.93\ J}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

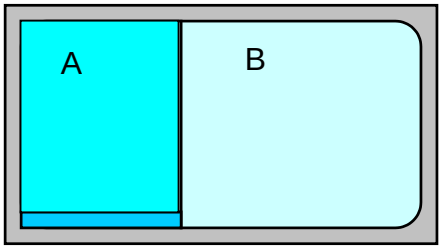
3.210

A rigid tank is divided into two rooms by a membrane, both containing water, shown in Fig. P3.210. Room A is at 200 kPa, $v = 0.5$ m^3/kg, $V_A = 1$ m^3, and room B contains 3.5 kg at 0.5 MPa, 400°C. The membrane now ruptures and heat transfer takes place so the water comes to a uniform state at 100°C. Find the heat transfer during the process.

Solution:

C.V.: Both rooms A and B in tank.



Continuity Eq.: $m_2 = m_{A1} + m_{B1}$;

Energy Eq.: $m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} = {}_1Q_2 - {}_1W_2$

State 1A: (P, v) Table B.1.2, $m_{A1} = V_A/v_{A1} = 1/0.5 = 2$ kg

$$x_{A1} = \frac{v - v_f}{v_{fg}} = \frac{0.5 - 0.001061}{0.88467} = 0.564$$

$$u_{A1} = u_f + x\, u_{fg} = 504.47 + 0.564 \times 2025.02 = 1646.6 \text{ kJ/kg}$$

State 1B: Table B.1.3, $v_{B1} = 0.6173$, $u_{B1} = 2963.2$, $V_B = m_{B1}v_{B1} = 2.16$ m^3

Process constant total volume: $V_{tot} = V_A + V_B = 3.16$ m^3 and ${}_1W_2 = \emptyset$

$$m_2 = m_{A1} + m_{B1} = 5.5 \text{ kg} \quad \Rightarrow \quad v_2 = V_{tot}/m_2 = 0.5746 \text{ m}^3\text{/kg}$$

State 2: T_2 , v_2 $\Rightarrow$ Table B.1.1 two-phase as $v_2 < v_g$

$$x_2 = \frac{v_2 - v_f}{v_{fg}} = \frac{0.5746 - 0.001044}{1.67185} = 0.343 ,$$

$$u_2 = u_f + x\, u_{fg} = 418.91 + 0.343 \times 2087.58 = 1134.95 \text{ kJ/kg}$$

Heat transfer is from the energy equation

$${}_1Q_2 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1}$$

$$= (5.5 \times 1134.95 - 2 \times 1646.6 - 3.5 \times 2963.2) \text{ kg} \times \text{kJ/kg}$$

$$= \mathbf{-7421\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.211

A piston cylinder has a water volume separated in $V_A = 0.2\ m^3$ and $V_B = 0.3\ m^3$ by a stiff membrane. The initial state in A is 1000 kPa, x = 0.75 and in B it is 1600 kPa and 250°C. Now the membrane ruptures and the water comes to a uniform state at 200°C. What is the final pressure? Find the work and the heat transfer in the process.

Take the water in A and B as CV.

Continuity: $m_2 - m_{1A} - m_{1B} = 0$

Energy: $m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} = {}_1Q_2 - {}_1W_2$

Process: $P_2 = P_{eq} = \text{constant} = P_{1A}$ as piston floats and m_p, P_o do not change

State 1A: Two phase. Table B.1.2

$v_{1A} = 0.001127 + 0.75 \times 0.19332 = 0.146117\ m^3/kg$,

$u_{1A} = 761.67 + 0.75 \times 1821.97 = 2128.15\ kJ/kg$

State 1B: Table B.1.3 $v_{1B} = 0.14184\ m^3/kg$, $u_{1B} = 2692.26\ kJ/kg$

=> $m_{1A} = V_{1A}/v_{1A} = 1.3688\ kg$, $m_{1B} = V_{1B}/v_{1B} = 2.115\ kg$

State 2: 1000 kPa, 200°C sup. vapor => $v_2 = 0.20596\ m^3/kg$, $u_2 = 2621.9\ kJ/kg$

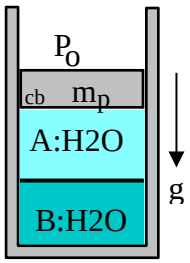
$m_2 = m_{1A} + m_{1B} = 3.4838\ kg$ => $V_2 = m_2v_2 = 3.4838 \times 0.20596 = 0.7175\ m^3$

Piston moves at constant pressure

${}_1W_2 = \int P\ dV = P_{eq}\,(V_2 - V_1) = 1000\ kPa \times (0.7175 - 0.5)\ m^3 =$ **217.5 kJ**

${}_1Q_2 = m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} + {}_1W_2$

$= 3.4838 \times 2621.9 - 1.3688 \times 2128.15 - 2.115 \times 2692.26 + 217.5 =$ **744 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.212

The cylinder volume below the constant loaded piston has two compartments A and B filled with water. A has 0.5 kg at 200 kPa, 150°C and B has 400 kPa with a quality of 50% and a volume of 0.1 m^3. The valve is opened and heat is transferred so the water comes to a uniform state with a total volume of 1.006 m^3.

a) Find the total mass of water and the total initial volume.

b) Find the work in the process

c) Find the process heat transfer.

Solution:

Take the water in A and B as CV.

Continuity: $m_2 - m_{1A} - m_{1B} = 0$

Energy: $m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} = {}_1Q_2 - {}_1W_2$

Process: P = constant = P_{1A} if piston floats

(V_A positive) i.e. if $V_2 > V_B = 0.1\ m^3$

State A1: Sup. vap. Table B.1.3 $v = 0.95964\ m^3/kg$, $u = 2576.9$ kJ/kg

$\Rightarrow V = mv = 0.5\ kg \times 0.95964\ m^3/kg = 0.47982$

State B1: Table B.1.2 $v = (1-x) \times 0.001084 + x \times 0.4625 = 0.2318\ m^3/kg$

$\Rightarrow m = V/v = 0.4314$ kg

$u = 604.29 + 0.5 \times 1949.3 = 1578.9$ kJ/kg

State 2: 200 kPa, $v_2 = V_2/m = 1.006/0.9314 = 1.0801\ m^3/kg$

Table B.1.3 => close to $T_2 = 200°C$ and $u_2 = 2654.4$ kJ/kg

So now

$V_1 = 0.47982 + 0.1 =$ **$0.5798\ m^3$**, $m_1 = 0.5 + 0.4314 =$ **0.9314 kg**

Since volume at state 2 is larger than initial volume piston goes up and the pressure then is constant (200 kPa which floats piston).

$${}_1W_2 = \int P\, dV = P_{lift}\,(V_2 - V_1) = 200\ kPa\ (1.006 - 0.57982)\ m^3 = \mathbf{85.24\ kJ}$$

$${}_1Q_2 = m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} + {}_1W_2$$

$$= 0.9314 \times 2654.4 - 0.5 \times 2576.9 - 0.4314 \times 1578.9 + 85.24 = \mathbf{588\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.213

Water in a tank A is at 250 kPa with a quality of 10% and mass 0.5 kg. It is connected to a piston cylinder holding constant pressure of 200 kPa initially with 0.5 kg water at 400°C. The valve is opened and enough heat transfer takes place to have a final uniform temperature of 150°C. Find the final P and V, the process work and the process heat transfer.

C.V. Water in A and B. Control mass goes through process: 1 -> 2

Continuity Eq.: $m_2 - m_{A1} - m_{B1} = 0$ => $m_2 = m_{A1} + m_{B1} = 0.5 + 0.5 = 1$ kg

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

State A1: $v_{A1} = 0.001067 + x_{A1} \times 0.71765 = 0.072832$; $V_{A1} = mv = 0.036416$ m^3

$u_{A1} = 535.08 + 0.1 \times 2002.14 = 735.22$ kJ/kg

State B1: $v_{B1} = 1.5493$ m^3/kg; $u_{B1} = 2966.69$ kJ/kg

=> $V_{B1} = m_{B1}v_{B1} = 0.77465$ m^3

State 2: If $V_2 > V_{A1}$ then $P_2 =$ **200 kPa** that is the piston floats.

For $(T_2, P_2) = (150°C, 200$ kPa) => superheated vapor $u_2 = 2576.87$ kJ/kg

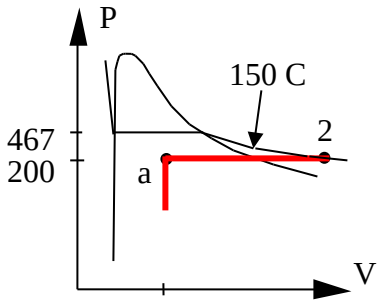
$v_2 = 0.95964$ m^3/kg $V_2 = m_2v_2 =$ **0.95964 m^3** $> V_{A1}$ checks OK.

The possible state 2 (P,V) combinations are shown. State "a" is at 200 kPa and

$$v_a = \frac{V_{A1}}{m_2} = 0.036 \text{ m}^3/\text{kg}$$

and thus two-phase

$T_a = 120°C < T_2$



Process: ${}_1W_2 = P_2 (V_2 - V_1) = 200$ kPa $\times (0.95964 - 0.77465 - 0.036416)$ m^3

= **29.72 kJ**

From the energy Eq.:

${}_1Q_2 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} + {}_1W_2$

$= 1 \times 2576.87 - 0.5 \times 735.222 - 0.5 \times 2966.69 + 29.72 =$ **755.6 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.214

Two rigid tanks are filled with water. Tank A is 0.2 m^3 at 100 kPa, 150^{o}C and tank B is 0.3 m^3 at saturated vapor 300 kPa. The tanks are connected by a pipe with a closed valve. We open the valve and let all the water come to a single uniform state while we transfer enough heat to have a final pressure of 300 kPa. Give the two property values that determine the final state and find the heat transfer.

State A1: u = 2582.75 kJ/kg, v = 1.93636 m^3/kg

=> m_{A1} = V/v = 0.2/1.93636 = **0.1033 kg**

State B1: u = 2543.55 kJ/kg, v = 0.60582 m^3/kg

=> m_{B1} = V/v = 0.3 / 0.60582 = **0.4952 kg**

The total volume (and mass) is the sum of volumes (mass) for tanks A and B.

$m_2 = m_{A1} + m_{B1} = 0.1033 + 0.4952 = 0.5985$ kg,

$V_2 = V_{A1} + V_{B1} = 0.2 + 0.3 = 0.5\ m^3$

=> $v_2 = V_2/m_2 = 0.5 / 0.5985 =$ **0.8354 m^3/kg**

State 2: $[P_2, v_2] = [300\ kPa, 0.8354\ m^3/kg]$

=> $T_2 = 274.76°C$ and $u_2 = 2767.32$ kJ/kg

The energy equation is (neglecting kinetic and potential energy)

$$m_2 u_2 - m_A u_{A1} - m_B u_{B1} = {}_1Q_2 - {}_1W_2 = {}_1Q_2$$

$${}_1Q_2 = (0.5985 \times 2767.32 - 0.1033 \times 2582.75 - 0.4952 \times 2543.55)\ kg \times kJ/kg$$

= **129.9 kJ**

3.215

A tank has a volume of 1 m^3 with oxygen at 15°C, 300 kPa. Another tank contains 4 kg oxygen at 60°C, 500 kPa. The two tanks are connected by a pipe and valve which is opened allowing the whole system to come to a single equilibrium state with the ambient at 20°C. Find the final pressure and the heat transfer.

C.V. Both tanks of constant volume.

Continuity Eq.: $m_2 - m_{1A} - m_{1B} = 0$

Energy Eq.: $m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} = {}_1Q_2 - {}_1W_2$

Process Eq.: $V_2 = V_A + V_B = \text{constant}, \quad {}_1W_2 = 0$

State 1A: $$m_{1A} = \frac{P_{1A}V_A}{RT_{1A}} = \frac{300 \text{ kPa} \times 1 \text{ m}^3}{0.2598 \text{ kJ/kg-K} \times 288.15 \text{ K}} = 4.007 \text{ kg}$$

State 1B: $$V_B = \frac{m_{1B}RT_{1B}}{P_{1B}} = \frac{4 \text{ kg} \times 0.2598 \text{ kJ/kg-K} \times 333.15 \text{ K}}{500 \text{ kPa}} = 0.6924 \text{ m}^3$$

State 2: $(T_2, v_2 = V_2/m_2) \quad V_2 = V_A + V_B = 1 + 0.6924 = 1.6924 \text{ m}^3$

$m_2 = m_{1A} + m_{1B} = 4.007 + 4 = 8.007 \text{ kg}$

$$P_2 = \frac{m_2RT_2}{V_2} = \frac{8.007 \text{ kg} \times 0.2598 \text{ kJ/kg-K} \times 293.15 \text{ K}}{1.6924 \text{ m}^3} = \mathbf{360.3 \text{ kPa}}$$

Heat transfer from energy equation

$${}_1Q_2 = m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} = m_{1A}(u_2 - u_{1A}) + m_{1B}(u_2 - u_{1B})$$

$$= m_{1A}C_v (T_2 - T_{1A}) + m_{1B} C_v (T_2 - T_{1B})$$

$$= 4.007 \text{ kg} \times 0.662 \text{ kJ/kg-K} \times (20 - 15) \text{ K} + 4 \text{ kg} \times 0.662 \text{ kJ/kg-K} \times (20 - 60) \text{ K}$$

$$= \mathbf{-92.65 \text{ kJ}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.216

A rigid insulated tank is separated into two rooms by a stiff plate. Room A of 0.5 m^3 contains air at 250 kPa, 300 K and room B of 1 m^3 has air at 500 kPa, 1000 K. The plate is removed and the air comes to a uniform state without any heat transfer. Find the final pressure and temperature.

Solution:

C.V. Total tank. Control mass of constant volume.

Mass and volume: $m_2 = m_A + m_B$; $V = V_A + V_B = 1.5\ m^3$

Energy Eq.: $U_2 - U_1 = m_2 u_2 - m_A u_{A1} - m_B u_{B1} = Q - W = 0$

Process Eq.: V = constant $\Rightarrow$ $W = 0$; Insulated $\Rightarrow$ $Q = 0$

Ideal gas at 1: $m_A = P_{A1}V_A/RT_{A1} = 250 \times 0.5/(0.287 \times 300) = 1.452$ kg

$u_{A1} = 214.364$ kJ/kg from Table A.7

Ideal gas at 2:

$m_B = P_{B1}V_B/RT_{B1} = 500$ kPa $\times$ 1 $m^3/(0.287$ kJ/kg-K $\times$ 1000 K) $= 1.742$ kg

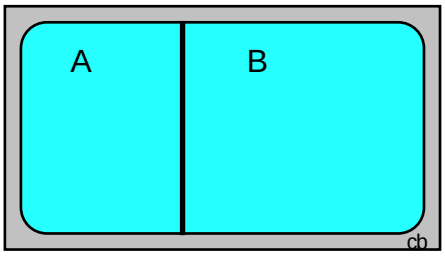
$u_{B1} = 759.189$ kJ/kg from Table A.7

$m_2 = m_A + m_B = 3.194$ kg

$$u_2 = \frac{m_A u_{A1} + m_B u_{B1}}{m_2} = \frac{1.452 \times 214.364 + 1.742 \times 759.189}{3.194} = 511.51 \text{ kJ/kg}$$

=> Table A.7.1: $\mathbf{T_2 = 698.6\ K}$

$P_2 = m_2 RT_2/V = 3.194$ kg $\times$ 0.287 kJ/kg-K $\times$ 698.6 K /1.5 m^3 = **426.9 kPa**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.217

A rigid tank A of volume 0.6 m^3 contains 3 kg water at 120°C and the rigid tank B is 0.4 m^3 with water at 600 kPa, 200°C. They are connected to a piston cylinder initially empty with closed valves. The pressure in the cylinder should be 800 kPa to float the piston. Now the valves are slowly opened and heat is transferred so the water reaches a uniform state at 250°C with the valves open. Find the final volume and pressure and the work and heat transfer in the process.

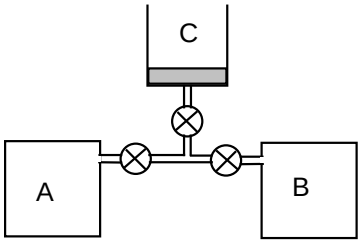
C.V.: A + B + C.

Only work in C, total mass constant.

$m_2 - m_1 = 0 \quad => \quad m_2 = m_{A1} + m_{B1}$

$U_2 - U_1 = {}_1Q_2 - {}_1W_2$;

${}_1W_2 = \int PdV = P_{lift}\,(V_2 - V_1)$



1A: $v = 0.6/3 = 0.2\ m^3/kg \quad => \quad x_{A1} = (0.2 - 0.00106)/0.8908 = 0.223327$

$u = 503.48 + 0.223327 \times 2025.76 = 955.89\ kJ/kg$

1B: $v = 0.35202\ m^3/kg \quad => \quad m_{B1} = 0.4/0.35202 = 1.1363\ kg$; $u = 2638.91\ kJ/kg$

$m_2 = 3 + 1.1363 = 4.1363\ kg$ and $V_1 = V_A + V_B = 1\ m^3$

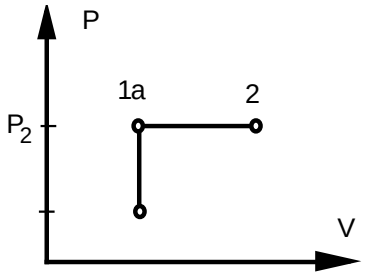
$V_2 = V_A + V_B + V_C = 1\ m^3 + V_C$

Locate state 2: Must be on P-V lines shown

State 1a: 800 kPa,

$$v_{1a} = \frac{V_A + V_B}{m} = 0.24176\ m^3/kg$$

800 kPa, $v_{1a} \quad => \quad T = 173°C$ too low.



Assume 800 kPa: 250°C => $v = 0.29314\ m^3/kg > v_{1a}$ OK

$V_2 = m_2 v_2 = 4.1363\ kg \times 0.29314\ m^3/kg =$ **1.2125 m^3**

Final state is : **800 kPa**; 250°C => $u_2 = 2715.46\ kJ/kg$

${}_1W_2 = P_{lift}\,(V_2 - V_1) = 800\ kPa \times (1.2125 - 1)\ m^3 =$ **170 kJ**

${}_1Q_2 = m_2u_2 - m_1u_1 + {}_1W_2 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} + {}_1W_2$

$= 4.1363 \times 2715.46 - 3 \times 955.89 - 1.1363 \times 2638.91 + 170$

$= 11\,232 - 2867.7 - 2998.6 + 170 =$ **5536 kJ**

3.218

Ten kilograms of water in a piston/cylinder setup with constant pressure is at 450°C and a volume of 0.633 m^3. It is now cooled to 20°C. Show the *P–v* diagram and find the work and heat transfer for the process.

Solution:

C.V. The 10 kg water.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

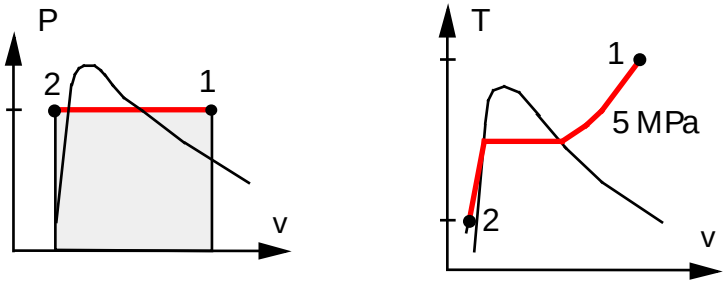
Process: $P = C \quad \Rightarrow \quad {}_1W_2 = mP(v_2 - v_1)$

State 1: (T, $v_1 = 0.633/10 = 0.0633$ m^3/kg) Table B.1.3

$P_1 = 5$ MPa, $h_1 = 3316.2$ kJ/kg

State 2: (P = P = 5 MPa, 20°C) $\Rightarrow$ Table B.1.4

$v_2 = 0.000\ 999\ 5$ m^3/kg ; $h_2 = 88.65$ kJ/kg



The work from the process equation is found as

${}_1W_2 = 10$ kg × 5000 kPa ×(0.0009995 - 0.0633) m^3/kg = **-3115 kJ**

The heat transfer from the energy equation is

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$

${}_1Q_2 = 10$ kg ×(88.65 - 3316.2) kJ/kg = **-32 276 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.219

A piston/cylinder (Fig. P3.171) contains 1 kg of water at 20°C with a volume of 0.1 m^3. Initially the piston rests on some stops with the top surface open to the atmosphere, P_o and a mass so a water pressure of 400 kPa will lift it. To what temperature should the water be heated to lift the piston? If it is heated to saturated vapor find the final temperature, volume and the work, ${}_1W_2$.

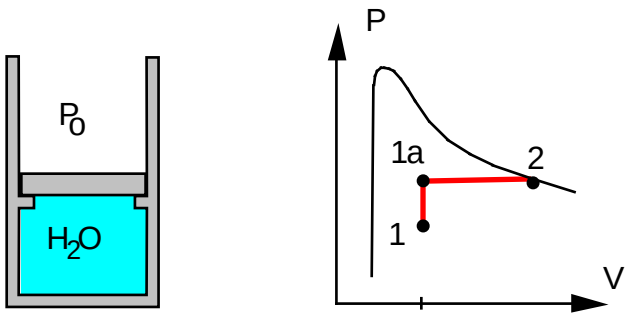
Solution:

(a) State to reach lift pressure of P = 400 kPa, $v = V/m = 0.1\ m^3/kg$

Table B.1.2: $v_f < v < v_g = 0.4625\ m^3/kg$

=> $T = T_{sat}$ = **143.63°C**

(b) State 2 is saturated vapor at 400 kPa since state 1a is two-phase.



$v_2 = v_g = 0.4625\ m^3/kg$, $V_2 = m\ v_2 = 0.4625\ m^3$,

Pressure is constant as volume increase beyond initial volume.

${}_1W_2 = \int P\ dV = P\ (V_2 - V_1) = P_{lift}\ (V_2 - V_1)$

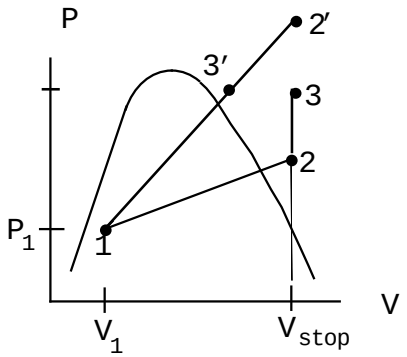
$= 400\ kPa \times (0.4625 - 0.1)\ m^3$ = **145 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.220

Two kilograms of water is contained in a piston/cylinder (Fig. P3.220) with a massless piston loaded with a linear spring and the outside atmosphere. Initially the spring force is zero and $P_1 = P_o = 100$ kPa with a volume of 0.2 m^3. If the piston just hits the upper stops the volume is 0.8 m^3 and $T = 600°C$. Heat is now added until the pressure reaches 1.2 MPa. Find the final temperature, show the *P–V* diagram and find the work done during the process.

Solution:



State 1: $v_1 = V/m = 0.2 / 2 = 0.1$ m^3/kg

Process: $1 \to 2 \to 3$ or $1 \to 3$'

State at stops: 2 or 2'

$v_2 = V_{stop}/m = 0.4$ m^3/kg & $T_2 = 600°C$

Table B.1.3 $\Rightarrow$ $P_{stop} = 1$ MPa $< P_3$

since $P_{stop} < P_3$ the process is as $1 \to 2 \to 3$

State 3: $P_3 = 1.2$ MPa, $v_3 = v_2 = 0.4$ m^3/kg $\Rightarrow$ $T_3 \cong$ **770°C**

$$W_{13} = W_{12} + W_{23} = \frac{1}{2}(P_1 + P_2)(V_2 - V_1) + 0$$

$$= \frac{1}{2}(100 + 1000) \text{ kPa} \times (0.8 - 0.2) \text{ m}^3$$

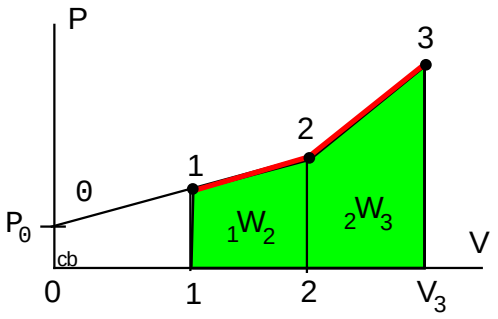
$$= \mathbf{330\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.221

Two springs with same spring constant are installed in a massless piston/cylinder with the outside air at 100 kPa. If the piston is at the bottom, both springs are relaxed and the second spring comes in contact with the piston at $V = 2$ m^3. The cylinder (Fig. P3.221) contains ammonia initially at –2°C, $x = 0.13$, $V = 1$ m^3, which is then heated until the pressure finally reaches 1200 kPa. At what pressure will the piston touch the second spring? Find the final temperature, the total work done by the ammonia and the heat transfer.

Solution :



State 1: P = 399.7 kPa Table B.2.1

v = 0.00156 + 0.13×0.3106 = 0.0419 m^3/kg

u = 170.52 + 0.13×1145.78 = 319.47 kJ/kg

m = V/v = 1/0.0419 = 23.866 kg

At bottom state 0: 0 m^3, 100 kPa

State 2: V = 2 m^3 and on line 0-1-2

Final state 3: 1200 kPa, on line segment 2.

Slope of line 0-1-2: $\Delta P/\Delta V = (P_1 - P_0)/\Delta V = (399.7\text{-}100)/1 = 299.7$ kPa/ m^3

$P_2 = P_1 + (V_2 - V_1)\Delta P/\Delta V = 399.7 + (2\text{-}1)\times 299.7 =$ **699.4 kPa**

State 3: Last line segment has twice the slope.

$P_3 = P_2 + (V_3 - V_2)2\Delta P/\Delta V \quad \Rightarrow \quad V_3 = V_2 + (P_3 - P_2)/(2\Delta P/\Delta V)$

$V_3 = 2 + (1200\text{-}699.4)/599.4 = 2.835$ m^3

$v_3 = v_1 V_3/V_1 = 0.0419\times 2.835/1 = 0.1188 \quad \Rightarrow \quad T_3 =$ **51°C**

$u_3 = 1384.39$ kJ/kg $= 1383 + (1404.8\text{-}1383)\dfrac{0.1188 - 0.11846}{0.12378 - 0.11846}$ from B.2.2

$_1W_3 = {}_1W_2 + {}_2W_3 = \frac{1}{2}(P_1 + P_2)(V_2 - V_1) + \frac{1}{2}(P_3 + P_2)(V_3 - V_2)$

$= 549.6 + 793.0 =$ **1342.6 kJ**

The energy equation gives the heat transfer as

$_1Q_3 = m(u_3 - u_1) + {}_1W_3 = 23.866$ kg $(1384.39 - 319.47)$ kJ/kg + 1342.6 kJ

= **26 758 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.222

Ammonia, NH_3, is contained in a sealed rigid tank at 0°C, $x = 50\%$ and is then heated to 100°C. Find the final state P_2, u_2 and the specific work and heat transfer.

Solution:

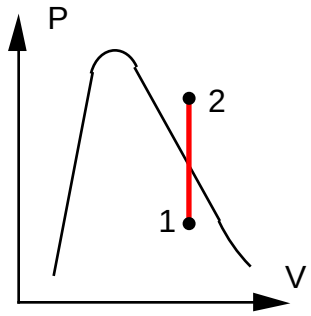
Continuity Eq.: $m_2 = m_1$;

Energy Eq.3.5: $E_2 - E_1 = {}_1Q_2$; $({}_1W_2 = \emptyset)$

Process: $V_2 = V_1 \Rightarrow v_2 = v_1 = 0.001566 + 0.5 \times 0.28783 = 0.14538$ m^3/kg

Table B.2.2: v_2 & $T_2 \Rightarrow$ between 1000 kPa and 1200 kPa

$$P_2 = 1000 + 200 \frac{0.14538 - 0.17389}{0.14347 - 0.17389} = \textbf{1187 kPa}$$



$u_2 = 1490.5 + (1485.8 - 1490.5) \times 0.935$

$= 1485.83$ kJ/kg

$u_1 = 179.69 + 0.5 \times 1138.3 = 748.84$ kJ/kg

Process equation gives no displacement: ${}_1w_2 = \mathbf{0}$;

The energy equation then gives the heat transfer as

${}_1q_2 = u_2 - u_1 = 1485.83 - 748.84 = \textbf{737 kJ/kg}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.223

A piston/cylinder system contains 50 L of air at 300°C, 100 kPa, with the piston initially on a set of stops as shown. A total external constant force acts on the piston so a balancing pressure inside should be 200 kPa. The cylinder is made of 2 kg of steel initially at 1300°C. The system is insulated so that heat transfer only occurs between the steel cylinder and the air. The system comes to equilibrium. Find the final temperature and the work done by the air in the process and plot the process P-V diagram.

C.V.: Steel + water out to ambient T_0. This is a control mass.

Energy Eq.: $U_2 - U_1 = m_{air}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $S_2 - S_1 = m_{air}(s_2 - s_1) + m_{st}(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1S_{2\,gen}$

Process: ${}_1Q_2 = 0$ and must be on P-V diagram shown

$$m_{air} = P_1V_1 / RT_1 = 100 \times 0.05 /(0.287 \times 573.15) = 0.0304 \text{ kg}$$

Since $V_{1a} = V_1$ then $T_{1a} = T_1(P_{float}/P_1) = 573.15 \times 200/100 = 1146.3$ K

Use constant C_v for air at 900 K: $C_v = \Delta u/\Delta T = 0.833$ kJ/kgK (from A.7)

To reach state 1a: $\Delta U_{air} = mC_v\Delta T = 0.0304 \times 0.833 \times (1146 - 573) = 14.5$ kJ

$$\Delta U_{st} = mC_v\Delta T = 2 \times 0.46 \times (1146 - 1573) = -392.8 \text{ kJ}$$

Conclusion from this is: T_2 is higher than T_{1a} = 1146 K, piston lifts, $P_2 = P_{float}$

Write the work as ${}_1W_2 = P_2 (V_2 - V_1)$ and use constant C_v in the energy Eq. as

$$m_{air}\, C_v\, (T_2 - T_1) + m_{st}\, C_{st}\, (T_2 - T_1) = - P_2 m_{air} v_2 + P_2\, V_1$$

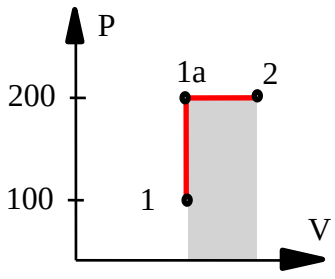
now $P_2\, v_2 = RT_2$ for the air, so isolate T_2 terms as

$$[m_{air}\,(C_v + R) + mC_{st}\,]\, T_2 = m_{air}\, C_v T_{1\,air} + mC_{st}\, T_{1\,st} + P_2V_1$$

$$[0.0304 \times 1.12 + 2 \times 0.46]\, T_2 = 0.0304 \times 0.833 \times 573.15 + 2 \times 0.46 \times 1573.15 + 200 \times 0.05$$

Solution gives: $T_2 =$ **1542.7 K**, $V_2 = 0.0304 \times 0.287 \times 1542.7/200 = 0.0673$ m^3

${}_1W_2 = P_2 (V_2 - V_1) = 200\,(0.0673 - 0.05) =$ **3.46 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.224

A piston/cylinder arrangement has the piston loaded with outside atmospheric pressure and the piston mass to a pressure of 150 kPa. It contains water at –2°C, which is then heated until the water becomes saturated vapor. Find the final temperature and specific work and heat transfer for the process.

Solution:

C.V. Water in the piston cylinder.

Continuity: $m_2 = m_1$,

Energy Eq.3.5 per unit mass: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Process: P = constant = P_1, => ${}_1w_2 = \int_1^2 P\, dv = P_1(v_2 - v_1)$

State 1: T_1 , P_1 => Table B.1.5 compressed solid, take as saturated solid.

$v_1 = 1.09\times10^{-3}$ m^3/kg, $u_1 = -337.62$ kJ/kg

State 2: x = 1, $P_2 = P_1 = 150$ kPa due to process => Table B.1.2

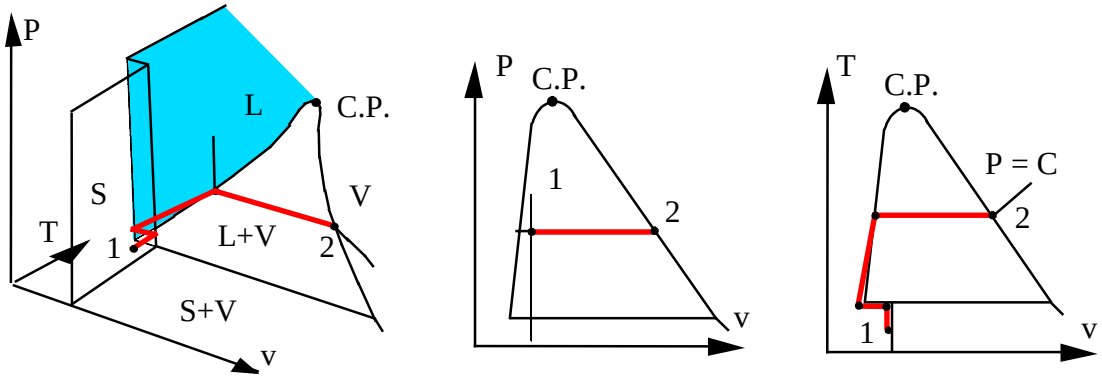
$v_2 = v_g(P_2) = 1.1593$ m^3/kg, $T_2 =$ **111.4°C** ; $u_2 = 2519.7$ kJ/kg

From the process equation

${}_1w_2 = P_1(v_2 - v_1) = 150$ kPa $(1.1593 - 1.09\times10^{-3})$ m^3/kg = **173.7 kJ/kg**

From the energy equation

${}_1q_2 = u_2 - u_1 + {}_1w_2 = 2519.7 - (-337.62) + 173.7 =$ **3031 kJ/kg**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.225

A piston/cylinder contains 1 kg of ammonia at 20°C with a volume of 0.1 m^3, shown in Fig. P3.225. Initially the piston rests on some stops with the top surface open to the atmosphere, *P*o, so a pressure of 1400 kPa is required to lift it. To what temperature should the ammonia be heated to lift the piston? If it is heated to saturated vapor find the final temperature, volume, and the heat transfer.

Solution:

C.V. Ammonia which is a control mass.

$$m_2 = m_1 = m \; ; \qquad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$$

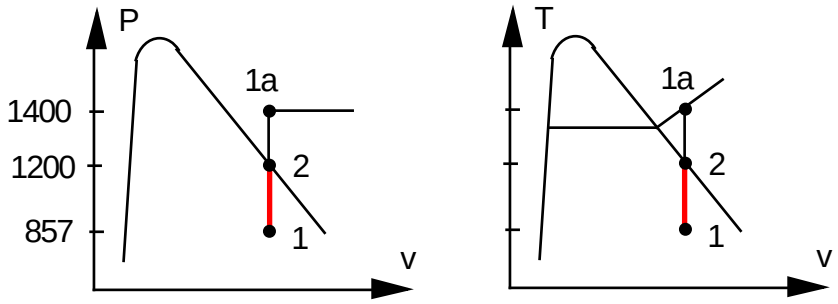
State 1: 20°C; $v_1 = 0.10 < v_g \Rightarrow x_1 = (0.1 - 0.001638)/0.14758 = 0.6665$

$$u_1 = u_f + x_1 u_{fg} = 272.89 + 0.6665 \times 1059.3 = 978.9 \text{ kJ/kg}$$

Process: Piston starts to lift at state 1a (P_{lift}, v_1)

State 1a: 1400 kPa, v_1 Table B.2.2 (superheated vapor)

$$T_a = 50 + (60 - 50)\frac{0.1 - 0.09942}{0.10423 - 0.09942} = 51.2 \text{ °C}$$



State 2: x = 1.0, $v_2 = v_1$ => $V_2 = mv_2 =$ **0.1 m^3**

$T_2 = 30 + (0.1 - 0.11049) \times 5/(0.09397 - 0.11049) =$ **33.2 °C**

$u_2 = 1338.7$ kJ/kg; ${}_1W_2 = 0$;

${}_1Q_2 = m_1 q_2 = m(u_2 - u_1) = 1 \text{ kg} \times (1338.7 - 978.9) \text{ kJ/kg} =$ **359.8 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.226

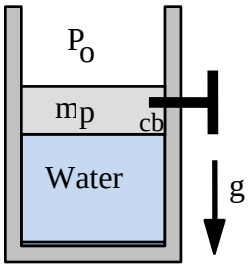
A piston held by a pin in an insulated cylinder, shown in Fig. P3.226, contains 2 kg water at 100°C, quality 98%. The piston has a mass of 102 kg, with cross-sectional area of 100 cm^2, and the ambient pressure is 100 kPa. The pin is released, which allows the piston to move. Determine the final state of the water, assuming the process to be adiabatic.

Solution:

C.V. The water. This is a control mass.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$



Process in cylinder: $P = P_{float}$ (if piston not supported by pin)

$$P_2 = P_{float} = P_0 + m_p g/A = 100 + \frac{102 \times 9.807}{100 \times 10^{-4} \times 10^3} = 200 \text{ kPa}$$

We thus need one more property for state 2 and we have one equation namely the energy equation. From the equilibrium pressure the work becomes

$${}_1W_2 = \int P_{float}\, dV = P_2\, m(v_2 - v_1)$$

With this work the energy equation gives per unit mass

$$u_2 - u_1 = {}_1q_2 - {}_1w_2 = 0 - P_2(v_2 - v_1)$$

or with rearrangement to have the unknowns on the left hand side

$$u_2 + P_2v_2 = h_2 = u_1 + P_2v_1$$

$$h_2 = u_1 + P_2v_1 = 2464.8 \text{ kJ/kg} + 200 \text{ kPa} \times 1.6395 \text{ m}^3/\text{kg} = 2792.7 \text{ kJ/kg}$$

State 2: (P_2, h_2) Table B.1.3 => $T_2 \cong$ **161.75°C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.227

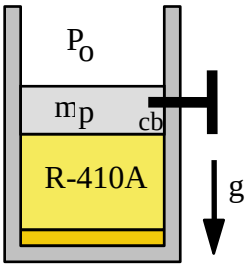
A vertical cylinder (Fig. P3.227) has a 61.18-kg piston locked with a pin trapping 10 L of R-410A at 10°C, 90% quality inside. Atmospheric pressure is 100 kPa, and the cylinder cross-sectional area is 0.006 m^2. The pin is removed, allowing the piston to move and come to rest with a final temperature of 10°C for the R-410A. Find the final pressure, final volume and the work done and the heat transfer for the R-410A.

Solution:

CV R-410A, this is a control mass.

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process in cylinder: $P = P_{float}$ (if piston not supported by pin)



State 1: (T, x) from table B.4.1

$v_1 = 0.000886 + 0.9 \times 0.02295 = 0.021541$ m^3/kg

$u_1 = 72.24 + 0.9 \times 183.66 = 131.64$ kJ/kg

$m = V_1/v_1 = 0.010\ m^3/0.021541\ m^3/kg = 0.464$ kg

Force balance on piston gives the equilibrium pressure

$$P_2 = P_0 + m_P g/A_P = 100 + \frac{61.18 \times 9.807}{0.006 \times 1000} = \mathbf{200\ kPa}$$

State 2: (T,P) in Table B.4.2 $v_2 = (0.1507 + 0.16322)/2 = 0.15696$ m^3/kg

$u_2 = (265.06 + 279.13)/2 = 272.095$ kJ/kg

$V_2 = mv_2 = 0.464\ kg \times 0.15696\ m^3/kg = 0.0728\ m^3 = \mathbf{72.8\ L}$

${}_1W_2 = \int P_{equil}\, dV = P_2(V_2 - V_1) = 200\ kPa\ (0.0728 - 0.010)\ m^3 = \mathbf{12.56\ kJ}$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$

$= 0.464\ kg\ (272.095 - 131.64)\ kJ/kg + 12.56\ kJ = \mathbf{77.73\ kJ}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.228

A cylinder having an initial volume of 3 m^3 contains 0.1 kg of water at 40°C. The water is then compressed in an isothermal quasi-equilibrium process until it has a quality of 50%. Calculate the work done in the process splitting it into two steps. Assume the water vapor is an ideal gas during the first step of the process.

Solution: C.V. Water

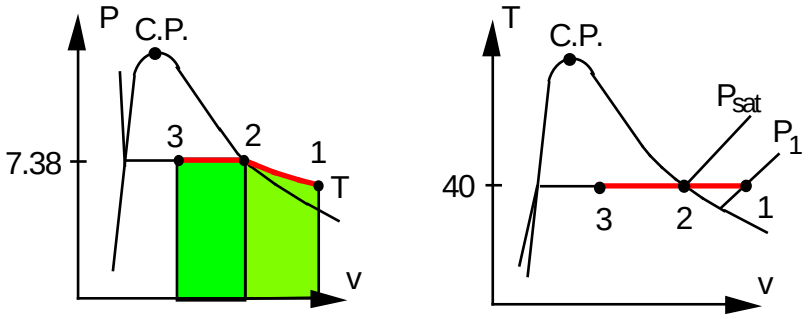
State 2: (40°C, x = 1) Tbl B.1.1 => P_G = 7.384 kPa, v_G = 19.52 m^3/kg

State 1: $v_1 = V_1/m = 3 / 0.1 = 30\ m^3/kg$ (> v_G)

so H_2O ~ ideal gas from 1-2 so since constant T

$$P_1 = P_G \frac{v_G}{v_1} = 7.384 \times \frac{19.52}{30} = 4.8\ kPa$$

$$V_2 = mv_2 = 0.1 \times 19.52 = 1.952\ m^3$$



Process T = C: and ideal gas gives work from Eq.3.21

$$_1W_2 = \int_1^2 PdV = P_1V_1 \ln \frac{V_2}{V_1} = 4.8 \times 3.0 \times \ln \frac{1.952}{3} = -6.19\ kJ$$

$v_3 = 0.001008 + 0.5 \times 19.519 = 9.7605$ => $V_3 = mv_3 = 0.976\ m^3$

P = C = P_g: This gives a work term as

$$_2W_3 = \int_2^3 PdV = P_g\,(V_3 - V_2) = 7.384\ kPa\ (0.976 - 1.952)\ m^3 = -7.21\ kJ$$

Total work:

$$_1W_3 = {}_1W_2 + {}_2W_3 = -6.19 - 7.21 = \mathbf{-13.4\ kJ}$$

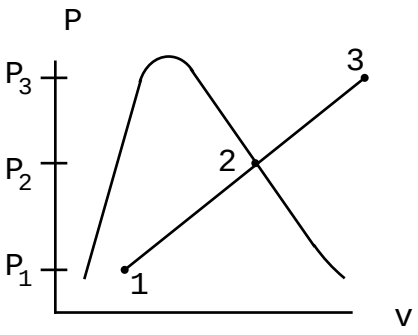
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.229

A spring-loaded piston/cylinder arrangement contains R-134a at 20°C, 24% quality with a volume 50 L. The setup is heated and thus expands, moving the piston. It is noted that when the last drop of liquid disappears the temperature is 40°C. The heating is stopped when $T = 130$°C. Verify the final pressure is about 1200 kPa by iteration and find the work done in the process.

Solution:

C.V. R-134a. This is a control mass.



State 1: Table B.5.1 =>

$v_1 = 0.000817 + 0.24 \times 0.03524 = 0.009274$

$P_1 = 572.8$ kPa,

$m = V/v_1 = 0.050 / 0.009274 = 5.391$ kg

Process: Linear Spring

$P = A + Bv$

State 2: $x_2 = 1$, $T_2 \Rightarrow P_2 = 1.017$ MPa, $v_2 = 0.02002$ m^3/kg

Now we have fixed two points on the process line so for final state 3:

$$P_3 = P_1 + \frac{P_2 - P_1}{v_2 - v_1}(v_3 - v_1) = \text{RHS}$$ Relation between P_3 and v_3

State 3: T_3 and on process line $\Rightarrow$ iterate on P_3 given T_3

at $P_3 = 1.2$ MPa => $v_3 = 0.02504$ => P_3 - RHS = -0.0247

at $P_3 = 1.4$ MPa => $v_3 = 0.02112$ => P_3 - RHS = 0.3376

Linear interpolation gives :

$$P_3 \cong 1200 + \frac{0.0247}{0.3376 + 0.0247}(1400 - 1200) = 1214 \text{ kPa}$$

$$v_3 = 0.02504 + \frac{0.0247}{0.3376 + 0.0247}(0.02112 - 0.02504) = 0.02478 \text{ m}^3/\text{kg}$$

$$W_{13} = \int P\, dV = \tfrac{1}{2}(P_1 + P_3)(V_3 - V_1) = \tfrac{1}{2}(P_1 + P_3)\, m\, (v_3 - v_1)$$

$$= \tfrac{1}{2} \times 5.391 \text{ kg } (572.8 + 1214) \text{ kPa} \times (0.02478 - 0.009274) \text{ m}^3/\text{kg}$$

$$= \mathbf{74.7\ kJ}$$

3.230

Water in a piston/cylinder, similar to Fig. P3.225, is at 100°C, x = 0.5 with mass 1 kg and the piston rests on the stops. The equilibrium pressure that will float the piston is 300 kPa. The water is heated to 300°C by an electrical heater. At what temperature would all the liquid be gone? Find the final (P,v), the work and heat transfer in the process.

C.V. The 1 kg water.

Continuity: $m_2 = m_1 = m$; Energy: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: V = constant if $P < P_{lift}$ otherwise $P = P_{lift}$ see P-v diagram.

State 1: (T,x) Table B.1.1

$v_1 = 0.001044 + 0.5 \times 1.6719 = 0.83697\ m^3/kg$

$u_1 = 418.91 + 0.5 \times 2087.58 = 1462.7\ kJ/kg$

State 1a: (300 kPa, $v = v_1 > v_{g\ 300\ kPa} = 0.6058\ m^3/kg$) so superheated vapor

Piston starts to move at state 1a, ${}_1W_{1a} = 0$, $u_{1a} = 2768.82\ kJ/kg$

${}_1Q_{1a} = m(u - u) = 1\ kg\ (2768.82 - 1462.7)\ kJ/kg = 1306.12\ kJ$

State 1b: reached before state 1a so $v = v_1 = v_g$ see this in B.1.1

$T_{1b} = 120 + 5\ (0.83697 - 0.8908)/(0.76953 - 0.8908) =$ **122.2°C**

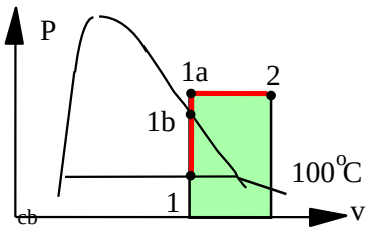
State 2: ($T_2 > T_{1a}$) Table B.1.3 => $v_2 = 0.87529$, $u_2 = 2806.69\ kJ/kg$

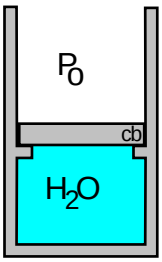
Work is seen in the P-V diagram (when volume changes $P = P_{lift}$)

${}_1W_2 = {}_{1a}W_2 = P_2\ m(v_2 - v_1) = 300 \times 1(0.87529 - 0.83697) =$ **11.5 kJ**

Heat transfer is from the energy equation

${}_1Q_2 = 1\ kg\ (2806.69 - 1462.7)\ kJ/kg + 11.5\ kJ =$ **1355.5 kJ**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.231

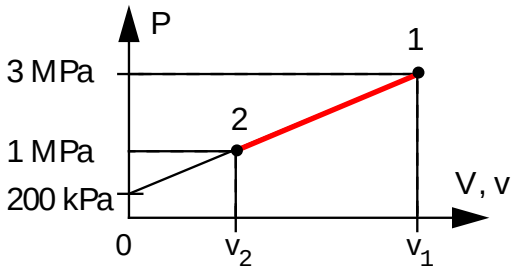
A piston/cylinder arrangement has a linear spring and the outside atmosphere acting on the piston, shown in Fig. P3.231. It contains water at 3 MPa, 400°C with the volume being 0.1 m^3. If the piston is at the bottom, the spring exerts a force such that a pressure of 200 kPa inside is required to balance the forces. The system now cools until the pressure reaches 1 MPa. Find the heat transfer for the process.

Solution:

C.V. Water.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$



State 1: Table B.1.3

$v_1 = 0.09936\ m^3/kg$, $u_1 = 2932.8\ kJ/kg$

$m = V/v_1 = 0.1/0.09936 = 1.006\ kg$

Process: Linear spring so P linear in v.

$P = P_0 + (P_1 - P_0)v/v_1$

$$v_2 = \frac{(P_2 - P_0)v_1}{P_1 - P_0} = \frac{(1000 - 200)0.09936}{3000 - 200} = 0.02839\ m^3/kg$$

State 2: P_2 , v_2 $\Rightarrow$ $x_2 = (v_2 - 0.001127)/0.19332 = 0.141$, $T_2 = 179.91°C$,

$u_2 = 761.62 + x_2 \times 1821.97 = 1018.58\ kJ/kg$

Process => ${}_1W_2 = \int PdV = \frac{1}{2} m(P_1 + P_2)(v_2 - v_1)$

$= \frac{1}{2}\ 1.006\ kg\ (3000 + 1000)\ kPa\ (0.02839 - 0.09936)\ m^3/kg$

$= -142.79\ kJ$

Heat transfer from the energy equation

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1.006\ kg\ (1018.58 - 2932.8)\ kJ/kg - 142.79\ kJ$

$= \mathbf{-2068.5\ kJ}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.232

A 1 m^3 tank containing air at 25°C and 500 kPa is connected through a valve to another tank containing 4 kg of air at 60°C and 200 kPa. Now the valve is opened and the entire system reaches thermal equilibrium with the surroundings at 20°C. Assume constant specific heat at 25°C and determine the final pressure and the heat transfer.

Control volume all the air. Assume air is an ideal gas.

Continuity Eq.: $m_2 - m_{A1} - m_{B1} = 0$

Energy Eq.: $U_2 - U_1 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} = {}_1Q_2 - {}_1W_2$

Process Eq.: V = constant $\Rightarrow$ ${}_1W_2 = 0$

State 1:

$$m_{A1} = \frac{P_{A1}V_{A1}}{RT_{A1}} = \frac{(500\ \text{kPa})(1\text{m}^3)}{(0.287\ \text{kJ/kgK})(298.2\ \text{K})} = 5.84\ \text{kg}$$

$$V_{B1} = \frac{m_{B1}RT_{B1}}{P_{B1}} = \frac{(4\ \text{kg})(0.287\ \text{kJ/kgK})(333.2\ \text{K})}{(200\ \text{kN/m}^2)} = 1.91\ \text{m}^3$$

State 2: $T_2 = 20°\text{C}$, $v_2 = V_2/m_2$

$m_2 = m_{A1} + m_{B1} = 4 + 5.84 = 9.84$ kg

$V_2 = V_{A1} + V_{B1} = 1 + 1.91 = 2.91\ \text{m}^3$

$$P_2 = \frac{m_2RT_2}{V_2} = \frac{(9.84\ \text{kg})(0.287\ \text{kJ/kgK})(293.2\ \text{K})}{2.91\ \text{m}^3} = \mathbf{284.5\ kPa}$$

Energy Eq.5.5 or 5.11:

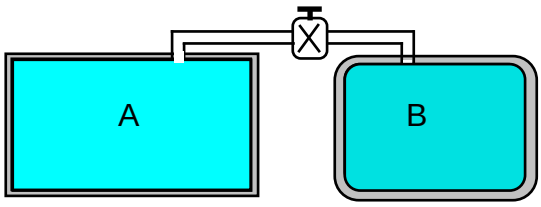
$${}_1Q_2 = U_2 - U_1 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1}$$

$$= m_{A1}(u_2 - u_{A1}) + m_{B1}(u_2 - u_{B1})$$

$$= m_{A1}C_{v0}(T_2 - T_{A1}) + m_{B1}C_{v0}(T_2 - T_{B1})$$

$$= 5.84 \times 0.717\ (20 - 25) + 4 \times 0.717\ (20 - 60) = \mathbf{-135.6\ kJ}$$

The air gave energy out.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.233

A rigid container has two rooms filled with water, each 1 m^3 separated by a wall (see Fig. P3.210). Room A has P = 200 kPa with a quality x = 0.80. Room B has P = 2 MPa and T = 400°C. The partition wall is removed and the water comes to a uniform state, which after a while due to heat transfer has a temperature of 200°C. Find the final pressure and the heat transfer in the process.

Solution:

C.V. A + B. Constant total mass and constant total volume.

Continuity: $m_2 - m_{A1} - m_{B1} = 0$; $V_2 = V_A + V_B = 2\ m^3$

Energy Eq.3.5: $U_2 - U_1 = m_2u_2 - m_{A1}u_{A1} - m_{A1}u_{A1} = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

Process: $V = V_A + V_B$ = constant => ${}_1W_2 = 0$

State 1A: Table B.1.2 $u_{A1} = 504.47 + 0.8 \times 2025.02 = 2124.47$ kJ/kg,

$v_{A1} = 0.001061 + 0.8 \times 0.88467 = 0.70877\ m^3/kg$

State 1B: Table B.1.3 $u_{B1} = 2945.2$, $v_{B1} = 0.1512$

$m_{A1} = 1/v_{A1} = 1.411$ kg $\quad m_{B1} = 1/v_{B1} = 6.614$ kg

State 2: T_2, $v_2 = V_2/m_2 = 2/(1.411 + 6.614) = 0.24924\ m^3/kg$

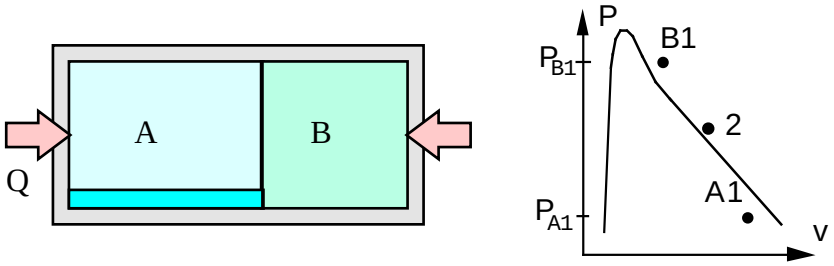
Table B.1.3 superheated vapor. 800 kPa < P_2 < 1 MPa

Interpolate to get the proper v_2

$$P_2 \cong 800 + \frac{0.24924 - 0.2608}{0.20596 - 0.2608} \times 200 = \mathbf{842\ kPa} \qquad u_2 \cong 2628.8 \text{ kJ/kg}$$

From the energy equation

${}_1Q_2 = 8.025 \times 2628.8 - 1.411 \times 2124.47 - 6.614 \times 2945.2 =$ **- 1381 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.234

Consider the piston/cylinder arrangement shown in Fig. P3.234. A frictionless piston is free to move between two sets of stops. When the piston rests on the lower stops, the enclosed volume is 400 L. When the piston reaches the upper stops, the volume is 600 L. The cylinder initially contains water at 100 kPa, 20% quality. It is heated until the water eventually exists as saturated vapor. The mass of the piston requires 300 kPa pressure to move it against the outside ambient pressure. Determine the final pressure in the cylinder, the heat transfer and the work for the overall process.

Solution:

C.V. Water. Check to see if piston reaches upper stops.

Energy Eq.3.5: $m(u_4 - u_1) = {}_1Q_4 - {}_1W_4$

Process: If $P < 300$ kPa then $V = 400$ L, line 2-1 and below

If $P > 300$ kPa then $V = 600$ L, line 3-4 and above

If $P = 300$ kPa then $400 \text{ L} < V < 600$ L line 2-3

State 1: $v_1 = 0.001043 + 0.2 \times 1.693 = 0.33964$; $m = \dfrac{V_1}{v_1} = \dfrac{0.4}{0.33964} = 1.178$ kg

$u_1 = 417.36 + 0.2 \times 2088.7 = 835.1$ kJ/kg

State 3: $v_3 = \dfrac{0.6}{1.178} = 0.5095 < v_G = 0.6058$ at $P_3 = 300$ kPa

$\Rightarrow$ Piston does reach upper stops to reach sat. vapor.

State 4: $v_4 = v_3 = 0.5095$ m^3/kg $= v_G$ at P_4 From Table B.1.2

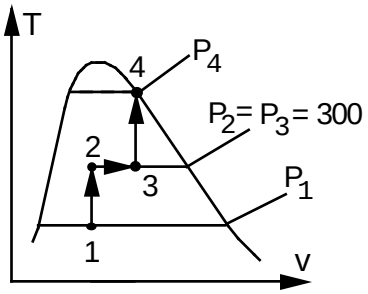
=> $P_4 =$ **361 kPa,** $u_4 = 2550.0$ kJ/kg

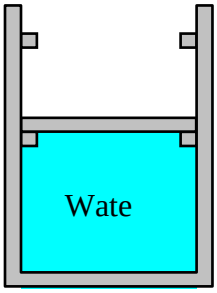
${}_1W_4 = {}_1W_2 + {}_2W_3 + {}_3W_4 = 0 + {}_2W_3 + 0$

${}_1W_4 = P_2(V_3 - V_2) = 300 \times (0.6 - 0.4) =$ **60 kJ**

${}_1Q_4 = m(u_4 - u_1) + {}_1W_4 = 1.178(2550.0 - 835.1) + 60 =$ **2080 kJ**

The three lines for process parts are shown in the P-V diagram, and is dictated by the motion of the piston (force balance).





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.235

Ammonia (2 kg) in a piston/cylinder is at 100 kPa, -20^{o}C and is now heated in a polytropic process with n = 1.3 to a pressure of 200 kPa. Do not use ideal gas approximation and find T_2, the work and heat transfer in the process.

Take CV as the Ammonia, constant mass.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: Pv^n = constant (n = 1.3)

State 1: Superheated vapor table B.2.2.

$v_1 = 1.2101$ m^3/kg, $u_1 = 1307.8$ kJ/kg

Process gives: $v_2 = v_1 (P_1/P_2)^{1/n} = 1.2101\ (100/200)^{1/1.3} = 0.710$ m^3/kg

State 2: Table B.2.2 at 200 kPa interpolate: $u_2 = 1376.49$ kJ/kg, $T_2 = 24^{o}$C

Work is done while piston moves at increasing pressure, so we get

$${}_1W_2 = \frac{m}{1 - n}(P_2v_2 - P_1v_1) = \frac{2}{1 - 1.3}\text{ kg } (200\times0.71 - 100\times1.2101)\text{ kJ/kg}$$

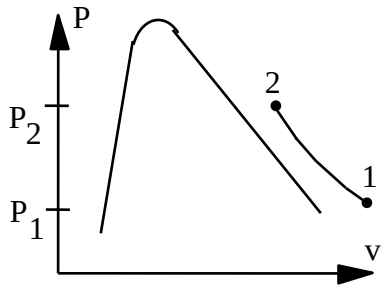
$$= \mathbf{-139.9\ kJ}$$

Heat transfer is found from the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$$

$$= 2\ (1376.49 - 1307.8) - 139.9$$

$$= \mathbf{-2.52\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.236

A small flexible bag contains 0.1 kg ammonia at –10°C and 300 kPa. The bag material is such that the pressure inside varies linear with volume. The bag is left in the sun with with an incident radiation of 75 W, loosing energy with an average 25 W to the ambient ground and air. After a while the bag is heated to 30°C at which time the pressure is 1000 kPa. Find the work and heat transfer in the process and the elapsed time.

Take CV as the Ammonia, constant mass.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = A + BV$ (linear in V)

State 1: Compressed liquid $P > P_{sat}$, take saturated liquid at same temperature.

$$v_1 = v_{f\,-10} = 0.001534\ m^3/kg, \qquad u_1 = u_f = 133.96\ kJ/kg$$

State 2: Table B.2.1 at 30°C : $P < P_{sat}$ so superheated vapor

$$v_2 = 0.13206\ m^3/kg,\ u_2 = 1347.1\ kJ/kg, \qquad V_2 = mv_2 = \mathbf{0.0132\ m^3}$$

Work is done while piston moves at increacing pressure, so we get

$${}_1W_2 = ½(300 + 1000)\ kPa * 0.1\ kg(0.13206 - 0.001534)\ m^3/kg = \mathbf{8.484\ kJ}$$

Heat transfer is found from the energy equation

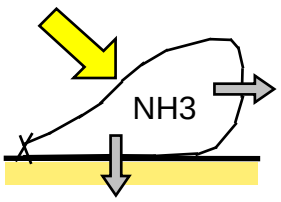
$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.1\ kg\ (1347.1 - 133.96)\ kJ/kg + 8.484\ kJ$$

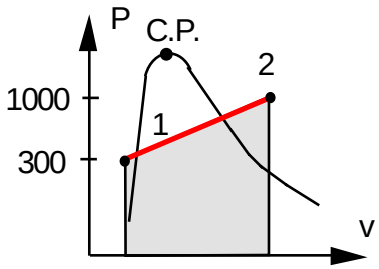
$$= 121.314 + 8.484 = \mathbf{129.8\ kJ}$$

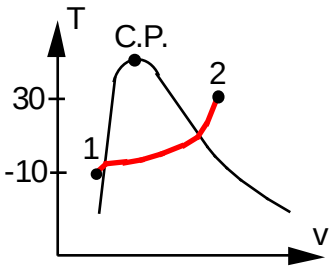
$$\dot{Q}_{net} = 75 - 25 = 50\ Watts$$

Assume the constant rate $\dot{Q}_{net} = dQ/dt = {}_1Q_2 / t$, so the time becomes

$$t = {}_1Q_2 / \dot{Q}_{net} = \frac{129800}{50}\ (J/W) = \mathbf{2596\ s} = \mathbf{43.3\ min}$$







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.237

A cylinder/piston arrangement contains 0.1 kg R-410A of quality x = 0.2534 and at –20°C. Stops are mounted so $V_{stop} = 3V_1$, see Fig. P3.237. The system is now heated to the final temperature of 20°C. Find the work and heat transfer in the process and draw the P-v diagram.

C.V. The R-410A mass.

Energy Eq.5.11: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: P = Constant if $V < V_{stop}$; $V = V_{stop}$ if $P > P_1$

State 1: $u_1 = 27.92 + x_1\ 218.07 = 83.18$ kJ/kg, $P_1 = P_{sat} = 399.6$ kPa

$v_1 = 0.000803 + x_1\ 0.064 = 0.01702\ m^3/kg$

State 1a: $v_{stop} = 3\ v_1 = 0.05106\ m^3/kg < v_g$ at P_1

State 2: at 20°C > T_1 **:** $v_{stop} > v_g = 0.01758\ m^3/kg$ so superheated vapor.

Table B.4.2: Find it at P_2 = **600 kPa**, $u_2 = 273.56$ kJ/kg

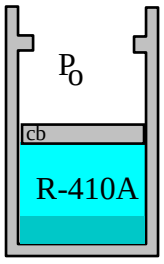
$V_1 = mv_1 = 0.0017\ m^3$, $V_2 = mv_2 = 0.0051\ m^3$

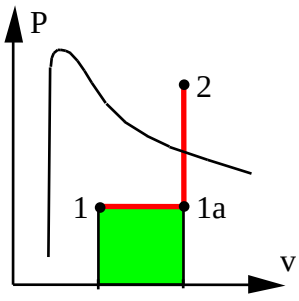
${}_1W_2 = \int PdV = P_1\ (V_2 - V_1) = 399.6$ kPa $(0.0051 - 0.0017)\ m^3 =$ **1.36 kJ**

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.1$ kg $(273.56 - 83.18)$ kJ/kg + 1.36 kJ

= **20.398 kJ**

See the work term from the process in the P-v diagram





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.238

A piston/cylinder, shown in Fig. P3.238, contains R-410A at – 20°C, x = 20%. The volume is 0.2 m^3. It is known that V_{stop} = 0.4 m^3, and if the piston sits at the bottom, the spring force balances the other loads on the piston. It is now heated up to 20°C. Find the mass of the fluid and show the P–v diagram. Find the work and heat transfer.

Solution:

C.V. R-410A, this is a control mass. Properties in Table B.4.

Continuity Eq.: $m_2 = m_1$

Energy Eq.3.5: $E_2 - E_1 = m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = A + BV$, $V < 0.4\ m^3$, $A = 0$ (at $V = 0$, $P = 0$)

State 1: $v_1 = 0.000803 + 0.2 \times 0.0640 = 0.0136\ m^3/kg$

$u_1 = 27.92 + 0.2 \times 218.07 = 71.5\ kJ/kg$

$m = m_1 = V_1/v_1 = 14.706\ kg$

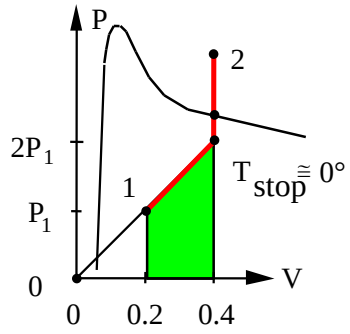
System: on line

$V \le V_{stop}$;

$P_1 = 399.6\ kPa$

$P_{stop} = 2P_1 = 799.2\ kPa$

$v_{stop} = 2v_1 = 0.0272\ m^3/kg$



State stop: (P,v) $\Rightarrow T_{stop} \cong 0°C$ TWO-PHASE STATE

Since $T_2 > T_{stop}$ $\Rightarrow$ $v_2 = v_{stop} = 0.0272\ m^3/kg$

State 2: (T_2 , v_2) Table B.4.2: Interpolate between 1000 and 1200 kPa

$P_2 = 1035\ kPa$; $u_2 = 366.5\ kJ/kg$

From the process curve, see also area in P-V diagram, the work is

$${}_1W_2 = \int PdV = \tfrac{1}{2}(P_1 + P_{stop})(V_{stop} - V_1) = \tfrac{1}{2}(399.6 + 799.2)0.2 = \mathbf{119.8\ kJ}$$

From the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 14.706(266.5 - 71.5) + 119.8 = \mathbf{2987.5\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.239

A spherical balloon contains 2 kg of R-410A at 0°C, 30% quality. This system is heated until the pressure in the balloon reaches 1 MPa. For this process, it can be assumed that the pressure in the balloon is directly proportional to the balloon diameter. How does pressure vary with volume and what is the heat transfer for the process?

Solution:

C.V. R-410A which is a control mass.

$m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

State 1: 0°C, x = 0.3. Table B.4.1 gives P_1 = 798.7 kPa

$v_1 = 0.000855 + 0.3 \times 0.03182 = 0.01040\ m^3/kg$

$u_1 = 57.07 + 0.3 \times 195.95 = 115.86\ kJ/kg$

Process: $P \propto D$, $V \propto D^3$ => $PV^{-1/3}$ = constant, polytropic n = -1/3.

=> $V_2 = mv_2 = V_1 (P_2 /P_1)^3 = mv_1 (P_2 /P_1)^3$

$v_2 = v_1 (P_2 /P_1)^3 = 0.01040 \times (1000 / 798.7)^3 = 0.02041\ m^3/kg$

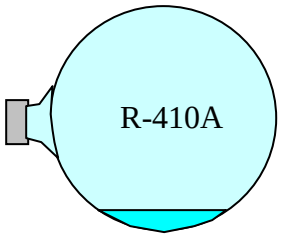
State 2: P_2 = 1 MPa, process : $v_2 = 0.02041$ → Table B.4.2, T_2 = 7.25°C (sat)

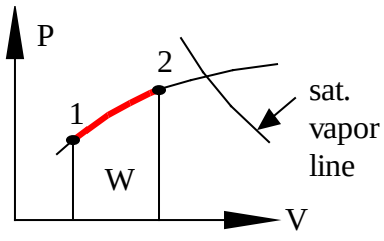
$v_f = 0.000877$, $v_{fg} = 0.02508\ m^3/kg$, $u_f = 68.02$, $u_{fg} = 187.18\ kJ/kg$

$x_2 = 0.7787$, $u_2 = 213.7\ kJ/kg$,

$${}_1W_2 = \int P\, dV = m\frac{P_2v_2 - P_1v_1}{1 - n} = 2\frac{1000 \times 0.02041 - 798.7 \times 0.0104}{1 - (-1/3)} = 18.16\ kJ$$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 2\ (213.7 - 115.86) + 18.16 =$ **213.8 kJ**





Notice: The R-410A is not an ideal gas at any state in this problem.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.240

A piston/cylinder arrangement B is connected to a 1-m^3 tank A by a line and valve, shown in Fig. P3.240. Initially both contain water, with A at 100 kPa, saturated vapor and B at 400°C, 300 kPa, 1 m^3. The valve is now opened and, the water in both A and B comes to a uniform state.

a. Find the initial mass in A and B.

b. If the process results in T_2 = 200°C, find the heat transfer and work.

Solution:

C.V.: A + B. This is a control mass.

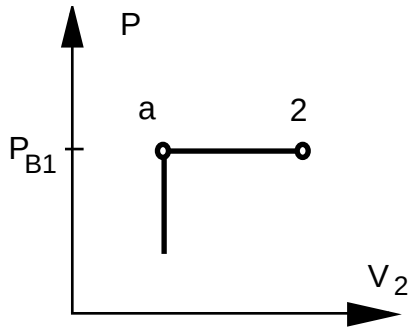
Continuity equation: $m_2 - (m_{A1} + m_{B1}) = 0$;

Energy: $m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} = {}_1Q_2 - {}_1W_2$

System: if $V_B \geq 0$ piston floats $\Rightarrow$ $P_B = P_{B1}$ = const.

if $V_B = 0$ then $P_2 < P_{B1}$ and $v = V_A/m_{tot}$ see P-V diagram

${}_1W_2 = \int P_B dV_B = P_{B1}(V_2 - V_1)_B = P_{B1}(V_2 - V_1)_{tot}$



State A1: Table B.1.1, x = 1

v_{A1} = 1.694 m^3/kg, u_{A1} = 2506.1 kJ/kg

$m_{A1} = V_A/v_{A1}$ = **0.5903 kg**

State B1: Table B.1.2 sup. vapor

v_{B1} = 1.0315 m^3/kg, u_{B1} = 2965.5 kJ/kg

$m_{B1} = V_{B1}/v_{B1}$ = **0.9695 kg**

$m_2 = m_{TOT}$ = 1.56 kg

***** At (T_2 , P_{B1}) v_2 = 0.7163 > $v_a = V_A/m_{tot}$ = 0.641 so $V_{B2} > 0$

so now state 2: $P_2 = P_{B1}$ = 300 kPa, T_2 = 200 °C

=> u_2 = 2650.7 kJ/kg and $V_2 = m_2 v_2$ = 1.56 × 0.7163 = 1.117 m^3

(we could also have checked T_a at: 300 kPa, 0.641 m^3/kg => T = 155 °C)

${}_1W_2 = P_{B1}(V_2 - V_1)$ = **-264.82 kJ**

${}_1Q_2 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} + {}_1W_2$ = **-484.7 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.241

Consider the system shown in Fig. P3.241. Tank A has a volume of 100 L and contains saturated vapor R-134a at 30°C. When the valve is cracked open, R-134a flows slowly into cylinder B. The piston mass requires a pressure of 200 kPa in cylinder B to raise the piston. The process ends when the pressure in tank A has fallen to 200 kPa. During this process heat is exchanged with the surroundings such that the R-134a always remains at 30°C. Calculate the heat transfer for the process.

Solution:

C.V. The R-134a. This is a control mass.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process in B: If $V_B > 0$ then $P = P_{float}$ (piston must move)

$$\Rightarrow \quad {}_1W_2 = \int P_{float}\, dV = P_{float} m(v_2 - v_1)$$

Work done in B against constant external force (equilibrium P in cyl. B)

State 1: 30°C, x = 1. Table B.5.1: $v_1 = 0.02671$ m^3/kg, $u_1 = 394.48$ kJ/kg

$$m = V/v_1 = 0.1 / 0.02671 = 3.744 \text{ kg}$$

State 2: 30°C, 200 kPa superheated vapor Table B.5.2

$$v_2 = 0.11889 \text{ m}^3\text{/kg}, \quad u_2 = 403.1 \text{ kJ/kg}$$

From the process equation

${}_1W_2 = P_{float} m(v_2 - v_1) = 200 \times 3.744 \times (0.11889 - 0.02671) = 69.02$ kJ

From the energy equation

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 3.744 \times (403.1 - 394.48) + 69.02 =$ **101.3 kJ**

3.242E

What is 1 cal in english units, what is 1 Btu in ft-lbf?

Look in Table A.1 for the conversion factors under energy

1 Btu = **778.1693 lbf-ft**

$$1 \text{ cal} = 4.1868 \text{ J} = \frac{4.1868}{1055} \text{ Btu} = \mathbf{0.00397\ Btu}$$

$$= 0.00397 \times 778.1693 \text{ lbf-ft} = \mathbf{3.088\ lbf\text{-}ft}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.243E

Work as F Δx has units of lbf-ft, what is that in Btu?

Look in Table A.1 for the conversion factors under energy

1 lbf-ft = 1 lbf-ft / (778.1693 ft-lbf/Btu) = 1.28507×10^{-3} Btu

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.244E

Work in the expression Eq. 3.18 or Eq. 3.22 involves PV. For P in psia and V in ft^3, how does that become Btu?

Units: $psia \times ft^3 = (lbf/in.^2) \times ft^3 = lbf\text{-}ft \times (ft/in.)^2 = 144\ lbf\text{-}ft$

$= (144/778.1693)\ Btu$

$= 144 \times 1.28507 \times 10^{-3}\ Btu$

$= 0.18509\ Btu$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.245E

Look at the R-410A value for u_f at -60 F. Can the energy really be negative? Explain.

The absolute value of *u* and *h* are arbitrary. A constant can be added to all *u* and *h* values and the table is still valid. It is customary to select the reference such that *u* for saturated liquid water at the triple point is zero. The standard for refrigerants like R-410A is that *h* is set to zero as saturated liquid at -40 F, other substances as cryogenic substances like nitrogen, methane etc. may have different states at which *h* is set to zero. The ideal gas tables use a zero point for *h* as 77 F or at absolute zero, 0 R.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.246E

An ideal gas in a piston-cylinder is heated with 2 Btu during an isothermal process. How much work is involved?

Energy Eq.: $u_2 - u_1 = {}_1q_2 - {}_1w_2 = 0$ since $u_2 = u_1$ (isothermal)

Then

$${}_1W_2 = {}_1Q_2 = m\ {}_1w_2 = \mathbf{2\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.247E

You heat a gas 20 R at P = C. Which one in table F.4 requires most energy? Why?

A constant pressure process in a control mass gives (recall p. 109 and Eq. 3.39)

$$ {}_1q_2 = u_2 - u_1 + {}_1w_2 = h_2 - h_1 \approx C_p \, \Delta T $$

The one with the highest specific heat is hydrogen, H_2. The hydrogen has the smallest mass, but the same kinetic energy per mol as other molecules and thus the most energy per unit mass is needed to increase the temperature.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.248E

The air drag force on a car is 0.225 A $\rho \mathbf{V}^2$. Verify that the unit becomes lbf.

$$F_d = 0.225\ A\ \rho \mathbf{V}^2$$

Units: $\quad ft^2 \times (lbm/ft^3) \times (ft/s)^2 = lbm\text{-}ft / s^2 = (1/32.174)\ lbf$

Recall the result from Newtons law p. 9.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Kinetic and Potential Energy

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.249E

An escalator raises a 200 lbm bucket of sand 30 ft in 1 minute. Determine the amount of work done during the process.

Solution:

$$W = \int F dx = F \int dx = F\,\Delta x = mgH$$

$$= 200 \text{ lbm} \times 32.174 \text{ ft/s}^2 \times 30 \text{ ft}$$

$$= 200 \text{ lbf} \times 30 \text{ ft} = 6000 \text{ ft lbf}$$

$$= (6000/778) \text{ Btu}$$

$$= \mathbf{7.71\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.250E

A hydraulic hoist raises a 3650 lbm car 6 ft in an auto repair shop. The hydraulic pump has a constant pressure of 100 lbf/in.^{2} on its piston. What is the increase in potential energy of the car and how much volume should the pump displace to deliver that amount of work?

Solution: C.V. Car.

No change in kinetic or internal energy of the car, neglect hoist mass.

$$E_2 - E_1 = PE_2 - PE_1 = mg\,(Z_2 - Z_1)$$

$$= \frac{3650 \times 32.174 \times 6}{32.174} = \mathbf{21\ 900\ lbf\text{-}ft}$$

The increase in potential energy is work into car from pump at constant P.

$$W = E_2 - E_1 = \int P\,dV = P\,\Delta V \quad \Rightarrow$$

$$\Delta V = \frac{E_2 - E_1}{P} = \frac{21\ 900}{100 \times 144} = \mathbf{1.52\ ft^3}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.251E

A piston motion moves a 50 lbm hammerhead vertically down 3 ft from rest to a velocity of 150 ft/s in a stamping machine. What is the change in total energy of the hammerhead?

Solution: C.V. Hammerhead

The hammerhead does not change internal energy i.e. same P,T

$$E_2 - E_1 = m(u_2 - u_1) + m(\frac{1}{2}V_2^2 - 0) + mg\,(h_2 - 0)$$

$$= 0 + [\,50 \times (1/2) \times 150^2 + 50 \times 32.174 \times (-3)]\ \text{lbm-(ft/s)}^2$$

$$= [562\,500 - 4826]/32.174 = 17\,333\ \text{lbf-ft}$$

$$= (\frac{17\,333}{778})\ \text{Btu} = \mathbf{22.28\ Btu}$$

Recall that $1\ \text{lbf-ft} = 32.174\ \text{lbm-(ft/s)}^2$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.252E

Airplane takeoff from an aircraft carrier is assisted by a steam driven piston/cylinder with an average pressure of 200 psia. A 38 500 lbm airplane should be accelerated from zero to a speed of 100 ft/s with 30% of the energy coming from the steam piston. Find the needed piston displacement volume.

Solution: C.V. Airplane.

No change in internal or potential energy; only kinetic energy is changed.

$$E_2 - E_1 = m\,(1/2)\,(\mathbf{V}_2^2 - 0) = 38\,500 \text{ lbm} \times (1/2) \times 100^2 \text{ (ft/s)}^2$$

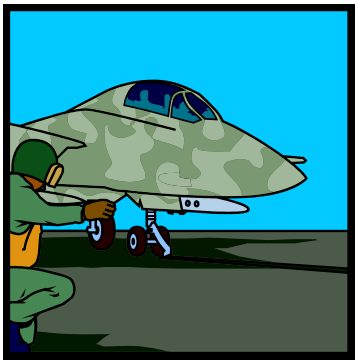
$$= 192\,500\,000 \text{ lbm-(ft/s)}^2 = 5\,983\,092 \text{ lbf-ft}$$

The work supplied by the piston is 30% of the energy increase.

$$W = \int P\,dV = P_{avg}\;\Delta V = 0.30\,(E_2 - E_1)$$

$$= 0.30 \times 5\,983\,092 \text{ lbf-ft} = 1\,794\,928 \text{ lbf-ft}$$

$$\Delta V = \frac{W}{P_{avg}} = \frac{1\,794\,928}{200}\,\frac{\text{lbf-ft}}{144 \text{ lbf/ft}^2} = \mathbf{62.3\ ft^3}$$



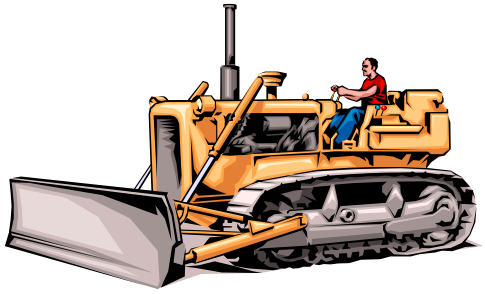
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.253E

A bulldozer pushes 1000 lbm of dirt 300 ft with a force of 400 lbf. It then lifts the dirt 10 ft up to put it in a dump truck. How much work did it do in each situation?

Solution:

$$W = \int F\,dx = F\,\Delta x$$
$$= 400 \text{ lbf} \times 300 \text{ ft}$$
$$= 120\,000 \text{ lbf-ft} = \mathbf{154\ Btu}$$



$$W = \int F\,dz = \int mg\,dz = mg\,\Delta Z$$
$$= 1000 \text{ lbm} \times 32.174 \text{ ft/s}^2 \times 10 \text{ ft} / (32.174 \text{ lbm-ft / s}^2\text{-lbf})$$
$$= 10\,000 \text{ lbf-ft} = \mathbf{12.85\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.254E

Two hydraulic cylinders maintain a pressure of 175 psia. One has a cross sectional area of 0.1 ft^2 the other 0.3 ft^2. To deliver a work of 1 Btu to the piston how large a displacement (V) and piston motion H is needed for each cylinder? Neglect P_{atm}

Solution:

$$W = \int F\,dx = \int P\,dV = \int PA\,dx = PA \times H = P\,\Delta V$$

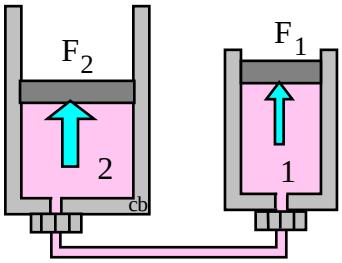
$$W = 1 \text{ Btu} = 778.17 \text{ lbf-ft}$$

$$\Delta V = \frac{W}{P} = \frac{778.17 \text{ lbf-ft}}{175 \times 144 \text{ lbf/ft}^2} = \mathbf{0.030\ 873\ ft^3}$$

Both cases the height is $H = \Delta V/A$

$$H_1 = \frac{0.030873}{0.1} = \mathbf{0.3087\ ft}$$

$$H_2 = \frac{0.030873}{0.3} = \mathbf{0.1029\ ft}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.255E

A linear spring, $F = k_S(x - x_0)$, with spring constant k_s = 35 lbf/ft, is stretched until it is 2.5 in. longer. Find the required force and work input.

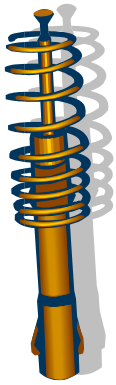
Solution:

$$F = k_S(x - x_0) = 35 \text{ lbf/ft} \times (2.5/12) \text{ ft} = 7.292 \text{ lbf}$$

$$W = \int F dx = \int k_S(x - x_0) d(x - x_0) = \frac{1}{2} k_S (x - x_0)^2$$

$$= \frac{1}{2} \times 35 \text{ lbf/ft} \times (2.5/12)^2 \text{ ft}^2 = 0.76 \text{ lbf-ft}$$

$$= \mathbf{9.76 \times 10^{-4}\ Btu}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.256E

A cylinder fitted with a frictionless piston contains 10 lbm of superheated refrigerant R-134a vapor at 100 lbf/in.^{2}, 300 F. The setup is cooled at constant pressure until the R-134a reaches a quality of 25%. Calculate the work done in the process.

Solution:

Constant pressure process boundary work. State properties from Table F.10

State 1: Table F.10.2 $v_1 = 0.76629$ ft^3/lbm;

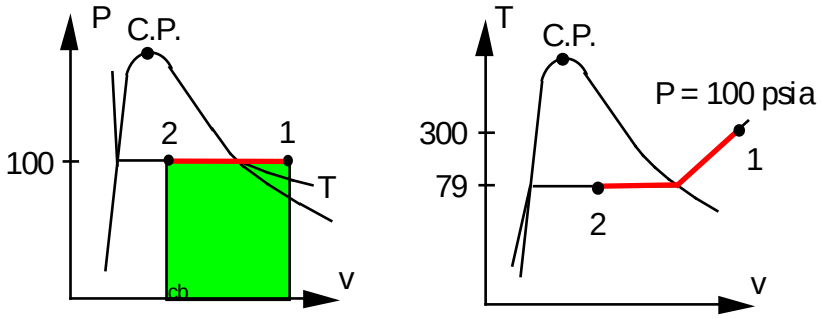
State 2: Table F.10.1 $v_2 = 0.013331 + 0.25 \times 0.46652 = 0.12996$ ft^3/lbm

Interpolated to be at 100 psia, numbers at 101.5 psia could have been used.

$$_1W_2 = \int P\, dV = P\,(V_2 - V_1) = mP\,(v_2 - v_1)$$

$$= 10 \text{ lbm} \times 100 \text{ lbf/in.}^2 \times \frac{144}{778} \frac{(\text{in/ft})^2}{\text{lbf-ft/Btu}} \times (0.12996 - 0.76629) \text{ ft}^3\text{/lbm}$$

$$= \mathbf{-117.78\ Btu}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.257E

A piston of 4 lbm is accelerated to 60 ft/s from rest. What constant gas pressure is required if the area is 4 in^2, the travel 4 in. and the outside pressure is 15 psia?

C.V. Piston

$$(E_2 - E_1)_{PIST.} = m(u_2 - u_1) + m[(1/2)V_2^2 - 0] + mg\,(0 - 0)$$

$$= (1/2)\, m\, V_2^2 = 0.5 \times 4 \text{ lbm} \times 60^2 \text{ (ft/s)}^2$$

$$= 7200 \text{ lbm-ft}^2/\text{s}^2 = \frac{7200}{32.174} \text{ ft-lbf}$$

Energy equation for the piston is:

$$(E_2 - E_1)_{PIST.} = W_{gas} - W_{atm} = P_{avg}\ \Delta V_{gas} - P_o\ \Delta V_{gas}$$

$$\Delta V_{gas} = A\ L = 4 \text{ in}^2 \times 4 \text{ in} = 16 \text{ in}^3$$

$$P_{avg}\ \Delta V_{gas} = (E_2 - E_1)_{PIST.} + P_o\ \Delta V_{gas}$$

$$P_{avg} = (E_2 - E_1)_{PIST.} / \Delta V_{gas} + P_o$$

$$= \frac{7200 \text{ lbf-ft}}{32.174 \times 16 \text{ in}^3} + 15 \text{ lbf/in}^2$$

$$= 167.84 \text{ psia} + 15 \text{ psia} = \mathbf{182.8 \text{ psia}}$$

3.258E

Find the missing properties and give the phase of the substance.

a. H_2O $u = 1000$ Btu/lbm, $T = 270$ F $h = ?$ $v = ?$ $x = ?$

b. H_2O $u = 450$ Btu/lbm, $P = 1500$ lbf/in.^{2} $T = ?$ $x = ?$ $v = ?$

c. R-410A $T = 30$ F, $P = 120$ lbf/in.^{2} $h = ?$ $x = ?$

Solution:

a) Table F.7.1: $u_f < u < u_g$ => 2-phase mixture of liquid and vapor

$x = (u - u_f)/ u_{fg} = (1000 - 238.81)/854.14 =$ **0.8912**

$v = v_f + x\, v_{fg} = 0.01717 + 0.8912 \times 10.0483 =$ **8.972 ft^3/lbm**

$h = h_f + x\, h_{fg} = 238.95 + 0.8912 \times 931.95 =$ **1069.5 Btu/lbm**

($h = u + Pv = 1000 + 41.848 \times 8.972 \times 144/778$)

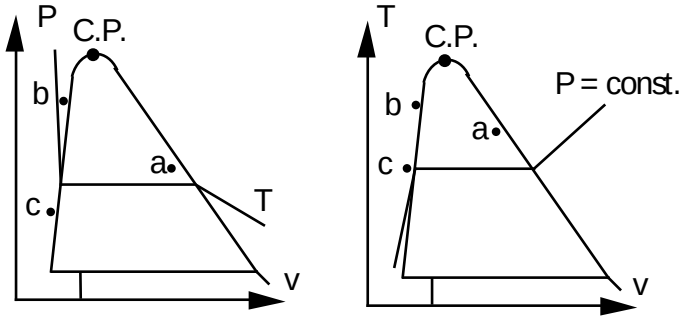
b) Table F.7.1: $u < u_f$ so compressed liquid B.1.3, x = **undefined**

T = **471.8 F**, v = **0.019689 ft^3/lbm**

c) Table F.9.1: P > Psat => x = **undef**, **compr. liquid**

Approximate as saturated liquid at same T, $h \cong h_f =$ **24.11 Btu/lbm**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.259E

Find the missing properties among (P, T, v, u, h) together with x, if applicable, and give the phase of the substance.

a. R-410A $T = 50$ F, $u = 85$ Btu/lbm

b. H_2O $T = 600$ F, $h = 1322$ Btu/lbm

c. R-410A $P = 150$ lbf/in.^{2}, $h = 135$ Btu/lbm

Solution:

a) Table F.9.1: $u < u_g$ => L+V mixture, P = **157.473 lbf/in^2**

x = (85 - 31.06)/ 78.96 = **0.6831**

v = 0.014 + 0.6831 × 0.3676 = **0.2653 ft^3/lbm**

h = 31.47 + 0.6831 × 89.67 = **92.72 Btu/lbm**

b) Table F.7.1: $h > h_g$ => superheated vapor follow 600 F in F.7.2

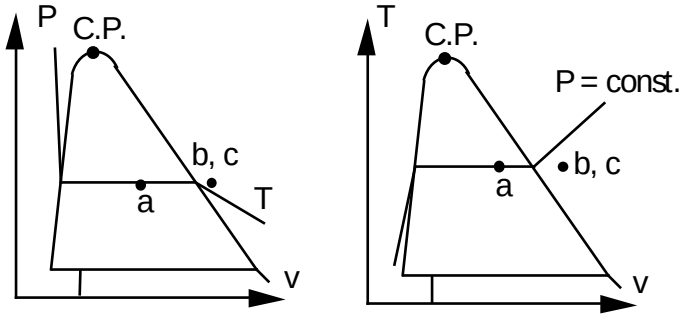
P ≅ **200 lbf/in^2** ; v = **3.058 ft^3/lbm ;** u = **1208.9 Btu/lbm**

c) Table F.9.1: $h > h_g$ => superheated vapor so in F.9.2

T ≅ **100 F** ; v **= 0.483 ft^3/lbm**

u = **121.25 Btu/lbm**

States shown are placed relative to the two-phase region, not to each other.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.260E

Find the missing properties among (P, T, v, u, h) together qwith x if applicable and give the phase of the substance.

a. R-134a $T = 140$ F, $h = 185$ Btu/lbm
b. NH_3 $T = 170$ F, $P = 60$ lbf/in.^{2}
c. R-134a $T = 100$ F, $u = 175$ Btu/lbm

Solution:

a) Table F.10.1: $h > h_g$ => x = **undef**, **superheated vapor** F.10.2,

find it at given T between saturated 243.9 psi and 200 psi to match h:

$$v \cong 0.1836 + (0.2459 - 0.1836) \times \frac{185 - 183.63}{186.82 - 183.63} = \mathbf{0.2104\ ft^3/lbm}$$

$$P \cong 243.93 + (200 - 243.93) \times \frac{185 - 183.63}{186.82 - 183.63} = \mathbf{225\ lbf/in^2}$$

b) Table F.8.1: $P < P_{sat} \Rightarrow$ x = **undef.** **superheated vapor** F.8.2,

$v = (6.3456 + 6.5694)/2 = \mathbf{6.457\ ft^3/lbm}$

$u = h - Pv = (1/2)(694.59 + 705.64) - 60 \times 6.4575 \times (144/778)$

$= 700.115 - 71.71 = \mathbf{628.405\ Btu/lbm}$

c) Table F.10.1: $u > u_g$ => **sup. vapor,**

Interpolate between 40 and 60 psia tables in F.10.2

$P = 40 + (40 - 20)(175 - 175.57)/(174.85 - 175.57)$

$= 40 + 20 \times 0.791667 = \mathbf{55.8\ lbf/in^2}$;

$v = 1.4015 + (0.9091 - 1.4015) \times 0.791667 = \mathbf{1.0117\ ft^3/lbm;}$

$h = 185.95 + (184.94 - 185.95) \times 0.791667 = \mathbf{185.15\ Btu/lbm}$

States shown are placed relative to the two-phase region, not to each other.

Simple Processes

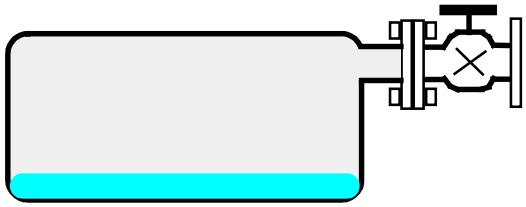
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

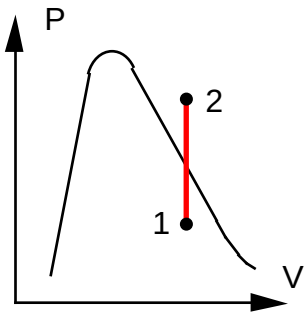
3.261E

Ammonia at 30 F, quality 60% is contained in a rigid 8-ft^3 tank. The tank and ammonia are now heated to a final pressure of 150 lbf/in.^{2}. Determine the heat transfer for the process.

Solution:

C.V.: NH_3





Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: Constant volume $\Rightarrow$ $v_2 = v_1$ & ${}_1W_2 = 0$

State 1: Table F.8.1 two-phase state.

$v_1 = 0.02502 + 0.6 \times 4.7978 = 2.904$ ft^3/lbm

$u_1 = 75.06 + 0.6 \times 491.17 = 369.75$ Btu/lbm

$m = V/v_1 = 8/2.904 = 2.755$ lbm

State 2: P_2, $v_2 = v_1$ superheated vapor Table F.8.2

$\Rightarrow$ $T_2 \cong 258$ F, $u_2 \cong 661.42$ Btu/lbm

So solve for heat transfer in the energy equation

${}_1Q_2 = 2.755$ lbm $\times$ (661.42 - 369.75) Btu/lbm = **803.6 Btu**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.262E

Saturated vapor R-410A at 30 F in a rigid tank is cooled to 0 F. Find the specific heat transfer.

Solution:

C.V.: R-410A in tank. $m_2 = m_1$;

Energy Eq.3.5: $(u_2 - u_1) = {}_1q_2 - {}_1w_2$

Process: V = constant, $v_2 = v_1 = V/m$ => $\mathbf{{}_1w_2 = 0}$

Table F.9.1: State 1: $v_1 = 0.5426$ ft^3/lbm, $u_1 = 108.63$ Btu/lbm

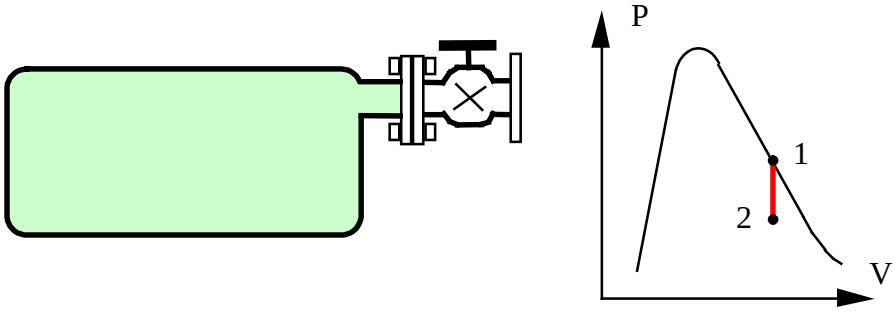
State 2: 0 F, $v_2 = v_1 = V/m$, look in Table F.9.1 at 0 F

$$x_2 = \frac{v_2 - v_{f2}}{v_{fg2}} = \frac{0.5426 - 0.01295}{0.9448} = 0.560595$$

$$u_2 = u_{f2} + x_2\, u_{fg2} = 13.37 + x_2 \times 92.75 = 65.365 \text{ Btu/lbm}$$

From the energy equation

$${}_1q_2 = (u_2 - u_1) = (65.365 - 108.63) = \mathbf{-43.26\ Btu/lbm}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.263E

Saturated vapor R-410A at 100 psia in a constant pressure piston cylinder is heated to 70 F. Find the specific heat transfer.

Solution:

C.V. R-410A: $m_2 = m_1 = m$;

Energy Eq.3.5 $(u_2 - u_1) = {}_1q_2 - {}_1w_2$

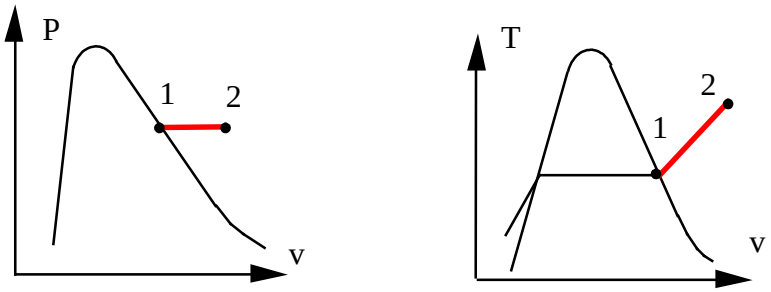
Process: P = const. $\Rightarrow {}_1w_2 = \int Pdv = P\Delta v = P(v_2 - v_1)$

State 1: Table F.9.2 (or F.9.1) $h_1 = 119.38$ Btu/lbm

State 2: Table F.9.2 $h_2 = 130.44$ Btu/lbm

$${}_1q_2 = (u_2 - u_1) + {}_1w_2 = (u_2 - u_1) + P(v_2 - v_1) = (h_2 - h_1)$$

$${}_1q_2 = 130.44 - 119.38 = \mathbf{11.06\ Btu/lbm}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.264E

A rigid tank holds 1.5 lbm R-410A at 100 F as saturated vapor. The tank is now cooled to 60 F by heat transfer to the ambient. Which two properties determine the final state. Determine the amount of work and heat transfer during the process.

C.V. The R-410A, this is a control mass.

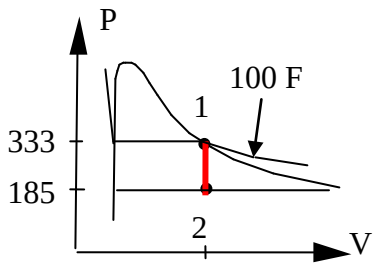
Process: Rigid tank V = C => v = constant & $_1W_2 = \int_1^2 PdV = \mathbf{0}$

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2 = {}_1Q_2$,

State 1: $v_1 = 0.1657$ ft^3/lbm,

$u_1 = 111.7$ Btu/lbm

State 2: **T, v** => two-phase (straight down in P-v diagram from state 1)



$x_2 = (v - v_f)/v_{fg} = (0.1657 - 0.01451)/0.3076 = 0.49151$

$u_2 = u_f + x_2\, u_{fg} = 34.78 + 0.49151 \times 75.82 = 72.046$ Btu/lbm

$_1Q_2 = m(u_2 - u_1) = 1.5$ lbm (72.046 – 111.7) Btu/lbm = **-59.5 Btu**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.265E

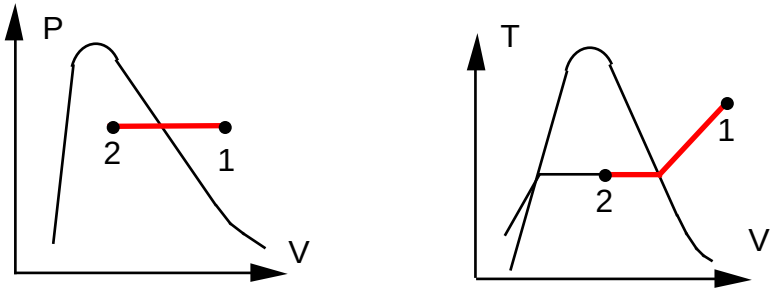
A cylinder fitted with a frictionless piston contains 4 lbm of superheated refrigerant R-134a vapor at 400 lbf/in.^{2}, 200 F. The cylinder is now cooled so the R-134a remains at constant pressure until it reaches a quality of 75%. Calculate the heat transfer in the process.

Solution:

C.V.: R-134a $\quad m_2 = m_1 = m;$

Energy Eq.3.5 $\quad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: P = const. $\Rightarrow {}_1W_2 = \int PdV = P\Delta V = P(V_2 - V_1) = Pm(v_2 - v_1)$



State 1: Table F.10.2 $\quad h_1 = 192.92$ Btu/lbm

State 2: Table F.10.1 $\quad h_2 = 140.62 + 0.75 \times 43.74 = 173.425$ Btu/lbm

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(u_2 - u_1) + Pm(v_2 - v_1) = m(h_2 - h_1)$

$= 4$ lbm $\times$ (173.425 – 192.92) Btu/lbm = **-77.98 Btu**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.266E

A water-filled reactor with volume of 50 ft^3 is at 2000 $lbf/in.^2$, 560 F and placed inside a containment room, as shown in Fig. P3.101. The room is well insulated and initially evacuated. Due to a failure, the reactor ruptures and the water fills the containment room. Find the minimum room volume so the final pressure does not exceed 30 $lbf/in.^2$.

C.V.: Containment room and reactor.

Mass: $m_2 = m_1 = V_{reactor}/v_1 = 50/0.02172 = 2295.7$ lbm

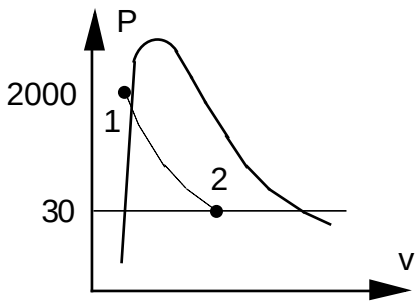
Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = 0 \Rightarrow u_2 = u_1 = 552.5$ Btu/lbm

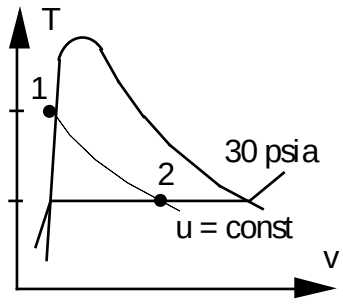
State 2: 30 $lbf/in.^2$, $u_2 < ug \Rightarrow$ 2 phase Table F.7.1

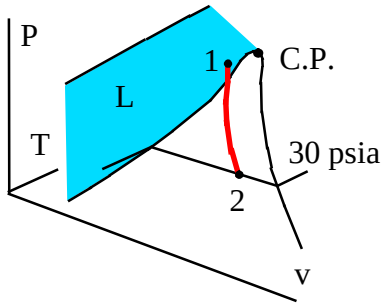
$$u = 552.5 = 218.48 + x_2\, 869.41 \Rightarrow x_2 = 0.3842$$

$$v_2 = 0.017 + 0.3842 \times 13.808 = 5.322\ ft^3/lbm$$

$$V_2 = mv_2 = 2295.7\ lbm \times 5.322\ ft^3/lbm = \mathbf{12\ 218\ ft^3}$$







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.267E

Ammonia (1 lbm) is in a piston cylinder at 30 psia, 20 F is heated in a process where the pressure varies linear with volume to a state of 240 F, 40 psia. Find the work and the heat transfer in the process.

Solution:

Take CV as the Ammonia, constant mass.

Continuity Eq.: $m_2 = m_1 = m$;

Process: $P = A + BV$ (linear in V)

State 1: Superheated vapor $v_1 = 9.7206$ ft^3/lbm,

$$u_1 = 622.39 - 30 \times 9.7206 \times \frac{144}{778} = 568.4 \text{ Btu/lbm}$$

State 2: Superheated vapor $v_2 = 10.9061$ ft^3/lbm,

$$u_2 = 741.4 - 40 \times 10.9061 \times 144/778 = 660.65 \text{ Btu/lbm}$$

Work is done while piston moves at increasing pressure, so we get

$$_1W_2 = \int P\, dV = \text{area} = P_{avg}\,(V_2 - V_1) = \tfrac{1}{2}(P_1 + P_2)m(v_2 - v_1)$$

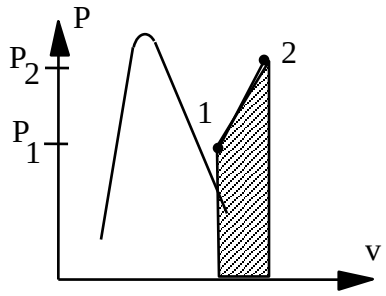
$$= ½(30 + 40) \text{ psi} \times 1 \text{ lbm } (10.9061 - 9.7206) \text{ ft}^3\text{/lbm}$$

$$= 41.493 \text{ psi-ft}^3 = 41.493 \times 144 \text{ lbf-ft} = 5974.92 \text{ lbf-ft} = \mathbf{7.68 \text{ Btu}}$$

(see conversions in A.1, p. 755)

Heat transfer from the energy equation

$$_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1\,(660.65 - 568.4) + 7.68 = \mathbf{99.93 \text{ Btu}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.268E

A piston cylinder arrangement with a linear spring similar to Fig. P3.105 contains R-134a at 60 F, x = 0.6 and a volume of 0.7 ft^3. It is heated to 140 F at which point the specific volume is 0.4413 ft^3/lbm. Find the final pressure, the work and the heat transfer in the process.

Take CV as the R-134a.

$$m_2 = m_1 = m \quad ; \qquad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$$

State 1: T_1, x_1 => Two phase so Table F.10.1: $P_1 = P_{sat} = 72.271$ psia

$v_1 = v_f + x_1 v_{fg} = 0.01291 + 0.6 \times 0.6503 = 0.40309$ ft^3/lbm

$u_1 = u_f + x_1 u_{fg} = 98.27 + 0.6 \times 69.31 = 139.856$ Btu/lbm

$m = V_1/v_1 = 0.7$ ft^3/ 0.40309 ft^3/lbm = 1.7366 lbm

State 2: (T, v) Superheated vapor, Table F.10.2.

$P_2 = 125$ psia, $v_2 = 0.4413$ ft^3/lbm, $u_2 = 180.77$ Btu/lbm

$V_2 = m v_2 = 1.7366 \times 0.4413 = 0.76636$ ft^3

Work is done while piston moves at linearly varying pressure, so we get

$${}_1W_2 = \int P\, dV = \text{area} = P_{avg}(V_2 - V_1) = 0.5(P_2 + P_1)(V_2 - V_1)$$

$$= 0.5 \times (72.271 + 125) \text{ psia } (0.76636 - 0.7) \text{ ft}^3$$

$$= 6.54545 \times (144/778) \text{ Btu} = \mathbf{1.212\ Btu}$$

Heat transfer is found from the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1.7366 \times (180.77 - 139.856) + 1.212$$

$$= \mathbf{72.26\ Btu}$$

3.269E

Water in a 6-ft^3 closed, rigid tank is at 200 F, 90% quality. The tank is then cooled to 20 F. Calculate the heat transfer during the process.

Solution:

C.V.: Water in tank. $m_2 = m_1$; $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: V = constant, $v_2 = v_1$, ${}_1W_2 = 0$

State 1: Two-phase L + V look in Table F.7.1

$v_1 = 0.01663 + 0.9 \times 33.6146 = 30.27$ ft^3/lbm

$u_1 = 168.03 + 0.9 \times 906.15 = 983.6$ Btu/lbm

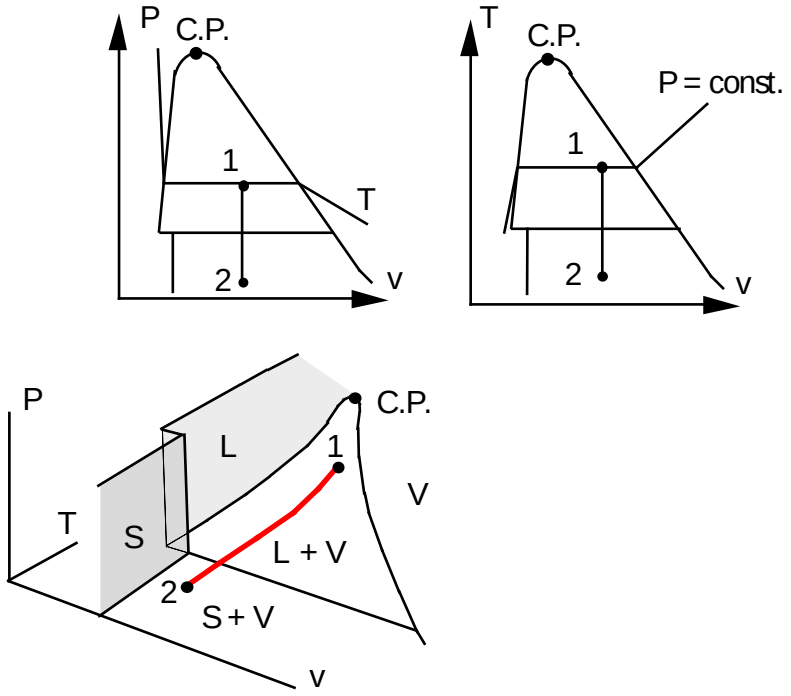
State 2: T_2, $v_2 = v_1$ $\Rightarrow$ mix of sat. solid + vap. Table F.7.4

$v_2 = 30.27 = 0.01744 + x_2 \times 5655$ => $x_2 = 0.00535$

$u_2 = -149.31 + 0.00535 \times 1166.5 = -143.07$ Btu/lbm

$m = V/v_1 = 6$ ft^3/ 30.27 ft^3/lbm = 0.198 lbm

${}_1Q_2 = m(u_2 - u_1) = 0.198$ lbm (-143.07 - 983.6) Btu/lbm = **-223 Btu**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.270E

A constant pressure piston/cylinder has 2 lbm water at 1100 F and 2.26 ft^3. It is now cooled to occupy 1/10 of the original volume. Find the heat transfer in the process.

C.V.: Water $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: P = const. $\Rightarrow {}_1W_2 = \int PdV = P\Delta V = P(V_2 - V_1) = Pm(v_2 - v_1)$

State 1: Table F.7.2 (T, $v_1 = V/m = 2.26/2 = 1.13$ ft^3/lbm)

$P_1 = 800$ psia, $h_1 = 1567.81$ Btu/lbm

State 2: Table F.7.2 (P, $v_2 = v_1/10 = 0.113$ ft^3/lbm) two-phase state

$T_2 = 510 + (520 - 510)(800 - 743.53)/(811.48 - 743.53) = 518.3$ F

$x_2 = (v_2 - v_f)/v_{fg} = (0.113 - 0.02087)/0.5488 = 0.1679$

$h_2 = h_f + x_2\, h_{fg} = 509.63 + x_2\, 689.62 = 625.42$ Btu/lbm

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$

$= 2\,(625.42 - 1567.81) =$ **-1884.8 Btu**

3.271E

I have 4 lbm of liquid water at 70 F, 15 psia. I now add 20 Btu of energy at a constant pressure. How hot does it get if it is heated? How fast does it move if it is pushed by a constant horizontal force? How high does it go if it is raised straight up?

a) Heat at 15 psia.
Energy equation:

$$E_2 - E_1 = {}_1Q_2 - {}_1W_2 = {}_1Q_2 - P(V_2 - V_1) = H_2 - H_1 = m(h_2 - h_1)$$

$$h_2 = h_1 + {}_1Q_2/m = 38.09 + 20/4 = 43.09 \text{ Btu/lbm}$$

Back interpolate in Table F.7.1: $T_2 =$ **75 F**

(We could also have used $\Delta T = {}_1Q_2/mC = 20 / (4 \times 1.00) = 5$ F)

b) Push at constant P. It gains kinetic energy.

$$0.5\ m\ \mathbf{V}_2^2 = {}_1W_2$$

$$\mathbf{V}_2 = \sqrt{2\ {}_1W_2/m} = \sqrt{2 \times 20 \times 778.17 \text{ lbf-ft}/4 \text{ lbm}}$$

$$= \sqrt{2 \times 20 \times 778.17 \times 32.174 \text{ lbm-(ft/s)}^2/4 \text{ lbm}} = \mathbf{500\ ft/s}$$

c) Raised in gravitational field

$$m\ g\ Z_2 = {}_1W_2$$

$$Z_2 = {}_1W_2/m\ g = \frac{20 \times 778.17 \text{ lbf-ft}}{4 \text{ lbm} \times 32.174 \text{ ft/s}^2} \times 32.174 \frac{\text{lbm-ft/s}^2}{\text{lbf}} = \mathbf{3891\ ft}$$

Comment: Notice how fast (500 ft/s) and how high it should be to have the same energy as raising the temperature just 5 degrees. I.e. in most applications we can disregard the kinetic and potential energies unless we have very high **V** or Z.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.272E

A computer cpu chip consists of 0.1 lbm silicon, 0.05 lbm copper, 0.1 lbm polyvinyl chloride (plastic). It now heats from 60 F to 160 F as the computer is turned on. How much energy did the heating require?

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2$

For the solid masses we will use the specific heats, Table F.2, and they all have the same temperature so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i} (T_2 - T_1)_i = (T_2 - T_1)\sum m_i C_{v\,i}$$

$$\sum m_i C_{v\,i} = 0.1 \times 0.167 + 0.05 \times 0.1 + 0.1 \times 0.229 = 0.0446 \text{ Btu/R}$$

$$U_2 - U_1 = 0.0446 \text{ Btu/R} \times (160 - 60) \text{ R} = \mathbf{4.46\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.273E

A copper block of volume 60 in.^{3} is heat treated at 900 F and now cooled in a 3-ft^3 oil bath initially at 70 F. Assuming no heat transfer with the surroundings, what is the final temperature?

C.V. Copper block and the oil bath.

Also assume no change in volume so the work will be zero.

Energy Eq.: $U_2 - U_1 = m_{met}(u_2 - u_1)_{met} + m_{oil}(u_2 - u_1)_{oil} = {}_1Q_2 - {}_1W_2 = 0$

Solid and liquid $\Delta u \cong C_V \Delta T$, C_V from Table F.2 and F.3

$m_{met} = V\rho = 60 \times 12^{-3}$ ft$^3 \times 518$ lbm/ft$^3 = 17.986$ lbm

$m_{oil} = V\rho = 3.0$ ft$^3 \times 57$ lbm/ft$^3 = 171$ lbm

$C_{V\,met} = 0.10$ Btu/lbm-R; $C_{V\,oil} = 0.43$ Btu/lbm-R

Energy equation becomes

$$m_{met} C_{V\,met} (T_2 - T_{1,met}) + m_{oil} C_{V\,oil} (T_2 - T_{1,oil}) = 0$$

$$17.986 \text{ lbm} \times 0.10 \text{ Btu/lbm-R} (T_2 - 900 \text{ F})$$

$$+ 171 \text{ lbm} \times 0.43 \text{ Btu/lbm-R} (T_2 - 70 \text{ F}) = 0$$

$$\Rightarrow T_2 = \mathbf{89.8\ F}$$

Ideal Gas

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.274E

Estimate the constant specific heats for R-134a from Table F.10.2 at 15 psia and 150 F. Compare this to table F.4 and explain the difference.

Solution:

Using values at 15 psia for h and u at 140 F and 160 F from Table F.10.2, the approximate specific heats at 150 F are

$$C_p \approx \frac{\Delta h}{\Delta T} = \frac{199.95 - 195.59}{160 - 140} = 0.218 \text{ Btu/lbm R}$$

compared with 0.203 Btu/lbm-R for the ideal-gas value at 77 F from Table F.4.

$$C_v \approx \frac{\Delta u}{\Delta T} = \frac{188.03 - 184.08}{160 - 140} = 0.198 \text{ Btu/lbm R}$$

compared with 0.184 Btu/lbm-R for the ideal-gas value at 77 F from Table F.4.

There are two reasons for the differences. First, R-134a is not exactly an ideal gas at the given state, 150 F and 15 psia. Second and by far the biggest reason for the differences is that R-134a, chemically CF_3CH_2 , is a polyatomic molecule with multiple vibrational mode contributions to the specific heats (see Appendix C), such that they are strongly dependent on temperature. Note that if we repeat the above approximation for C_p in Table F.10.2 at 77 F, the resulting value is 0.203 Btu/lbm R

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.275E

Air is heated from 540 R to 640 R at V = C. Find $_1q_2$? What if from 2400 to 2500 R?

Process: V = C → $_1W_2 = Ø$

Energy Eq.: $u_2 - u_1 = {}_1q_2 - 0$ → $_1q_2 = u_2 - u_1$

Read the u-values from Table F.5

a) $_1q_2 = u_2 - u_1 = 109.34 - 92.16 =$ **17.18 Btu/lbm**

b) $_1q_2 = u_2 - u_1 = 474.33 - 452.64 =$ **21.7 Btu/lbm**

case a) $C_v \approx 17.18/100 = 0.172$ Btu/lbm-R, see F.4

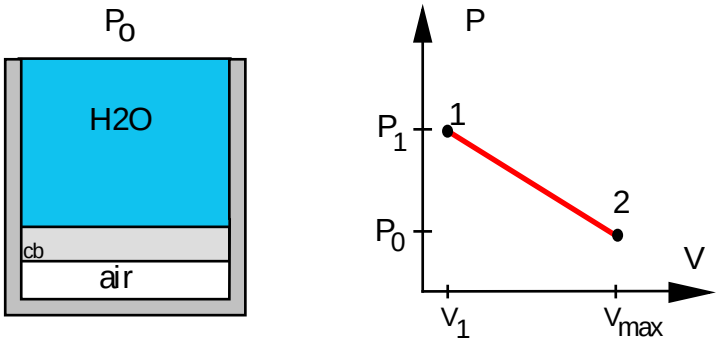
case b) $C_v \approx 21.7/100 = 0.217$ Btu/lbm-R (26 % higher)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.276E

A 30-ft high cylinder, cross-sectional area 1 ft^2, has a massless piston at the bottom with water at 70 F on top of it, as shown in Fig. P3.107. Air at 540 R, volume 10 ft^3 under the piston is heated so that the piston moves up, spilling the water out over the side. Find the total heat transfer to the air when all the water has been pushed out.

Solution



The water on top is compressed liquid and has mass

$$V_{H2O} = V_{tot} - V_{air} = 30 \times 1 - 10 = 20 \text{ ft}^3$$

$$m_{H2O} = V_{H2O}/v_f = 20/0.016051 = 1246 \text{ lbm}$$

Initial air pressure is: $P_1 = P_0 + m_{H2O}g/A = 14.7 + \dfrac{g}{1 \times 144} = 23.353$ psia

and then $m_{air} = \dfrac{PV}{RT} = \dfrac{23.353 \times 10 \times 144}{53.34 \times 540} = 1.1675$ lbm

State 2: $P_2 = P_0 = 14.7$ lbf/in^2, $V_2 = 30 \times 1 = 30$ ft^3

$$_1W_2 = \int PdV = \tfrac{1}{2}(P_1 + P_2)(V_2 - V_1)$$

$$= \tfrac{1}{2}(23.353 + 14.7)(30 - 10) \times 144 = 54\,796 \text{ lbf-ft} = 70.43 \text{ Btu}$$

State 2: $P_2, V_2 \Rightarrow T_2 = \dfrac{T_1 P_2 V_2}{P_1 V_1} = \dfrac{540 \times 14.7 \times 30}{23.353 \times 10} = 1019.7$ R

$$_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1.1675 \times 0.171\ (1019.7 - 540) + 70.43$$

$$= \mathbf{166.2\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.277E

A closed rigid container is filled with 3 lbm water at 1 atm, 130 F, 2 lbm of stainless steel and 1 lbm of PVC (polyvinyl chloride) both at 70 F and 0.2 lbm of air at 700 R, 1 atm. It is now left alone with no external heat transfer and no water vaporizes. Find the final temperature and air pressure.

CV. Container.

Process: V = constant => $_1W_2 = 0$ and also given $_1Q_2 = 0$

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2 = 0$

For the liquid and the metal masses we will use the specific heats (Tbl F.3, F.4) so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i}\,(T_2 - T_1)_i = T_2 \sum m_i C_{v\,i} - \sum m_i C_{v\,i} T_{1\,i}$$

noticing that all masses have the same T_2 but not same initial T.

$$\sum m_i C_{v\,i} = 3 \times 1.0 + 2 \times 0.11 + 1 \times 0.229 + 0.2 \times 0.171 = 3.4832 \text{ Btu/R}$$

The T for air must be converted to F like the others.

Energy Eq.: $3.4832\ T_2 = 3 \times 1.0 \times 130 + (2 \times 0.11 + 1 \times 0.229) \times 70$

$$+ 0.2 \times 0.171 \times (700 - 459.67) = 429.649 \text{ Btu}$$

$$T_2 = \mathbf{123.35\ F}$$

The volume of the air is constant so from PV = mRT it follows that P varies with T

$$P_2 = P_1\, T_2/T_{1\,air} = 1 \text{ atm} \times (123.35 + 459.67) / 700 = \mathbf{0.833\ atm}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.278E

An engine consists of a 200 lbm cast iron block with a 40 lbm aluminum head, 40 lbm steel parts, 10 lbm engine oil and 12 lbm glycerine (antifreeze). Everything begins at 40 F and as the engine starts, it absorbs a net of 7000 Btu before it reaches a steady uniform temperature. We want to know how hot it becomes.

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

Process: The steel does not change volume and the change for the liquid is minimal, so ${}_1W_2 \cong 0$.

So sum over the various parts of the left hand side in the energy equation

$$m_{Fe}(u_2 - u_1) + m_{Al}(u_2 - u_1)_{Al} + m_{st}(u - u_1)_{st} + m_{oil}(u_2 - u_1)_{oil} + m_{gly}(u_2 - u_1)_{gly} = {}_1Q_2$$

Tbl F.2 : $C_{Fe} = 0.1$, $C_{Al} = 0.215$, $C_{st} = 0.11$ all units of Btu/lbm-R

Tbl F.3 : $C_{oil} = 0.46$, $C_{gly} = 0.58$ all units of Btu/lbm-R

So now we factor out $T_2 - T_1$ as $u_2 - u_1 = C(T_2 - T_1)$ for each term

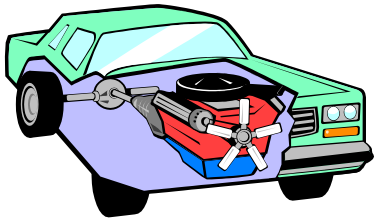
$$[\, m_{Fe}C_{Fe} + m_{Al}C_{Al} + m_{st}C_{st} + m_{oil}C_{oil} + m_{gly}C_{gly} \,](T_2 - T_1) = {}_1Q_2$$

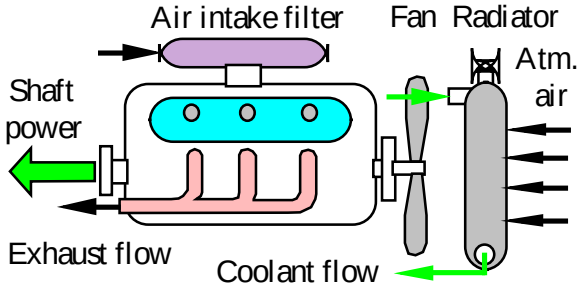
$$T_2 - T_1 = {}_1Q_2 / \Sigma m_i C_i$$

$$= \frac{7000}{200\times 0.1 + 40\times 0.215 + 40\times 0.11 + 10\times 0.46 + 12\times 0.58}$$

$$= \frac{7000}{44.56}\,R = 157\ R$$

$$T_2 = T_1 + 157\ F = 40 + 157 = \mathbf{197\ F}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.279E

A car with mass 3250 lbm drives with 60 mi/h when the brakes are applied to quickly decrease its speed to 20 mi/h. Assume the brake pads are 1 lbm mass with heat capacity of 0.2 Btu/lbm R and the brake discs/drums are 8 lbm steel where both masses are heated uniformly. Find the temperature increase in the brake assembly.

C.V. Car. Car looses kinetic energy and brake system gains internal u.

No heat transfer (short time) and no work term.

m = constant;

Energy Eq.3.5: $E_2 - E_1 = 0 - 0 = m_{car} \frac{1}{2}(V_2^2 - V_1^2) + m_{brake}(u_2 - u_1)$

The brake system mass is two different kinds so split it, also use C_v since we do not have a u table for steel or brake pad material.

$$m_{steel} C_v \Delta T + m_{pad} C_v \Delta T = m_{car} \frac{1}{2}(V_2^2 - V_1^2)$$

$$(8 \times 0.11 + 1 \times 0.2) \text{ Btu/R} \times \Delta T$$

$$= 3250 \times 0.5 \times (3600 - 400) \times 1.46667^2 / (32.174 \times 778) \text{ Btu}$$

$$= 446.9 \text{ Btu}$$

$$\Rightarrow \quad \Delta T = \mathbf{414\ F}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.280E

Water at 60 psia is brought from 320 F to 1800 F. Evaluate the change in specific internal energy using a) the steam tables, b) the ideal gas Table F.6, and the specific heat F.4

Solution:

a)

State 1: Table F.7.3 Superheated vapor $u_1 = 1109.46$ Btu/lbm

State 2: Table F.7.3 $u_2 = 1726.69$ Btu/lbm

$u_2 - u_1 = 1726.69 - 1109.46 =$ **617.23 Btu/lbm**

b)

Table F.6 at 780 R: $u_1 = 1978.7 - 1.98589 \times 780 = 429.71$ Btu/lbmol

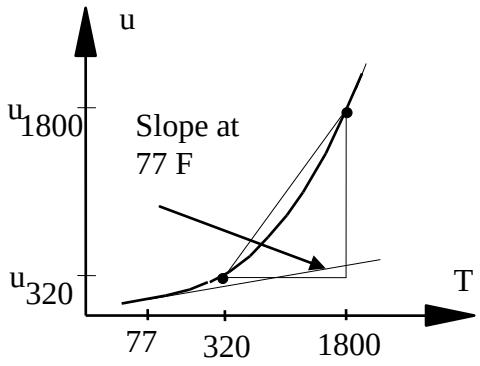
Table F.6 at 2260 R: $u_2 = 15894 - 1.98589 \times 2260 = 11\ 406$ Btu/lbmol

$u_2 - u_1 = (11\ 406 - 429.71)/18.013 =$ **609.35 Btu/lbm**

c) Table F.4 : $C_{vo} = 0.337$ Btu/lbm-R

$u_2 - u_1 = 0.337$ Btu/lbm-R (1800 – 320) R = **498.8 Btu/lbm**

Notice how the average slope from 320 F to 1800 F is higher than the one at 77 F (= C_{vo})



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.281E

A 65 gallons rigid tank contains methane gas at 900 R, 200 psia. It is now cooled down to 540 R. Assume ideal gas and find the needed heat transfer.

Solution:

Ideal gas and recall from Table A.1 that 1 gal = 231 in^3,

$$m = P_1V/RT_1 = \frac{200 \text{ psi} \times 65 \text{ gal} \times 231 \text{ in}^3/\text{gal}}{96.35 \text{ lbf-ft/lbm-R} \times 900 \text{ R} \times 12 \text{ in/ft}} = 2.886 \text{ lbm}$$

Process: $V = \text{constant} = V_1 \quad \Rightarrow \quad {}_1W_2 = 0$

Use specific heat from Table F.4

$$u_2 - u_1 = C_v (T_2 - T_1) = 0.415 \text{ Btu/lbm-R } (900 - 540) \text{ R}$$
$$= -149.4 \text{ Btu/lbm}$$

Energy Equation

$${}_1Q_2 = m(u_2 - u_1) = 2.886 \ (-149.4) = \mathbf{-431.2 \ Btu}$$

3.282E

Oxygen at 50 lbf/in.^{2}, 200 F is in a piston/cylinder arrangement with a volume of 4 ft^3. It is now compressed in a polytropic process with exponent, $n = 1.2$, to a final temperature of 400 F. Calculate the heat transfer for the process.

Continuity: $m_2 = m_1$; Energy: $E_2 - E_1 = m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

State 1: T, P and ideal gas, small change in T, so use Table F.4

$$\Rightarrow \quad m = \frac{P_1V_1}{RT_1} = \frac{50 \text{ psi} \times 4 \text{ ft}^3 \times 144 \text{ in}^2/\text{ft}^2}{48.28 \text{ lbf-ft/lbm-R} \times 659.67 \text{ R}} = 0.9043 \text{ lbm}$$

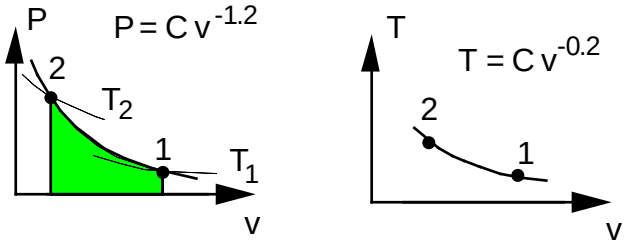
Process: $PV^n = \text{constant}$

$${}_1W_2 = \frac{1}{1\text{-}n}(P_2V_2 - P_1V_1) = \frac{mR}{1\text{-}n}(T_2 - T_1) = \frac{0.9043 \times 48.28}{1 - 1.2} \times \frac{400 - 200}{778}$$

$$= -56.12 \text{ Btu}$$

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 \cong mC_V(T_2 - T_1) + {}_1W_2$$

$$= 0.9043 \times 0.158\,(400 - 200) - 56.12 = \mathbf{-27.54\ Btu}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.283E

An air pistol contains compressed air in a small cylinder, as shown in Fig. P3.164. Assume that the volume is 1 in.^{3}, pressure is 10 atm, and the temperature is 80 F when armed. A bullet, m = 0.04 lbm, acts as a piston initially held by a pin (trigger); when released, the air expands in an isothermal process (T = constant). If the air pressure is 1 atm in the cylinder as the bullet leaves the gun, find

a. The final volume and the mass of air.
b. The work done by the air and work done on the atmosphere.
c. The work to the bullet and the bullet exit velocity.

C.V. Air. Air ideal gas:

$$m_{air} = \frac{P_1V_1}{RT_1} = \frac{10 \text{ atm} \times 14.7 \text{ psi/atm} \times 1 \text{ in}^3}{53.34 \text{ lbf-ft/lbm-R} \times 539.67 \text{ R} \times 12 \text{ in/ft}} = \mathbf{4.26\times10^{-5}\ lbm}$$

Process: $PV = \text{const} = P_1V_1 = P_2V_2 \Rightarrow V_2 = V_1P_1/P_2 = \mathbf{10\ in^3}$

$$_1W_2 = \int PdV = P_1V_1 \int (1/V)\, dV = P_1V_1 \ln(V_2/V_1)$$

$$= 147 \text{ psi} \times 1 \text{ in}^3 \times \ln(10) = 28.2 \text{ lbf-ft} = \mathbf{0.0362\ Btu}$$

$$_1W_{2,ATM} = P_0(V_2 - V_1) = 14.7 \text{ psi} \times 9 \text{ in}^3 = 11.03 \text{ lbf-ft} = \mathbf{0.0142\ Btu}$$

$$W_{bullet} = {}_1W_2 - {}_1W_{2,ATM} = 0.022 \text{ Btu} = \tfrac{1}{2} m_{bullet}(\mathbf{V}_{ex})^2$$

$$\mathbf{V}_{ex} = (2W_{bullet}/m_B)^{1/2} = (2\times0.022\times778\times32.174 / 0.04)^{1/2} = \mathbf{165.9\ ft/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.284E

Helium gas expands from 20 psia, 600 R and 9 ft^3 to 15 psia in a polytropic process with n = 1.667. How much heat transfer is involved?

Solution:
C.V. Helium gas, this is a control mass.
Energy equation: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process equation: $PV^n = \text{constant} = P_1V_1^n = P_2V_2^n$

Ideal gas (F.4): $m = PV/RT = \dfrac{20 \text{ psi} \times 9 \text{ ft}^3 \times 144 \text{ in}^2/\text{ft}^2}{386 \text{ lbf-ft/lbm-R} \times 600 \text{ R}} = 0.112 \text{ lbm}$

Solve for the volume at state 2

$$V_2 = V_1 (P_1/P_2)^{1/n} = 9 \times \left(\frac{20}{15}\right)^{0.6} = 10.696 \text{ ft}^3$$

$$T_2 = T_1 P_2V_2/(P_1V_1) = 600 \text{ R} \frac{15 \times 10.696}{20 \times 9} = 534.8 \text{ R}$$

Work from Eq.3.21

$${}_1W_2 = \frac{P_2V_2 - P_1V_1}{1-n} = \frac{15 \times 10.696 - 20 \times 9}{1 - 1.667} \text{ psi ft}^3 = 29.33 \text{ psia ft}^3$$
$$= 4223 \text{ lbf-ft} = 5.43 \text{ Btu}$$

Use specific heat from Table F.4 to evaluate $u_2 - u_1$, $C_v = 0.744$ Btu/lbm R

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m\, C_v\, (T_2 - T_1) + {}_1W_2$$
$$= 0.112 \text{ lbm} \times 0.744 \text{ Btu/lbm-R} \times (534.8 - 600) \text{ R} + 5.43 \text{ Btu}$$
$$= \mathbf{-0.003 \text{ Btu}}$$

3.285E

Water in a tank A is at 270 F with a quality of 10% and mass 1 lbm. It is connected to a piston cylinder holding constant pressure of 40 psia initially with 1 lbm water at 700 F. The valve is opened and enough heat transfer takes place to have a final uniform temperature of 280 F. Find the final P and V, the process work and the process heat transfer.

Solution:

C.V. Water in A and B. Control mass goes through process: 1 -> 2

Continuity Eq.: $m_2 - m_{A1} - m_{B1} = 0$ => $m_2 = m_{A1} + m_{B1} = 1.0 + 1.0 = 2$ lbm

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

State A1: $v_{A1} = 0.01717 + x_{A1} \times 10.0483 = 1.022$; $V_{A1} = mv = 1.022$ ft^3

$u_{A1} = 238.81 + 0.1 \times 854.14 = 324.22$ Btu/lbm

State B1: $v_{B1} = 17.196$ ft^3/lbm; $u_{B1} = 1255.14$ Btu/lbm

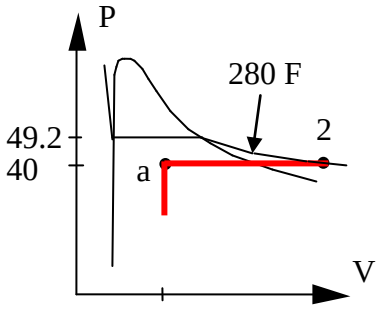
=> $V_{B1} = m_{B1}v_{B1} = 17.196$ ft^3

State 2: If $V_2 > V_{A1}$ then $P_2 =$ **40 psia** that is the piston floats.

For $(T_2, P_2) = (280$ F, 40 psia) => superheated vapor $u_2 = 1097.31$ Btu/lbm

$v_2 = 10.711$ ft^3/lbm $V_2 = m_2v_2 =$ **21.422 ft^3** $> V_{A1}$ checks OK.

The possible state 2 (P,V) combinations are shown. State a is 40 psia, $v_a = V_{A1}/m_2 = 0.511$ and thus two-phase $T_a = 267.3$ F less than T_2



Process: ${}_1W_2 = P_2 (V_2 - V_1) = 40 (21.422 - 1.022 - 17.196)\frac{144}{778} =$ **23.72 Btu**

From the energy Eq.:

${}_1Q_2 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} + {}_1W_2$

$= 2 \times 1097.31 - 1.0 \times 324.22 - 1.0 \times 1255.14 + 23.72$

= **638.98 Btu**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.286E

Two rigid tanks are filled with water as shown in Fig. P.3.214. Tank A is 7 ft^3 at 1 atm, 280 F and tank B is 11 ft^3 at saturated vapor 40 psia. The tanks are connected by a pipe with a closed valve. We open the valve and let all the water come to a single uniform state while we transfer enough heat to have a final pressure of 40 psia. Give the two property values that determine the final state and find the heat transfer.

Solution:

State A1: u = 1102.4 Btu/lbm, v = 29.687 ft^3/lbm

=> $m_{A1} = V/v = 7.0/29.687 = 0.236$ lbm

State B1: u = 1092.3 Btu/lbm, v = 19.501 ft^3/lbm

=> $m_{B1} = V/v = 11.0 / 19.501 = 0.564$ lbm

The total volume (and mass) is the sum of volumes (mass) for tanks A and B.

$m_2 = m_{A1} + m_{B1} = 0.236 + 0.564 = 0.800$ lbm,

$V_2 = V_{A1} + V_{B1} = 7.0 + 11.0 = 18.0\ ft^3$

=> $v_2 = V_2/m_2 = 18.0 /0.800 =$ **22.5 ft^3/lbm**

State 2: $[P_2, v_2] = [40$ psia, 22.5 ft^3/lbm$]$

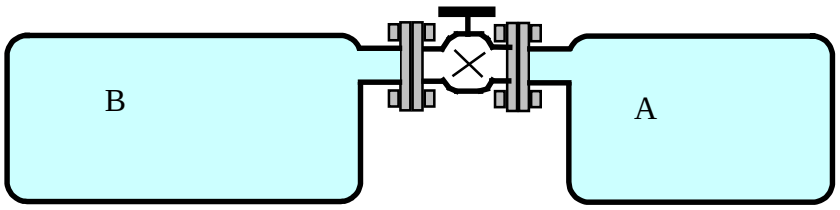
=> $T_2 = 1053.5$ F and $u_2 = 1395.1$ Btu/lbm

The energy equation is (neglecting kinetic and potential energy)

$m_2 u_2 - m_A u_{A1} - m_B u_{B1} = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

${}_1Q_2 = 0.800 \times 1395.1 - 0.236 \times 1102.4 - 0.564 \times 1092.3$

= **239.9 Btu**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.287E

A vertical cylinder fitted with a piston contains 10 lbm of R-410A at 50 F, shown in Fig. P3.173. Heat is transferred to the system causing the piston to rise until it reaches a set of stops at which point the volume has doubled. Additional heat is transferred until the temperature inside reaches 120 F, at which point the pressure inside the cylinder is 200 lbf/in.^{2}.

a. What is the quality at the initial state?

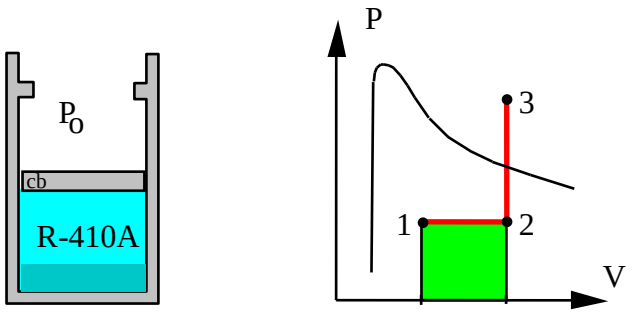
b. Calculate the heat transfer for the overall process.

Solution:

C.V. R-410A. Control mass goes through process: 1 -> 2 -> 3

As piston floats pressure is constant (1 -> 2) and the volume is constant for the second part (2 -> 3). So we have: $v_3 = v_2 = 2 \times v_1$

State 3: Table F.9.2 (P,T) $v_3 = 0.3652$ ft^3/lbm, $u_3 = 123.5$ Btu/lbm



So we can determine state 1 and 2 Table F.9.1:

$$v_1 = 0.1826 = 0.01420 + x_1(0.3636) \quad \Rightarrow \quad x_1 = \mathbf{0.463}$$

$$u_1 = 31.06 + 0.463 \times 78.96 = 67.6 \text{ Btu/lbm}$$

State 2: $v_2 = 0.3652$ ft^3/lbm, $P_2 = P_1 = 157.5$ psia, this is still 2-phase.

We get the work from the process equation (see P-V diagram)

$$_1W_3 = {}_1W_2 = \int_1^2 PdV = P_1(V_2 - V_1)$$

$$= 157.5 \text{ psia} \times 10 \text{ lbm } (0.3652 - 0.1826) \text{ ft}^3\text{/lbm} \times 144 \text{ (in/ft)}^2$$

$$= 41\,413.7 \text{ lbf-ft} = 53.2 \text{ Btu}$$

The heat transfer from the energy equation becomes

$$_1Q_3 = m(u_3 - u_1) + {}_1W_3 = 10(123.5 - 67.6) + 53.2 = \mathbf{612.2 \text{ Btu}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.288E

A piston cylinder shown in Fig. P3.169 contains 18 ft^3 of R-410A at 300 psia, 300 F. The piston mass and atmosphere gives a pressure of 70 psia that will float the piston. The whole setup cools in a freezer maintained at 0 F. Find the heat transfer and show the P-v diagram for the process when T_2 = 0 F.

Solution:

C.V.: R-410A. Control mass.

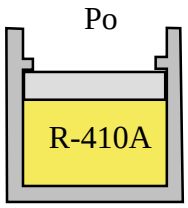
Continuity: m = constant,

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $F\downarrow = F\uparrow = P\,A = P_{air}A + F_{stop}$

$$\text{if } V < V_{stop} \Rightarrow F_{stop} = \emptyset$$

This is illustrated in the P-v diagram shown below.



State 1: $v_1 = 0.3460$ ft^3/lbm, $u_1 = 159.95$ Btu/lbm

$\Rightarrow$ m = V/v = 52.023 lbm

State 2: T_2 and on line $\Rightarrow$ compressed liquid, see figure below.

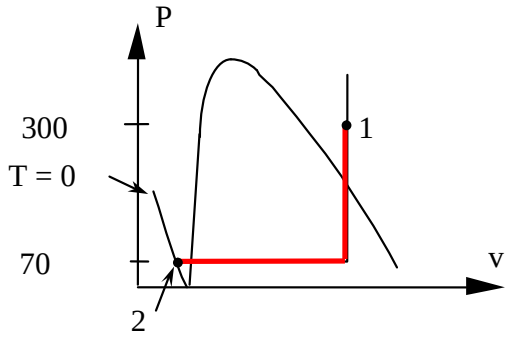
$v_2 \cong v_f = 0.01295$ ft^3/lbm $\Rightarrow V_2 = 0.674$ ft^3; $u_2 = u_f = 13.37$ Btu/lbm

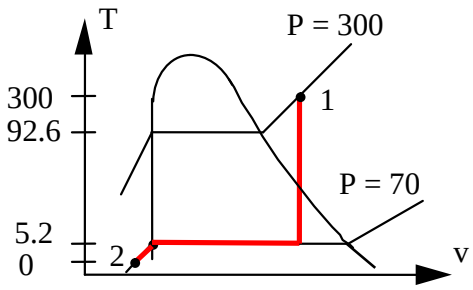
${}_1W_2 = \int PdV = P_{lift}(V_2 - V_1) = 70$ psi $(0.674 - 18)$ ft^3 $\times$ 144 in^2/ft^2

$= -174\,646$ lbf-ft $= -224.5$ Btu

Energy eq. $\Rightarrow$

$${}_1Q_2 = 52.023\,(13.37 - 159.95) - 224.5 = \mathbf{-7850\ Btu}$$



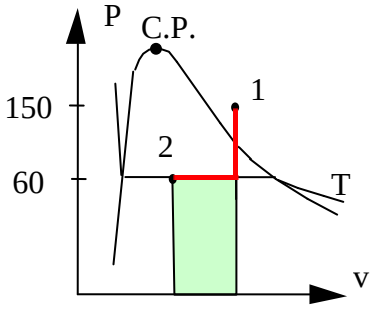


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.289E

A setup as in Fig. P3.169 has the R-410A initially at 150 psia, 120 F of mass 0.2 lbm. The balancing equilibrium pressure is 60 psia and it is now cooled so the volume is reduced to half the starting volume. Find the heat transfer for the process.

Solution:



Take as CV the 0.2 lbm of R-410A.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $P = P_{float}$ or $v = C = v_1$,

State 1: (P, T) => $v_1 = 0.5099$ ft^3/lbm

$u_1 = 125.28$ Btu/lbm

State 2: (P, v) => $v_2 = v_1/2 = 0.2550$ ft^3/lbm < v_g, so it is two-phase.

$x_2 = (v_2 - v_f)/v_{fg} = (0.255 - 0.0129)/0.9911 = 0.2443$

$u_2 = u_f + x_2\, u_{fg} = 12.57 + x_2\, 93.33 = 35.37$ Btu/lbm

From process eq.: ${}_1W_2 = \int P\, dV$ = area = $mP_2\,(v_2 - v_1)$

= 0.2 lbm × 60 psi (0.255 – 0.5099) ft^3/lbm ×144 in^2/ft^2

= 440.5 lbf-ft = - 0.57 Btu

From energy eq.: ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.2 \times (35.37 - 125.28) - 0.57$

= **-18.55 Btu**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.290E

A piston cylinder contains air at 150 psia, 1400 R with a volume of 1.75 ft^3. The piston is pressed against the upper stops, see Fig. P3.14-c and it will float at a pressure of 110 psia. Now the air is cooled to 700 R. What is the process work and heat transfer?

CV. Air, this is a control mass

Energy Eq.3.5 $\quad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $\quad P = P_{float}$ or $v = C = v_1$,

State 1: $u = 247.04$ Btu/lbm,

$m = PV/RT = 150$ psi $\times$ 1.75 ft^3/(53.34 lbf-ft/lbm-R $\times$ 1400 R) = 0.506 lbm

We need to find state 2. Let us see if we proceed past state 1a during the cooling.

$$T_{1a} = T_1 \, P_{float} / P_1 = 1400 \text{ R} \times 110 / 150 = 1026.67 \text{ R}$$

so we do cool below T_{1a}. That means the piston is floating. Write the ideal gas law for state 1 and 2 to get

$$V_2 = \frac{mRT_2}{P_2} = \frac{P_1V_1T_2}{P_2T_1} = \frac{150 \times 1.75 \times 700}{110 \times 1400} = 1.1932 \text{ ft}^3$$

$${}_1W_2 = {}_{1a}W_2 = \int P \, dV = P_2 (V_2 - V_1)$$

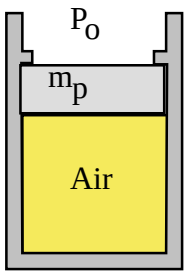
$$= 110 \text{ psia} \times (1.1932 - 1.75) \text{ ft}^3 = \mathbf{-8819.7 \text{ lbf-ft} = -11.34 \text{ Btu}}$$

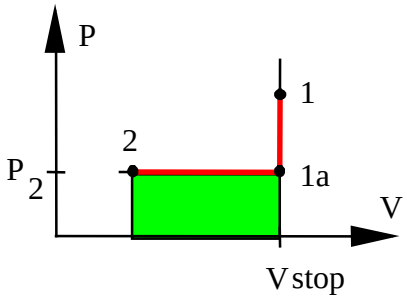
From the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$$

$$= 0.506 \text{ lbm} \times (119.7 - 247.04) \text{ Btu/lbm} - 11.34 \text{ Btu}$$

$$= \mathbf{-75.8 \text{ kJ}}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.291E

A mass of 6 lbm nitrogen gas at 3600 R, V = C, cools with 1 Btu/s. What is dT/dt?

Process: $V = C \quad \rightarrow \quad {}_1W_2 = 0$

$$\frac{dE}{dt} = \frac{dU}{dt} = m\frac{dU}{dt} = mC_v\frac{dT}{dt} = \dot{Q} - W = \dot{Q} = -1 \text{ Btu/s}$$

$$C_{p\,3600} = \frac{dh}{dT} = \frac{\Delta h}{\Delta T} = \frac{h_{3800} - h_{3400}}{3800\text{-}3400} = \frac{25857 - 22421}{400 \times 28.013} = 0.3066 \text{ Btu/lbm-R}$$

$$C_{v\,3600} = C_{p\,3600} - R = 0.3066 - 55.15 / 778 = 0.2357 \text{ Btu/lbm-R}$$

$$\frac{dT}{dt} = \frac{\dot{Q}}{mC_v} = \frac{-1 \text{ Btu/s}}{6 \times 0.2357 \text{ Btu/R}} = \mathbf{-0.71}\ \frac{\mathbf{R}}{\mathbf{s}}$$

Remark: Specific heat from Table F.4 has $C_{v\,300} = 0.178$ Btu/lbm-R which is nearly 25% lower and thus would over-estimate the rate with 25%.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.292E

A crane use 7000 Btu/h to raise a 200 lbm box 60 ft. How much time does it take?

$$\text{Power} = \dot{W} = F\mathbf{V} = mg\mathbf{V} = mg\frac{L}{t}$$

$$F = mg = 200\,\frac{32.174}{32.174}\,\text{lbf} = 200\ \text{lbf}$$

$$t = \frac{FL}{\dot{W}} = \frac{200\ \text{lbf} \times 60\ \text{ft}}{7000\ \text{Btu/h}} = \frac{200 \times 60 \times 3600}{7000 \times 778.17}\ \text{s}$$

$$= \mathbf{7.9\ s}$$

Recall Eq. on page 9: 1 lbf = 32.174 lbm ft/s^2, 1 Btu = 778.17 lbf-ft (A.1)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.293E

A computer in a closed room of volume 5000 ft^3 dissipates energy at a rate of 10 kW. The room has 100 lbm of wood, 50 lbm of steel and air, with all material at 540 R, 1 atm. Assuming all the mass heats up uniformly how long time will it take to increase the temperature 20 F?

C.V. Air, wood and steel. $m_2 = m_1$; no work

Energy Eq.3.5: $U_2 - U_1 = {}_1Q_2 = \dot{Q}\Delta t$

The total volume is nearly all air, but we can find volume of the solids.

$V_{wood} = m/\rho = 100/44.9 = 2.23\ ft^3$; $V_{steel} = 50/488 = 0.102\ ft^3$

$V_{air} = 5000 - 2.23 - 0.102 = 4997.7\ ft^3$

$m_{air} = PV/RT = 14.7 \times 4997.7 \times 144/(53.34 \times 540) = 367.3$ lbm

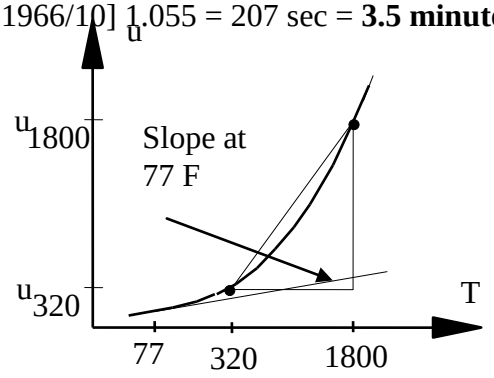
We do not have a u table for steel or wood so use specific heat.

$$\Delta U = [m_{air}\, C_v + m_{wood}\, C_v + m_{steel}\, C_v\,]\, \Delta T$$

$$= (367.3 \times 0.171 + 100 \times 0.3 + 50 \times 0.11)\ Btu/F \times 20\ F$$

$$= 1256.2 + 600 + 110 = 1966\ Btu = \dot{Q} \times \Delta t = (10/1.055) \times \Delta t$$

=> $\Delta t = [1966/10]\ 1.055 = 207$ sec = **3.5 minutes**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.294E

Water is in a piston cylinder maintaining constant P at 330 F, quality 90% with a volume of 4 ft^3. A heater is turned on heating the water with 10 000 Btu/h. What is the elapsed time to vaporize all the liquid?

Solution:

Control volume water.

Continuity Eq.: m_{tot} = constant = $m_{vapor} + m_{liq}$

on a rate form: $\dot{m}_{tot} = 0 = \dot{m}_{vapor} + \dot{m}_{liq} \quad \Rightarrow \quad \dot{m}_{liq} = -\dot{m}_{vapor}$

Energy equation: $\dot{U} = \dot{Q} - \dot{W} = \dot{m}_{vapor}\, u_{fg} = \dot{Q} - P\, \dot{m}_{vapor}\, v_{fg}$

Rearrange to solve for $\dot{m}_{vapor}$

$$\dot{m}_{vapor}\,(u_{fg} + Pv_{fg}) = \dot{m}_{vapor}\, h_{fg} = \dot{Q}$$

From table F.7.1

h_{fg} = 887.5 Bt/lbm, $v_1 = 0.01776 + 0.9\ 4.2938 = 3.8822$ ft^3/lbm

$m_1 = V_1/v_1 = 4/3.8822 = 1.0303$ lbm, $m_{liq} = (1\text{-}x_1)m_1 = 0.10303$ lbm

$$\dot{m}_{vapor} = \dot{Q}/h_{fg} = \frac{10\ 000}{887.5}\frac{\text{Btu/h}}{\text{Btu/lbm}} = 11.2676 \text{ lbm/h} = 0.00313 \text{ lbm/s}$$

$\Delta t = m_{liq} / \dot{m}_{vapor} = 0.10303 / 0.00313 =$ **32.9 s**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.295E

A piston/cylinder has 2 lbm of R-134a at state 1 with 200 F, 90 lbf/in.^{2}, and is then brought to saturated vapor, state 2, by cooling while the piston is locked with a pin. Now the piston is balanced with an additional constant force and the pin is removed. The cooling continues to a state 3 where the R-134a is saturated liquid. Show the processes in a P-V diagram and find the work and heat transfer in each of the two steps, 1 to 2 and 2 to 3.

Solution :

C.V. R-134a This is a control mass. Properties from table F.10.1 and F.10.2

State 1: (T,P) => $v = 0.7239$ ft^3/lbm, $u = 194.605$ Btu/lbm

State 2 given by fixed volume and $x_2 = 1.0$, $v_2 = v_1 = v_g$ => $_1\mathbf{W_2 = 0}$

$$T_2 = 50 + 10 \times \frac{0.7239 - 0.7921}{0.6632 - 0.7921} = 55.3 \text{ F},$$

$$P_2 = 60.311 + (72.271 - 60.311) \times 0.5291 = 66.64 \text{ psia}$$

$$u_2 = 164.95 + (166.28 - 164.95) \times 0.5291 = 165.65 \text{ Btu/lbm}$$

From the energy equation $_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(u_2 - u_1)$

$$= 2\ (165.65 - 194.605) = \mathbf{-57.91\ Btu}$$

State 3 reached at constant P (F = constant) state 3: $P_3 = P_2$ and

$$v_3 = v_f = 0.01271 + (0.01291 - 0.01271) \times 0.5291 = 0.01282 \text{ ft}^3\text{/lbm}$$

$$u_3 = u_f = 91.68 + (94.95 - 91.68) \times 0.5291 = 93.41 \text{ Btu/lbm}$$

$$_1W_3 = {}_1W_2 + {}_2W_3 = 0 + {}_2W_3 = \int P\, dV = P(V_3 - V_2) = mP(v_3 - v_2)$$

$$= 2 \times 66.64\ (0.01282 - 0.7239)\ \frac{144}{778} = \mathbf{-\ 17.54\ Btu}$$

From the energy equation

$$_2Q_3 = m(u_3 - u_2) + {}_2W_3 = 2(93.41 - 165.65) - 17.54 = \mathbf{-162.02\ Btu}$$

3.296E

A force of 300 lbf moves a truck with 40 mi/h up a hill. What is the power?

Solution:

$$\dot{W} = F\,\mathbf{V} = 300 \text{ lbf} \times 40 \text{ (mi/h)}$$

$$= 12\,000 \times \frac{1609.3 \times 3.28084}{3600} \frac{\text{lbf-ft}}{\text{s}}$$

$$= 17\,600 \frac{\text{lbf-ft}}{\text{s}} = \mathbf{22.62\ Btu/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Heat Transfer Rates

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.297E

Find the rate of conduction heat transfer through a 1.5 cm thick hardwood board, k = 0.09 Btu/h-ft-R, with a temperature difference between the two sides of 40 F.

One dimensional heat transfer by conduction, we do not know the area so we can find the flux (heat transfer per unit area Btu/ft^{2}h).

t = 1.5 cm = 0.59 in. = 0.0492 ft

$$\dot{q} = \dot{Q}/A = k \frac{\Delta T}{\Delta x} = 0.09 \frac{\text{Btu}}{\text{h-ft-R}} \times \frac{40}{0.0492} \frac{\text{R}}{\text{ft}} = \mathbf{73.2\ Btu/ft^2\text{-}h}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.298E

A water-heater is covered up with insulation boards over a total surface area of 30 ft^2. The inside board surface is at 175 F and the outside surface is at 70 F and the board material has a conductivity of 0.05 Btu/h ft F. How thick a board should it be to limit the heat transfer loss to 720 Btu/h ?

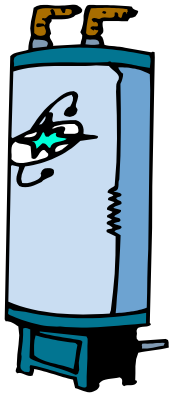
Solution:

Steady state conduction through a single layer board.

$$\dot{Q}_{cond} = k\ A\ \frac{\Delta T}{\Delta x} \quad \Rightarrow \quad \Delta x = k\ A\ \Delta T/\dot{Q}$$

$$\Delta x = 0.05\ \frac{\text{Btu}}{\text{h-ft-R}} \times 30\ \text{ft}^2\ (175\text{-}70)\ \text{R}/\ 720\ \text{Btu/h}$$

$$= 0.219\ \text{ft} = \mathbf{2.6\ in}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.299E

The sun shines on a 1500 ft^2 road surface so it is at 115 F. Below the 2 inch thick asphalt, average conductivity of 0.035 Btu/h-ft-F, is a layer of compacted rubbles at a temperature of 60 F. Find the rate of heat transfer to the rubbles.

Solution:

$$\dot{Q} = k\ A\ \frac{\Delta T}{\Delta x}$$

$$= 0.035 \frac{\text{Btu}}{\text{h-ft-R}} \times 1500\ \text{ft}^2 \times \frac{115 - 60}{2/12} \frac{\text{R}}{\text{ft}}$$

$$= \mathbf{17325\ Btu/h}$$

3.300E

A cylinder having an initial volume of 100 ft^3 contains 0.2 lbm of water at 100 F. The water is then compressed in an isothermal quasi-equilibrium process until it has a quality of 50%. Calculate the work done in the process assuming water vapor is an ideal gas.

Solution:

State 1: T_1, $v_1 = V/m = \frac{100}{0.2} = 500$ ft^3/lbm (> v_g)

since $P_g = 0.95$ psia, very low so water is an ideal gas from 1 to 2.

$$P_1 = P_g \times \frac{v_g}{v_1} = 0.950 \times \frac{350}{500} = 0.6652 \text{ lbf/in}^2$$

$$V_2 = mv_2 = 0.2 \text{ lbm} * 350 \text{ ft}^3/\text{lbm} = 70 \text{ ft}^3$$

$$v_3 = 0.01613 + 0.5 \times (350 - 0.01613) = 175.0 \text{ ft}^3/\text{lbm}$$

For ideal gas and constant T the work term follows Eq. 3.21

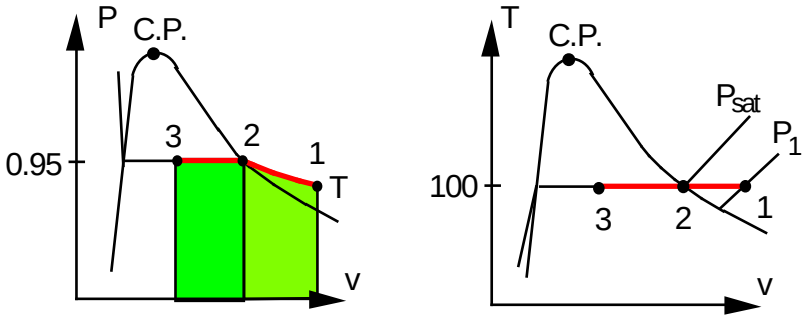
$$_1W_2 = \int PdV = P_1V_1 \ln \frac{V_2}{V_1} = 0.6652 \times \frac{144}{778} \times 100 \ln \frac{70}{100} = -4.33 \text{ Btu}$$

For the constant pressure part of the process the work becomes

$$_2W_3 = P_2\, m(v_3 - v_2) = 0.95 \text{ psi} \times 0.2 \text{ lbm} \times (175 - 350) \text{ ft}^3/\text{lbm} \times 144 \text{ in}^2/\text{ft}^2$$

$$= -4788 \text{ lbf-ft} = -6.15 \text{ Btu}$$

$$_1W_3 = -6.15 - 4.33 = \mathbf{-10.48\ Btu}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.301E

A piston/cylinder contains 2 lbm of water at 70 F with a volume of 0.1 ft^3, shown in Fig. P3.225. Initially the piston rests on some stops with the top surface open to the atmosphere, *P*o, so a pressure of 40 lbf/in.^{2} is required to lift it. To what temperature should the water be heated to lift the piston? If it is heated to saturated vapor find the final temperature, volume, and the heat transfer.

Solution:

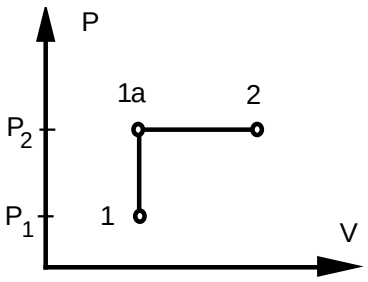
C.V. Water. This is a control mass.

$$m_2 = m_1 = m \; ; \quad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$$

State 1: 20 C, $v_1 = V/m = 0.1/2 = 0.05$ ft^3/lbm

$x = (0.05 - 0.01605)/867.579 = 0.0003913$

$u_1 = 38.09 + 0.0003913 \times 995.64 = 38.13$ Btu/lbm



To find state 2 check on state 1a:

P = 40 psia, $v = v_1 = 0.05$ ft^3/lbm

Table F.7.1: $v_f < v < v_g = 10.501$, $x_{1a} > 0$

State 2 is saturated vapor at 40 psia as state 1a is two-phase. $T_2 = 267.3$ F

$v_2 = vg = 10.501$ ft^3/lbm , $V_2 = m\, v_2 = 21.0$ ft^3, $u_2 = ug = 1092.27$ Btu/lbm

Pressure is constant as volume increase beyond initial volume.

${}_1W_2 = \int P\, dV = P_{lift}\,(V_2 - V_1) = 40\,(21.0 - 0.1) \times 144 / 778 = 154.75$ Btu

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 2\,(1092.27 - 38.13) + 154.75 = 2263$ Btu

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.302E

A twenty pound-mass of water in a piston/cylinder with constant pressure is at 1100 F and a volume of 22.6 ft^3. It is now cooled to 100 F. Show the *P–v* diagram and find the work and heat transfer for the process.

Solution:
C.V. Water

Energy Eq.3.5: $_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$

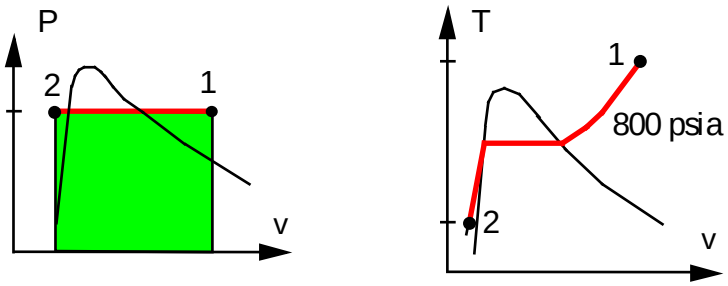
Process Eq.: Constant pressure $\Rightarrow$ $_1W_2 = mP(v_2 - v_1)$

Properties from Table F.7.2 and F.7.3

State 1: T_1, $v_1 = 22.6/20 = 1.13$ ft^3/lbm, $P_1 = 800$ lbf/in^2, $h_1 = 1567.8$ Btu/lbm

State 2: 800 lbf/in^2, 100 F

$\Rightarrow$ $v_2 = 0.016092$ ft^3/lbm, $h_2 = 70.15$ Btu/lbm



The work from the process equation is found as

$$_1W_2 = 20 \text{ lbm} \times 800 \text{ psi} \times (0.016092 - 1.13) \text{ ft}^3/\text{lbm} \times 144 \text{ in}^2/\text{ft}^2$$

$$= -2\,566\,444 \text{ lbf-ft} = \mathbf{-3299 \text{ Btu}}$$

The heat transfer from the energy equation is

$$_1Q_2 = 20 \text{ lbm} \times (70.15 - 1567.8) \text{ Btu/lbm} = \mathbf{-29\,953 \text{ Btu}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.303E

A cylinder fitted with a frictionless piston contains R-134a at 100 F, 80% quality, at which point the volume is 3 Gal. The external force on the piston is now varied in such a manner that the R-134a slowly expands in a polytropic process to 50 lbf/in.^{2}, 80 F. Calculate the work and the heat transfer for this process.

Solution:

C.V. The mass of R-134a. Properties in Table F.10.1

$v_1 = v_f + x_1 v_{fg} = 0.01387 + 0.8 \times 0.3278 = 0.2761$ ft^3/lbm

$u_1 = 108.51 + 0.8 \times 62.77 = 158.73$ Btu/lbm; $P_1 = 138.926$ psia

$m = V/v_1 = 3 \times 231 \times 12^{-3} / 0.2761 = 0.401 / 0.2761 = 1.4525$ lbm

State 2: $v_2 = 1.1035$ ft^3/lbm (sup.vap.); $u_2 = 171.32$ Btu/lbm

(linear interpolation is not so accurate as v is more like ~1/P)

Process: $n = \ln \frac{P_1}{P_2} / \ln \frac{V_2}{V_1} = \ln \frac{138.926}{50} / \ln \frac{1.1035}{0.2761} = 0.7376$

$$ {}_1W_2 = \int P\, dV = \frac{P_2 V_2 - P_1 V_1}{1 - n} $$

$$ = \frac{50 \times 1.1035 - 138.926 \times 0.2761}{1 - 0.7376} \times 1.4525 \times \frac{144}{778} = \mathbf{17.23\ Btu} $$

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1.4525\,(171.32 - 158.73) + 17.23 = \mathbf{35.5\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.304E

Ammonia, NH_3, is contained in a sealed rigid tank at 30 F, x = 50% and is then heated to 200 F. Find the final state P_2, u_2 and the specific work and heat transfer.

Solution:

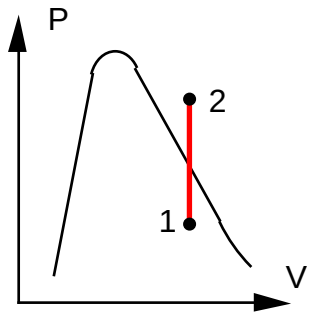
Continuity Eq.: $m_2 = m_1$;

Energy Eq.3.5: $E_2 - E_1 = {}_1Q_2$; $({}_1W_2 = \emptyset)$

Process: $V_2 = V_1 \Rightarrow v_2 = v_1 = 0.02502 + 0.5 \times 4.7945 = 2.422$ ft^3/lbm

State 1: Table F.8.1, $u_1 = 75.06 + 0.5 \times 491.17 = 320.65$ Btu/lbm

Table F.8.2: v_2 & $T_2 \Rightarrow$ between 150 psia and 175 psia



$P_2 = 163$ lbf/in^2, $u_2 = 633.5$ Btu/lbm

linear interpolation

Process equation gives no displacement: ${}_1w_2 = \mathbf{0}$;

The energy equation then gives the heat transfer as

${}_1q_2 = u_2 - u_1 = 633.5 - 320.65 =$ **312.85 Btu/lbm**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.305E

Water in a piston/cylinder, similar to Fig. P3.225, is at 212 F, x = 0.5 with mass 1 lbm and the piston rests on the stops. The equilibrium pressure that will float the piston is 40 psia. The water is heated to 500 F by an electrical heater. At what temperature would all the liquid be gone? Find the final (P,v), the work and heat transfer in the process.

C.V. The 1 lbm water.

Continuity: $m_2 = m_1 = m$; Energy: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: V = constant if $P < P_{lift}$ otherwise $P = P_{lift}$ see P-v diagram.

State 1: (T,x) Table F.7.1

$v_1 = 0.01672 + 0.5 \times 26.7864 = 13.4099$ ft^3/lbm

$u_1 = 180.09 + 0.5 \times 897.51 = 628.845$ Btu/lbm

State 1a: (40 psia, $v = v_1 > v_{g\ 40\ psia} = 10.501$ ft^3/lbm) so superheated vapor

Piston starts to move at state 1a, ${}_1W_{1a} = 0$,

State 1b: reached before state 1a so $v = v_1 = v_g$ see this in F.7.1

$T_{1b} = 250 + 10\ (13.40992 - 13.8247)/(11.7674 - 13.8247) =$ **252 F**

State 2: ($T_2 > T_{1a}$) Table F.7.2 => $v_2 = 14.164$, $u_2 = 1180.06$ Btu/lbm

Work is seen in the P-V diagram (when volume changes $P = P_{lift}$)

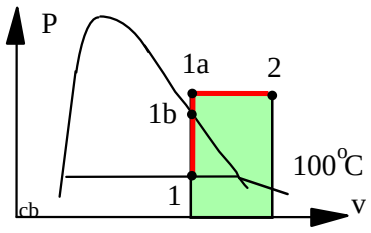
${}_1W_2 = {}_{1a}W_2 = P_2\ m(v_2 - v_1)$

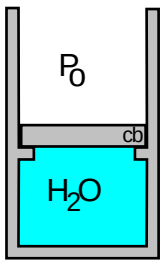
$= 40$ psi $\times$ 1 lbm (14.164 - 13.4099) ft^3/lbm $\times 144$ in^2/ft^2

$= 4343.5$ lbf-ft = **5.58 Btu**

Heat transfer is from the energy equation

${}_1Q_2 = 1$ lbm (1180.06 - 628.845) Btu/lbm + 5.58 Btu = **556.8 Btu**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

3.306E

An insulated cylinder is divided into two parts of 10 ft^3 each by an initially locked piston. Side A has air at 2 atm, 600 R and side B has air at 10 atm, 2000 R as shown in Fig. P3.151. The piston is now unlocked so it is free to move, and it conducts heat so the air comes to a uniform temperature $T_A = T_B$. Find the mass in both A and B and also the final T and P.

C.V. A + B . Then ${}_1Q_2 = \emptyset$, ${}_1W_2 = \emptyset$.

Force balance on piston: $P_A A = P_B A$, so final state in A and B is the same.

State 1A: $u_{A1} = 102.457$ Btu/lbm;

$$m_A = \frac{PV}{RT} = \frac{29.4 \text{ psi} \times 10 \text{ ft}^3 \times 144 \text{ in}^2/\text{ft}^2}{53.34 \text{ lbf-ft/lbm-R} \times 600 \text{ R}} = \mathbf{1.323 \text{ lbm}}$$

State 1B: $u_{B1} = 367.642$ Btu/lbm ;

$$m_B = \frac{PV}{RT} = \frac{147 \text{ psi} \times 10 \text{ ft}^3 \times 144 \text{ in}^2/\text{ft}^2}{53.34 \text{ lbf-ft/lbm-R} \times 2000 \text{ R}} = \mathbf{1.984 \text{ lbm}}$$

For chosen C.V. ${}_1Q_2 = 0$, ${}_1W_2 = 0$ so the energy equation becomes

$$m_A(u_2 - u_1)_A + m_B(u_2 - u_1)_B = 0$$

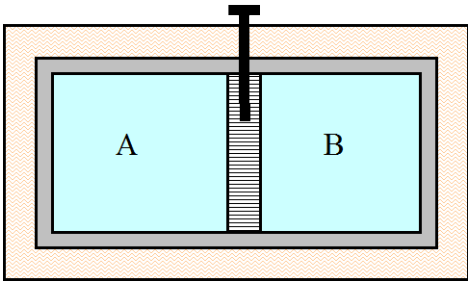
$$(m_A + m_B)u_2 = m_A u_{A1} + m_B u_{B1}$$

$$= 1.323 \times 102.457 + 1.984 \times 367.642 = 864.95 \text{ Btu}$$

$$u_2 = 864.95 \text{ Btu}/3.307 \text{ lbm} = 261.55 \text{ Btu/lbm} \quad \Rightarrow \quad T_2 = \mathbf{1475 \text{ R}}$$

$$P = m_{tot} R T_2 / V_{tot} = \frac{3.307 \text{ lbm} \times 53.34 \text{ lbf-ft/lbm-R} \times 1475 \text{ R}}{20 \text{ ft}^3 \times 144 \text{ in}^2/\text{ft}^2}$$

$$= \mathbf{90.34 \text{ lbf/in}^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

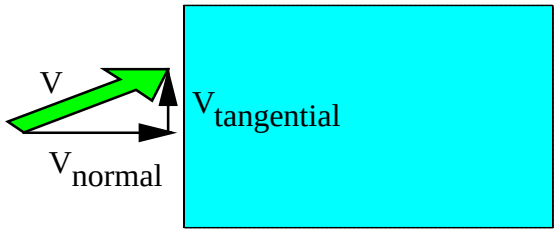
In-Text Concept Questions

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.a

A mass flow rate into a control volume requires a normal velocity component. Why?

The tangential velocity component does not bring any substance across the control volume surface as it flows parallel to it, the normal component of velocity brings substance in or out of the control volume according to its sign. The normal component must be into the control volume to bring mass in, just like when you enter a bus (it does not help that you run parallel with the bus side).



4.b

Can a steady state device have boundary work?

No. Any change in size of the control volume would require either a change in mass inside or a change in state inside, neither of which is possible in a steady-state process.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.c

Can you say something about changes in $\dot{m}$ and $\dot{V}$ through a steady flow device?

The continuity equation expresses the conservation of mass, so the total amount of $\dot{m}$ entering must be equal to the total amount leaving. For a single flow device the mass flow rate is constant through it, so you have the same mass flow rate across any total cross-section of the device from the inlet to the exit.

The volume flow rate is related to the mass flow rate as

$$\dot{V} = v\,\dot{m}$$

so it can vary if the state changes (then v changes) for a constant mass flow rate.

This also means that the velocity can change (influenced by the area as $\dot{V} = \mathbf{V}A$) and the flow can experience an acceleration (like in a nozzle) or a deceleration (as in a diffuser).

4.d

In a multiple device flow system, I want to determine a state property. Where should I be looking for information—upstream or downstream?

Generally flow is affected more by what happened to it which is upstream than what is in front of it. Only the pressure information can travel upstream and give rise to accelerations (nozzle) or decelerations (stagnation type flow). Heat transfer that can heat or cool a flow can not travel very fast and is easily overpowered by the convection. If the flow velocity exceeds the speed of sound even the pressure information can not travel upstream.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.e

How does a nozzle or sprayhead generate kinetic energy?

By accelerating the fluid from a high pressure towards the lower pressure, which is outside the nozzle. The higher pressure pushes harder than the lower pressure so there is a net force on any mass element to accelerate it.

4.f

What is the difference between a nozzle flow and a throttle process?

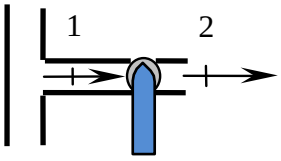
In both processes a flow moves from a higher to a lower pressure. In the nozzle the pressure drop generates kinetic energy, whereas that does not take place in the throttle process. The pressure drop in the throttle is due to a flow restriction and represents a loss.

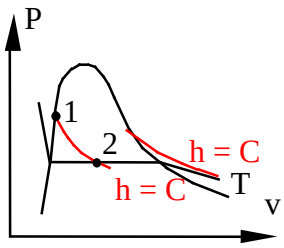
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.g

If you throttle a saturated liquid what happens to the fluid state? What if this is done to an ideal gas?

The throttle process is approximated as a constant enthalpy process. Changing the state from saturated liquid to a lower pressure with the same h gives a two-phase state so some of the liquid will vaporize and it becomes colder.





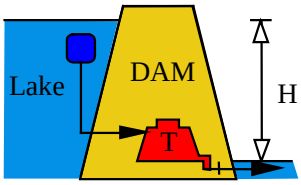
If the same process happens in an ideal gas then same h gives the same temperature (h a function of T only) at the lower pressure.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.h

A turbine at the bottom of a dam has a flow of liquid water through it. How does that produce power? Which terms in the energy equation are important if the CV is the turbine only? If the CV is the turbine plus the upstream flow up to the top of the lake, which terms in the energy equation are then important?

The water at the bottom of the dam in the turbine inlet is at a high pressure. It runs through a nozzle generating kinetic energy as the pressure drops. This high kinetic energy flow impacts a set of rotating blades or buckets, which converts the kinetic energy to power on the shaft and the flow leaves at low pressure and low velocity.



CV Turbine only.

The high P in and the low P out shows up in the (h = u + Pv) flow terms of the energy equation giving the difference in the flow work terms Pv in and out.

CV Turbine plus upstream flow.

For this CV the pressures in and out are the same (1 atm) so the difference is in the potential energy terms (gz) included in h_{tot}.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.i

If you compress air the temperature goes up, why? When the hot air, high P flows in long pipes it eventually cools to ambient T. How does that change the flow?

As the air is compressed, volume decreases so work is done on a mass element, its energy and hence temperature goes up. If it flows at nearly constant P and cools, its density increases (v decreases) so it slows down for same mass flow rate ($\dot{m} = \rho A \mathbf{V}$) and flow area.

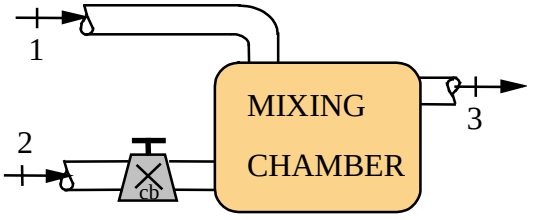
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.j

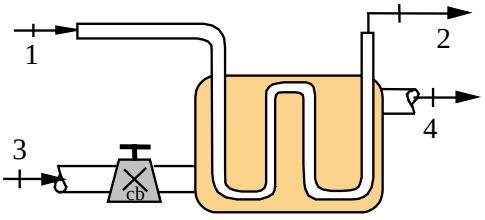
A mixing chamber has all flows at the same P, neglecting losses. A heat exchanger has separate flows exchanging energy, but they do not mix. Why have both kinds?

You might allow mixing when you can use the resulting output mixture, say it is the same substance. You may also allow it if you definitely want the outgoing mixture, like water out of a faucet where you mix hot and cold water. Even if it is different substances it may be desirable, say you add water to dry air to make it more moist, typical for a winter time air-conditioning set-up.

In other cases it is different substances that flow at different pressures with one flow heating or cooling the other flow. This could be hot combustion gases heating a flow of water or a primary fluid flow around a nuclear reactor heating a transfer fluid flow. Here the fluid being heated should stay pure so it does not absorb gases or radioactive particles and becomes contaminated. Even when the two flows have the same substance there may be a reason to keep them at separate pressures.



An open mixing chamber



A closed tube in shell heat exchanger.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.k

An initially empty cylinder is filled with air from 20^{o}C, 100 kPa until it is full. Assuming no heat transfer is the final temperature larger, equal to or smaller than 20^{o}C? Does the final T depend on the size of the cylinder?

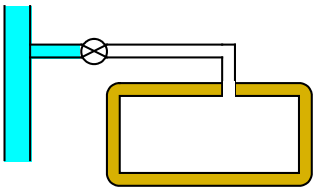
This is a transient problem with no heat transfer and no work. The balance equations for the tank as C.V. become

Continuity Eq.: $m_2 - 0 = m_i$

Energy Eq.: $m_2u_2 - 0 = m_ih_i + Q - W = m_ih_i + 0 - 0$

Final state: $u_2 = h_i = u_i + P_iv_i$ & $P_2 = P_i$

$T_2 > T_i$ and it does not depend on V



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

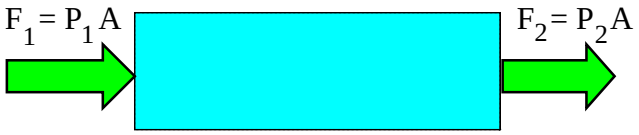
Concept-Study Guide Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.1

A temperature difference drives a heat transfer. Does a similar concept apply to $\dot{m}$?

Yes. A pressure difference drives the flow. The fluid is accelerated in the direction of a lower pressure as it is being pushed harder behind it than in front of it. This also means a higher pressure in front can decelerate the flow to a lower velocity which happens at a stagnation point on a wall.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.2

What kind of effect can be felt upstream in a flow?

Only the pressure can be felt upstream in a subsonic flow. In a supersonic flow no information can travel upstream. The temperature information travels by conduction and even small velocities overpowers the conduction with the convection of energy so the temperature at a given location is mainly given by the upstream conditions and influenced very little by the downstream conditions.

4.3

Which one of the properties (P, v, T) can be controlled in a flow? How?

Since the flow is not contained there is no direct control over the volume and thus no control of v. The pressure can be controlled by installation of a pump or compressor if you want to increase it or use a turbine, nozzle or valve through which the pressure will decrease. The temperature can be controlled by heating or cooling the flow in a heat exchanger.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.4

Air at 500 kPa is expanded to 100 kPa in two steady flow cases. Case one is a nozzle and case two is a turbine, the exit state is the same for both cases. What can you say about the specific turbine work relative to the specific kinetic energy in the exit flow of the nozzle?

For these single flow devices let us assume they are adiabatic and that the turbine does not have any exit kinetic energy then the energy equations become:

Energy Eq.4.13 nozzle: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Energy Eq.4.13 turbine: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + gZ_2 + w_T$

Comparing the two we get $\frac{1}{2}\mathbf{V}_2^2 = w_T$ so the result is that the nozzle delivers kinetic energy of the same amount as the turbine delivers shaft work.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.5

Pipes that carry a hot fluid like steam in a power plant, exhaust pipe for a diesel engine in a ship etc. are often insulated. Is that to reduce the heat loss or is there another purpose?

You definitely want to insulate pipes that carry hot steam from the boiler to the turbines in a power plant and pipes that flows hot water from one location to another. Even if the energy in the flow is unwanted the pipes should be insulated for safety. Any place that people could touch a hot surface (or very cold surface) there is a risk of a burn and that should be avoided.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.6

A windmill takes a fraction of the wind kinetic energy out as power on a shaft. In what manner does the temperature and wind velocity influence the power? Hint: write the power as mass flow rate times specific work.

The work as a fraction f of the flow of kinetic energy becomes

$$\dot{W} = \dot{m}w = \dot{m}\, f \tfrac{1}{2} \mathbf{V}_{in}^2 = \rho A \mathbf{V}_{in}\, f \tfrac{1}{2} \mathbf{V}_{in}^2$$

so the power is proportional to the velocity cubed. The temperature enters through the density, so assuming air is ideal gas

$$\rho = 1/v = P/RT$$

and the power is inversely proportional to temperature.

A windmill farm west of Denmark in the North Sea.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

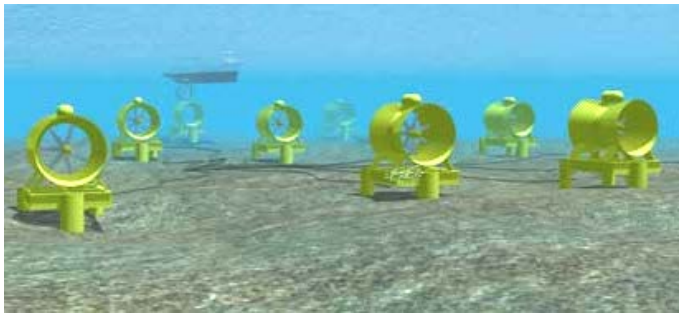
4.7

An underwater turbine extracts a fraction of the kinetic energy from the ocean current. In what manner does the temperature and water velocity influence the power? Hint: write the power as mass flow rate times specific work.

The work as a fraction f of the flow of kinetic energy becomes

$$\dot{W} = \dot{m}w = \dot{m}\, f\, \frac{1}{2}\mathbf{V}_{in}^2 = \rho A \mathbf{V}_{in}\, f\, \frac{1}{2}\mathbf{V}_{in}^2$$

so the power is proportional to the velocity cubed. The temperature enters through the density, so assuming water is incompressible density is constant and the power does not vary with the temperature.



A proposed underwater tidal flow turbine farm. Each turbine is for 1 MW with a diameter of 11.5 m mounted on the seafloor.

4.8

A liquid water turbine in the bottom of a dam takes energy out as power on a shaft. Which term(s) in the energy equation are changing and important?

The water at the bottom of the dam in the turbine inlet is at a high pressure. In a standard turbine it runs through blade passages like a propeller. In this case the inlet high pressure is used directly to generate the force on the moving blades.

For a Pelton turbine the water runs through a nozzle generating kinetic energy as the pressure drops. The high kinetic energy flow impacts a set of rotating buckets and converts the flow kinetic energy to power on the shaft so the flow leaves at low pressure and low velocity.

4.9

You blow a balloon up with air. What kind of work terms including flow work do you see in that case? Where is the energy stored?

As the balloon is blown up mass flow in has flow work associated with it. Also as the balloon grows there is a boundary work done by the inside gas and a smaller boundary work from the outside of the balloon to the atmosphere. The difference between the latter two work terms goes into stretching the balloon material and thus becomes internal energy (or you may call that potential energy) of the balloon material. The work term to the atmosphere is stored in the atmosphere and the part of the flow work that stays in the gas is stored as the gas internal energy.

4.10

A storage tank for natural gas (NG) has a top dome that can move up or down as gas is added or subtracted from the tank maintaining 110 kPa, 290 K inside. A pipeline at 110 kPa, 290 K now supplies some NG to the tank. Does it change state during the filling process? What happens to the flow work?

As the pressure inside the storage tank is the same as in the pipeline the state does not change. However the tank volume goes up and work is done on the moving boundary at the 110 kPa so this work equals the flow work. The net effect is the flow work goes into raising the dome.

4.11

A large brewery has a pipe of cross sectional area a 0.2 m^2 flowing carbon dioxide at 400 kPa, 10°C with a volume flow rate of 0.3 m^3/s. Find the velocity and the mass flow rate.

$$\dot{m} = A\mathbf{V}/v = \dot{V}/v$$

$$v = RT/P = 0.1889 \text{ kJ/kg-K} \times 283.15 \text{ K}/ 400 \text{ kPa} = 0.1337 \text{ m}^3/\text{kg}$$

$$\dot{m} = \dot{V}/ v = (0.3 \text{ m}^3/\text{s}) \ / (0.1337 \text{ m}^3/\text{kg}) = \mathbf{2.24 \text{ kg/s}}$$

$$\mathbf{V} = \dot{V} / A = 0.1337 \ (\text{m}^3/\text{s}) / 0.2 \text{ m}^2 = \mathbf{0.67 \text{ m/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.12

Air at 35°C, 105 kPa, flows in a 100 mm × 150 mm rectangular duct in a heating system. The mass flow rate is 0.015 kg/s. What are the velocity of the air flowing in the duct and the volume flow rate?

Solution:

Assume a constant velocity across the duct area with

$$A = 100 \times 150 \times 10^{-6} \text{ m}^2 = 0.015 \text{ m}^2$$

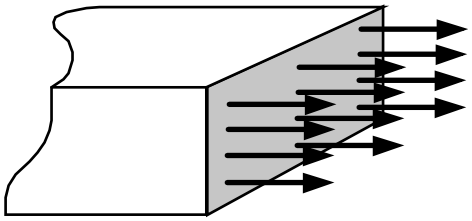
Ideal gas so:

$$v = \frac{RT}{P} = \frac{0.287 \text{ kJ/kg-K} \times 308.2 \text{ K}}{105 \text{ kPa}} = 0.8424 \text{ m}^3/\text{kg}$$

and the volumetric flow rate from Eq. 4.3,

$$\dot{V} = \dot{m}v = A\mathbf{V} = 0.015 \text{ kg/s} \times 0.8424 \text{ m}^3/\text{kg} = \mathbf{0.01264 \ m^3/s}$$

$$\mathbf{V} = \frac{\dot{V}}{A} = \frac{0.01264 \text{ m}^3/\text{s}}{0.015 \text{ m}^2} = \mathbf{0.84 \ m/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.13

A pool is to be filled with 60 m^3 water from a garden hose of 2.5 cm diameter flowing water at 2 m/s. Find the mass flow rate of water and the time it takes to fill the pool.

Solution:
With constant velocity we have

$$\dot{V} = \dot{m}v = A\mathbf{V} = \pi \times (0.025\ \text{m})^2 \times 2\ \text{m/s} = 0.003927\ \text{m}^3/\text{s}$$

$$\Delta t = V / \dot{V} = 60\ \text{m}^3 / (0.003927\ \text{m}^3/\text{s}) = 15279\ \text{s} = \mathbf{4\ h\ 14\ min\ 39\ s}$$

From table A.3 we get the water density

$$\dot{m} = \dot{V}/\ v = \rho\dot{V} = 997\ \text{kg/ m}^3 \times 0.003927\ \text{m}^3/\text{s} = \mathbf{3.9\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.14

An empty bathtub has its drain closed and is being filled with water from the faucet at a rate of 10 kg/min. After 10 minutes the drain is opened and 4 kg/min flows out and at the same time the inlet flow is reduced to 2 kg/min. Plot the mass of the water in the bathtub versus time and determine the time from the very beginning when the tub will be empty.

Solution:

During the first 10 minutes we have

$$\frac{dm_{cv}}{dt} = \dot{m}_i = 10 \text{ kg/min}, \qquad \Delta m = \dot{m}\,\Delta t_1 = 10 \times 10 = 100 \text{ kg}$$

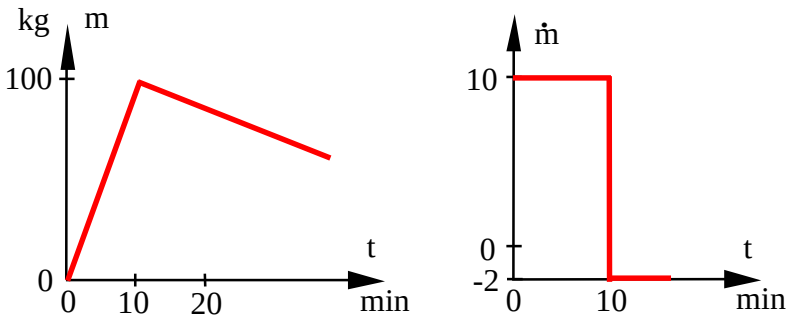
So we end up with 100 kg after 10 min. For the remaining period we have

$$\frac{dm_{cv}}{dt} = \dot{m}_i - \dot{m}_e = 2 - 4 = -2 \text{ kg/min}$$

$$\Delta m_2 = \dot{m}_{net}\,\Delta t_2 \rightarrow \quad \Delta t_2 = \frac{\Delta m}{\dot{m}_{net}} = -100/-2 = 50 \text{ min.}$$

So it will take an additional 50 min. to empty

$$\Delta t_{tot} = \Delta t_1 + \Delta t_2 = 10 + 50 = \mathbf{60\ min.}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.15

A flat channel of depth 1 m has a fully developed laminar flow of air at P_o, T_o with a velocity profile as: $V = 4V_c\, x(H - x)/H^2$, where V_c is the velocity on the center-line and x is the distance across the channel as shown in Fig. P4.15. Find the total mass flow rate and the average velocity both as functions of V_c and H.

$$\dot{m} = AV/v = \dot{V}/v$$

Since the velocity is distributed we need to integrate over the area. From Eq.4.2

$$\dot{V} = \int V_{local}\, dA = \int V(x)\, W\, dx$$

where W is the depth. Substituting the velocity we get

$$\dot{V} = \int 4V_c\, (x/H)\, (1 - x/H)\, W\, dx$$

$$= 4\, V_c\, WH \int_0^1 z\, (1 - z)\, dz \qquad (z = x/H)$$

$$= 4\, V_c\, WH\, (\tfrac{1}{2} z^2 - \tfrac{1}{3} z^3)\Big|_0^1 = \frac{2}{3} V_c\, WH = \frac{2}{3} V_c\, A$$

Average velocity: $V = \dot{V}/A = \frac{2}{3} V_c$

Mass flow rate: $\dot{m} = \dot{V}/\mathbf{v} = \frac{2}{3} V_c\, WH/v$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.16

Nitrogen gas flowing in a 50-mm diameter pipe at 15°C, 200 kPa, at the rate of 0.05 kg/s, encounters a partially closed valve. If there is a pressure drop of 30 kPa across the valve and essentially no temperature change, what are the velocities upstream and downstream of the valve?

Solution:

Same inlet and exit area: $A = \frac{\pi}{4}(0.050)^2 = 0.001963\ \text{m}^2$

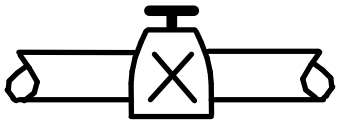
Ideal gas: $v_i = \frac{RT_i}{P_i} = \frac{0.2968\ \text{kJ/kg-K} \times 288.2\ \text{K}}{200\ \text{kPa}} = 0.4277\ \text{m}^3/\text{kg}$

From Eq.6.3,

$$\mathbf{V}_i = \frac{\dot{m}v_i}{A} = \frac{0.05\ \text{kg/s} \times 0.4277\ \text{m}^3/\text{kg}}{0.001963\ \text{m}^2} = \mathbf{10.9\ m/s}$$

Ideal gas: $v_e = \frac{RT_e}{P_e} = \frac{0.2968\ \text{kJ/kg-K} \times 288.2\ \text{K}}{170\ \text{kPa}} = 0.5032\ \text{m}^3/\text{kg}$

$$\mathbf{V}_e = \frac{\dot{m}v_e}{A} = \frac{0.05\ \text{kg/s} \times 0.5032\ \text{m}^3/\text{kg}}{0.001963\ \text{m}^2} = \mathbf{12.8\ m/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.17

A boiler receives a constant flow of 5000 kg/h liquid water at 5 MPa, 20°C and it heats the flow such that the exit state is 450°C with a pressure of 4.5 MPa. Determine the necessary minimum pipe flow area in both the inlet and exit pipe(s) if there should be no velocities larger than 20 m/s.

Solution:

Mass flow rate from Eq. 4.3, both $\mathbf{V} \leq 20$ m/s

$$\dot{m}_i = \dot{m}_e = (A\mathbf{V}/v)_i = (A\mathbf{V}/v)_e = 5000 \ \frac{1}{3600} \ \text{kg/s}$$

Table B.1.4 $\quad v_i = 0.001 \ \text{m}^3/\text{kg}$,

Table B.1.3 $\quad v_e = (0.08003 + 0.0633)/2 = 0.07166 \ \text{m}^3/\text{kg}$,

$$A_i \geq v_i \dot{m}/\mathbf{V}_i = 0.001 \ \text{m}^3/\text{kg} \times \frac{5000}{3600} \ \text{kg/s} \ / \ 20 \ \text{m/s}$$

$$= 6.94 \times 10^{-5} \ \text{m}^2 = \mathbf{0.69 \ cm^2}$$

$$A_e \geq v_e \dot{m}/\mathbf{V}_e = 0.07166 \ \text{m}^3/\text{kg} \times \frac{5000}{3600} \ \text{kg/s} \ / \ 20 \ \text{m/s}$$

$$= 4.98 \times 10^{-3} \ \text{m}^2 = \mathbf{50 \ cm^2}$$

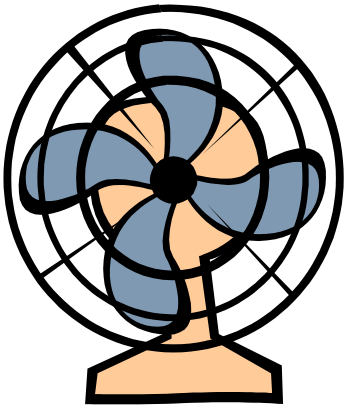
4.18

A 0.6 m diameter household fan takes air in at 98 kPa, 20°C and delivers it at 105 kPa, 21°C with a velocity of 1.5 m/s. What are the mass flow rate (kg/s), the inlet velocity and the outgoing volume flow rate in m^3/s?

Solution:



Continuity Eq. $\dot{m}_i = \dot{m}_e = A\mathbf{V}/ v$

Ideal gas $v = RT/P$

Area : $A = \frac{\pi}{4} D^2 = \frac{\pi}{4} \times 0.6^2 = 0.2827\ m^2$

$\dot{V}_e = A\mathbf{V}_e = 0.2827 \times 1.5 = \mathbf{0.4241\ m^3/s}$

$$v_e = \frac{RT_e}{P_e} = \frac{0.287 \times (21 + 273)}{105} = 0.8036\ m^3/kg$$

$\dot{m}_i = \dot{V}_e/v_e = 0.4241/0.8036 = \mathbf{0.528\ kg/s}$

$AV_i /v_i = \dot{m}_i = A\mathbf{V}_e / v_e$

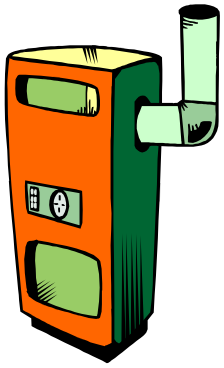
$$\mathbf{V}_i = \mathbf{V}_e \times (v_i/v_e) = \mathbf{V}_e \times \frac{RT_i}{P_i v_e} = 1.5 \times \frac{0.287\ kJ/kg\text{-}K \times (20 + 273)\ K}{98\ kPa \times 0.8036\ m^3/kg} = \mathbf{1.6\ m/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.19

An airport ventilation system takes 2.5 m^3/s air at 100 kPa, 17°C into a furnace and heats it to 52°C and delivers the flow to a duct with cross-sectional area 0.4 m^2 at 110 kPa. Find the mass flow rate and the velocity in the duct?

Solution:



The inflate flow is given by a $\dot{m}_i$

Continuity Eq.: $\dot{m}_i = \dot{V}_i / v_i = \dot{m}_e = A_e \mathbf{V}_e / v_e$

Ideal gas: $v_i = \dfrac{RT_i}{P_i} = \dfrac{0.287 \times 290}{100} = 0.8323 \dfrac{m^3}{kg}$

$$v_e = \frac{RT_e}{P_e} = \frac{0.287 \times (52 + 273)}{110}$$

$$= 0.8479 \ m^3/kg$$

$$\dot{m}_i = \dot{V}_i / v_i = 2.5 \ (m^3/s) \ / 0.8323 \ (m^3/kg) = 3.004 \ kg/s$$

$$\mathbf{V}_e = \dot{m} \ v_e / A_e = \frac{3.004 \times 0.8479}{0.4} \ \frac{m^3/s}{m^2} = \mathbf{6.37 \ m/s}$$

4.20

Liquid water at 15^{o}C flows out of a nozzle straight up 15 m. What is nozzle $\mathbf{V}_{exit}$?

Energy Eq.4.13: $h_{exit} + \frac{1}{2}\mathbf{V}_{exit}^2 + gH_{exit} = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gH_2$

If the water can flow 15 m up it has specific potential energy of gH_2 which must equal the specific kinetic energy out of the nozzle $\mathbf{V}_{exit}^2/2$. The water does not change P or T so h is the same.

$$\mathbf{V}_{exit}^2/2 = g(H_2 - H_{exit}) = gH \quad =>$$
$$\mathbf{V}_{exit} = \sqrt{2gH} = \sqrt{2 \times 9.807 \times 15\ m^2/s^2} = \mathbf{17.15\ m/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.21

A nozzle receives an ideal gas flow with a velocity of 25 m/s, and the exit is at 100 kPa, 300 K with a velocity of 250 m/s. Determine the inlet temperature if the gas is argon, helium or nitrogen.

Solution:

C.V. Nozzle: $\dot{m}_i = \dot{m}_e$ & assume no heat transfer $\Rightarrow$

Energy Eq.4.13: $h_i + \frac{1}{2}\mathbf{V}_i^2 = \frac{1}{2}\mathbf{V}_e^2 + h_e \Rightarrow h_i = h_e + \frac{1}{2}\mathbf{V}_e^2 - \frac{1}{2}\mathbf{V}_i^2$

$$h_i - h_e \approx C_p (T_i - T_e) = \tfrac{1}{2}(\mathbf{V}_e^2 - \mathbf{V}_i^2) = \tfrac{1}{2}(250^2 - 25^2) \text{ m}^2/\text{s}^2$$

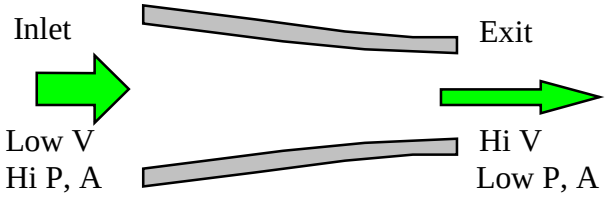
$$= 30937.5 \text{ J/kg} = 30.938 \text{ kJ/kg}$$

Specific heats for ideal gases are from table A.5

Argon $C_p = 0.52$ kJ/kg K; $\Delta T = \dfrac{30.938}{0.52} = 59.5$ **T_i = 359.5 K**

Helium $C_p = 5.913$ kJ/kg K; $\Delta T = \dfrac{30.938}{5.193} = 5.96$ **T_i = 306 K**

Nitrogen $C_p = 1.042$ kJ/kg K; $\Delta T = \dfrac{30.938}{1.042} = 29.7$ **T_i = 330 K**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.22

A diffuser receives 0.1 kg/s steam at 500 kPa, 350^{O}C. The exit is at 1 MPa, 400^{O}C with negligible kinetic energy and the flow is adiabatic. Find the diffuser inlet velocity and the inlet area.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$

State 1: Table B.1.3 $h_1 = 3167.65$ kJ/kg, $v_1 = 0.57012$ m^3/kg

State 2: $V_2 = 0$, Table B.1.3 $h_2 = 3263.88$ kJ/kg

Then from the energy equation

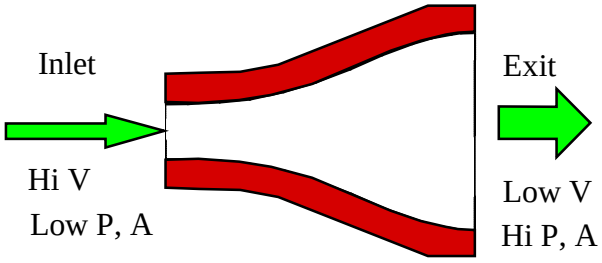
$$\frac{1}{2}\mathbf{V}_1^2 = h_2 - h_1 = 3263.88 - 3167.65 = 96.23 \text{ kJ/kg}$$

$$\mathbf{V}_1 = \sqrt{2(h_2 - h_1)} = \sqrt{2 \times 96.23 \times 1000} = \mathbf{438.7 \text{ m/s}}$$

The mass flow rate from Eq.4.3

$$\dot{m} = \rho A\mathbf{V} = A\mathbf{V}/v$$

$$A = \dot{m}v/\mathbf{V} = 0.1 \text{ kg/s} \times 0.57012 \text{ m}^3\text{/kg} / 438.7 \text{ m/s} = 0.00013 \text{ m}^2 = \mathbf{1.3 \text{ cm}^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.23

In a jet engine a flow of air at 1000 K, 200 kPa and 30 m/s enters a nozzle, as shown in Fig. P4.23, where the air exits at 850 K, 90 kPa. What is the exit velocity assuming no heat loss?

Solution:

C.V. nozzle. No work, no heat transfer

Continuity $\dot{m}_i = \dot{m}_e = \dot{m}$

Energy : $\dot{m}\,(h_i + \frac{1}{2}\mathbf{V}_i^2) = \dot{m}(h_e + \frac{1}{2}\mathbf{V}_e^2)$

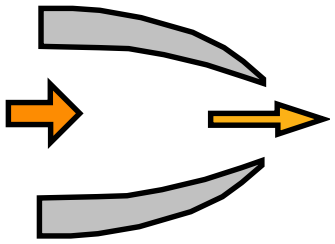
Due to high T take h from table A.7.1

$$\tfrac{1}{2}\mathbf{V}_e^2 = \tfrac{1}{2}\,\mathbf{V}_i^2 + h_i - h_e$$

$$= \frac{1}{2000}(30)^2 + 1046.22 - 877.4$$

$$= 0.45 + 168.82 = 169.27 \text{ kJ/kg}$$

$$\mathbf{V}_e = (2000 \times 169.27)^{1/2} = \mathbf{581.8\ m/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.24

In a jet engine a flow of air at 1000 K, 200 kPa and 40 m/s enters a nozzle where the air exits at 500 m/s, 90 kPa. What is the exit temperature assuming no heat loss?

Solution:

C.V. nozzle, no work, no heat transfer

Continuity $\dot{m}_i = \dot{m}_e = \dot{m}$

Energy : $\dot{m}\,(h_i + \frac{1}{2}\mathbf{V}_i^2) = \dot{m}(h_e + \frac{1}{2}\mathbf{V}_e^2)$

Due to the high T we take the h value from Table A.7.1

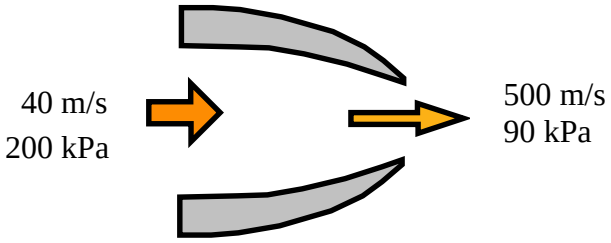
$$h_e = h_i + \tfrac{1}{2}\,\mathbf{V}_i^2 - \tfrac{1}{2}\mathbf{V}_e^2$$

$$= 1046.22 \text{ kJ/kg} + 0.5 \times (40^2 - 500^2)\ \text{m}^2/\text{s}^2 \times (1/1000)\ \text{kJ/J}$$

$$= 1046.22 - 124.2 = 922.02 \text{ kJ/kg}$$

Interpolation in Table A.7.1

$$T_e = 850 + 50\,\frac{922.02 - 877.4}{933.15 - 877.4} = \mathbf{890\ K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.25

Superheated vapor ammonia enters an insulated nozzle at 30°C, 1000 kPa, shown in Fig. P4.25, with a low velocity and at the steady rate of 0.01 kg/s. The ammonia exits at 300 kPa with a velocity of 450 m/s. Determine the temperature (or quality, if saturated) and the exit area of the nozzle.

Solution:

C.V. Nozzle, steady state, 1 inlet and 1 exit flow, insulated so no heat transfer.

Energy Eq.4.13: $q + h_i + \mathbf{V}_i^2/2 = h_e + \mathbf{V}_e^2/2,$

Process: $q = 0, \quad \mathbf{V}_i = 0$

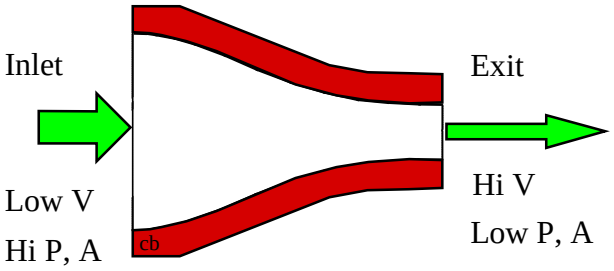
Table B.2.2: $h_i = 1479.1 = h_e + 450^2/(2\times1000) \quad \Rightarrow \quad h_e = 1377.85$ kJ/kg

Table B.2.1: $P_e = 300$ kPa Sat. state at –9.24°C :

$h_e = 1377.85 = 137.89 + x_e \times 1293.82,$

=> $x_e = \mathbf{0.9584}, \qquad v_e = 0.001536 + x_e \times 0.40566 = 0.3903$ m^3/kg

$$A_e = \dot{m}_e v_e/\mathbf{V}_e = 0.01 \times 0.3903 / 450 = \mathbf{8.67 \times 10^{-6}\ m^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.26

The wind is blowing horizontally at 30 m/s in a storm at P_0, 20°C toward a wall, where it comes to a stop (stagnation) and leaves with negligible velocity similar to a diffuser with a very large exit area. Find the stagnation temperature from the energy equation.

Solution:

Energy Eq.: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$ and $V_2 = 0$

$$h_2 = h_1 + \frac{1}{2}\mathbf{V}_1^2$$

$$T_2 = T_1 + \frac{1}{2} \times (\mathbf{V}_1^2 \,/\, C_p)$$

$$= 293 \text{ K} + \frac{1}{2} \times (30 \text{ m/s})^2 / (1.004 \text{ kJ/kg-K} \times 1000 \text{ J/kJ})$$

$$= \mathbf{293.45\ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.27

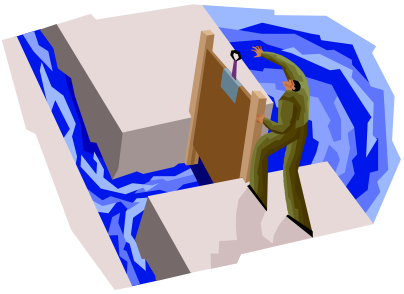
A sluice gate dams water up 5 m. There is a small hole at the bottom of the gate so liquid water at 20^{O}C comes out of a 1 cm diameter hole. Neglect any changes in internal energy and find the exit velocity and mass flow rate.

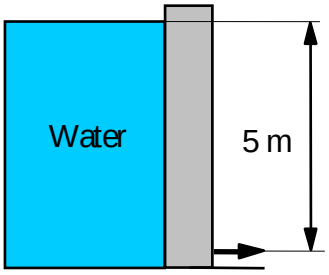
Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $h_1 = h_2$ both at P = 1 atm

$V_1 = 0$ $Z_1 = Z_2 + 5$ m





$$\frac{1}{2}\mathbf{V}_2^2 = g\,(Z_1 - Z_2)$$

$$\mathbf{V}_2 = \sqrt{2g(Z_1 - Z_2)} = \sqrt{2 \times 9.806 \times 5} = \mathbf{9.902\ m/s}$$

$$\dot{m} = \rho A\mathbf{V} = A\mathbf{V}/v = \frac{\pi}{4} D^2 \times (\mathbf{V}_2/v)$$

$$= \frac{\pi}{4} \times (0.01)^2\ m^2 \times (9.902\ m/s) / (0.001002\ m^3/kg) = \mathbf{0.776\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.28

A diffuser, shown in Fig. P4.28, has air entering at 100 kPa, 300 K, with a velocity of 200 m/s. The inlet cross-sectional area of the diffuser is 100 mm^2. At the exit, the area is 860 mm^2, and the exit velocity is 20 m/s. Determine the exit pressure and temperature of the air.

Solution:

Continuity Eq.4.3: $\dot{m}_i = A_i \mathbf{V}_i / v_i = \dot{m}_e = A_e \mathbf{V}_e / v_e$,

Energy Eq.(per unit mass flow) 4.13: $h_i + \frac{1}{2}\mathbf{V}_i^2 = h_e + \frac{1}{2}\mathbf{V}_e^2$

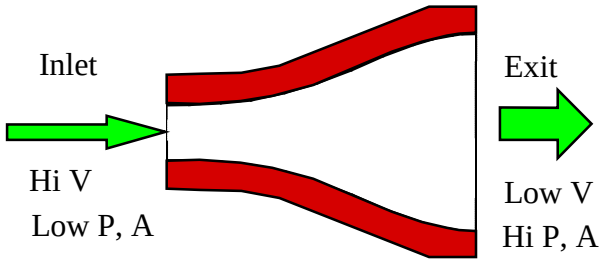
$$h_e - h_i = \tfrac{1}{2} \times 200^2/1000 - \tfrac{1}{2} \times 20^2/1000 = 19.8 \text{ kJ/kg}$$

$$T_e = T_i + (h_e - h_i)/C_p = 300 + \frac{19.8 \text{ kJ/kg}}{1.004 \text{ kJ/kg-K}} = \mathbf{319.72\ K}$$

Now use the continuity equation and the ideal gas law

$$v_e = v_i \left(\frac{A_e \mathbf{V}_e}{A_i \mathbf{V}_i}\right) = (RT_i/P_i)\left(\frac{A_e \mathbf{V}_e}{A_i \mathbf{V}_i}\right) = RT_e/P_e$$

$$P_e = P_i \left(\frac{T_e}{T_i}\right)\left(\frac{A_i \mathbf{V}_i}{A_e \mathbf{V}_e}\right) = 100 \text{ kPa} \left(\frac{319.72}{300}\right)\left(\frac{100 \times 200}{860 \times 20}\right) = \mathbf{123.92\ kPa}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.29

A meteorite hits the upper atmosphere at 3000 m/s, where the pressure is 0.1 atm and the temperature is –40°C. How hot does the air become right in front of the meteorite assuming no heat transfer in this adiabatic stagnation process?

Solution:

Energy Eq.: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$ and $V_2 = 0$

$$h_2 = h_1 + \frac{1}{2}\mathbf{V}_1^2$$

$$T_2 = T_1 + \frac{1}{2} \times (\mathbf{V}_1^2/C_p) = 233 + \frac{1}{2} \times \frac{3000^2}{1.004 \times 1000} = \mathbf{4715\ K}$$

At this high temperature we cannot assume constant specific heats, so use A.7

$$h_2 = h_1 + \frac{1}{2}\mathbf{V}_1^2 = 233.3 + \frac{1}{2} \times \frac{3000^2}{1000} = 4733.3 \text{ kJ/kg}$$

Table A.7 is listed to 3000 K so we have to extrapolate to get

$$T_2 = 3000 + 50\, \frac{4733.3 - 3525.36}{3525.36 - 3460.73} = \mathbf{3935\ K}$$

The value of C_p over 3000 K is 1.293 kJ/kgK from the last two table entries. At this temperature there will be some chemical reactions that should be considered to have a more realistic temperature.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.30

The front of a jet engine acts similar to a diffuser, receiving air at 900 km/h, –5°C, 50 kPa, bringing it to 80 m/s relative to the engine before entering the compressor. If the flow area is increased to 120% of the inlet area, find the temperature and pressure in the compressor inlet.

Solution:

C.V. Diffuser, Steady state, 1 inlet, 1 exit flow, no q, no w.

Continuity Eq.4.3: $\dot{m}_i = \dot{m}_e = (A\mathbf{V}/v)$

Energy Eq.4.12: $\dot{m}\,(h_i + \frac{1}{2}\mathbf{V}_i^2) = \dot{m}\,(\frac{1}{2}\mathbf{V}_e^2 + h_e)$

$$h_e - h_i = C_p (T_e - T_i) = \tfrac{1}{2}\mathbf{V}_i^2 - \tfrac{1}{2}\mathbf{V}_e^2 = \tfrac{1}{2}\left(\frac{900 \times 1000}{3600}\right)^2 - \tfrac{1}{2}(80)^2$$

$$= \tfrac{1}{2}(250)^2 - \tfrac{1}{2}(80)^2 = 28050 \text{ J/kg} = 28.05 \text{ kJ/kg}$$

$\Delta T = 28.05/1.004 = 27.9 \Rightarrow \quad T_e = -5 + 27.9 = \mathbf{22.9°C}$

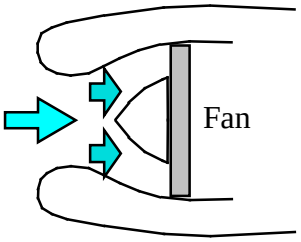
Now use the continuity eq.:

$$A_i\mathbf{V}_i / v_i = A_e\mathbf{V}_e / v_e \Rightarrow \quad v_e = v_i \left(\frac{A_e\mathbf{V}_e}{A_i\mathbf{V}_i}\right)$$

$$v_e = v_i \times \frac{1.2 \times 80}{1 \times 250} = v_i \times 0.384$$

Ideal gas: $Pv = RT \Rightarrow v_e = RT_e/P_e = RT_i \times 0.384/P_i$

$P_e = P_i (T_e/T_i)/0.384 = 50 \text{ kPa} \times 296/(268 \times 0.384) = \mathbf{143.8 \text{ kPa}}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Throttle flow

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.31

R-410A at –5°C, 700 kPa is throttled, so it becomes cold at –40°C. What is the exit P?

C.V. Throttle. Steady state,

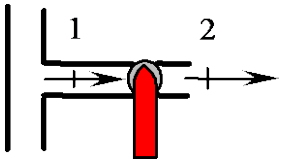
Process with: $q = w = 0$; and $\mathbf{V}_i = \mathbf{V}_e$, $Z_i = Z_e$

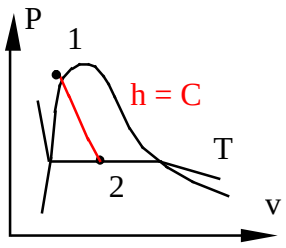
Energy Eq.4.13: $h_i = h_e$,

Inlet state: Table B.4.1 $h_i = 50.22$ kJ/kg (slightly compressed liquid)

Exit state: Table B.4.1 since $h < h_g = 262.83$ kJ/kg it is two-phase

$P = P_{sat} =$ **175 kPa**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.32

Carbon dioxide is throttled from 20°C, 2 MPa to 800 kPa. Find the exit temperature assuming ideal gas behavior and repeat for real-gas behavior.

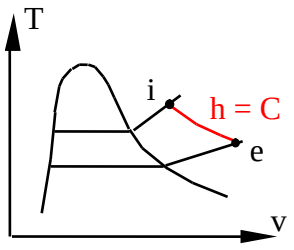
C.V. Throttle (valve, restriction), Steady flow, 1 inlet and exit, no q, w

Energy Eq.4.13: $h_i = h_e$

Ideal gas: same h gives $T_i = T_e = 20^oC$

Real gas : $h_i = h_e = 368.42$ kJ/kg, $P_e = 0.8$ MPa } Table B.3.2 T_e = **5.3°C** (= **278 K**)

Comment: As you go towards lower P it becomes closer to ideal gas and the constant h curve bends to become horizontal (h becomes fct of T only)



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.33

Saturated liquid R-134a at 25°C is throttled to 300 kPa in a refrigerator. What is the exit temperature? Find the percent increase in the volume flow rate.

Solution:
Steady throttle flow. Assume no heat transfer and no change in kinetic or potential energy.

$$h_e = h_i = h_{f\,25^oC} = 234.59 \text{ kJ/kg} = h_{f\,e} + x_e\, h_{fg\,e} \quad \text{at 300 kPa}$$

From table B.5.1 we get $T_e = T_{sat}$ (300 kPa) = **0.56°C**

Let's use 0°C for the following (we could interpolate to get at 0.56°C)

$$x_e = \frac{h_e - h_{f\,e}}{h_{fg\,e}} = \frac{234.59 - 200}{198.36} = 0.1744$$

$$v_e = v_f + x_e\, v_{fg} = 0.000773 + x_e\, 0.06842 = 0.0127 \text{ m}^3/\text{kg}$$

$$v_i = v_{f\,25^oC} = 0.000829 \text{ m}^3/\text{kg}$$

$\dot{V} = \dot{m}v$ so the ratio becomes

$$\frac{\dot{V}_e}{\dot{V}_i} = \frac{\dot{m}v_e}{\dot{m}v_i} = \frac{v_e}{v_i} = \frac{0.0127}{0.000829} = \mathbf{15.32}$$

So the increase is 14.32 times or **1432 %**

4.34

A supply line has a steady flow of R-410A at 1000 kPa, 60°C from which a flow is taken out through a throttle with an exit flow at 300 kPa. Find the exit temperature.

C.V. Throttle. Steady state,

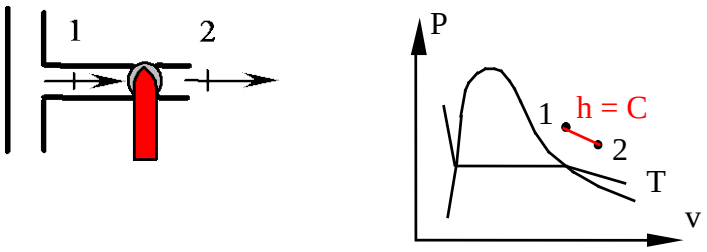
Process with: $q = w = 0$; and $\mathbf{V}_i = \mathbf{V}_e$, $Z_i = Z_e$

Energy Eq.4.13: $h_i = h_e$,

Inlet state: Table B.4.2 $h_i = 335.75$ kJ/kg

Exit state: Table B.4.2 since $h > h_g$

Interpolate: $$T = 40 + 20 \frac{335.75 - 327.22}{344.81 - 327.22} = \mathbf{49.7^oC},$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.35

Carbon dioxide used as a natural refrigerant flows out of a cooler at 10 MPa, 40^{o}C after which it is throttled to 1.4 MPa. Find the state (T, x) for the exit flow.

C.V. Throttle. Steady state,

Process with: q = w = 0; and $\mathbf{V}_i = \mathbf{V}_e$, $Z_i = Z_e$

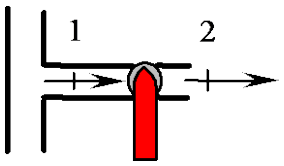
Energy Eq.4.13: $h_i = h_e$,

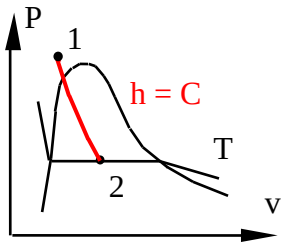
Inlet state: Table B.3.2 $h_i = 200.14$ kJ/kg

Exit state: Table B.3.1 since $h < h_g = 323.87$ kJ/kg

Interpolate: T = **-30.6^{o}C**, $h_f = 19.2$ kJ/kg, $h_{fg} = 304.67$ kJ/kg

$x = (200.14 - 19.2) / 304.67 =$ **0.594**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.36

Liquid water at 180^{o}C, 2000 kPa is throttled into a flash evaporator chamber having a pressure of 500 kPa. Neglect any change in the kinetic energy. What is the fraction of liquid and vapor in the chamber?

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = \mathbf{V}_1$

$\Rightarrow \quad h_2 = h_1 = 763.71$ kJ/kg from Table B.1.4

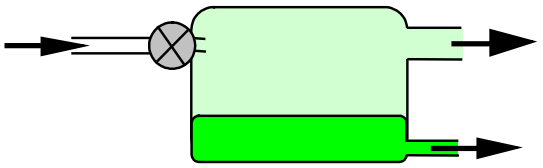
State 2: P_2 & $h_2 \quad \Rightarrow \quad$ 2 – phase

$h_2 = h_f + x_2\, h_{fg}$

$x_2 = (h_2 - h_f) / h_{fg} = \dfrac{763.71 - 640.21}{2108.47} = 0.0586$

Fraction of Vapor: $x_2 = 0.0586$ (5.86 %)

Liquid: $1 - x_2 = 0.941$ (94.1 %)



Two-phase out of the valve. The liquid drops to the bottom.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.37

Helium is throttled from 1.2 MPa, 20°C, to a pressure of 100 kPa. The diameter of the exit pipe is so much larger than the inlet pipe that the inlet and exit velocities are equal. Find the exit temperature of the helium and the ratio of the pipe diameters.

Solution:

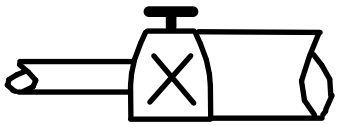
C.V. Throttle. Steady state,

Process with: $q = w = 0$; and $\mathbf{V}_i = \mathbf{V}_e$, $Z_i = Z_e$

Energy Eq.4.13: $h_i = h_e$, Ideal gas => $T_i = T_e =$ **20°C**

$\dot{m} = \dfrac{A\mathbf{V}}{RT/P}$ But $\dot{m}$, $\mathbf{V}$, T are constant => $P_iA_i = P_eA_e$

$$\Rightarrow \quad \frac{D_e}{D_i} = \left(\frac{P_i}{P_e}\right)^{1/2} = \left(\frac{1.2}{0.1}\right)^{1/2} = \mathbf{3.464}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.38

Methane at 1 MPa, 300 K is throttled through a valve to 100 kPa. Assume no change in the kinetic energy. What is the exit temperature?

Solution:

Energy Eq. 4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = \mathbf{V}_1$

State 1, Table B.7.2: $h_1 = 618.76$ kJ/kg

Use energy eq.: $\Rightarrow \quad h_2 = h_1 = 618.76$ kJ/kg

State 2: P_2 & $h_2 \quad \Rightarrow$ look in B.7.2 : Superheated vapor

$$T_2 = 275 + 25 \frac{618.76 - 572.36}{627.58 - 572.36} = \mathbf{296\ K}$$

Notice if it had been ideal gas then $T_2 = T_1$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.39

R-134a is throttled in a line flowing at 25^{o}C, 750 kPa with negligible kinetic energy to a pressure of 165 kPa. Find the exit temperature and the ratio of exit pipe diameter to that of the inlet pipe (D_{ex}/D_{in}) so the velocity stays constant.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = \mathbf{V}_1$

State 1, Table B.5.1: $h_1 = 234.59$ kJ/kg, $v_1 = v_f = 0.000829$ m^3/kg

Use energy eq.: $\Rightarrow \quad h_2 = h_1 = 234.59$ kJ/kg

State 2: P_2 & $h_2 \quad \Rightarrow \quad 2$ – phase and $T_2 = T_{sat}$ (165 kPa) = **-15°C**

$h_2 = h_f + x_2 h_{fg} = 234.59$ kJ/kg

$x_2 = (h_2 - h_f) / h_{fg} = (234.59 - 180.19) / 209 = 0.2603$

$v_2 = v_f + x_2 \times v_{fg} = 0.000746 + 0.2603 \times 0.11932 = 0.0318$ m^3/kg

Now the continuity equation with $\mathbf{V}_2 = \mathbf{V}_1$ gives, from Eq.4.3,

$$\dot{m} = \rho A\mathbf{V} = A\mathbf{V}/v = A_1\mathbf{V}_1/v_1 = (A_2\,\mathbf{V}_1) / v_2$$

$$(A_2 / A_1) = v_2 / v_1 = (D_2 / D_1)^2$$

$$(D_2/D_1) = (v_2 / v_1)^{0.5} = (0.0318 / 0.000829)^{0.5} = \mathbf{6.19}$$

Turbines, Expanders

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.40

A steam turbine has an inlet of 3 kg/s water at 1200 kPa, 350^{O}C and velocity of 15 m/s. The exit is at 100 kPa, 150^{O}C and very low velocity. Find the specific work and the power produced.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2 + w_T$

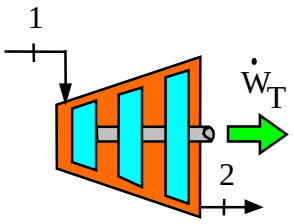
Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = 0$

Table B.1.3: $h_1 = 3153.59$ kJ/kg, $h_2 = 2776.38$ kJ/kg

$$w_T = h_1 + \frac{1}{2}\mathbf{V}_1^2 - h_2 = 3153.59 + \frac{15^2}{2000} - 2776.38 = \mathbf{377.3\ kJ/kg}$$

(remember to convert m^2/s^2 = J/kg to kJ/kg by dividing with 1000)

$$\dot{W}_T = \dot{m} \times w_T = 3\ \text{kg/s} \times 377.3\ \text{kJ/kg}$$
$$= \mathbf{1132\ kW}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.41

Air at 20 m/s, 1500 K, 875 kPa with 5 kg/s flows into a turbine and it flows out at 25 m/s, 850 K, 105 kPa. Find the power output using constant specific heats.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2 + w_T$

Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = 0$

Table A.5: $C_p = 1.004$ kJ/kg-K

$$w_T = h_1 + \tfrac{1}{2}\mathbf{V}_1^2 - h_2 - \tfrac{1}{2}\mathbf{V}_2^2 = C_p(T_1 - T_2) + \tfrac{1}{2}\mathbf{V}_1^2 - \tfrac{1}{2}\mathbf{V}_2^2$$

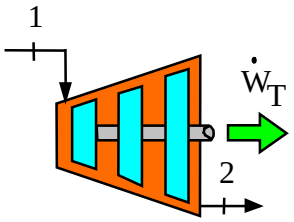
$$= 1.004 \text{ kJ/kg-K} \times (1500 - 850) \text{ K} + \frac{20^2 - 25^2}{2000} (\text{m}^2/\text{s}^2) \times (\text{kJ/J})$$

$$= \mathbf{652.5 \text{ kJ/kg}}$$

(remember to convert m^2/s^2 = J/kg to kJ/kg by dividing with 1000)

$$\dot{W}_T = \dot{m} \times w_T = 5 \text{ kg/s} \times 652.5 \text{ kJ/kg}$$

$$= \mathbf{3263 \text{ kW}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.42

Solve the previous problem using Table A.7.
Air at 20 m/s, 1500 K, 875 kPa with 5 kg/s flows into a turbine and it flows out at 25 m/s, 850 K, 105 kPa. Find the power output using constant specific heats.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2 + w_T$

Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = 0$

Table A.7.1: $h_1 = 1635.8$ kJ/kg, $h_2 = 877.4$ kJ/kg

$$w_T = h_1 - h_2 + \frac{1}{2}\mathbf{V}_1^2 - \frac{1}{2}\mathbf{V}_2^2$$

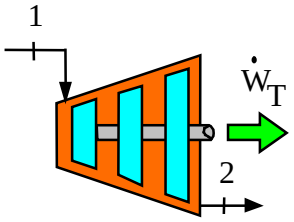
$$= (1635.8 - 877.4)\ \text{kJ/kg} + \frac{20^2 - 25^2}{2000}\ (\text{m}^2/\text{s}^2) \times (\text{kJ/J})$$

$$= \mathbf{758.3\ kJ/kg}$$

(remember to convert m^2/s^2 = J/kg to kJ/kg by dividing with 1000)

$$\dot{W}_T = \dot{m} \times w_T = 5\ \text{kg/s} \times 758.3\ \text{kJ/kg}$$

$$= \mathbf{3792\ kW}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.43

A windmill with rotor diameter of 20 m takes 40% of the kinetic energy out as shaft work on a day with 20°C and wind speed of 35 km/h. What power is produced?

Solution:

Continuity Eq. $\dot{m}_i = \dot{m}_e = \dot{m}$

Energy $\dot{m}\,(h_i + \tfrac{1}{2}\mathbf{V}_i^2 + gZ_i) = \dot{m}(h_e + \tfrac{1}{2}\mathbf{V}_e^2 + gZ_e) + \dot{W}$

Process information: $\dot{W} = \dot{m}\tfrac{1}{2}\mathbf{V}_i^2 \times 0.4$

$\dot{m} = \rho A\mathbf{V} = A\mathbf{V}_i / v_i$

$A = \frac{\pi}{4} D^2 = \frac{\pi}{4} 20^2 = 314.16 \text{ m}^2$

$v_i = RT_i/P_i = \dfrac{0.287 \times 293}{101.3} = 0.8301 \text{ m}^3/\text{kg}$

$\mathbf{V}_i = 35 \text{ km/h} = \dfrac{35 \times 1000}{3600} = 9.7222 \text{ m/s}$

$\dot{m} = A\mathbf{V}_i / v_i = \dfrac{314.16 \times 9.7222}{0.8301} = 3679.5 \text{ kg/s}$

$\tfrac{1}{2}\,\mathbf{V}_i^2 = \tfrac{1}{2}\ 9.7222^2 \text{ m}^2/\text{s}^2 = 47.26 \text{ J/kg}$

$\dot{W} = 0.4\,\dot{m}\tfrac{1}{2}\,\mathbf{V}_i^2 = 0.4 \times 3679.5 \text{ kg/s} \times 47.26 \text{ J/kg} = 69\,557 \text{ W}$

$= \mathbf{69.56\ kW}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.44

A liquid water turbine receives 2 kg/s water at 2000 kPa, 20^{O}C and velocity of 15 m/s. The exit is at 100 kPa, 20^{O}C and very low velocity. Find the specific work and the power produced.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2 + w_T$

Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = 0$

State 1: Table B.1.4 $h_1 = 85.82$ kJ/kg

State 2: Table B.1.1 $h_2 = 83.94$ (which is at 2.3 kPa so we should add $\Delta Pv = 97.7 \times 0.001$ to this)

$w_T = h_1 + \frac{1}{2}\mathbf{V}_1^2 - h_2 = 85.82 + 15^2/2000 - 83.94 =$ **1.9925 kJ/kg**

$$\dot{W}_T = \dot{m} \times w_T = 2 \text{ kg/s} \times 1.9925 \text{ kJ/kg} = \mathbf{3.985\ kW}$$

Notice how insignificant the specific kinetic energy is.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.45

What is the specific work one can expect from the dam in Problem 4.27?

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2 + w_T$

Process: $\mathbf{V}_2 = \mathbf{V}_1$; $P_1 = P_2 = P_0$; $h_1 = h_2$

Same velocity if same flow area (incompressible flow) and the water temperature does not change significantly. The specific potential enrgy difference can be extracted

$$w_T = gZ_1 - gZ_2 = 9.806\ \text{m/s}^2 \times (5 - 0)\ \text{m} = 49\ \text{m}^2/\text{s}^2 = \mathbf{49\ J/kg}$$

This is a very small amount of specific work.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.46

A small, high-speed turbine operating on compressed air produces a power output of 100 W. The inlet state is 400 kPa, 50°C, and the exit state is 150 kPa, –30°C. Assuming the velocities to be low and the process to be adiabatic, find the required mass flow rate of air through the turbine.

Solution:

C.V. Turbine, no heat transfer, no ΔKE, no ΔPE

Energy Eq.4.13: $h_{in} = h_{ex} + w_T$

Ideal gas so use constant specific heat from Table A.5

$$w_T = h_{in} - h_{ex} \cong C_p(T_{in} - T_{ex})$$

$$= 1.004 \text{ (kJ/kg-K)} [50 - (-30)] \text{ K} = 80.3 \text{ kJ/kg}$$

$$\dot{W} = \dot{m} w_T \quad \Rightarrow \quad \dot{m} = \dot{W}/w_T = 0.1 \text{ kW } /80.3 \text{ kJ/kg} = \mathbf{0.00125 \text{ kg/s}}$$

The dentist's drill has a small air flow and is not really adiabatic.

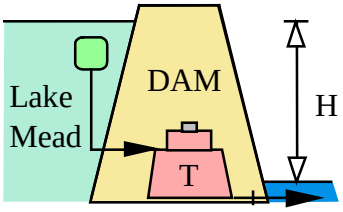
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.47

Hoover Dam across the Colorado River dams up Lake Mead 200 m higher than the river downstream. The electric generators driven by water-powered turbines deliver 1300 MW of power. If the water is 17.5°C, find the minimum amount of water running through the turbines.

Solution:

C.V.: H_2O pipe + turbines,



Continuity: $\dot{m}_{in} = \dot{m}_{ex}$;

Energy Eq.4.13: $(h + \mathbf{V}^2/2 + gz)_{in} = (h + \mathbf{V}^2/2 + gz)_{ex} + w_T$

Water states: $h_{in} \cong h_{ex}$; $v_{in} \cong v_{ex}$

Now the specific turbine work becomes

$$w_T = gz_{in} - gz_{ex} = 9.807 \times 200/1000 = 1.961 \text{ kJ/kg}$$

$$\dot{m} = \dot{W}_T/w_T = \frac{1300\times10^3 \text{ kW}}{1.961 \text{ kJ/kg}} = 6.63 \times 10^5 \text{ kg/s}$$

$$\dot{V} = \dot{m}v = 6.63 \times 10^5 \text{ kg/s} \times 0.001001 \text{ m}^3/\text{kg} = \mathbf{664\ m^3/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.48

A small turbine, shown in Fig. P 4.48, is operated at part load by throttling a 0.25 kg/s steam supply at 1.4 MPa, 250°C down to 1.1 MPa before it enters the turbine and the exhaust is at 10 kPa. If the turbine produces 110 kW, find the exhaust temperature (and quality if saturated).

Solution:

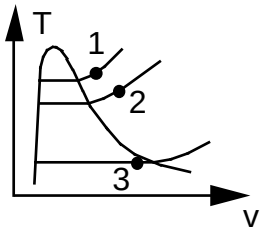
C.V. Throttle, Steady, q = 0 and w = 0. No change in kinetic or potential energy. The energy equation then reduces to

Energy Eq.4.13: $h_1 = h_2 = 2927.2$ kJ/kg from Table B.1.3

C.V. Turbine, Steady, no heat transfer, specific work: $w = \frac{110}{0.25} = 440$ kJ/kg

Energy Eq.: $h_1 = h_2 = h_3 + w = 2927.2$ kJ/kg

$\Rightarrow \quad h_3 = 2927.2 - 440 = 2487.2$ kJ/kg



State 3: (P, h) Table B.1.2 $h < h_g$

$2487.2 = 191.83 + x_3 \times 2392.8$

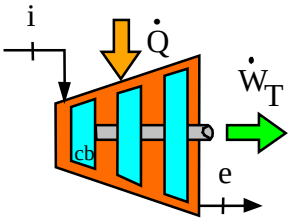
$\Rightarrow \quad T = \mathbf{45.8°C}$, $x_3 = \mathbf{0.959}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.49

A small expander (a turbine with heat transfer) has 0.05 kg/s helium entering at 1000 kPa, 550 K and it leaves at 250 kPa, 300 K. The power output on the shaft is measured to 55 kW. Find the rate of heat transfer neglecting kinetic energies.
Solution:

C.V. Expander. Steady operation



Cont. $\dot{m}_i = \dot{m}_e = \dot{m}$

Energy $\dot{m}h_i + \dot{Q} = \dot{m}h_e + \dot{W}$

$$\dot{Q} = \dot{m}\,(h_e - h_i) + \dot{W}$$

Use specific heat from Table A.5: $C_{p\,He} = 5.193$ kJ/kg K

$$\dot{Q} = \dot{m}C_p\,(T_e - T_i) + \dot{W}$$
$$= 0.05 \text{ kg/s} \times 5.193 \text{ kJ/kg-K} \times (300 - 550) \text{ K} + 55 \text{ kW}$$
$$= -64.91 + 55 = \mathbf{-9.9\ kW}$$

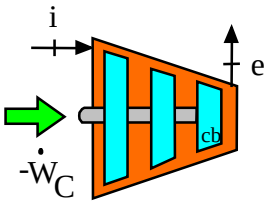
4.50

A compressor in a commercial refrigerator receives R-410A at -25^{o}C, x = 1. The exit is at 1000 kPa, 40^{o}C. Neglect kinetic energies and find the specific work.

Solution:

C.V. Compressor, steady state, single inlet and exit flow. For this device we also assume no heat transfer and $Z_i = Z_e$



From Table B.4.1 : $h_i = 269.77$ kJ/kg

From Table B.4.2 : $h_e = 316.05$ kJ/kg

Energy Eq.4.13 reduces to

$$w_C = h_i - h_e = (269.77 - 316.05) \text{ kJ/kg} = \mathbf{-46.28\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.51

A compressor brings nitrogen from 100 kPa, 290 K to 2000 kPa. The process has a specific work input of 450 kJ/kg and the exit temperature is 450 K. Find the specific heat transfer using constant specific heats.

Solution:

C.V. Compressor. Not adiabatic, neglect kinetic and potential energy changes.

Energy Eq.4.13: $q + h_i + \mathbf{V}_i^2/2 + gZ_i = h_e + \mathbf{V}_e^2/2 + w + gZ_e$

Process: $Z_i = Z_e$; $\mathbf{V}_i^2/2 = \mathbf{V}_e^2/2$

Solve for the heat transfer

$$q = h_e + w - h_i = C_p (T_e - T_i) + w$$

$$= 1.042 \text{ kJ/kg-K} \times (450 - 290) \text{ K} - 450 \text{ kJ/kg} = \mathbf{-283.3 \text{ kJ/kg}}$$

Recall standard sign notation is work positive out.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.52

A portable fan blows 0.3 kg/s room air with a velocity of 15 m/s (see Fig. P4.18). What is the minimum power electric motor that can drive it? Hint: Are there any changes in P or T?

Solution:

C.V. Fan plus space out to near stagnant inlet room air.

Energy Eq.4.13: $q + h_i + \mathbf{V}_i^2/2 = h_e + \mathbf{V}_e^2/2 + w$

Here $q \cong 0$, $\mathbf{V}_i \cong 0$ and $h_i = h_e$ same P and T

$-w = \mathbf{V}_e^2/2 = (15^2/2)\ (\text{m/s})^2 = 112.5\ \text{J/kg} = 0.1125\ \text{kJ/kg}$

$-\dot{W} = -\dot{m}w = 0.3\ \text{kg/s} \times 0.1125\ \text{kJ/kg} = \mathbf{0.034\ kW}$

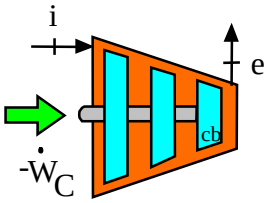
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.53

A refrigerator uses the natural refrigerant carbon dioxide where the compressor brings 0.02 kg/s from 1 MPa, -20^{O}C to 6 MPa using 2 kW of power. Find the compressor exit temperature.

Solution:

C.V. Compressor, steady state, single inlet and exit flow. For this device we also assume no heat transfer and $Z_i = Z_e$



From Table B.3.2 : $h_i = 342.31$ kJ/kg

Energy Eq.4.13 reduces to

$$\dot{W} = \dot{m} w_C = \dot{m} (h_i - h_e) \Rightarrow \quad h_e = h_i - \dot{W}/\dot{m}$$

$h_e = 342.31$ kJ/kg – [–2 kW] / (0.02 kg/s) = 442.31 kJ/kg

From Table B.3.2 :

$T_e = 100 + 20\ (442.31 - 421.69)/(445.02 - 421.69) =$ **117.7 ^{o}C**

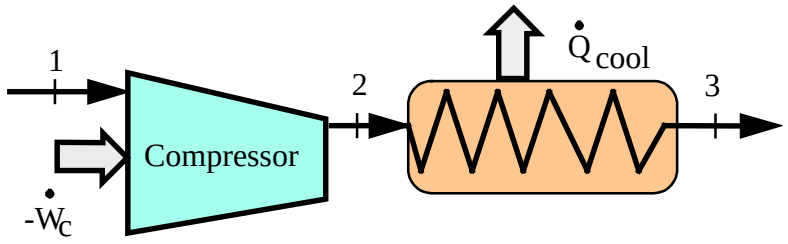
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.54

An air compressor takes in air at 100 kPa, 17°C and delivers it at 1 MPa, 600 K to a constant-pressure cooler, which it exits at 300 K. Find the specific compressor work and the specific heat transfer in the cooler.

Solution
C.V. air compressor $q = 0$

Continuity Eq.: $\dot{m}_2 = \dot{m}_1$
Energy Eq.4.13: $0 = h_1 + w_{c\ in} - h_2$



Compressor section Cooler section

Table A.7: $h_1 = 290.19$ kJ/kg, $h_2 = 607.32$ kJ/kg, $h_3 = 300.47$ kJ/kg

$w_{c\ in} = h_2 - h_1 = 607.32 - 290.19 =$ **317.13 kJ/kg**

C.V. cooler $w = 0$

Continuity Eq.: $\dot{m}_3 = \dot{m}_1$
Energy Eq.4.13: $0 = h_2 - q_{out} - h_3$

$q_{out} = h_2 - h_3 = 607.32 - 300.47 =$ **306.85 kJ/kg**

Comment: For thess temperatures we could have used constant specific heats from A.5

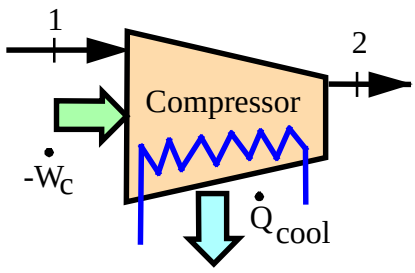
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.55

A compressor brings R-134a from 150 kPa, -10°C to 1200 kPa, 50°C. It is water cooled with a heat loss estimated as 40 kW and the shaft work input is measured to be 150 kW. How much is the mass flow rate through the compressor?

Solution:

C.V Compressor. Steady flow.
Neglect kinetic and potential energies.



Energy : $\dot{m}\, h_i + \dot{Q} = \dot{m} h_e + \dot{W}$

$$\dot{m} = (\dot{Q} - \dot{W})/(h_e - h_i)$$

Look in table B.5.2

$h_i = 393.84$ kJ/kg, $h_e = 426.84$ kJ/kg

$$\dot{m} = \frac{-40 - (-150)}{426.84 - 393.84} \frac{\text{kW}}{\text{kJ/kg}} = \mathbf{3.333\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.56

The compressor of a large gas turbine receives air from the ambient at 95 kPa, 20°C, with a low velocity. At the compressor discharge, air exits at 1.52 MPa, 430°C, with velocity of 90 m/s. The power input to the compressor is 5000 kW. Determine the mass flow rate of air through the unit.

Solution:

C.V. Compressor, steady state, single inlet and exit flow.

Energy Eq.4.13: $q + h_i + \mathbf{V}_i^2/2 = h_e + \mathbf{V}_e^2/2 + w$

Here we assume $q \cong 0$ and $\mathbf{V}_i \cong 0$ so using constant C_{Po} from A.5

$$-w = C_{Po}(T_e - T_i) + \mathbf{V}_e^2/2 = 1.004(430 - 20) + \frac{(90)^2}{2 \times 1000} = 415.5 \text{ kJ/kg}$$

Notice the kinetic energy is 1% of the work and can be neglected in most cases. The mass flow rate is then from the power and the specific work

$$\dot{m} = \frac{\dot{W}_c}{-w} = \frac{5000}{415.5}\frac{\text{kW}}{\text{kJ/kg}} = \mathbf{12.0\ kg/s}$$

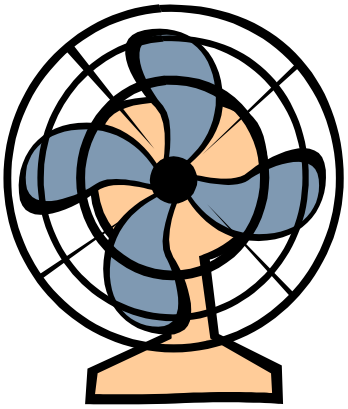
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.57

How much power is needed to run the fan in Problem 4.18?

A household fan of diameter 0.6 m takes air in at 98 kPa, 20°C and delivers it at 105 kPa, 21°C with a velocity of 1.5 m/s. What are the mass flow rate (kg/s), the inlet velocity and the outgoing volume flow rate in m^3/s?

Solution:



Continuity Eq. $\dot{m}_i = \dot{m}_e = A\mathbf{V}/ v$

Ideal gas $v = RT/P$

Area : $A = \frac{\pi}{4} D^2 = \frac{\pi}{4} \times 0.6^2 = 0.2827\ m^2$

$\dot{V}_e = A\mathbf{V}_e = 0.2827 \times 1.5 = 0.4241\ m^3/s$

$v_e = \frac{RT_e}{P_e} = \frac{0.287 \times (21 + 273)}{105} = 0.8036\ m^3/kg$

$\dot{m}_i = \dot{V}_e/v_e = 0.4241/0.8036 = 0.528\ kg/s$

$AV_i /v_i = \dot{m}_i = A\mathbf{V}_e / v_e$

$$\mathbf{V}_i = \mathbf{V}_e \times (v_i/v_e) = \mathbf{V}_e \times \frac{RT_i}{P_i v_e} = 1.5 \times \frac{0.287\ kJ/kg\text{-}K \times (20 + 273)\ K}{98\ kPa \times 0.8036\ m^3/kg} = 1.6\ m/s$$

$$\dot{W} = \dot{m}(h_i + \tfrac{1}{2}V_i^2 - h_e - \tfrac{1}{2}V_e^2) = \dot{m}\,[C_p\,(T_i - T_e) + \tfrac{1}{2}\,V_i^2 - \tfrac{1}{2}V_e^2]$$

$$= 0.528\,[\,1.004\,(-1) + \frac{1.6^2 - 1.5^2}{2000}] = 0.528\,[-1.004 + 0.000155]$$

$$= -\,\mathbf{0.53\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.58

A compressor in an industrial air-conditioner compresses ammonia from a state of saturated vapor at 200 kPa to a pressure of 1000 kPa. At the exit the temperature is measured to be 100^{O}C and the mass flow rate is 0.5 kg/s. What is the required motor size (kW) for this compressor?

Solution:

C.V. Compressor. Assume adiabatic and neglect kinetic energies.

Energy Eq.4.13: $w_C = h_1 - h_2$

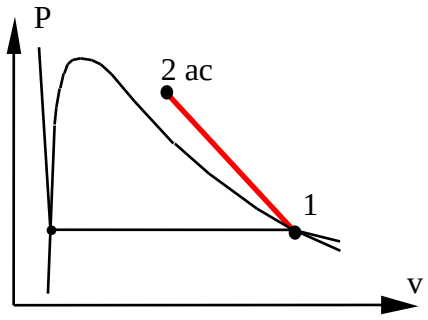
States: 1: B.2.2: $h_1 = 1419.6$ kJ/kg

2: B.2.2 $h_{2,AC} = 1664.3$ kJ/kg

Energy equation:

$-w_C = h_2 - h_1 = 1664.3 - 1419.6 = 244.7$ kJ/kg

$$\dot{W} = 0.5 \text{ kg/s} \times 244.7 \text{ kJ/kg} = \mathbf{122\ kW}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.59

An exhaust fan in a building should be able to move 3 kg/s air atmospheric pressure air at 25^{O}C through a 0.5 m diameter vent hole. How high a velocity must it generate and how much power is required to do that?

Solution:

C.V. Fan and vent hole. Steady state with uniform velocity out.

Continuity Eq.: $\dot{m}$ = constant = $\rho A\mathbf{V} = A\mathbf{V} / v = A\mathbf{V}P/RT$

Ideal gas : $Pv = RT$, and area is $A = \frac{\pi}{4} D^2$

Now the velocity is found

$$\mathbf{V} = \dot{m}\, RT/(\frac{\pi}{4} D^2 P)$$

$$= 3 \text{ kg/s} \times 0.287 \text{ kJ/kg-K} \times 293.15 \text{ K} / (\frac{\pi}{4} \times 0.5^2 \text{ m}^2 \times 101 \text{ kPa})$$

$$= \mathbf{12.7 \text{ m/s}}$$

The kinetic energy out is

$$\tfrac{1}{2}\mathbf{V}_2^2 = \tfrac{1}{2} \times 12.7^2 / 1000 = 0.08065 \text{ kJ/kg}$$

which is provided by the work (only two terms in energy equation that does not cancel, we assume $\mathbf{V}_1 = 0$)

$$\dot{W}_{in} = \dot{m}\ \tfrac{1}{2}\mathbf{V}_2^2 = 3 \text{ kg/s} \times 0.08065 \text{ kJ/kg} = \mathbf{0.242 \text{ kW}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.60

A compressor receives R-410A as saturated vapor R-410A at 400 kPa and brings it to 2000 kPa, 60^{o}C. Then a cooler brings it to saturated liquid at 2000 kPa (see Fig. P4.54). Find the specific compressor work and the specific heat transfer in the cooler?

C.V. Compressor. Assume adiabatic and neglect kinetic, potential energies.

Energy Eq.4.13: $w = h_1 - h_2$

States: 1: B.4.2 $h_1 = 271.9$ kJ/kg

2: B.4.2 $h_2 = 320.62$ kJ/kg

3: B.4.1 $h_3 = 106.14 + \frac{2.31}{5}(114.95 - 106.14) = 110.2$ kJ/kg

$-w_C = h_2 - h_1 = 320.62 - 271.9 =$ **48.72 kJ/kg**

C.V. Cooler. No work, neglect kinetic, potential energies.

Energy Eq. 4.13: $q = h_3 - h_2 = 110.2 - 320.62 =$ **–210.4 kJ/kg**

The compressor is inside the unit to the left that also houses a fan and the heat exchanger.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.61

An air flow is brought from 20^{o}C, 100 kPa to 1000 kPa, 330^{o}C by an adiabatic compressor driven by a 50-kW motor. What are the mass flow rate and the exit volume flow rate of air?

C.V. Compressor. Assume adiabatic and neglect kinetic, potential energies.

Energy Eq.4.13: $w = h_1 - h_2$

$$-w_C = h_2 - h_1 \approx C_P (T_2 - T_1) = 1.004 \text{ kJ/kg-K} \times (330 - 20) \text{ K}$$

$$= 311.2 \text{ kJ/kg}$$

The mass flow rate scale the work term so

$$\dot{m} = \dot{W} / -w_C = \frac{50 \text{ kW}}{311.2 \text{ kJ/kg}} = \mathbf{0.1606 \text{ kg/s}}$$

$$\dot{V} = \dot{m}\, v = \dot{m} \frac{RT}{P} = 0.1606 \text{ kg/s} \frac{0.287 \times (330 + 273) \text{ kJ/kg}}{1000 \text{ kPa}}$$

$$= \mathbf{0.0278 \text{ m}^3/\text{s}}$$

Heaters/Coolers

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.62

The air conditioner in a house or a car has a cooler that brings atmospheric air from 30^{o}C to 10^{o}C both states at 101 kPa. If the flow rate is 0.75 kg/s find the rate of heat transfer.

Solution:

CV. Cooler. Steady state single flow with heat transfer.

Neglect changes in kinetic and potential energy and no work term.

Energy Eq. 4.13: $q_{out} = h_i - h_e$

Use constant specific heat from Table A.5 (T is around 300 K)

$$q_{out} = h_i - h_e = C_P\,(T_i - T_e)$$

$$= 1.004\,\frac{\text{kJ}}{\text{kg K}} \times (30 - 10)\ \text{K} = 20.1\ \text{kJ/kg}$$

$$\dot{Q}_{out} = \dot{m}\, q_{out} = 0.75 \times 20.1 = \mathbf{15\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.63

A boiler section boils 3 kg/s saturated liquid water at 2000 kPa to saturated vapor in a reversible constant-pressure process. Find the specific heat transfer in the process.

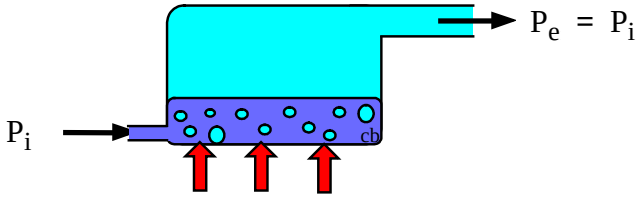
C.V. Boiler. Steady state single inlet and exit flow, neglect potential energy and since velocities are low we neglect kinetic energies.

Energy Eq. 4.13: $q + h_i = h_e$

From Table B.1.2: $h_i = 908.77$ kJ/kg

Table B.1.3: $h_e = 2799.51$ kJ/kg

$$q = h_e - h_i = 2799.51 - 908.77 = \mathbf{1890.74\ kJ/kg}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.64

A condenser (cooler) receives 0.05 kg/s R-410A at 2000 kPa, 80^{o}C and cools it to 10^{o}C. Assume the exit properties are as for saturated liquid with the same T. What cooling capacity (kW) must the condenser have?

Solution:

C.V. R-410A condenser. Steady state single flow, heat transfer out and no work.

Energy Eq. 4.12: $\dot{m}\, h_1 = \dot{m}\, h_2 + \dot{Q}_{out}$

Inlet state: Table B.4.2 $h_1 = 343.22$ kJ/kg,

Exit state: Table B.4.1 $h_2 = 73.21$ kJ/kg (compressed liquid)

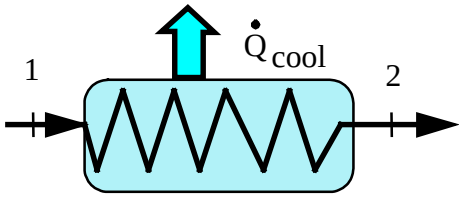
To be more accurate we could have added (P-Psat)v to the h_2.

Process: Neglect kinetic and potential energy changes.

Cooling capacity is taken as the heat transfer out i.e. positive out so

$$\dot{Q}_{out} = \dot{m}\,(h_1 - h_2) = 0.05 \text{ kg/s} \times (343.22 - 73.21) \text{ kJ/kg}$$

$$= \mathbf{13.5\ kW}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.65

Carbon dioxide enters a steady-state, steady-flow heater at 300 kPa, 300 K, and exits at 275 kPa, 1500 K, as shown in Fig. P4.65. Changes in kinetic and potential energies are negligible. Calculate the required heat transfer per kilogram of carbon dioxide flowing through the heater.

Solution:

C.V. Heater Steady state single inlet and exit flow.

Energy Eq. 4.13: $q + h_i = h_e$

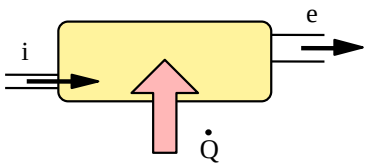


Table A.8: $q = h_e - h_i = 1614.9 - 214.4 =$ **1400.5 kJ/kg**

[If we use C_{p0} from A.5 then $q \cong 0.842$ kJ/kg-K × (1500 - 300)K = 1010.4 kJ/kg]

Too large ΔT, T_{ave} to use C_{p0} at room temperature.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.66

Find the heat transfer in Problem 4.17

A boiler receives a constant flow of 5000 kg/h liquid water at 5 MPa, 20°C and it heats the flow such that the exit state is 450°C with a pressure of 4.5 MPa. Determine the necessary minimum pipe flow area in both the inlet and exit pipe(s) if there should be no velocities larger than 20 m/s.

Solution:

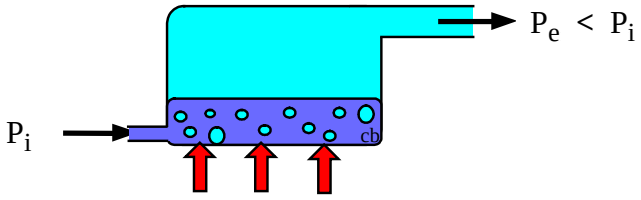
C.V. Heater. Steady state single inlet and exit flow, neglect potential energy and since velocities are low we neglect kinetic energies.

Energy Eq. 4.13: $q + h_i = h_e$

From Table B.1.4: $h_i = 88.64$ kJ/kg

Table B.1.3: $h_e = (3330.23 + 3316.15)/2 = 3323.19$ kJ/kg

$$q = h_e - h_i = 3323.19 - 88.64 = \mathbf{3234.6\ kJ/kg}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.67

A chiller cools liquid water for air-conditioning purposes. Assume 2.5 kg/s water at 20^{o}C, 100 kPa is cooled to 5^{o}C in a chiller. How much heat transfer (kW) is needed?

Solution:

C.V. Chiller. Steady state single flow with heat transfer. Neglect changes in kinetic and potential energy and no work term.

Energy Eq. 4.13: $q_{out} = h_i - h_e$

Properties from Table B.1.1:

$h_i = 83.94$ kJ/kg and $h_e = 20.98$ kJ/kg

Now the energy equation gives

$$q_{out} = 83.94 - 20.98 = 62.96 \text{ kJ/kg}$$

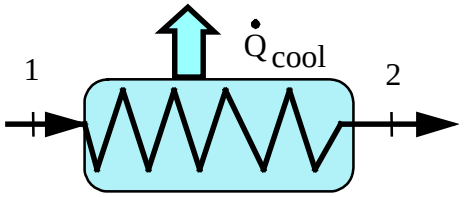
$$\dot{Q}_{out} = \dot{m}\, q_{out} = 2.5 \times 62.96 = \mathbf{157.4\ kW}$$

Alternative property treatment since single phase and small ΔT

If we take constant specific heat for the liquid from Table A.4

$$q_{out} = h_i - h_e \cong C_p\,(T_i - T_e)$$
$$= 4.18 \text{ kJ/kg-K} \times (20 - 5) \text{ K} = 62.7 \text{ kJ/kg}$$

$$\dot{Q}_{out} = \dot{m}\, q_{out} = 2.5 \text{ kg/s} \times 62.7 \text{ kJ/kg} = \mathbf{156.75\ kW}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.68

Saturated liquid nitrogen at 600 kPa enters a boiler at a rate of 0.008 kg/s and exits as saturated vapor, see Fig. P4.68. It then flows into a super heater also at 600 kPa where it exits at 600 kPa, 280 K. Find the rate of heat transfer in the boiler and the super heater.

Solution:

C.V.: boiler steady single inlet and exit flow, neglect KE, PE energies in flow

Continuity Eq.: $\dot{m}_1 = \dot{m}_2 = \dot{m}_3$

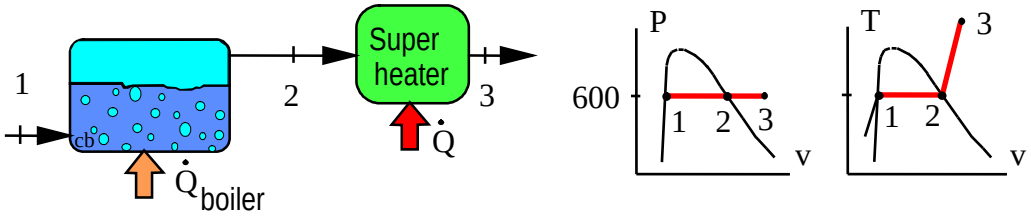


Table B.6.1: $h_1 = -81.469$ kJ/kg, $h_2 = 86.85$ kJ/kg,

Table B.6.2: $h_3 = 289.05$ kJ/kg

Energy Eq. 4.13: $q_{boiler} = h_2 - h_1 = 86.85 - (-81.469) = 168.32$ kJ/kg

$\dot{Q}_{boiler} = \dot{m}_1 q_{boiler} = 0.008$ kg/s × 168.32 kJ/kg = **1.346 kW**

C.V. Superheater (same approximations as for boiler)

Energy Eq. 4.13: $q_{sup\ heater} = h_3 - h_2 = 289.05 - 86.85 = 202.2$ kJ/kg

$\dot{Q}_{sup\ heater} = \dot{m}_2 q_{sup\ heater} = 0.008$ kg/s × 202.2 kJ/kg = **1.62 kW**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.69

Carbon dioxide used as a natural refrigerant flows through a cooler at 10 MPa, which is supercritical so no condensation occurs. The inlet is at 220^{O}C and the exit is at 50^{O}C. Find the specific heat transfer.

C.V. Cooler. Steady state single flow with heat transfer. Neglect changes in kinetic and potential energy and no work term.

Energy Eq. 4.13: $0 = h_i - h_e + q$

Properties from Table B.3.2:

$h_i = 542.91$ kJ/kg and

$h_e = (200.14 + 312.11)/2 = 256.13$ kJ/kg

Now the energy equation gives

$q = 256.13 - 542.91 =$ **–286.79 kJ/kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.70

In a steam generator, compressed liquid water at 10 MPa, 30°C, enters a 30-mm diameter tube at the rate of 3 L/s. Steam at 9 MPa, 400°C exits the tube. Find the rate of heat transfer to the water.

Solution:

C.V. Steam generator. Steady state single inlet and exit flow.

Constant diameter tube: $A_i = A_e = \frac{\pi}{4}(0.03)^2 = 0.0007068\ m^2$

Table B.1.4 $\dot{m} = \dot{V}_i/v_i = 0.003/0.0010003 = 3.0\ kg/s$

$\mathbf{V}_i = \dot{V}_i/A_i = 0.003/0.0007068 = 4.24\ m/s$

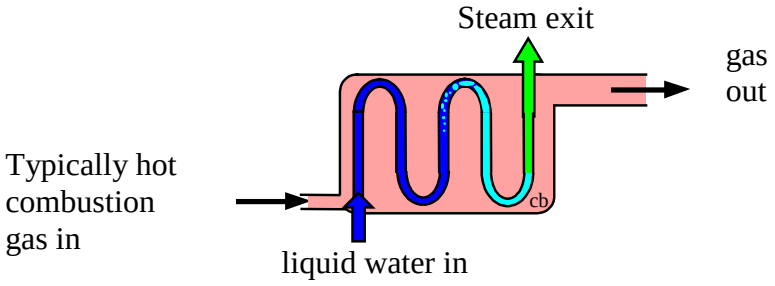
Exit state properties from Table B.1.3

$\mathbf{V}_e = \mathbf{V}_i \times v_e/v_i = 4.24 \times 0.02993/0.0010003 = 126.86\ m/s$

The energy equation Eq. 4.12 is solved for the heat transfer as

$$\dot{Q} = \dot{m}\left[(h_e - h_i) + \left(\mathbf{V}_e^2 - \mathbf{V}_i^2\right)/2\right]$$

$$= 3.0\ kg/s \times \left[3117.8 - 134.86 + \frac{126.86^2 - 4.24^2}{2 \times 1000}\right] kJ/kg = \mathbf{8973\ kW}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.71

An oven has five radiant heaters; each one is rated at 15 kW. It should heat some 2-kg steel plates from 20°C to 800 K. How many of these plates per minute can it heat?

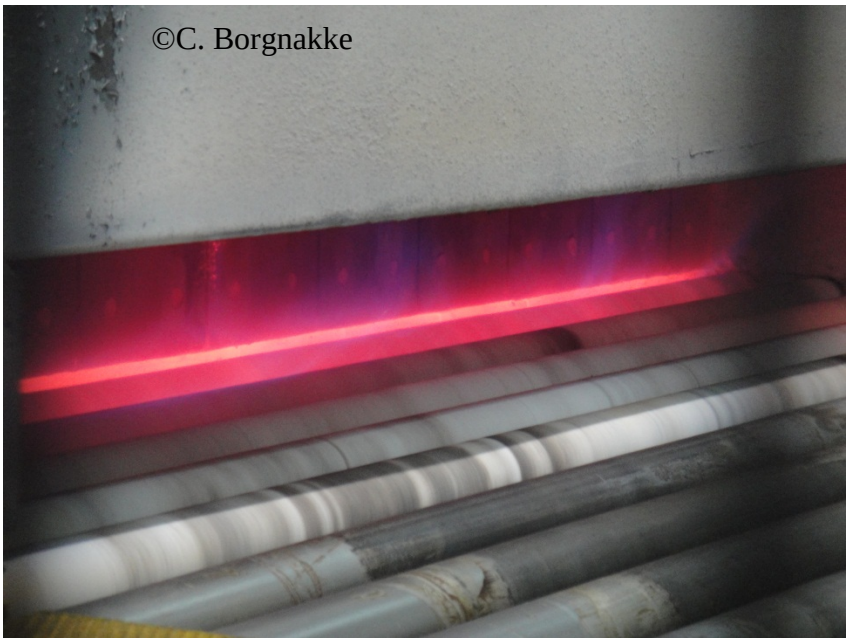
C.V. Oven, steady state operation. A flow of plates in (represents an $\dot{m}$**)**

Energy Eq.: $0 = \dot{m}\,(h_i - h_e) + \dot{Q}$

$$\dot{Q} = \dot{m}\,(h_e - h_i) = \dot{m}\,C\,(T_e - T_i)$$

$$\dot{m} = \dot{Q} / C\,(T_e - T_i) = \frac{5 \times 15 \text{ kW}}{0.46\,(800 - 293) \text{ kJ/kg}} = 0.322 \text{ kg/s}$$

$N = \dot{m}/m = (0.322 / 2)\ 1/s = 0.161\ 1/s =$ **9.65 per min**



Front end of oven with steel rollers to bring the plates in a skirt hangs down to limit heat losses.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.72

A cryogenic fluid as liquid nitrogen at 90 K, 400 kPa flows into a probe used in cryogenic surgery. In the return line the nitrogen is then at 160 K, 400 kPa. Find the specific heat transfer to the nitrogen. If the return line has a cross sectional area 100 times larger than the inlet line what is the ratio of the return velocity to the inlet velocity?

Solution:

C.V line with nitrogen. No kinetic or potential energy changes

Continuity Eq.: $\dot{m} = \text{constant} = \dot{m}_e = \dot{m}_i = A_e \mathbf{V}_e / v_e = A_i \mathbf{V}_i / v_i$

Energy Eq. 4.13: $q = h_e - h_i$

State i, Table B.6.1: $h_i = -95.58$ kJ/kg, $v_i = 0.001343$ m^3/kg

State e, Table B.6.2: $h_e = 162.96$ kJ/kg, $v_e = 0.11647$ m^3/kg

From the energy equation

$$q = h_e - h_i = 162.96 - (-95.58) = \mathbf{258.5\ kJ/kg}$$

From the continuity equation

$$\mathbf{V}_e / \mathbf{V}_i = A_i / A_e \, (v_e / v_i) = \frac{1}{100} \, \frac{0.11647}{0.001343} = \mathbf{0.867}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.73

An evaporator has R-410A at −20°C and quality 20% flowing in, with the exit flow being saturated vapor at −20°C. Knowing that there is no work, find the specific heat transfer.

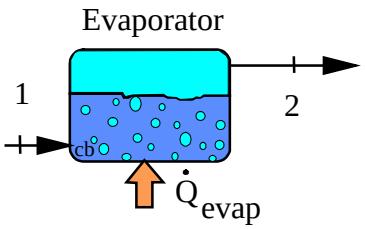
C.V. Heater Steady state single inlet and exit flow.

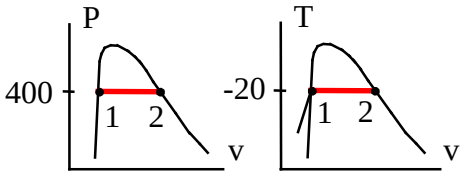
Energy Eq.4.13: $0 = q + h_1 - h_2$

Table B.4: $h_1 = 28.24 + 0.2 \times 243.65 = 76.97$ kJ/kg

$h_2 = 271.89$ kJ/kg

$q = h_2 - h_1 = 271.89 - 76.97 =$ **194.92 kJ/kg**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.74

A flow of liquid glycerine flows around an engine, cooling it as it absorbs energy. The glycerine enters the engine at 60°C and receives 19 kW of heat transfer. What is the required mass flow rate if the glycerine should come out at maximum 95° C?

Solution:

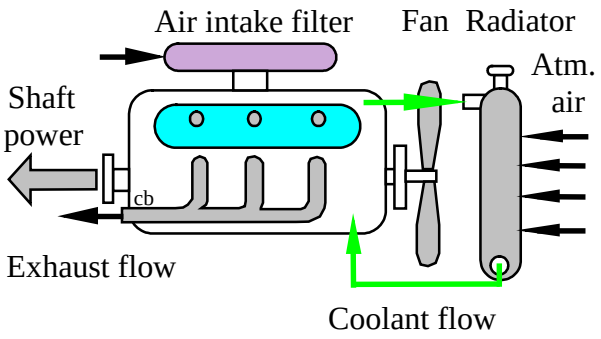
C.V. Liquid flow (glycerine is the coolant), steady flow. no work.

Energy Eq.: $\dot{m}h_i + \dot{Q} = \dot{m}h_e$

$$\dot{m} = \dot{Q}/(h_e - h_i) = \frac{\dot{Q}}{C_{gly}\,(T_e - T_i)}$$

From table A.4 $C_{gly} = 2.42$ kJ/kg-K

$$\dot{m} = \frac{19}{2.42\ (95 - 60)}\ \frac{\text{kW}}{\text{kJ/kg}} = \mathbf{0.224\ kg/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Pumps, pipe and channel flows

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.75

An irrigation pump takes water from a river at 10^{o}C, 100 kPa and pumps it up to an open canal, where it flows out 100 m higher at 10^{o}C. The pipe diameter in and out of the pump is 0.1 m and the motor driving the unit is 5 hp. What is the flow rate neglecting kinetic energy and losses?

C.V. Pump plus pipe to canal.

This is a single steady flow device with atmospheric pressure in and out.

Energy Eq.: $0 = h_i + 0 + gZ_i + w_{p\ in} - h_e - 0 - gZ_e$

$$w_{p\ in} = g(Z_e - Z_i) = 9.81\ \text{m/s}^2 \times 100\ (\text{m/s})^2 = 0.981\ \text{kJ/kg}$$

$$\dot{W}_{p\ in} = 5\ \text{hp} = 5\ \text{hp} \times 0.746\ \text{kW/hp} = 3.73\ \text{kW}$$

Find the flow rate from the work

$$\dot{m} = \dot{W}_{p\ in} / w_{p\ in} = 3.73\ \text{kW}/\ 0.981\ \text{kJ/kg} = \mathbf{3.8\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.76

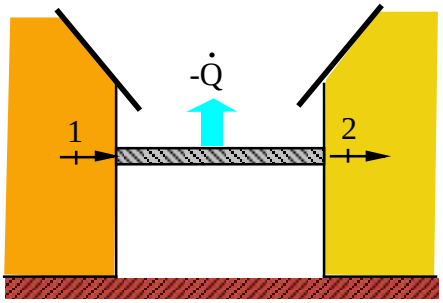
A pipe flows water at 15^{o}C from one building to another. In the winter time the pipe loses an estimated 500 W of heat transfer. What is the minimum required mass flow rate that will ensure that the water does not freeze (i.e. reach 0^{o}C)?

Solution:

Energy Eq.: $\dot{m}h_i + \dot{Q} = \dot{m}h_e$

Assume saturated liquid at given T from table B.1.1

$$\dot{m} = \frac{\dot{Q}}{h_e - h_i} = \frac{-500 \times 10^{-3}}{0 - 62.98}\frac{\text{kW}}{\text{kJ/kg}} = \frac{0.5}{62.98}\text{kg/s} = \mathbf{0.007\ 94\ kg/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.77

A river flowing at 0.5 m/s across a 1-m-high and 10-m-wide area has a dam that creates an elevation difference of 2 m. How much energy could a turbine deliver per day if 80% of the potential energy can be extracted as work?

CV Dam from upstream to downstream 2 m lower elevation

Continuity Eq.: $\dot{m} = \text{constant} = \dot{m}_e = \dot{m}_i = A_e \mathbf{V}_e / v_e = A_i \mathbf{V}_i / v_i$

Find the mass flow rate

$$\dot{m} = A\mathbf{V}_i / v = \rho A \mathbf{V}_i = 997 \text{ kg/m}^3 \times (1 \times 10) \text{ m}^2 \times 0.5 \text{ m/s} = 4985 \text{ kg/s}$$

Energy Eq.: $0 = \dot{m} (h_i + 0.5\mathbf{V}_i^2 + gZ_i) - \dot{m} (h_e + 0.5\mathbf{V}_e^2 + gZ_e) - \dot{W}$

The velocity in and out is the same assuming same flow area and the two enthalpies are also the same since same T and $P = P_0$.

$$\dot{W} = 0.8\, \dot{m}\, g(Z_i - Z_e) = 0.8 \times 4985 \text{ kg/s} \times 9.807 \text{ m/s}^2 \times 2 \text{ m}$$
$$= 78\,221 \text{ J/s} = 78\,221 \text{ W} = 78.2 \text{ kW}$$

$$W = \dot{W}\, \Delta t = 78.2 \text{ (kJ/s)} \times 24 \times 60 \times 60 \text{ s} = \mathbf{6.76\ GJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.78

A steam pipe for a 300-m tall building receives superheated steam at 200 kPa at ground level. At the top floor the pressure is 125 kPa and the heat loss in the pipe is 110 kJ/kg. What should the inlet temperature be so that no water will condense inside the pipe?

Solution:

C.V. Pipe from 0 to 300 m, no ΔKE, steady state, single inlet and exit flow. Neglect any changes in kinetic energy.

Energy Eq. 4.13: $q + h_i = h_e + gZ_e$

No condensation means: Table B.1.2, $h_e = h_g$ at 125 kPa = 2685.4 kJ/kg

$$h_i = h_e + gZ_e - q = 2685.4 + \frac{9.807 \times 300}{1000} - (-110) = 2810.1 \text{ kJ/kg}$$

At 200 kPa: T ~ **170^{O}C** Table B.1.3

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.79

Consider a water pump that receives liquid water at 25^{o}C, 100 kPa and delivers it to a same diameter short pipe having a nozzle with exit diameter of 2 cm (0.02 m) to the atmosphere 100 kPa. Neglect the kinetic energy in the pipes and assume constant *u* for the water. Find the exit velocity and the mass flow rate if the pump draws a power of 1 kW.

Solution:

Continuity Eq.: $\dot{m}_i = \dot{m}_e = A\mathbf{V}/v$; $A = \frac{\pi}{4} D_e^2 = \frac{\pi}{4} \times 0.02^2 = 3.1416 \times 10^{-4}$ m^2

Energy Eq. 4.13: $h_i + \frac{1}{2}\mathbf{V}_i^{\,2} + gZ_i = h_e + \frac{1}{2}\mathbf{V}_e^{\,2} + gZ_e + w$

Properties: $h_i = u_i + P_i v_i = h_e = u_e + P_e v_e$; $P_i = P_e$; $v_i = v_e$

$$w = -\frac{1}{2}\mathbf{V}_e^{\,2} \quad \Rightarrow \quad -\dot{W} = \dot{m}\,(\frac{1}{2}\mathbf{V}_e^{\,2}) = A \times \frac{1}{2}\mathbf{V}_e^{\,3}/v_e$$

$$\mathbf{V}_e = \left(\frac{-2\,\dot{W}\,v_e}{A} \right)^{1/3} = \left(\frac{2 \times 1000 \times 0.001003}{3.1416 \times 10^{-4}} \right)^{1/3} = \mathbf{18.55\ m/s}$$

$$\dot{m} = A\mathbf{V}_e/v_e = 3.1416 \times 10^{-4} \times 18.55 / 0.001003 = \mathbf{5.81\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.80

A small water pump is used in an irrigation system. The pump takes water in from a river at 10°C, 100 kPa at a rate of 5 kg/s. The exit line enters a pipe that goes up to an elevation 20 m above the pump and river, where the water runs into an open channel. Assume the process is adiabatic and that the water stays at 10°C. Find the required pump work.

Solution:

C.V. pump + pipe. Steady state , 1 inlet, 1 exit flow. Assume same velocity in and out, no heat transfer.

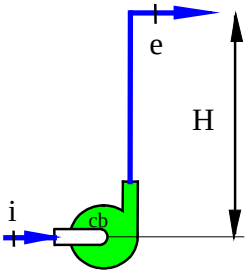
Continuity Eq.: $\dot{m}_{in} = \dot{m}_{ex} = \dot{m}$

Energy Eq. 4.12:

$$\dot{m}(h_{in} + (1/2)\mathbf{V}_{in}^2 + gz_{in}) =$$

$$\dot{m}(h_{ex} + (1/2)\,\mathbf{V}_{ex}^2 + gz_{ex}) + \dot{W}$$

States: $h_{in} = h_{ex}$ same (T, P)



$$\dot{W} = \dot{m}\, g(z_{in} - z_{ex}) = 5 \text{ kg/s} \times 9.807 \text{ m/s}^2 \times (0 - 20) \text{ m} / (1000 \text{ J/kJ})$$

$$= \mathbf{-0.98\ kW}$$

I.E. 0.98 kW required input

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.81

A small stream with water at 15°C runs out over a cliff creating a 50 m tall waterfall. Estimate the downstream temperature when you neglect the horizontal flow velocities upstream and downstream from the waterfall. How fast was the water dropping just before it splashed into the pool at the bottom of the waterfall?

Solution:

CV. Waterfall, steady state. Assume no $\dot{Q}$ nor $\dot{W}$

Energy Eq. 4.13: $h + \frac{1}{2}V^2 + gZ = \text{const.}$

State 1: At the top zero velocity $Z_1 = 100$ m

State 2: At the bottom just before impact, $Z_2 = 0$

State 3: At the bottom after impact in the pool.

$$h_1 + 0 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + 0 = h_3 + 0 + 0$$

Properties: $h_1 \cong h_2$ same T, P

$$\Rightarrow \quad \frac{1}{2}\mathbf{V}_2^2 = gZ_1$$

$$\mathbf{V}_2 = \sqrt{2gZ_1} = \sqrt{2 \times 9.806\ \text{m/s}^2 \times 50\ \text{m}} = \mathbf{31.3\ m/s}$$

Energy equation from state 1 to state 3

$$h_3 = h_1 + gZ_1$$

use $\Delta h = C_p\,\Delta T$ with value from Table A.4 (liquid water)

$$T_3 = T_1 + gZ_1 / C_p$$
$$= 20 + 9.806\ \text{m/s}^2 \times 50\ \text{m}/\ (4180\ \text{J/kg-K}) = \mathbf{20.12\ °C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.82

A cutting tool uses a nozzle that generates a high speed jet of liquid water. Assume an exit velocity of 500 m/s of 20^{O}C liquid water with a jet diameter of 2 mm (0.002 m). How much mass flow rate is this? What size (power) pump is needed to generate this from a steady supply of 20^{O}C liquid water at 200 kPa?

Solution:

C.V. Nozzle. Steady state, single flow.

Continuity equation with a uniform velocity across A

$$\dot{m} = A\mathbf{V}/v = \frac{\pi}{4} D^2 \mathbf{V} / v = \frac{\pi}{4} 0.002^2 \times 500 / 0.001002 = \mathbf{1.568\ kg/s}$$

Assume $Z_i = Z_e = Ø$, $u_e = u_i$ and $\mathbf{V}_i = 0$ $P_e = 100$ kPa (atmospheric)

Energy Eq.4.13: $h_i + Ø + Ø = h_e + \frac{1}{2}\mathbf{V}_e^2 + Ø + w$

$$w = h_i - h_e - \tfrac{1}{2}\mathbf{V}_e^2 = u_i - u_e + P_i v_i - P_e v_e - \tfrac{1}{2}\mathbf{V}_e^2$$

$$= (P_i - P_e) v_i - \tfrac{1}{2}\mathbf{V}_e^2$$

$$= 0.001002\ \text{m}^3/\text{kg} \times (200 - 100)\ \text{kPa} - 0.5 \times \frac{500^2\ \text{m}^2/\text{s}^2}{1000\ \text{J/kJ}}$$

$$= 0.1002 - 125 \cong -125\ \text{kJ/kg}$$

$$\dot{W} = \dot{m}w = 1.568\ \text{kg/s} \times (-125\ \text{kJ/kg}) = \mathbf{-196\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.83

The main waterline into a tall building has a pressure of 600 kPa at 5 m below ground level. A pump brings the pressure up so the water can be delivered at 200 kPa at the top floor 100 m above ground level. Assume a flow rate of 10 kg/s liquid water at 10^{o}C and neglect any difference in kinetic energy and internal energy u. Find the pump work.

Solution:

C.V. Pipe from inlet at -5 m up to exit at +150 m, 200 kPa.

Energy Eq.4.13: $h_i + \frac{1}{2}V_i^2 + gZ_i = h_e + \frac{1}{2}V_e^2 + gZ_e + w$

With the same u the difference in h's are the Pv terms

$$w = h_i - h_e + \frac{1}{2}(V_i^2 - V_e^2) + g(Z_i - Z_e)$$

$$= P_i v_i - P_e v_e + g(Z_i - Z_e)$$

$$= 600 \times 0.001 - 200 \times 0.001 + 9.806 \times (-5 - 100)/1000$$

$$= 0.4 - 1.03 = -0.63 \text{ kJ/kg}$$

$$\dot{W} = \dot{m}w = 10 \times (-0.63) = \mathbf{-6.3\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Multiple flow single device processes

Turbines, Compressors, Expanders

4.84

An adiabatic steam turbine in a power plant receives 5 kg/s steam at 3000 kPa, 500^{o}C. Twenty percent of the flow is extracted at 1000 kPa, 350^{o}C to a feedwater heater, and the remainder flows out at 200 kPa, 200^{o}C (see Fig. P4.84). Find the turbine power output.

C.V. Turbine Steady state, 1 inlet and 2 exit flows.

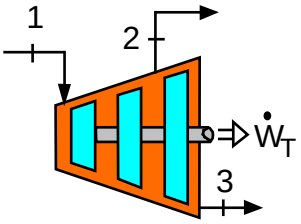
Continuity Eq.4.9: $\dot{m}_1 = \dot{m}_2 + \dot{m}_3$; => $\dot{m}_3 = \dot{m}_1 - \dot{m}_2 = 150$ lbm/s

Energy Eq.4.10: $\dot{m}_1 h_1 = \dot{W}_T + \dot{m}_2 h_2 + \dot{m}_3 h_3$

Table B.1.2 $h_1 = 3456.48$ kJ/kg,

$h_2 = 3157.65$ kJ/kg

Table B.1.1 : $h_3 = 2870.46$ kJ/kg



From the energy equation, Eq.4.10

$$\dot{W}_T = \dot{m}_1 h_1 - \dot{m}_2 h_2 - \dot{m}_3 h_3 = (5 \times 3456.48 - 1 \times 3157.65 - 4 \times 2870.46)\ \text{kJ/s}$$

$$= \mathbf{2643\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.85

A compressor receives 0.05 kg/s R-410A at 200 kPa, -20^{O}C and 0.1 kg/s R-410A at 400 kPa, 0^{O}C. The exit flow is at 1000 kPa, 60^{O}C as shown in Fig. P4.85. Assume it is adiabatic, neglect kinetic energies and find the required power input.

C.V. whole compressor steady, 2 inlets, 1 exit, no heat transfer $\dot{Q} = 0$

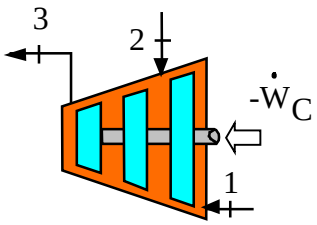
Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3 = 0.05 + 0.1 = 0.15$ kg/s

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 - \dot{W}_C = \dot{m}_3 h_3$

Table B.3.2: $h_1 = 278.72$ kJ/kg,

$h_2 = 290.42$ kJ/kg

Table B.3.2: $h_3 = 335.75$ kJ/kg



$$\dot{W}_C = 0.05 \times 278.72 + 0.1 \times 290.42 - 0.15 \times 335.75 = -7.385 \text{ kW}$$

Power input is **7.4 kW**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.86

Cogeneration is often used where a steam supply is needed for industrial process energy. Assume a supply of 5 kg/s steam at 0.5 MPa is needed. Rather than generating this from a pump and boiler, the setup in Fig. P4.86 is used so the supply is extracted from the high-pressure turbine. Find the power the turbine now cogenerates in this process.

Solution:

C.V. Turbine, steady state, 1 inlet and 2 exit flows, assume adiabatic, $\dot{Q}_{CV} = 0$

Continuity Eq.4.9: $\dot{m}_1 = \dot{m}_2 + \dot{m}_3$

Energy Eq.4.10: $\dot{Q}_{CV} + \dot{m}_1 h_1 = \dot{m}_2 h_2 + \dot{m}_3 h_3 + \dot{W}_T$;

Supply state 1: 20 kg/s at 10 MPa, 500°C

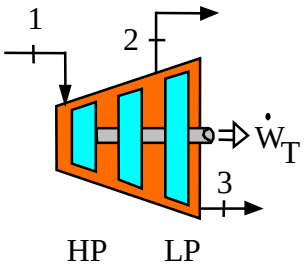
Process steam 2: 5 kg/s, 0.5 MPa, 155°C,

Exit state 3: 20 kPa, x = 0.9

Table B.1.3: $h_1 = 3373.7$, $h_2 = 2755.9$ kJ/kg,

Table B.1.2: $h_3 = 251.4 + 0.9 \times 2358.3$

$= 2373.9$ kJ/kg



$\dot{W}_T = (20 \times 3373.7 - 5 \times 2755.9 - 15 \times 2373.9)$ (kg/s) (kJ/kg)

$= 18\,084$ kW = **18.084 MW**

4.87

A steam turbine receives steam from two boilers. One flow is 5 kg/s at 3 MPa, 700°C and the other flow is 10 kg/s at 800 kPa, 500°C. The exit state is 10 kPa, with a quality of 96%. Find the total power out of the adiabatic turbine.

Solution:

C.V. whole turbine steady, 2 inlets, 1 exit, no heat transfer $\dot{Q} = 0$

Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3 = 5 + 15 = 20$ kg/s

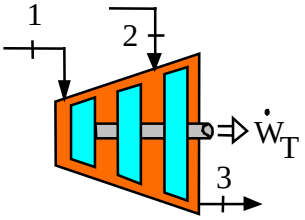
Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 + \dot{W}_T$

Table B.1.3: $h_1 = 3911.7$ kJ/kg,

$h_2 = 3480.6$ kJ/kg

Table B.1.2: $h_3 = 191.8 + 0.96 \times 2392.8$

$= 2488.9$ kJ/kg



$\dot{W}_T = 5 \times 3911.7 + 10 \times 3480.6 - 15 \times 2488.9 = 17\,031$ kW = **17 MW**

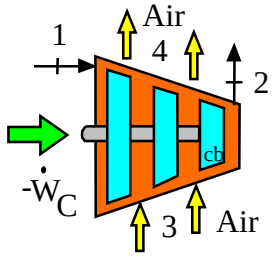
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.88

A compressor receives 0.1 kg/s R-134a at 150 kPa, -10°C and delivers it at 1000 kPa, 40°C. The power input is measured to be 3 kW. The compressor has heat transfer to air at 100 kPa coming in at 20°C and leaving at 30°C. How much is the mass flow rate of air?

Solution:

C.V. Compressor, steady state, single inlet and exit flow. For this device we also have an air flow outside the compressor housing no changes in kenetic or potential energy.



Continuity Eq.: $\dot{m}_2 = \dot{m}_1$

Energy Eq. 4.12: $\dot{m}_1 h_1 + \dot{W}_{in} + \dot{m}_{air} h_3 = \dot{m}_2 h_2 + \dot{m}_{air} h_4$

Ideal gas for air and constant specific heat: $h_4 - h_3 \sim C_{p\,air} (T_4 - T_3)$

$$\dot{m}_{air} = [\dot{m}_1 (h_1 - h_2) + \dot{W}_{in}] / C_{p\,air} (T_4 - T_3)$$

$$= \frac{0.1 (393.84 - 420.25) + 3}{1.004 (30 - 20)} = \frac{0.359}{10} \frac{\text{kW}}{\text{kJ/kg}}$$

$$= \mathbf{0.0359\ kg/s}$$

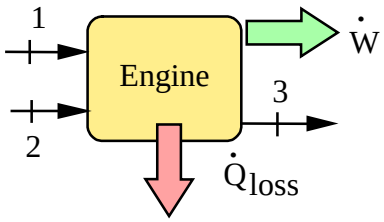
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.89

Two steady flows of air enters a control volume, shown in Fig. P4.89. One is 0.025 kg/s flow at 350 kPa, 150°C, state 1, and the other enters at 450 kPa, 15°C, state 2. A single flow of air exits at 100 kPa, –40°C, state 3. The control volume rejects 1 kW heat to the surroundings and produces 4 kW of power. Neglect kinetic energies and determine the mass flow rate at state 2.

Solution:

C.V. Steady device with two inlet and one exit flows, we neglect kinetic energies. Notice here the Q is rejected so it goes out.



Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3 = 0.025 + \dot{m}_2$

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 + \dot{W}_{CV} + \dot{Q}_{loss}$

Substitute the work and heat transfer into the energy equation and use constant specific heat

$$0.025 \times 1.004 \times 423.2 + \dot{m}_2 \times 1.004 \times 288.2$$

$$= (0.025 + \dot{m}_2)\ 1.004 \times 233.2 \ + 4.0 + 1.0$$

Now solve for $\dot{m}_2$.

$$\dot{m}_2 = \frac{4.0 + 1.0 + 0.025 \times 1.004 \times (233.2 - 423.2)}{1.004\ (288.2 - 233.2)}\ \text{kW/(kJ/kg)}$$

$$= \mathbf{0.0042\ kg/s}$$

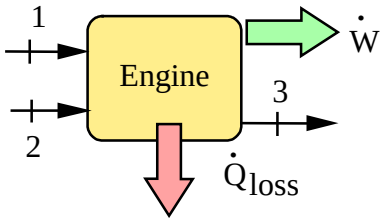
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.90

A large expansion engine has two low velocity flows of water entering. High pressure steam enters at point 1 with 2.0 kg/s at 2 MPa, 500°C and 0.5 kg/s cooling water at 120 kPa, 30°C enters at point 2. A single flow exits at point 3 with 150 kPa, 80% quality, through a 0.15 m diameter exhaust pipe. There is a heat loss of 300 kW. Find the exhaust velocity and the power output of the engine.

Solution:

C.V. : Engine (Steady state)



Constant rates of flow, $\dot{Q}_{loss}$ and $\dot{W}$

State 1: Table B.1.3: $h_1 = 3467.6$ kJ/kg

State 2: Table B.1.1: $h_2 = 125.77$ kJ/kg

$h_3 = 467.1 + 0.8 \times 2226.5 = 2248.3$ kJ/kg

$v_3 = 0.00105 + 0.8 \times 1.15825 = 0.92765$ m^3/kg

Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3 = 2 + 0.5 = 2.5$ kg/s $= (AV/v) = (\pi/4)D^2V/v$

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3(h_3 + 0.5\ V^2) + \dot{Q}_{loss} + \dot{W}$

$\mathbf{V} = \dot{m}_3 v_3 / [\frac{\pi}{4} D^2] = 2.5 \times 0.92765 / (0.7854 \times 0.15^2) =$ **131.2 m/s**

$0.5\ \mathbf{V}^2 = (0.5 \times 131.2^2\ m^2/s^2)/1000$ J/kJ $= 8.6$ kJ/kg

$\dot{W} = 2 \times 3467.6 + 0.5 \times 125.77 - 2.5\ (2248.3 + 8.6) - 300 =$ **1056 kW**

Heat Exchangers

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.91

A condenser (heat exchanger) brings 1 kg/s water flow at 10 kPa quality 95% to saturated liquid at 10 kPa, as shown in Fig. P4.91. The cooling is done by lake water at 20°C that returns to the lake at 30°C. For an insulated condenser, find the flow rate of cooling water.

Solution:

C.V. Heat exchanger

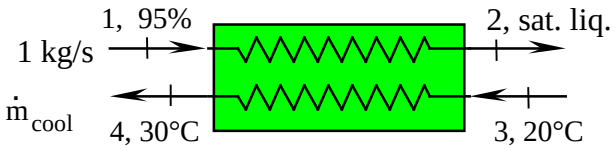

Table B.1.1: $h_{20} = 83.94$ kJ/kg , $h_{30} = 125.77$ kJ/kg

Table B.1.2: $h_{95\%,\ 10kPa} = 191.81 + 0.95 \times 2392.82 = 2465$ kJ/kg

$h_{f,\ 10\ kPa} = 191.81$ kJ/kg

Energy Eq.4.10: $\dot{m}_{cool} h_{20} + \dot{m}_{H_2O} h_{300} = \dot{m}_{cool} h_{30} + \dot{m}_{H_2O} h_{f,\ 10\ kPa}$

$$\dot{m}_{cool} = \dot{m}_{H_2O} \frac{h_{95\%} - h_{f,\ 10kPa}}{h_{30} - h_{20}} = 1 \text{ kg/s} \times \frac{2465 - 191.81}{125.77 - 83.94} = \mathbf{54.3\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.92

Air at 600 K flows with 3 kg/s into a heat exchanger and out at 100^{o}C. How much (kg/s) water coming in at 100 kPa, 20^{o}C can the air heat to the boiling point?

C.V. Total heat exchanger. The flows are not mixed so the two flowrates are constant through the device. No external heat transfer and no work.

Energy Eq.4.10: $\dot{m}_{air} h_{air\ in} + \dot{m}_{water} h_{water\ in} = \dot{m}_{air} h_{air\ out} + \dot{m}_{water} h_{water\ out}$

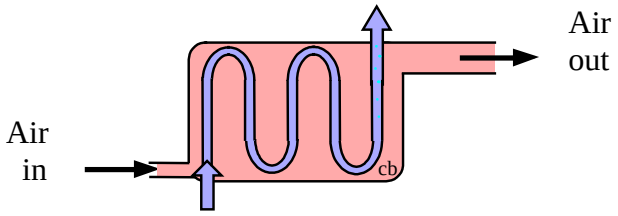
$$\dot{m}_{air}[h_{air\ in} - h_{air\ out}] = \dot{m}_{water}[h_{water\ out} - h_{water\ in}]$$

Table B.1.2: $h_{water\ out} - h_{water\ in} = 2675.46 - 83.94 = 2591.5$ kJ/kg

Table A.7.1: $h_{air\ in} - h_{air\ out} = 607.32 - 374.14 = 233.18$ kJ/kg

Solve for the flow rate of water from the energy equation

$$\dot{m}_{water} = \dot{m}_{air} \frac{h_{air\ in} - h_{air\ out}}{h_{water\ out} - h_{water\ in}} = 3\ \text{kg/s} \times \frac{233.18}{2591.5} = \mathbf{0.27\ kg/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.93

Steam at 500 kPa, 300^{o}C is used to heat cold water at 15^{o}C to 75^{o}C for domestic hot water supply. How much steam per kg liquid water is needed if the steam should not condense?

Solution:
C.V. Each line separately. No work but there is heat transfer out of the steam flow and into the liquid water flow.

Water line energy Eq.: $\dot{m}_{liq} h_i + \dot{Q} = \dot{m}_{liq} h_e \quad \Rightarrow \quad \dot{Q} = \dot{m}_{liq}(h_e - h_i)$

For the liquid water look in Table B.1.1

$$\Delta h_{liq} = h_e - h_i = 313.91 - 62.98 = 250.93 \text{ kJ/kg}$$

$$(\cong C_p \, \Delta T = 4.18 \, (75 - 15) = 250.8 \text{ kJ/kg})$$

Steam line energy has the same heat transfer but it goes out

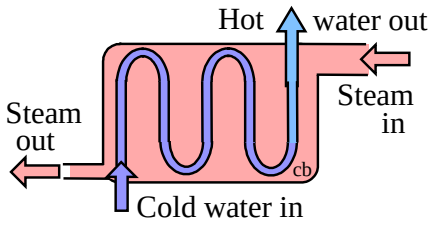
Steam Energy Eq.: $\dot{m}_{steam} h_i = \dot{Q} + \dot{m}_{steam} h_e \quad \Rightarrow \quad \dot{Q} = \dot{m}_{steam}(h_i - h_e)$

For the steam look in Table B.1.3 at 500 kPa

$$\Delta h_{steam} = h_i - h_e = 3064.2 - 2748.67 = 315.53 \text{ kJ/kg}$$

Now the heat transfer for the steam is substituted into the energy equation for the water to give

$$\dot{m}_{steam} / \dot{m}_{liq} = \Delta h_{liq} / \Delta h_{steam} = \frac{250.93}{315.53} = \mathbf{0.795}$$

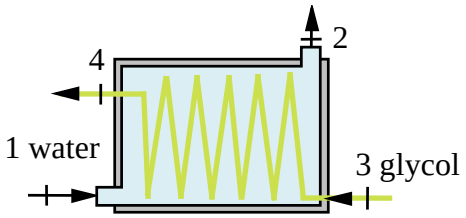


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.94

A dual-fluid heat exchanger has 5 kg/s water entering at 40°C, 150 kPa and leaving at 10°C, 150 kPa. The other fluid is glycol, entering at −10°C, 160 kPa and leaving at 10°C, 160 kPa. Find the required mass flow rate of glycol and the rate of internal heat transfer.

C.V. Heat exchanger, steady flow 1 inlet and 1 exit for glycol and water each. The two flows exchange energy with no heat transfer to/from the outside.



Continuity Eqs.: Each line has a constant flow rate through it.

Energy Eq.4.10: $\dot{m}_{H_2O}\, h_1 + \dot{m}_{glycol}\, h_3 = \dot{m}_{H_2O}\, h_2 + \dot{m}_{glycol}\, h_4$

Process: Each line has a constant pressure.

Table B.1: $h_1 = 167.54$ kJ/kg, $h_2 = 41.99$ kJ/kg

Table A.4: $C_{P\ gly} = 2.42$ kJ/kg-K so

$$h_4 - h_3 = C_{P\ gly}\,(T_4 - T_3) = 2.42\ [10 - (-10)] = 48.4 \text{ kJ/kg}$$

$$\dot{m}_{glycol} = \dot{m}_{H_2O}\,\frac{h_1 - h_2}{h_4 - h_3} = 5\,\frac{167.54 - 41.99}{48.4} = \mathbf{12.97\ kg/s}$$

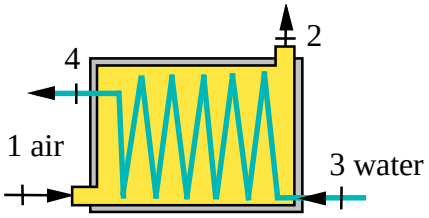
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.95

A heat exchanger, shown in Fig. P4.95, is used to cool an air flow from 800 K to 360 K, both states at 1 MPa. The coolant is a water flow at 15°C, 0.1 MPa. If the water leaves as saturated vapor, find the ratio of the flow rates $\dot{m}_{H_2O}/\dot{m}_{air}$

Solution:

C.V. Heat exchanger, steady flow 1 inlet and 1 exit for air and water each. The two flows exchange energy with no heat transfer to/from the outside.



Continuity Eqs.: Each line has a constant flow rate through it.

Energy Eq.4.10: $\dot{m}_{air}h_1 + \dot{m}_{H_2O}h_3 = \dot{m}_{air}h_2 + \dot{m}_{H_2O}h_4$

Process: Each line has a constant pressure.

Air states, Table A.7.1: $h_1 = 822.20$ kJ/kg, $h_2 = 360.86$ kJ/kg

Water states, Table B.1.1: $h_3 = 62.98$ kJ/kg (at 15°C),

Table B.1.2: $h_4 = 2675.5$ kJ/kg (at 100 kPa)

$$\dot{m}_{H_2O}/\dot{m}_{air} = \frac{h_1 - h_2}{h_4 - h_3} = \frac{822.20 - 360.86}{2675.5 - 62.99} = \mathbf{0.1766}$$

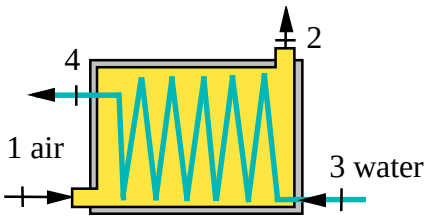
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.96

A superheater brings 2.5 kg/s saturated water vapor at 2 MPa to 450^{o}C. The energy is provided by hot air at 1200 K flowing outside the steam tube in the opposite direction as the water, which is a counter flowing heat exchanger. Find the smallest possible mass flow rate of the air so the air exit temperature is 20^{o}C larger than the incoming water temperature (so it can heat it).

Solution:

C.V. Superheater. Steady state with no external $\dot{Q}$ or any $\dot{W}$ the two flows exchanges energy inside the box. Neglect kinetic and potential energies at all states.



Energy Eq.4.10: $\dot{m}_{H_2O}\, h_3 + \dot{m}_{air}\, h_1 = \dot{m}_{H_2O}\, h_4 + \dot{m}_{air}\, h_2$

Process: Constant pressure in each line.

State 1: Table B.1.2 $T_3 = 212.42°C,\ h_3 = 2799.51$ kJ/kg

State 2: Table B.1.3 $h_4 = 3357.48$ kJ/kg

State 3: Table A.7 $h_1 = 1277.81$ kJ/kg

State 4: $T_2 = T_3 + 20 = 232.42°C = 505.57$ K

A.7 : $h_2 = 503.36 + \frac{5.57}{20}(523.98 - 503.36) = 509.1$ kJ/kg

From the energy equation we get

$$\dot{m}_{air} = \dot{m}_{H_2O}\ (h_4 - h_3)/(h_1 - h_2)$$

$$= 2.5\ (3357.48 - 2799.51) / (1277.81 - 509.1) = \mathbf{1.815\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.97

A two fluid heat exchanger has 2 kg/s liquid ammonia at 20°C, 1003 kPa entering state 3 and exiting at state 4. It is heated by a flow of 1 kg/s nitrogen at 1500 K, state 1, leaving at 600 K, state 2 similar to Fig. P4.95. Find the total rate of heat transfer inside the heat exchanger. Sketch the temperature versus distance for the ammonia and find state 4 (T, v) of the ammonia.

Solution:

CV: Nitrogen flow line, steady rates of flow, $\dot{Q}$ out and $\dot{W} = 0$

Continiuty: $\dot{m}_1 = \dot{m}_2 = 1$ kg/s ; Energy Eq: $\dot{m}_1 h_1 = \dot{m}_2 h_2 + \dot{Q}_{out}$

Tbl. A.8: $h_1 = 1680.7$ kJ/kg; $h_2 = 627.24$ kJ/kg

$$\dot{Q}_{out} = \dot{m}_1(h_1 - h_2) = 1\ (1680.7 - 627.24) = \mathbf{1053.5\ kW}$$

If Tbl A.5 is used: Cp = 1.042 kJ/kg K

$$\dot{Q}_{out} = \dot{m}_1\ Cp\ (T_1 - T_2) = 1 \times 1.042\ (1500 - 600) = \mathbf{937.8\ kW}$$

CV The whole heat exchanger: No external $\dot{Q}$, constant pressure in each line.

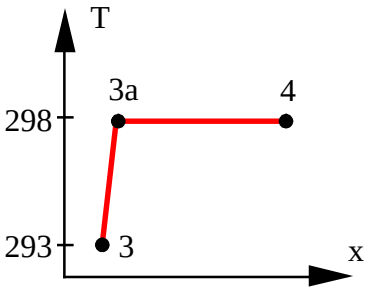
$$\dot{m}_1 h_1 + \dot{m}_3 h_3 = \dot{m}_1 h_2 + \dot{m}_3 h_4 \quad \Rightarrow \quad h_4 = h_3 + \dot{m}_1(h_1 - h_2)/\dot{m}_3$$

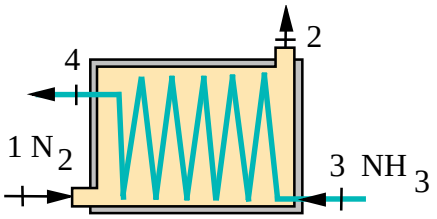
$h_4 = 274.3 + 1053.5\ /2 = 801$ kJ/kg $< h_g \Rightarrow$ 2-phase

$x_4 = (h_4 - h_f)/\ h_{fg} = (801 - 298.25) / 1165.2 = 0.43147$

$v_4 = v_f + x_4\ v_{fg} = 0.001658 + 0.43147 \times 0.12647 = 0.05623\ m^3/kg$

$T_4 = T_{3a} = 25°C$ This is the boiling temperature for 1003 kPa.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.98

In a co-flowing (same direction) heat exchanger 1 kg/s air at 500 K flows into one channel and 2 kg/s air flows into the neighboring channel at 300 K. If it is infinitely long what is the exit temperature? Sketch the variation of T in the two flows.

C.V. Heat Exchanger (no $\dot{W}$)

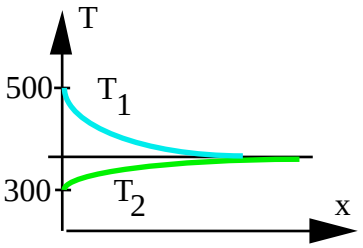
Continuity Eq.: $\dot{m}_1 = \dot{m}_3$ and $\dot{m}_2 = \dot{m}_4$

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_1 h_3 + \dot{m}_2 h_4$

Same exit T: $h_3 = h_4 = [\dot{m}_1 h_1 + \dot{m}_2 h_2] / [\dot{m}_1 + \dot{m}_2]$

Using conctant specific heat

$$T_3 = T_4 = \frac{\dot{m}_1}{\dot{m}_1 + \dot{m}_2} T_1 + \frac{\dot{m}_2}{\dot{m}_1 + \dot{m}_2} T_2 = \frac{1}{3} \times 500 + \frac{2}{3} \times 300 = \mathbf{367\ K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.99

An air/water counter flowing heat exchanger has one line with 2 kg/s at 125 kPa, 1000 K entering, and the air is leaving at 100 kPa, 400 K. The other line has 0.5 kg/s water entering at 200 kPa, 20°C and leaving at 200 kPa. What is the exit temperature of the water?

C.V. Heat Exchanger (no $\dot{W}$)

Continuity Eq.: $\dot{m}_1 = \dot{m}_3 = \dot{m}_{H_2O}$ and $\dot{m}_2 = \dot{m}_4 = \dot{m}_{air}$

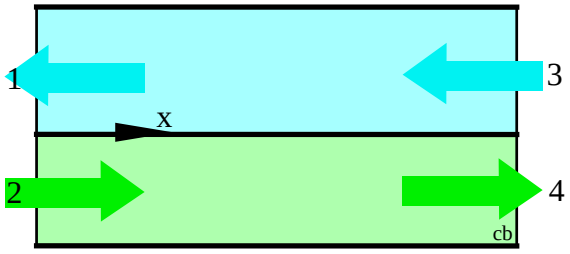
Energy Eq.4.10: $\dot{m}_{H_2O} h_1 + \dot{m}_{air} h_4 = \dot{m}_{H_2O} h_3 + \dot{m}_{air} h_2$

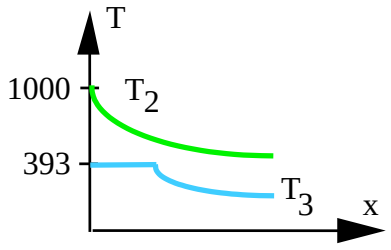
Flowrates and properties known except for T_1

$$h_1 = h_3 + \dot{m}_{air} (h_2 - h_4) / \dot{m}_{H_2O}$$

$$= 83.94 + 2 (1046.22 - 401.3) / 0.5 = 2663.6 \text{ kJ/kg}$$

$h_1 < h_1 = 2706.6$ kJ/kg at 200 kPa so two-phase T = **120.23°C**





The water is not completely evaporated at the exit.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.100

An automotive radiator has glycerine at 95°C enter and return at 55°C as shown in Fig. P4.100. Air flows in at 20°C and leaves at 25°C. If the radiator should transfer 25 kW what is the mass flow rate of the glycerine and what is the volume flow rate of air in at 100 kPa?

Solution:

If we take a control volume around the whole radiator then there is no external heat transfer - it is all between the glycerin and the air. So we take a control volume around each flow separately.

Glycerine: $\dot{m}h_i + (-\dot{Q}) = \dot{m}h_e$

Table A.4: $\dot{m}_{gly} = \dfrac{-\dot{Q}}{h_e - h_i} = \dfrac{-\dot{Q}}{C_{gly}(T_e - T_i)} = \dfrac{-25}{2.42(55 - 95)} = \mathbf{0.258\ kg/s}$

Air $\dot{m}h_i + \dot{Q} = \dot{m}h_e$

Table A.5: $\dot{m}_{air} = \dfrac{\dot{Q}}{h_e - h_i} = \dfrac{\dot{Q}}{C_{air}(T_e - T_i)} = \dfrac{25}{1.004(25 - 20)} = 4.98\ \text{kg/s}$

$$\dot{V} = \dot{m}v_i\ ; \quad v_i = \frac{RT_i}{P_i} = \frac{0.287 \times 293}{100}\frac{\text{kJ/kg-K} \times \text{K}}{\text{kPa}} = 0.8409\ \text{m}^3/\text{kg}$$

$$\dot{V}_{air} = \dot{m}v_i = 4.98 \times 0.8409 = \mathbf{4.19\ m^3/s}$$

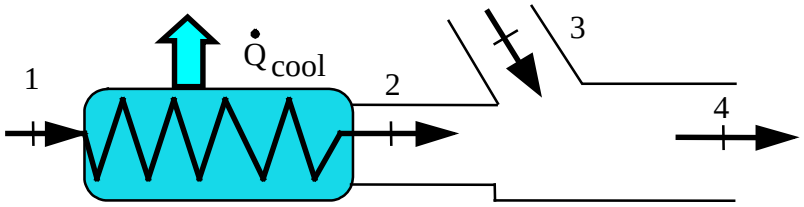
4.101

A cooler in an air conditioner brings 0.5 kg/s air at 35°C to 5°C, both at 101 kPa and it then mix the output with a flow of 0.25 kg/s air at 20°C, 101 kPa sending the combined flow into a duct. Find the total heat transfer in the cooler and the temperature in the duct flow.

Solution:



C.V. Cooler section (no $\dot{W}$)

Energy Eq.4.12: $\dot{m}h_1 = \dot{m}h_2 + \dot{Q}_{cool}$

$\dot{Q}_{cool} = \dot{m}(h_1 - h_2) = \dot{m}\, C_p\, (T_1 - T_2) = 0.5 \times 1.004 \times (35\text{-}5) = 15.06$ kW

C.V. mixing section (no $\dot{W}$, $\dot{Q}$)

Continuity Eq.: $\dot{m}_2 + \dot{m}_3 = \dot{m}_4$

Energy Eq.4.10: $\dot{m}_2 h_2 + \dot{m}_3 h_3 = \dot{m}_4 h_4$

$\dot{m}_4 = \dot{m}_2 + \dot{m}_3 = 0.5 + 0.25 = 0.75$ kg/s

$\dot{m}_4 h_4 = (\dot{m}_2 + \dot{m}_3) h_4 = \dot{m}_2 h_2 + \dot{m}_3 h_3$

$\dot{m}_2\, (h_4 - h_2) + \dot{m}_3\, (h_4 - h_3) = Ø$

$\dot{m}_2\, C_p\, (T_4 - T_2) + \dot{m}_3\, C_p\, (T_4 - T_3) = Ø$

$T_4 = (\dot{m}_2 / \dot{m}_4)\, T_2 + (\dot{m}_3 / \dot{m}_4)\, T_3 = 5(0.5/0.75) + 20(0.25/0.75) =$ **10°C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.102

A copper wire has been heat treated to 1000 K and is now pulled into a cooling chamber that has 1.5 kg/s air coming in at 20°C; the air leaves the other end at 60° C. If the wire moves 0.25 kg/s copper, how hot is the copper as it comes out?

Solution:
C.V. Total chamber, no external heat transfer

Energy eq.: $\dot{m}_{cu}\, h_{i\,cu} + \dot{m}_{air}\, h_{i\,air} = \dot{m}_{cu}\, h_{e\,cu} + \dot{m}_{air}\, h_{e\,air}$

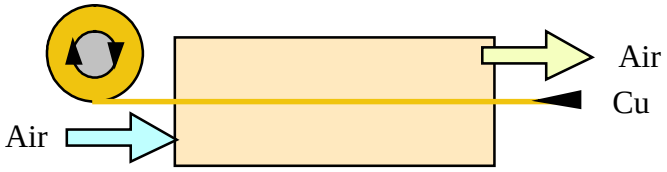
$$\dot{m}_{cu}\,(h_e - h_i)_{cu} = \dot{m}_{air}(h_i - h_e)_{air}$$

$$\dot{m}_{cu}\, C_{cu}\,(T_e - T_i)_{cu} = \dot{m}_{air}\, C_{p\,air}(T_e - T_i)_{air}$$

Heat capacities from A.3 for copper and A.5 for air

$$(T_e - T_i)_{cu} = \frac{\dot{m}_{air} C_{p\,air}}{\dot{m}_{cu} C_{cu}} (T_e - T_i)_{air} = \frac{1.5 \times 1.004}{0.25 \times 0.42} (20 - 60)\ \text{K} = -573.7\ \text{K}$$

$$T_e = T_i - 573.7 = 1000 - 573.7 = \mathbf{426.3\ K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.103

A coflowing (same-direction) heat exchanger has one line with 0.25 kg/s oxygen at 17◦C, 200 kPa entering and the other line has 0.6 kg/s nitrogen at 150 kPa, 500 K entering. The heat exchanger is very long, so the two flows exit at the same temperature. Use constant heat capacities and find the exit temperature.

C.V. Heat Exchanger (no $\dot{W}$)

Continuity Eq.: $\dot{m}_1 = \dot{m}_3$ and $\dot{m}_2 = \dot{m}_4$

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_1 h_3 + \dot{m}_2 h_4$

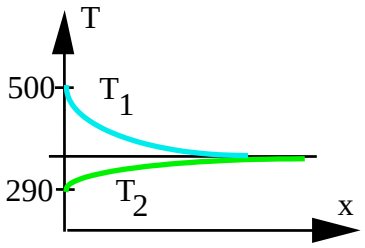
Same exit T: $T_3 = T_4 = T_{ex}$

Using conctant specific heat

$$\dot{m}_1 C_{P\,O2} T_1 + \dot{m}_2 C_{P\,N2} T_2 = \dot{m}_1 C_{P\,O2} T_{ex} + \dot{m}_2 C_{P\,N2} T_{ex}$$

$$T_{ex} = \frac{\dot{m}_1 C_{P\,O2}}{\dot{m}_1 C_{P\,O2} + \dot{m}_2 C_{P\,N2}} T_1 + \frac{\dot{m}_2 C_{P\,N2}}{\dot{m}_1 C_{P\,O2} + \dot{m}_2 C_{P\,N2}} T_2$$

$$= \frac{0.25 \times 0.922 \times 290 + 0.6 \times 1.042 \times 500}{0.25 \times 0.922 + 0.6 \times 1.042} = \mathbf{443.4\ K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Mixing processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.104

Two flows of air are both at 200 kPa; one has 1 kg/s at 400 K and the other has 2 kg/s at 290 K. The two flows are mixed together in an insulated box to produce a single exit flow at 200 kPa. Find the exit temperature.

Solution:

Cont.: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

Energy: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3$

$= (\dot{m}_1 + \dot{m}_2) h_3$

Mixing chamber

Solve for the exit enthalpy

$$h_3 = [\ \dot{m}_1 h_1 + \dot{m}_2 h_2\ ] / (\dot{m}_1 + \dot{m}_2)$$

since the T's are modest use constant specific heats

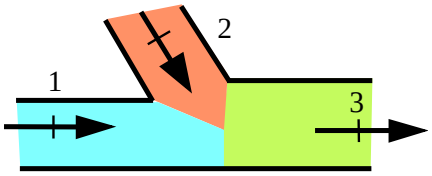
$$T_3 = [\ \dot{m}_1 T_1 + \dot{m}_2 T_2\ ] / (\dot{m}_1 + \dot{m}_2) = \frac{1}{3} \times 400 + \frac{2}{3} \times 290 = \mathbf{326.7\ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.105

Two air flows are combined to a single flow. Flow one is 1 m^3/s at 20°C and the other is 2 m^3/s at 200°C both at 100 kPa. They mix without any heat transfer to produce an exit flow at 100 kPa. Neglect kinetic energies and find the exit temperature and volume flow rate.

Solution:



Mixing section

Cont. $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

Energy $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3$

$= (\dot{m}_1 + \dot{m}_2) h_3$

$\dot{m}_1 (h_3 - h_1) + \dot{m}_2 (h_3 - h_2) = 0$

$\dot{m}_1 C_p (T_3 - T_1) + \dot{m}_2 C_p (T_3 - T_2) = 0$

$T_3 = (\dot{m}_i/\dot{m}_3) T_1 + (\dot{m}_2/\dot{m}_3) T_2$

We need to find the mass flow rates

$v_1 = RT_1/P_1 = (0.287 \text{ kJ/kg-K} \times 293 \text{ K})/100 \text{ kPa} = 0.8409 \text{ m}^3/\text{kg}$

$v_2 = RT_2/P_2 = (0.287 \text{ kJ/kg-K} \times 473 \text{ K})/100 \text{ kPa} = 1.3575 \text{ m}^3/\text{kg}$

$$\dot{m}_1 = \frac{\dot{V}_1}{v_1} = \frac{1}{0.8409} = 1.1892 \frac{\text{kg}}{\text{s}}, \quad \dot{m}_2 = \frac{\dot{V}_2}{v_2} = \frac{2}{1.3575} = 1.4733 \frac{\text{kg}}{\text{s}}$$

$\dot{m}_3 = \dot{m}_1 + \dot{m}_2 = 2.6625 \text{ kg/s}$

$$T_3 = \frac{1.1892}{2.6625} \times 20 + \frac{1.4733}{2.6625} \times 200 = \mathbf{119.6^o\ C}$$

$$v_3 = \frac{RT_3}{P_3} = \frac{0.287\ (119.6 + 273)}{100} = 1.1268 \text{ m}^3/\text{kg}$$

$\dot{V}_3 = \dot{m}_3 v_3 = 2.6625 \text{ kg/s} \times 1.1268 \text{ m}^3/\text{kg} = \mathbf{3.0\ m^3/s}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.106

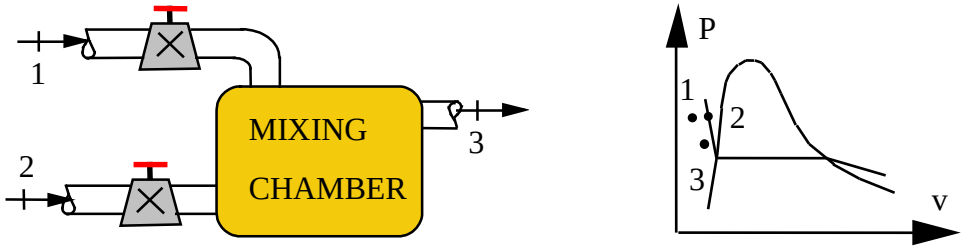
A flow of water at 2000 kPa, 20°C is mixed with a flow of 2 kg/s water at 2000 kPa, 180°C. What should the flowrate of the first flow be to produce an exit state of 200 kPa and 100°C?

Solution:

C.V. Mixing chamber and valves. Steady state no heat transfer or work terms.

Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 = (\dot{m}_1 + \dot{m}_2) h_3$



Properties Table B.1.1: $h_1 = 85.8$ kJ/kg; $h_3 = 419.0$ kJ/kg

Table B.1.4: $h_2 = 763.7$ kJ/kg

$$\dot{m}_1 = \dot{m}_2 \times \frac{h_2 - h_3}{h_3 - h_1} = 2 \times \frac{763.7 - 419.0}{419.0 - 85.8} = \mathbf{2.069\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

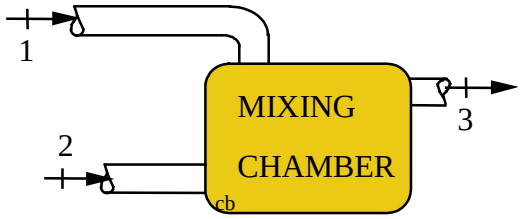
4.107

An open feedwater heater in a powerplant heats 4 kg/s water at 45^{o}C, 100 kPa by mixing it with steam from the turbine at 100 kPa, 250^{o}C. Assume the exit flow is saturated liquid at the given pressure and find the mass flow rate from the turbine.

Solution:

C.V. Feedwater heater.

No external $\dot{Q}$ or $\dot{W}$

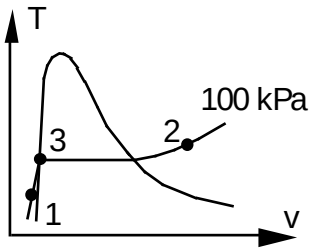


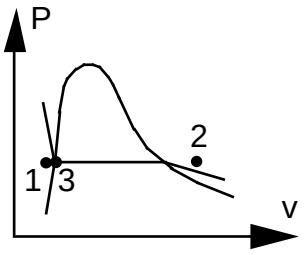
Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 = (\dot{m}_1 + \dot{m}_2) h_3$

State 1: Table B.1.1 $h = h_f = 188.42$ kJ/kg at 45^{o}C
State 2: Table B.1.3 $h_2 = 2974.33$ kJ/kg
State 3: Table B.1.2 $h_3 = h_f = 417.44$ kJ/kg at 100 kPa

$$\dot{m}_2 = \dot{m}_1 \times \frac{h_1 - h_3}{h_3 - h_2} = 4 \times \frac{188.42 - 417.44}{417.44 - 2974.33} = \mathbf{0.358\ kg/s}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.108

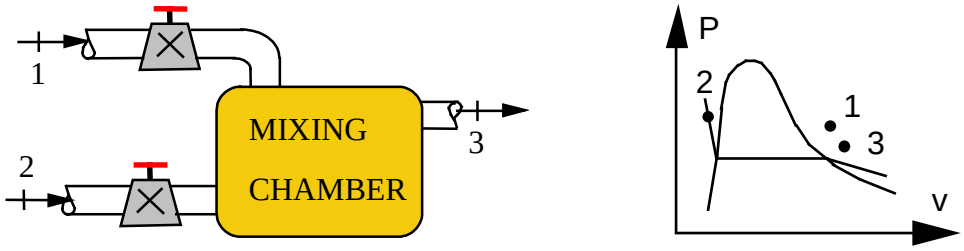
Two flows are mixed to form a single flow. Flow at state 1 is 1.5 kg/s water at 400 kPa, 200^{O}C and flow at state 2 is 500 kPa, 100^{O}C. Which mass flow rate at state 2 will produce an exit T_3 = 150^{O}C if the exit pressure is kept at 300 kPa?

Solution:

C.V. Mixing chamber and valves. Steady state no heat transfer or work terms.

Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 = (\dot{m}_1 + \dot{m}_2) h_3$



Properties Table B.1.3: h_1 = 2860.51 kJ/kg; h_3 = 2760.95 kJ/kg

Table B.1.4: h_2 = 419.32 kJ/kg

$$\dot{m}_2 = \dot{m}_1 \times \frac{h_1 - h_3}{h_3 - h_2} = 1.5 \times \frac{2860.51 - 2760.95}{2760.95 - 419.32} = \mathbf{0.0638\ kg/s}$$

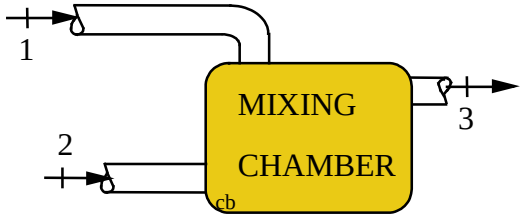
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.109

A de-superheater has a flow of ammonia 1.5 kg/s at 1000 kPa, 100°C which is mixed with another flow of ammonia at 25°C and quality 50% in an adiabatic mixing chamber. Find the flow rate of the second flow so the outgoing ammonia is saturated vapor at 1000 kPa.

C.V. Desuperheater.

No external $\dot{Q}$ or $\dot{W}$



Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

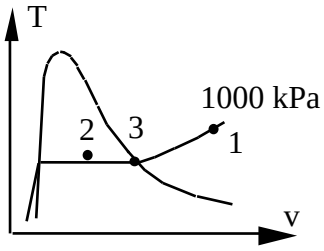
Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 = (\dot{m}_1 + \dot{m}_2) h_3$

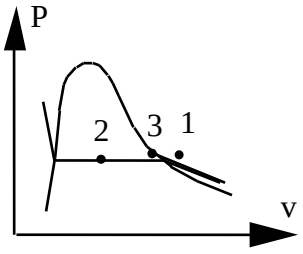
State 1: Table B.2.2 $h_1 = 1664.3$ kJ/kg

State 2: Table B.2.1 $h_2 = 298.25 + 0.5 \times 1165.2 = 880.85$ kJ/kg

State 3: Table B.2.2 $h_3 = 1463.4$ kJ/kg

$$\dot{m}_2 = \dot{m}_1 \times \frac{h_1 - h_3}{h_3 - h_2} = 1.5 \times \frac{1664.3 - 1463.4}{1463.4 - 880.85} = \mathbf{0.517\ kg/s}$$





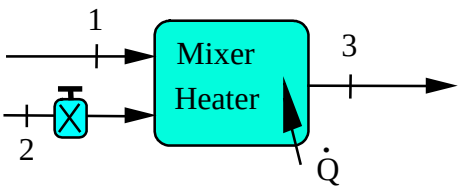
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

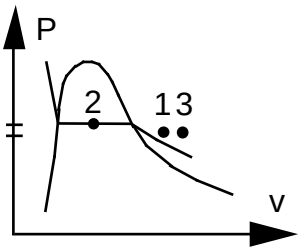
4.110

A mixing chamber with heat transfer receives 2 kg/s of R-410A at 1 MPa, 40°C in one line and 1 kg/s of R-410A at 15°C, quality 50% in a line with a valve. The outgoing flow is at 1 MPa, 60°C. Find the rate of heat transfer to the mixing chamber.

Solution:

C.V. Mixing chamber. Steady with 2 flows in and 1 out, heat transfer in.





Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$; => $\dot{m}_3 = 2 + 1 = 3$ kg/s

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 + \dot{Q} = \dot{m}_3 h_3$

Properties: Table B.4.2: $h_1 = 316.05$ kJ/kg, $h_3 = 335.75$ kJ/kg

Table B.4.1: $h_2 = 81.15 + 0.5 \times 201.64 = 181.97$ kJ/kg

Energy equation then gives the heat transfer as

$$\dot{Q} = 3 \times 335.75 - 2 \times 316.05 - 1 \times 181.97 = \mathbf{193.18\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.111

A geothermal supply of hot water at 500 kPa, 150°C is fed to an insulated flash evaporator at the rate of 1.5 kg/s. A stream of saturated liquid at 200 kPa is drained from the bottom of the chamber, and a stream of saturated vapor at 200 kPa is drawn from the top and fed to a turbine. Find the mass flow rate of the two exit flows.

C.V. Flash chamber. Disregard any kinetic and potential energies

Continuity Eq.: $0 = \dot{m}_1 - \dot{m}_2 - \dot{m}_3$

Energy Eq.: $0 = \dot{m}_1 h_1 - \dot{m}_2 h_2 - \dot{m}_3 h_3$

Process: $\dot{Q} = 0, \ \dot{W} = 0$

$h_1 = 632.2$ kJ/kg from Table B.1.4 (B.1.1: 632.18)

State 2 and 3: Saturated vapor $h_2 = 2706.63$ kJ/kg

Saturated liquid $h_3 = 504.68$ kJ/kg

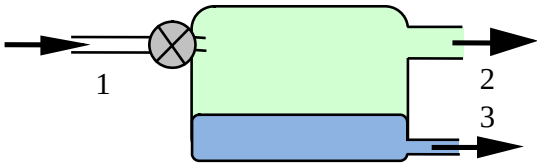
Substitute $\dot{m}_3$ from continuity eq. into the energy eq. to get

$$0 = \dot{m}_1 h_1 - \dot{m}_2 h_2 - (\dot{m}_1 - \dot{m}_2) h_3$$

$$\dot{m}_2 = \dot{m}_1 (h_1 - h_3) / (h_2 - h_3) = \dot{m}_1 (h_1 - h_f) / (h_g - h_f)$$
$$= 1.5 (632.2 - 504.68) /(2706.63 - 504.68) = \mathbf{0.0869\ kg/s}$$

$$\dot{m}_3 = \dot{m}_1 - \dot{m}_2 = 1.5 - 0.0869 = \mathbf{1.413\ kg/s}$$

The fraction of the flow at state 2 equals the quality x in the flow right after the valve and the fraction going out at state 3 is (1 – x)



Two-phase out of the valve. The liquid drops to the bottom.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.112

An insulated mixing chamber receives 2 kg/s R-134a at 1 MPa, 100°C in a line with low velocity. Another line with R-134a as saturated liquid 60°C flows through a valve to the mixing chamber at 1 MPa after the valve, as shown in Fig. P4.110. The exit flow is saturated vapor at 1 MPa flowing at 20 m/s. Find the flow rate for the second line.

Solution:

C.V. Mixing chamber. Steady state, 2 inlets and 1 exit flow.

Insulated $q = 0$, No shaft or boundary motion $w = 0$.

Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$;

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 (h_3 + \frac{1}{2} \mathbf{V}_3^2)$

$$\dot{m}_2 (h_2 - h_3 - \tfrac{1}{2} \mathbf{V}_3^2) = \dot{m}_1 (h_3 + \tfrac{1}{2} \mathbf{V}_3^2 - h_1)$$

1: Table B.5.2: 1 MPa, 100°C, $h_1 = 483.36$ kJ/kg

2: Table B.5.1: $x = \varnothing$, 60°C, $h_2 = 287.79$ kJ/kg

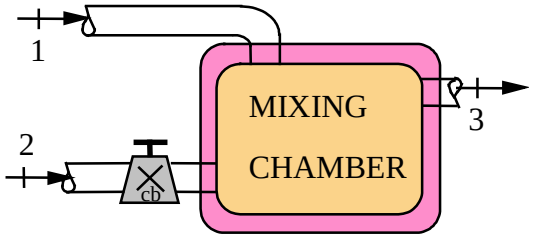
3: Table B.5.1: $x = 1$, 1 MPa, 20 m/s, $h_3 = 419.54$ kJ/kg

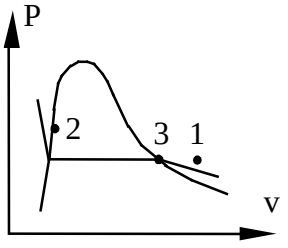
Now solve the energy equation for $\dot{m}_2$

$$\dot{m}_2 = 2 \times [419.54 + \tfrac{1}{2} 20^2 \times \frac{1}{1000} - 483.36] / [287.79 - 419.54 - \tfrac{1}{2} \frac{20^2}{1000}]$$

$$= 2 \times [-63.82 + 0.2] / [-131.75 - 0.2] = \mathbf{0.964\ kg/s}$$

Notice how kinetic energy was insignificant.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.113

To keep a jet engine cool some intake air bypasses the combustion chamber. Assume 2 kg/s hot air at 2000 K, 500 kPa is mixed with 1.5 kg/s air 500 K, 500 kPa without any external heat transfer. Find the exit temperature by using constant specific heat from Table A.5.

Solution:

C.V. Mixing Section

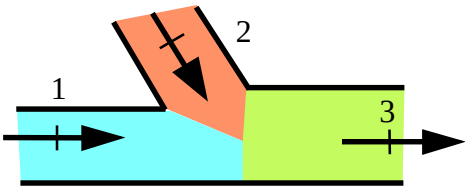
Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$ => $\dot{m}_3 = 2 + 1.5 = 3.5$ kg/s

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3$

$$h_3 = (\dot{m}_1 h_1 + \dot{m}_2 h_2) / \dot{m}_3 ;$$

For a constant specific heat divide the equation for h_3 with C_p to get

$$T_3 = \frac{\dot{m}_1}{\dot{m}_3} T_1 + \frac{\dot{m}_2}{\dot{m}_3} T_2 = \frac{2}{3.5} 2000 + \frac{1.5}{3.5} 500 = \mathbf{1357\ K}$$



Mixing section

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.114

Solve the previous problem using values from Table A.7
To keep a jet engine cool some intake air bypasses the combustion chamber. Assume 2 kg/s hot air at 2000 K, 500 kPa is mixed with 1.5 kg/s air 500 K, 500 kPa without any external heat transfer. Find the exit temperature by using values from Table A.7.

Solution:

C.V. Mixing Section

Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$ => $\dot{m}_3 = 2 + 1.5 = 3.5$ kg/s

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3$

$$h_3 = (\dot{m}_1 h_1 + \dot{m}_2 h_2) / \dot{m}_3 ;$$

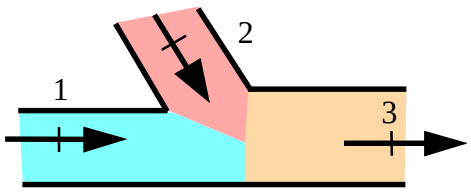
Using A.7 we look up the h at states 1 and 2 to calculate h_3

$$h_3 = \frac{\dot{m}_1}{\dot{m}_3} h_1 + \frac{\dot{m}_2}{\dot{m}_3} h_2 = \frac{2}{3.5} 2251.58 + \frac{1.5}{3.5} 503.36 = 1502 \text{ kJ/kg}$$

Now we can backinterpolate to find at what temperature do we have that h

$$T_3 = 1350 + 50 \frac{1502 - 1455.43}{1515.27 - 1455.43} = \mathbf{1389\ K}$$

This procedure is the most accurate.



Mixing section

4.115

A flow of 5 kg/s water at 100 kPa, 20°C should be delivered as steam at 1000 kPa, 350°C to some application. Consider compressing it to 1000 kPa, 20°C and then heat it at constant 1000 kPa to 350°C. Which devices are needed and find the specific energy transfers in those devices.

To raise the pressure of a liquid flow requires a pump which delivers the difference between the flow work going out and in. Constant pressure heating is a simple heater (or heat exchanger).

Inlet state: B.1.1: $h_1 = 83.94$ kJ/kg, $v_1 = 0.001002$ m^3/kg

State 3: $h_3 = 3157.65$ kJ/kg

The pump delivers the difference between the flow work out and flow work in.

Pump: $-w_p = (P_2 - P_1)\, v_1 = (1000 - 100)$ kPa $\times$ 0.001002 m^3/kg

$= \mathbf{0.9\ kJ/kg}$.

Heater: $q = h_3 - h_2 = h_3 - (h_1 - w_p)$

$= 3157.65 - (83.94 + 0.9) = \mathbf{3072.8\ kJ/kg}$

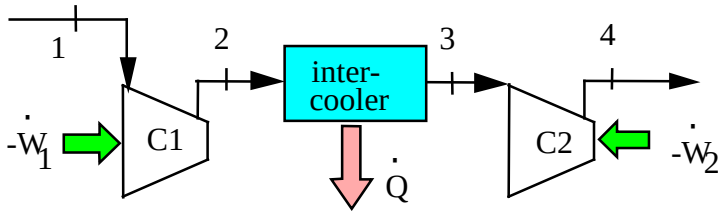
4.116

A two-stage compressor takes nitrogen in at 20°C, 150 kPa and compresses it to 600 kPa, 450 K. Then it flows through an intercooler, where it cools to 320 K, and the second stage compresses it to 3000 kPa, 530 K. Find the specific work in each of the two compressor stages and the specific heat transfer in the intercooler.

The setup is like this:



C.V.: Stage 1 nitrogen, Steady flow

Process: adiabatic: q = 0,

Energy Eq. 4.13: $-w_{C1} = h_2 - h_1$,

Assume constant $C_{P0} = 1.042$ from A.5

$w_{C1} = h_1 - h_2 = C_{P0}(T_1 - T_2) = 1.042$ kJ/kgK (293 – 450) K = **-163.6 kJ/kg**

C.V. Intercooler, no work and no changes in kinetic or potential energy.

$q_{23} = h_3 - h_2 = C_{P0}(T_3 - T_2) = 1.042\ (320 - 450) =$ **-135.5 kJ/kg**

C.V. Stage 2. Analysis the same as stage 1.

$w_{C2} = h_3 - h_4 = C_{P0}(T_3 - T_4) = 1.042\ (320 - 530) =$ **-218.8 kJ/kg**

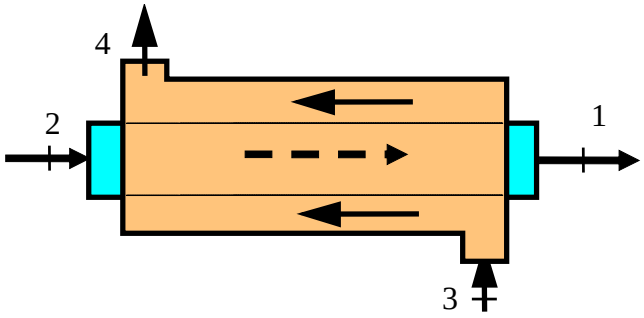
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.117

The intercooler in the previous problem uses cold liquid water to cool the nitrogen. The nitrogen flow is 0.1 kg/s, and the liquid water inlet is 20°C and is set up to flow in the opposite direction from the nitrogen, so the water leaves at 35°C. Find the flow rate of the water.

Solution:

C.V. Heat exchanger, steady 2 flows in and two flows out.



Continuity eq.: $\dot{m}_1 = \dot{m}_2 = \dot{m}_{H2O}$; $\dot{m}_3 = \dot{m}_4 = \dot{m}_{N2}$

Energy eq.: $0 = \dot{m}_{H2O}(h_3 - h_4) + \dot{m}_{N2}\,(h_2 - h_1)$

Due to the lower range of temperature we will use constant specific heats from A.5 and A.4 so the energy equation is approximated as

$$0 = \dot{m}_{H2O} C_{pH2O}\,(T_3 - T_4) + \dot{m}_{N2} C_p\,(T_2 - T_1)$$

Now solve for the water flow rate

$$\dot{m}_{H2O} = \dot{m}_{N2}\, C_{pN2}\,(T_2 - T_1) / [C_{pH2O}\,(T_4 - T_3)]$$
$$= 0.1 \text{ kg/s} \times 1.042 \times (450 - 320) / [4.18 \times (35 - 20)]$$
$$= \mathbf{0.216 \text{ kg/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.118

The following data are for a simple steam power plant as shown in Fig. P4.118.

State	1	2	3	4	5	6	7
P MPa	6.2	6.1	5.9	5.7	5.5	0.01	0.009
T °C		45	175	500	490		40
h kJ/kg	-	194	744	3426	3404	-	168

State 6 has $x_6 = 0.92$, and velocity of 200 m/s. The rate of steam flow is 25 kg/s, with 300 kW power input to the pump. Piping diameters are 200 mm from steam generator to the turbine and 75 mm from the condenser to the steam generator. Determine the velocity at state 5 and the power output of the turbine.

Solution:

Turbine $A_5 = (\pi/4)(0.2)^2 = 0.031\ 42\ m^2$, $v_5 = 0.06163\ m^3/kg$

$$\mathbf{V}_5 = \dot{m} v_5 / A_5 = 25\ kg/s \times 0.061\ 63\ m^3/kg \ /\ 0.031\ 42\ m^2 = \mathbf{49\ m/s}$$

$$h_6 = 191.83 + 0.92 \times 2392.8 = 2393.2\ kJ/kg$$

$$w_T = h_5 - h_6 + \tfrac{1}{2}(\mathbf{V}_5^2 - \mathbf{V}_6^2)$$

$$= 3404 - 2393.2 + (49^2 - 200^2)/(2 \times 1000) = 992\ kJ/kg$$

$$\dot{W}_T = \dot{m} w_T = 25\ kg/s \times 992\ kJ/kg = \mathbf{24\ 800\ kW}$$

Remark: Notice the kinetic energy change is small relative to enthalpy change.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.119

For the same steam power plant as shown in Fig. P4.118, assume the cooling water comes from a lake at 15°C and is returned at 25°C. Determine the rate of heat transfer in the condenser and the mass flow rate of cooling water from the lake.

Solution:

Condenser $A_7 = (\pi/4)(0.075)^2 = 0.004\ 418\ m^2$, $v_7 = 0.001\ 008\ m^3/kg$

$\mathbf{V}_7 = \dot{m}v_7/A_7 = 25 \times 0.001\ 008 / 0.004\ 418 = 5.7$ m/s

$h_6 = 191.83 + 0.92 \times 2392.8 = 2393.2$ kJ/kg

$$q_{COND} = h_7 - h_6 + \frac{1}{2}(\mathbf{V}_7^2 - \mathbf{V}_6^2)$$

$$= 168 - 2393.2 + (5.7^2 - 200^2)/(2\times1000) = -2245.2 \text{ kJ/kg}$$

$\dot{Q}_{COND} = 25$ kg/s $\times$ (–2245.2 kJ/kg) = **–56 130 kW**

This rate of heat transfer is carried away by the cooling water so

$$-\dot{Q}_{COND} = \dot{m}_{H_2O}(h_{out} - h_{in})_{H_2O} = 56\ 130 \text{ kW}$$

$$\Rightarrow \quad \dot{m}_{H_2O} = \frac{56\ 130}{104.9 - 63.0} \frac{\text{kW}}{\text{kJ/kg}} = \mathbf{1339.6\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.120

For the same steam power plant as shown in Fig. P4.118, determine the rate of heat transfer in the economizer, which is a low temperature heat exchanger. Find also the rate of heat transfer needed in the steam generator.

Solution:

Economizer $A_7 = \pi D_7^2/4 = 0.004\ 418\ m^2$, $v_7 = 0.001\ 008\ m^3/kg$

$$\mathbf{V}_2 = \mathbf{V}_7 = \dot{m}v_7/A_7 = 25 \times 0.001\ 008/0.004\ 418 = 5.7\ m/s,$$

$$\mathbf{V}_3 = (v_3/v_2)\mathbf{V}_2 = (0.001\ 118 / 0.001\ 008)\ 5.7 = 6.3\ m/s \approx \mathbf{V}_2$$

so kinetic energy change unimportant

$$q_{ECON} = h_3 - h_2 = 744 - 194 = 550.0\ kJ/kg$$

$$\dot{Q}_{ECON} = \dot{m}q_{ECON} = 25\ kg/s \times 550.0\ kJ/kg = \mathbf{13\ 750\ kW}$$

Generator $A_4 = \pi D_4^2/4 = 0.031\ 42\ m^2$, $v_4 = 0.060\ 23\ m^3/kg$

$$\mathbf{V}_4 = \dot{m}v_4/A_4 = 25\ kg/s \times 0.060\ 23\ m^3/kg\ /0.031\ 42\ m^2 = 47.9\ m/s$$

$$q_{GEN} = 3426 - 744 + (47.9^2 - 6.3^2)/(2\times1000) = 2683\ kJ/kg$$

$$\dot{Q}_{GEN} = \dot{m}q_{GEN} = 25\ kg/s \times 2683\ kJ/kg = \mathbf{67\ 075\ kW}$$

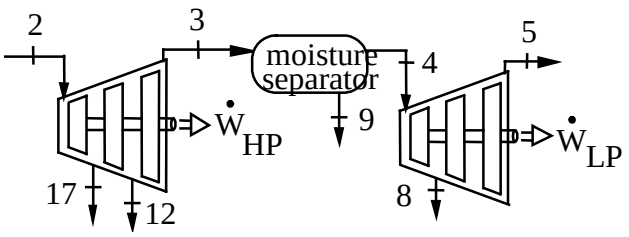
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.121

A somewhat simplified flow diagram for a nuclear power plant is given in Fig. P4.121. Mass flow rates and the various states in the cycle are shown in the accompanying table. The cycle includes a number of heaters in which heat is transferred from steam, taken out of the turbine at some intermediate pressure, to liquid water pumped from the condenser on its way to the steam drum. The heat exchanger in the reactor supplies 157 MW, and it may be assumed that there is no heat transfer in the turbines.

a. Assume the moisture separator has no heat transfer between the two turbinesections, determine the enthalpy and quality (h_4, x_4).
b. Determine the power output of the low-pressure turbine.
c. Determine the power output of the high-pressure turbine.
d. Find the ratio of the total power output of the two turbines to the total power delivered by the reactor.

Solution:



a) Moisture Separator, steady state, no heat transfer, no work

Continuity Eq.: $\dot{m}_3 = \dot{m}_4 + \dot{m}_9$, $\dot{m}_4 = \dot{m}_3 - \dot{m}_9 = 62.874 - 4.662 = 58.212$ kg/s

Energy Eq.: $\dot{m}_3 h_3 = \dot{m}_4 h_4 + \dot{m}_9 h_9$;

From the energy equation we get

$$h_4 = (\dot{m}_3 h_3 - \dot{m}_9 h_9) / \dot{m}_4 = \frac{62.874 \times 2517 - 4.662 \times 558}{58.212} = 2673.9 \text{ kJ/kg}$$

$h_4 = 2673.9 = 566.18 + x_4 \times 2160.6$ => $x_4 =$ **0.9755**

b) Low Pressure Turbine, steady state no heat transfer

Continuity Eq.: $\dot{m}_4 = \dot{m}_5 + \dot{m}_8$

Energy Eq.: $\dot{m}_4 h_4 = \dot{m}_5 h_5 + \dot{m}_8 h_8 + \dot{W}_{CV(LP)}$

$\dot{m}_5 = \dot{m}_4 - \dot{m}_8 = 58.212 - 2.772 = 55.44$ kg/s

$\dot{W}_{CV(LP)} = \dot{m}_4 h_4 - \dot{m}_5 h_5 - \dot{m}_8 h_8$

$= 58.212 \times 2673.9 - 55.44 \times 2279 - 2.772 \times 2459$

$= 22\,489$ kW = **22.489 MW**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

c) High Pressure Turbine, steady state no heat transfer

Energy Eq.: $\dot{m}_2 h_2 = \dot{m}_3 h_3 + \dot{m}_{12} h_{12} + \dot{m}_{17} h_{17} + \dot{W}_{CV(HP)}$

$\dot{W}_{CV(HP)} = \dot{m}_2 h_2 - \dot{m}_3 h_3 - \dot{m}_{12} h_{12} - \dot{m}_{17} h_{17}$

$= 75.6 \times 2765 - 62.874 \times 2517 - 8.064 \times 2517 - 4.662 \times 2593$

$= 18\ 394$ kW = **18.394 MW**

d) $\eta = (\dot{W}_{HP} + \dot{W}_{LP})/\dot{Q}_{REACT} = (22.489 + 18.394) / 157 =$ **0.26**

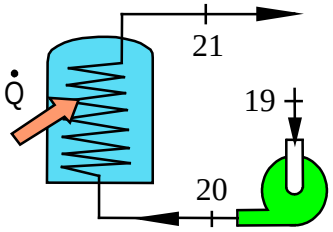
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.122

Consider the power plant as described in the previous problem.
a. Determine the quality of the steam leaving the reactor.
b. What is the power to the pump that feeds water to the reactor?

Solution:

a) Reactor: Cont.: $\dot{m}_{20} = \dot{m}_{21}$; $\dot{Q}_{CV} = 157$ MW



Energy Eq.4.12:

$$\dot{Q}_{CV} + \dot{m}_{20} h_{20} = \dot{m}_{21} h_{21}$$

157 000 kW + 1386 kg/s × 1221 kJ/kg = 1386 kg/s × h_{21}

h_{21} = 1334.3 kJ/kg = (1282.4 + x_{21} × 1458.3) kJ/kg => x_{21} = **0.0349**

b) C.V. Reactor feedwater pump

Cont. $\dot{m}_{19} = \dot{m}_{20}$ Energy Eq.: $\dot{m}_{19} h_{19} = \dot{m}_{19} h_{20} + \dot{W}_{Cv,P}$

Table B.1: $h_{19} = h(277°C, 7240\ kPa) = 1220$ kJ/kg, $h_{20} = 1221$ kJ/kg

$\dot{W}_{Cv,P} = \dot{m}_{19}(h_{19} - h_{20}) = 1386$ kg/s (1220 - 1221) kJ/kg = **-1386 kW**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.123

A R-410A heat pump cycle shown in Fig. P4.123 has a R-410A flow rate of 0.05 kg/s with 5 kW into the compressor. The following data are given

State	1	2	3	4	5	6
P, kPa	3100	3050	3000	420	400	390
T, °C	120	110	45		-10	-5
h, kJ/kg	377	367	134	-	280	284

Calculate the heat transfer from the compressor, the heat transfer from the R-410A in the condenser and the heat transfer to the R-410A in the evaporator.

Solution:

CV: Compressor

$$\dot{Q}_{COMP} = \dot{m}(h_1 - h_6) + \dot{W}_{COMP} = 0.05\ (377 - 284) - 5.0 = \mathbf{-0.35\ kW}$$

CV: Condenser

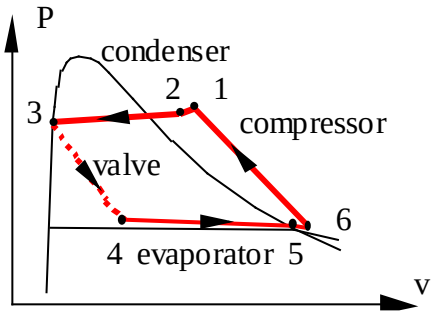
$$\dot{Q}_{COND} = \dot{m}(h_3 - h_2) = 0.05\ kg/s\ (134 - 367)\ kJ/kg = \mathbf{-11.65\ kW}$$

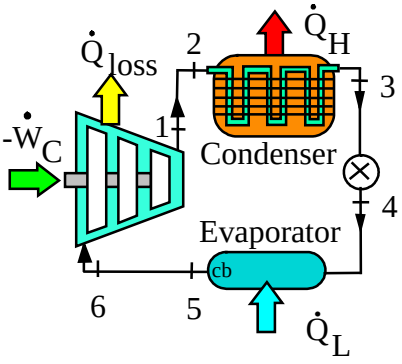
C.V. Valve:

$$h_4 = h_3 = 134\ kJ/kg$$

CV: Evaporator

$$\dot{Q}_{EVAP} = \dot{m}\ (h_5 - h_4) = 0.05\ kg/s\ (280 - 134)\ kJ/kg = \mathbf{7.3\ kW}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.124

A modern jet engine has a temperature after combustion of about 1500 K at 3200 kPa as it enters the turbine setion, see state 3 Fig. P.4.124. The compressor inlet is 80 kPa, 260 K state 1 and outlet state 2 is 3300 kPa, 780 K; the turbine outlet state 4 into the nozzle is 400 kPa, 900 K and nozzle exit state 5 at 80 kPa, 640 K. Neglect any heat transfer and neglect kinetic energy except out of the nozzle. Find the compressor and turbine specific work terms and the nozzle exit velocity.

Solution:
The compressor, turbine and nozzle are all steady state single flow devices and they are adiabatic.

We will use air properties from table A.7.1:

h_1 = 260.32, h_2 = 800.28, h_3 = 1635.80, h_4 = 933.15, h_5 = 649.53 kJ/kg

Energy equation for the compressor gives

$$w_{c\ in} = h_2 - h_1 = 800.28 - 260.32 = \mathbf{539.36\ kJ/kg}$$

Energy equation for the turbine gives

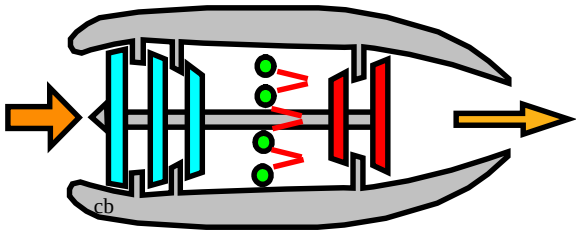
$$w_T = h_3 - h_4 = 1635.80 - 933.15 = \mathbf{702.65\ kJ/kg}$$

Energy equation for the nozzle gives

$$h_4 = h_5 + \tfrac{1}{2}\,\mathbf{V}_5^2$$

$$\tfrac{1}{2}\,\mathbf{V}_5^2 = h_4 - h_5 = 933.15 - 649.53 = 283.62\ \text{kJ/kg}$$

$$\mathbf{V}_5 = [2(h_4 - h_5)]^{1/2} = (2 \times 283.62 \times 1000)^{1/2} = \mathbf{753\ m/s}$$

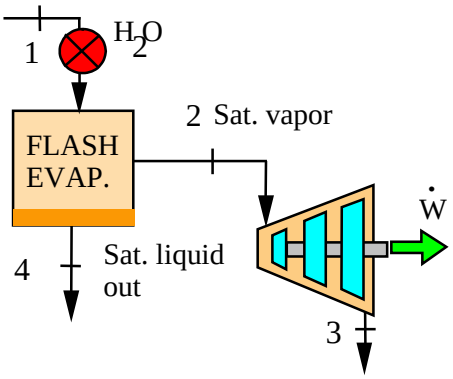


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.125

A proposal is made to use a geothermal supply of hot water to operate a steam turbine, as shown in Fig. P4.125. The high-pressure water at 1.5 MPa, 180°C, is throttled into a flash evaporator chamber, which forms liquid and vapor at a lower pressure of 400 kPa. The liquid is discarded while the saturated vapor feeds the turbine and exits at 10 kPa, 90% quality. If the turbine should produce 1 MW, find the required mass flow rate of hot geothermal water in kilograms per hour.

Solution:



Separation of phases in flash-evaporator constant h in the valve flow so

Table B.1.3: $h_1 = 763.5$ kJ/kg

$h_1 = 763.5 = 604.74 + x \times 2133.8$

$\Rightarrow \quad x = 0.07439 = \dot{m}_2/\dot{m}_1$

Table B.1.2: $h_2 = 2738.6$ kJ/kg;

$h_3 = 191.83 + 0.9 \times 2392.8 = 2345.4$ kJ/kg

Energy Eq.4.12 for the turbine

$$\dot{W} = \dot{m}_2(h_2 - h_3) \qquad => \qquad \dot{m}_2 = \frac{1000}{2738.6 - 2345.4}\frac{\text{kW}}{\text{kJ/kg}} = 2.543 \text{ kg/s}$$

$\Rightarrow \quad \dot{m}_1 = \dot{m}_2/x = 34.19$ kg/s = **123 075 kg/h**

4.126

An initially empty cylinder is filled with air from 20^{o}C, 100 kPa until it is full. Assuming no heat transfer is the final temperature larger, equal to or smaller than 20^{o}C? Does the final T depend on the size of the cylinder?

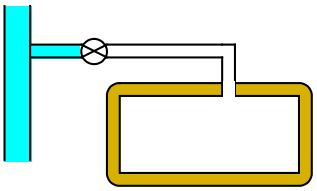
This is a transient problem with no heat transfer and no work. The balance equations for the tank as C.V. become

Continuity Eq.: $m_2 - 0 = m_i$

Energy Eq.: $m_2u_2 - 0 = m_ih_i + Q - W = m_ih_i + 0 - 0$

Final state: $u_2 = h_i$ & $P_2 = P_i$

$T_2 > T_i$ and it does not depend on V



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.127

An initially empty canister of volume 0.2 m^3 is filled with carbon dioxide from a line at 800 kPa, 400 K. Assume the process runs until it stops by itself and it is adiabatic. Use constant specific heat to find the final temperature in the canister.

C.V. Canister and valve, transient process with no heat transfer or work.

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$;

Energy Eq.4.16: $m_2u_2 - m_1u_1 = - m_{in} h_{in} + {}_1Q_2 - {}_1W_2$

Process: ${}_1Q_2 = 0$, V= constant so ${}_1W_2 = 0$

State 1: $m_1 = 0$ => $m_2 = m_{in}$

State 2: $P_2 = P_{line} = 800$ kPa, one more property

Energy Eq.: $u_2 = h_{in} = u_{in} + RT_{in} \Rightarrow C_{vo} T_2 = C_{vo} T_{in} + RT_{in} = C_{Po}T_{in}$

$T_2 = (C_{Po}/C_{vo}) T_{in} = k \times T_{in} = 1.289 \times 400$ K = **515.6 K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.128

Repeat the previous problem but use the ideal gas Tables A.8 to solve it.

C.V. Canister and valve, transient process with no heat transfer or work.

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$;

Energy Eq.4.16: $m_2u_2 - m_1u_1 = - m_{in} h_{in} + {}_1Q_2 - {}_1W_2$

Process: ${}_1Q_2 = 0$, V= constant so ${}_1W_2 = 0$

State 1: $m_1 = 0$ => $m_2 = m_{in}$

State 2: $P_2 = P_{line} = 800$ kPa, one more property

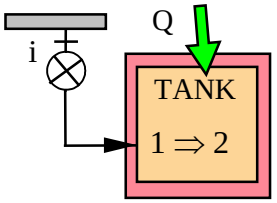
Energy Eq.: $u_2 = h_{in} = 303.76$ kJ/kg from A.8

back interpolate for u_2: $T_2 =$ **495.9 K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.129

A tank contains 1 m^3 air at 100 kPa, 300 K. A pipe flowing air at 1000 kPa, 300 K is connected to the tank and it is filled slowly to 1000 kPa. Find the heat transfer to reach a final temperature of 300 K.



C.V. The tank volume and the compressor.

This is a transient problem (filling of tank).

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = {}_1Q_2 - {}_1W_2 + m_{in}h_{in}$

Process: Constant volume ${}_1W_2 = 0$,

States: $u_1 = u_2 = u_{in} = u_{300}$; $h_{in} = u_{in} + RT_{in}$

$$m_1 = P_1V_1/RT_1 = 100 \text{ kPa} \times 1 \text{ m}^3 /(0.287 \text{ kJ/kg-K} \times 300 \text{ K})$$
$$= 1.1614 \text{ kg}$$

$$m_2 = P_2V_2/RT_2 = 1000 \text{ kPa} \times 1 \text{ m}^3/(0.287 \text{ kJ/kg-K} \times 300 \text{ K})$$
$$= 11.6144 \text{ kg}$$

Heat transfer from the energy equation

$${}_1Q_2 = m_2u_2 - m_1u_1 - m_{in}h_{in} = (m_1 + m_{in})\, u_1 - m_1u_1 - m_{in}u_{in} - m_{in}RT_{in}$$
$$= m_1u_1 - m_1u_1 + m_{in}u_1 - m_{in}u_{in} - m_{in}RT_{in} = - m_{in}RT_{in}$$
$$= (11.6144 - 1.1614) \text{ kg} \times 0.287 \text{ kJ/kg-K} \times 300 \text{ K} = \mathbf{-900 \text{ kJ}}$$

4.130

A 1-m^3 tank contains ammonia at 150 kPa, 25°C. The tank is attached to a line flowing ammonia at 1200 kPa, 60°C. The valve is opened, and mass flows in until the tank is half full of liquid, by volume at 25°C. Calculate the heat transferred from the tank during this process.

Solution:

C.V. Tank. Transient process as flow comes in.

State 1 Table B.2.2 interpolate between 20 °C and 30°C:

$v_1 = 0.9552\ m^3/kg;\ u_1 = 1380.6\ kJ/kg$

$m_1 = V/v_1 = 1/0.9552 = 1.047\ kg$

State 2: 0.5 m^3 liquid and 0.5 m^3 vapor from Table B.2.1 at 25°C

$v_f = 0.001658\ m^3/kg;\ v_g = 0.12813\ m^3/kg$

$m_{LIQ2} = 0.5/0.001658 = 301.57\ kg,\quad m_{VAP2} = 0.5/0.12813 = 3.902\ kg$

$m_2 = 305.47\ kg,\quad x_2 = m_{VAP2}/m_2 = 0.01277,$

From continuity equation

$m_i = m_2 - m_1 = 304.42\ kg$

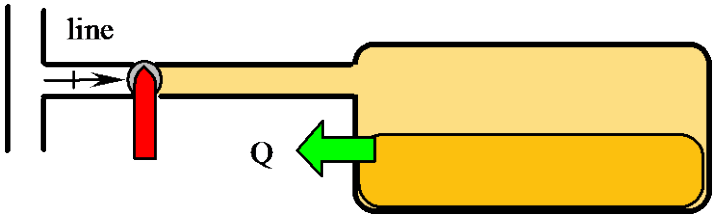
Table B.2.1: $u_2 = 296.6 + 0.01277 \times 1038.4 = 309.9\ kJ/kg$

State inlet: Table B.2.2 $h_i = 1553.3\ kJ/kg$

Energy Eq.4.16:

$Q_{CV} + m_i h_i = m_2 u_2 - m_1 u_1$

$Q_{CV} = 305.47 \times 309.9 - 1.047 \times 1380.6 - 304.42 \times 1553.3 =$ **-379 636 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.131

A 2.5-L tank initially is empty and we want 10 g of ammonia in it. The ammonia comes from a line with saturated vapor at 25°C. To end up with the desired amount we cool the can while we fill it in a slow process keeping the can and content at 30°C. Find the final pressure to reach before closing the valve and the heat transfer?

Solution:

C.V. Tank:

Continuity Eq.4.15: $m_i = m_2$

Energy Eq.4.16: $m_2u_2 - 0 = m_ih_i + {}_1Q_2$

State 2: 30°C, $v_2 = V/m_2 = 0.0025\ m^3/0.010\ kg = 0.25\ m^3/kg$

From Table B.2.2 we locate the state between 500 and 600 kPa.

$$P_2 = 500 + (600 - 500)\frac{0.25 - 0.28103}{0.23152 - 0.28103} = \mathbf{562.7\ kPa}$$

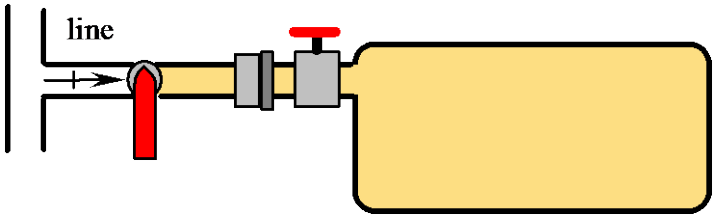
$u_2 = 1370$ kJ/kg,

State i Table B.2.2: $h_i = 1463.5$ kJ/kg

Now use the energy ewquation to solve for the heat transfer

$${}_1Q_2 = m_2u_2 - m_ih_i = m_2(u_2 - h_i)$$

$$= 0.01\ kg \times (1370 - 1463.5)\ kJ/kg = \mathbf{-0.935\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.132

An evacuated 150-L tank is connected to a line flowing air at room temperature, 25°C, and 8 MPa pressure. The valve is opened allowing air to flow into the tank until the pressure inside is 6 MPa. At this point the valve is closed. This filling process occurs rapidly and is essentially adiabatic. The tank is then placed in storage where it eventually returns to room temperature. What is the final pressure?

Solution:

C.V. Tank:

Continuity Eq.4.15: $m_i = m_2$

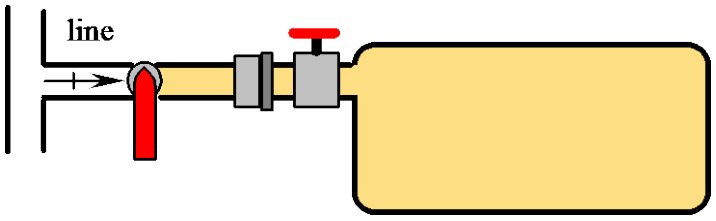
Energy Eq.4.16: $m_i h_i = m_2 u_2$ => $u_2 = h_i$

Use constant specific heat C_{Po} from table A.5 then energy equation:

$$T_2 = (C_P/C_v)\, T_i = kT_i = 1.4 \times 298.2 = 417.5 \text{ K}$$

Process: constant volume cooling to T_3:

$$P_3 = P_2 \times T_3/T_2 = 6.0 \text{ MPa} \times 298.15 \text{ K}/ 417.5 \text{ K} = \mathbf{4.29 \text{ MPa}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.133

An insulated 2-m^3 tank is to be charged with R- 134a from a line flowing the refrigerant at 3 MPa, 90°C. The tank is initially evacuated, and the valve is closed when the pressure inside the tank reaches 3 MPa. Find the mass in the tank and its final temperature.

C.V. Tank and valve, transient process with no heat transfer or work.

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$;

Energy Eq.4.16: $m_2u_2 - m_1u_1 = - m_{in}\, h_{in} + {}_1Q_2 - {}_1W_2$

Process: ${}_1Q_2 = 0$, V= constant so ${}_1W_2 = 0$

State 1: $m_1 = 0$ => $m_2 = m_{in}$

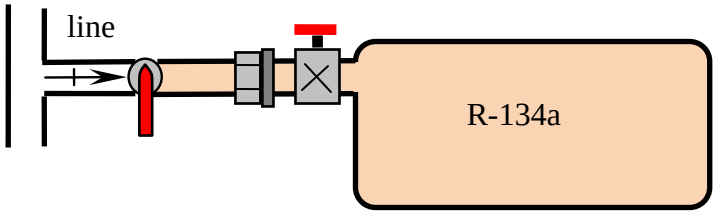
State 2: $P_2 = P_{line} = 3$ MPa, one more property

Energy Eq.: $u_2 = h_{in} = 436.19$ kJ/kg

State 2: (P, u) interpolate B.5.2: $T_2 = 100 + 10 \dfrac{436.19 - 433.77}{446.48 - 433.77} =$ **101.9°C**,

$v_2 = 0.00665 + 0.1904\ (0.00734 - 0.00665) = 0.006781$ m^3/kg

$m_2 = V/v_2 = [2\ \text{m}^3/0.006781\ \text{m}^3/\text{kg}] =$ **294.9 kg**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.134

Find the final state for the previous problem if the valve is closed when the tank reaches 2 MPa.

C.V. Tank and valve, transient process with no heat transfer or work.

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$;

Energy Eq.4.16: $m_2u_2 - m_1u_1 = - m_{in} h_{in} + {}_1Q_2 - {}_1W_2$

Process: ${}_1Q_2 = 0$, V= constant so ${}_1W_2 = 0$

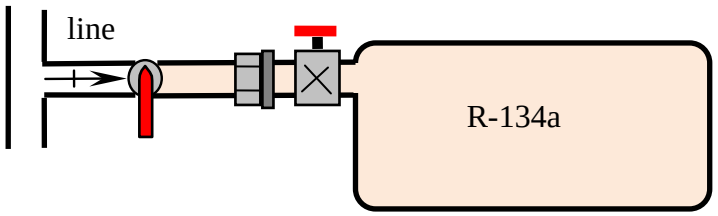
State 1: $m_1 = 0$ => $m_2 = m_{in}$

State 2: $P_2 = 2$ MPa, one more property

Energy Eq.: $u_2 = h_{in} = 436.19$ kJ/kg

State 2: (P, u) B.5.2: $T_2 =$ **90°C** very close, $v_2 = 0.01137\ m^3/kg$

$m_2 = V/v_2 = [2\ m^3/0.01137\ m^3/kg] =$ **175.9 kg**



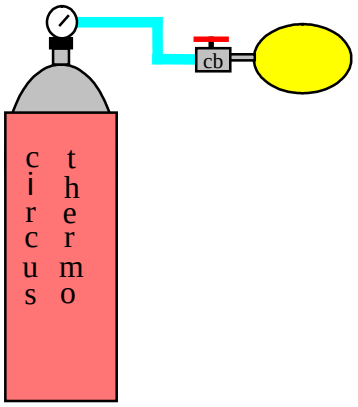
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.135

Helium in a steel tank is at 250 kPa, 300 K with a volume of 0.1 m^3. It is used to fill a balloon. When the tank pressure drops to 150 kPa the flow of helium stops by itself. If all the helium still is at 300 K how big a balloon did I get? Assume the pressure in the balloon varies linearly with volume from 100 kPa (V = 0) to the final 150 kPa. How much heat transfer did take place?

Solution:

Take a C.V. of all the helium.
This is a control mass, the tank mass changes density and pressure.



Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

Process Eq.: $P = 100 + CV$

State 1: P_1, T_1, V_1

State 2: $P_2, T_2, V_2 = ?$

Ideal gas:

$$P_2 V_2 = mRT_2 = mRT_1 = P_1V_1$$

$$V_2 = V_1(P_1/P_2) = 0.1 \times (250/150) = 0.16667 \text{ m}^3$$

$$V_{bal} = V_2 - V_1 = 0.16667 - 0.1 = 0.06667 \text{ m}^3$$

$${}_1W_2 = \int P\, dV = \text{AREA} = \tfrac{1}{2} (P_1 + P_2)(V_2 - V_1)$$

$$= \tfrac{1}{2}(250 + 150) \text{ kPa} \times 0.06667 \text{ m}^3 = 13.334 \text{ kJ}$$

$$U_2 - U_1 = {}_1Q_2 - {}_1W_2 = m (u_2 - u_1) = mC_v (T_2 - T_1) = 0$$

so $${}_1Q_2 = {}_1W_2 = \mathbf{13.334\ kJ}$$

Remark: The process is transient, but you only see the flow mass if you select the tank or the balloon as a control volume. That analysis leads to more terms that must be elliminated between the tank control volume and the balloon control volume.

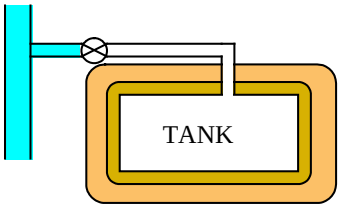
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.136

A 25-L tank, shown in Fig. P4.136, that is initially evacuated is connected by a valve to an air supply line flowing air at 20°C, 800 kPa. The valve is opened, and air flows into the tank until the pressure reaches 600 kPa.Determine the final temperature and mass inside the tank, assuming the process is adiabatic. Develop an expression for the relation between the line temperature and the final temperature using constant specific heats.

Solution:

C.V. Tank:



Continuity Eq.4.15: $m_2 = m_i$

Energy Eq.4.16: $m_2 u_2 = m_i h_i$

Table A.7: $u_2 = h_i = 293.64$ kJ/kg

$$\Rightarrow T_2 = \mathbf{410.0\ K}$$

$$m_2 = \frac{P_2 V}{R T_2} = \frac{600 \times 0.025}{0.287 \times 410} = \mathbf{0.1275\ kg}$$

Assuming constant specific heat,

$$h_i = u_i + RT_i = u_2\ , \quad RT_i = u_2 - u_i = C_{vo}(T_2 - T_i)$$

$$C_{vo}T_2 = (\ C_{vo} + R\ )T_i = C_{Po}T_i\ , \quad T_2 = \left(\frac{C_{Po}}{C_{vo}}\right) T_i = kT_i$$

For $T_i = 293.2$K & constant C_{Po}, $T_2 = 1.40 \times 293.2 =$ **410.5 K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.137

A nitrogen line, 300 K and 0.5 MPa, shown in Fig. P4.137, is connected to a turbine that exhausts to a closed initially empty tank of 50 m^3. The turbine operates to a tank pressure of 0.5 MPa, at which point the temperature is 250 K. Assuming the entire process is adiabatic, determine the turbine work.

Solution:

C.V. turbine & tank $\Rightarrow$ Transient process

Conservation of mass Eq.4.15: $m_i = m_2 \Rightarrow m$

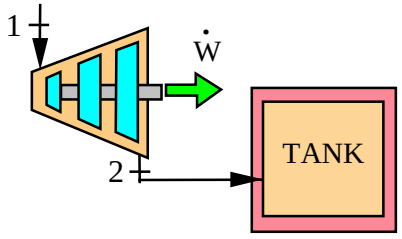
Energy Eq.4.16: $m_i h_i = m_2 u_2 + W_{CV}$; $W_{CV} = m(h_i - u_2)$

Table B.6.2: $P_i = 0.5$ MPa, $T_i = 300$ K, Nitrogen; $h_i = 310.28$ kJ/kg

2: $P_2 = 0.5$ MPa, $T_2 = 250$ K, $u_2 = 183.89$ kJ/kg, $v_2 = 0.154$ m^3/kg

$m_2 = V/v_2 = 50\ m^3 / (0.154\ m^3/kg) = 324.7$ kg

$W_{CV} = 324.7$ kg (310.28 - 183.89) kJ/kg = 41 039 kJ = **41.04 MJ**



We could with good accuracy have solved using ideal gas and Table A.5

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.138

A 1- m^3 rigid tank contains 100 kg R-410A at ambient temperature 15°C. A valve on top of the tank is opened, and saturated vapor is throttled to ambient pressure, 100 kPa, and flows to a collector system. During the process, the temperature inside the tank remains at 15°C. The valve is closed when no more liquid remains inside. Calculate the heat transfer to the tank.

C.V. Tank, no work and neglect kinetic and potential energies.

Continuity Eq.4.15: $m_2 - m_1 = - m_e$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = {}_1Q_2 - m_eh_e$

State 1 has $v_1 = V/m_1 = 1/100 = 0.01\ m^3/kg < v_g$ so two-phase

B.4.1: $x_1 = (0.01 - 0.000904)/0.01955 = 0.46527$

$u_1 = u_f + x_1u_{fg} = 80.02 + x_1 \times 177.1 = 162.42$ kJ/kg

State 2 is saturated vapor $T_2 = 15°C$

$v_2 = v_g = 0.02045\ m^3/kg,\ u_2 = u_g = 257.12$ kJ/kg

$$m_2 = V/v_2 = \frac{1\ m^3}{0.02045\ m^3/kg} = 48.9\ kg$$

The exit state e: $h_e = h_g = 282.79$ kJ/kg

$${}_1Q_2 = m_2u_2 - m_1u_1 + m_eh_e$$
$$= 48.9 \times 257.12 - 100 \times 162.42 + (100 - 48.9) \times 282.79$$
$$= \mathbf{10\ 782\ kJ}$$

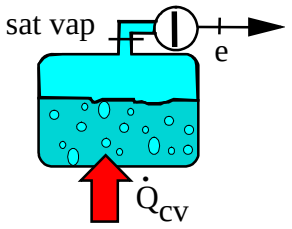
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.139

A 200 liter tank initially contains water at 100 kPa and a quality of 1%. Heat is transferred to the water thereby raising its pressure and temperature. At a pressure of 2 MPa a safety valve opens and saturated vapor at 2 MPa flows out. The process continues, maintaining 2 MPa inside until the quality in the tank is 90%, then stops. Determine the total mass of water that flowed out and the total heat transfer.

Solution:

C.V. Tank, no work but heat transfer in and flow out. Denoting State 1: initial state, State 2: valve opens, State 3: final state.



Continuity Eq.: $m_3 - m_1 = -m_e$

Energy Eq.: $m_3u_3 - m_1u_1 = -m_eh_e + {}_1Q_3$

State 1 Table B.1.2: $v_1 = v_f + x_1v_{fg} = 0.001043 + 0.01 \times 1.69296$

$= 0.01797\ m^3/kg$

$u_1 = u_f + x_1u_{fg} = 417.33 + 0.01 \times 2088.72 = 438.22\ kJ/kg$

$m_1 = V/v_1 = 0.2\ m^3/(0.01797\ m^3/kg) = 11.13\ kg$

State 3 (2MPa): $v_3 = v_f + x_3v_{fg} = 0.001177 + 0.9 \times 0.09845 = 0.8978\ m^3/kg$

$u_3 = u_f + x_3u_{fg} = 906.42 + 0.9 \times 1693.84 = 2430.88\ kJ/kg$

$m_3 = V/v_3 = 0.2\ m^3/(0.08978\ m^3/kg) = 2.23\ kg$

Exit state (2MPa): $h_e = h_g = 2799.51\ kJ/kg$

Hence: $m_e = m_1 - m_3 = 11.13\ kg - 2.23\ kg =$ **8.90 kg**

Applying the 1st law between state 1 and state 3

$${}_1Q_3 = m_3u_3 - m_1u_1 + m_eh_e$$

$$= 2.23 \times 2430.88 - 11.13 \times 438.22 + 8.90 \times 2799.51$$

$$= 25\ 459\ kJ =$$ **25.46 MJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.140

A 1-L can of R-134a is at room temperature 20°C with a quality 50%. A leak in the top valve allows vapor to escape and heat transfer from the room takes place so we reach a final state of 5°C with a quality of 100%. Find the mass that escaped and the heat transfer.

Solution:

CV The can of R-134a not including the nozzle/valve out to ambient 20°C

Continuity Eq.: $m_2 - m_1 = - m_e$

Energy Eq.: $m_2u_2 - m_1u_1 = - m_eh_e + {}_1Q_2 - {}_1W_2$

Process Eq.: V = constant => ${}_1W_2 = \int PdV = 0$

State 1: (T,x) $v_1 = v_f + x_1v_{fg} = 0.000817 + 0.5 \times 0.03524 = 0.018437$ m^3/kg

$u_1 = u_f + x_1u_{fg} = 227.03 + 0.5 \times 162.16 = 308.11$ kJ/kg

$m_1 = V / v_1 = 0.001$ m^3/ 0.018437 m^3/kg = 0.05424 kg

State 2: (T,x)

$v_2 = v_g = 0.05833$ m^3/kg, $u_2 = u_g = 380.85$ kJ/kg

$m_2 = V/v_2 = 0.001$ m^3/ 0.05833 m^3/kg = 0.017144 kg

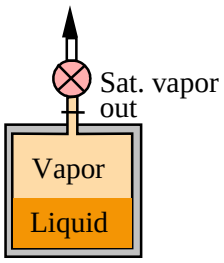
Exit state e: Saturated vapor starting at 20°C ending at 5°C so we take an **average**

$h_e = 0.5(h_{e1} + h_{e2}) = 0.5\ (409.84 + 401.32) = 405.58$ kJ/kg

$m_e = m_1 - m_2 =$ **0.0371 kg**

The heat transfer from the energy equation becomes

${}_1Q_2 = m_2u_2 - m_1u_1 + m_eh_e = 6.5293 - 16.7119 + 15.047 =$ **4.864 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.141

A 2 m tall cylinder has a small hole in the bottom. It is filled with liquid water 1 m high, on top of which is 1 m high air column at atmospheric pressure of 100 kPa. As the liquid water near the hole has a higher P than 100 kPa it runs out. Assume a slow process with constant T. Will the flow ever stop? When?

Solution:

$$P_{bot} = P_{air} + \rho g L_f$$

For the air PV = mRT and the total height is H = 2 m

$$P_{air} = mRT/V_{air} \quad ; V_{air} = A\, L_{air} = A\,(H - L_f)$$

$$P_{bot} = \frac{m_a R_a T_a}{A(H-L_f)} + \rho_f g\, L_f = \frac{P_{a1} V_{a1}}{A(H-L_f)} + \rho_f\, g L_f = \frac{P_{a1} L_{a1}}{H-L_f} + \rho_f\, g L_f \geq P_o$$

Solve for L_f ; $\rho_f = 1/(v_f) = 1/0.0021002 = 998\ kg/m^3$

$$P_{a1}\, L_{a1} + \rho_f\, g\, L_f\,(H - L_f) \geq P_o\,(H - L_f)$$

$$(\rho_f g H + P_o)\, L_f - \rho_f g L_f^2 = P_o\, H - P_{a1}\, L_{a1} \geq 0$$

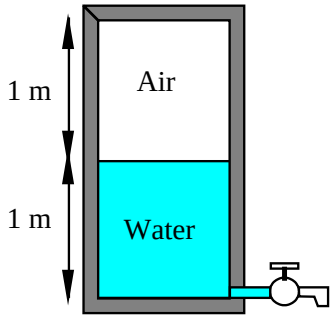
Put in numbers and solve quadratic eq.

$$L_f^2 - [\,H + (P_o/\rho g)\,]\, L_f + \frac{P_o H - P_{a1} L_{a1}}{\rho g} = 0$$

$$(P_o/\rho g) = \frac{100\ kPa\ m^3\ s^3}{998 \times 9.807\ kg\ m} = 10.217\ m$$

$$\frac{P_o H - P_{a1} L_{a1}}{\rho g} = \frac{100\,(2-1)}{998 \times 9.807} = 10.217\ m$$

$$L_f^2 - 12.217\, L_f + 10.217 = 0$$



$$L_f = \frac{12.217}{2} \pm \sqrt{\frac{12.217^2}{4} - \frac{12.217}{4}} = 6.1085 \pm 5.2055$$

=> 11.314 or **0.903 m** so the second root is the solution

Verify

$$P_{a2} = P_{a1} \cdot \frac{L_{a1}}{H-L_f} = 100\, \frac{1}{2 - 0.903} = 91.158\ kPa$$

$$\rho g L_f = 998 \times 9.807 \times 0.903 = 8838\ Pa = 8.838\ kPa$$

$$P_{bot} = P_{a2} + \rho g L_f = 91.158 + 8.838 = 99.996\ kPa \quad OK$$

4.142

A pipe of radius R has a fully developed laminar flow of air at P_o, T_o with a velocity profile as: $V = V_c [1 - (r/R)^2]$, where V_c is the velocity on the center-line and r is the radius as shown in Fig. P4.142. Find the total mass flow rate and the average velocity both as functions of V_c and R.

$$\dot{m} = AV/v = \dot{V}/v$$

Since the velocity is distributed we need to integrate over the area. From Eq.4.2

$$\dot{V} = \int V_{local}\, dA = \int V(r)\, 2\pi r\, dr$$

where W is the depth. Substituting the velocity we get

$$\dot{V} = \int V_c\, 2\pi r\, [1 - (r/R)^2]\, dr$$

$$= 2\pi\, V_c\, R^2 \int_0^1 z\,(1 - z^2)\, dz$$

$$= 2\pi\, V_c\, R^2 \left(\tfrac{1}{2} z^2 - \tfrac{1}{4} z^4 \right)\Big|_0^1 = \frac{\pi}{2} V_c\, R^2 = \tfrac{1}{2} V_c\, A$$

$$V = \dot{V}/A = \tfrac{1}{2} V_c$$

$$\dot{m} = \dot{V}/\mathbf{v} = \frac{\pi}{2} V_c\, R^2/v$$

4.143

Steam at 3 MPa, 400°C enters a turbine with a volume flow rate of 5 m^3/s. An extraction of 15% of the inlet mass flow rate exits at 600 kPa, 200°C. The rest exits the turbine at 20 kPa with a quality of 90%, and a velocity of 20 m/s. Determine the volume flow rate of the extraction flow and the total turbine work.

Solution:

Inlet flow (Table B.1.3): $v_1 = 0.09936\ m^3/kg$, $h_1 = 3230.82$ kJ/kg

$$\dot{m}_1 = \dot{V}/v_1 = 5/0.09936 = 50.32\ kg/s$$

Extraction flow : $v_2 = 0.35202\ m^3/kg$; $h_2 = 2850.12$ kJ/kg

$$\dot{m}_2 = 0.15\ \dot{m}_1 = 7.55\ kg/s;$$

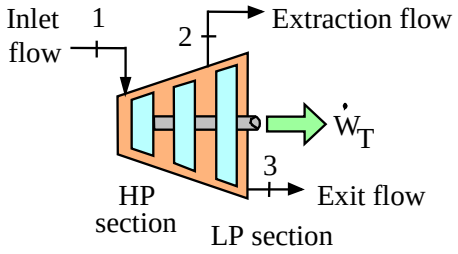
$$\dot{V}_2 = \dot{m}_2 v = 7.55\ kg/s \times 0.35202\ m^3/kg = \mathbf{2.658\ m^3/s}$$

Exit flow : $\dot{m}_3 = 0.85\ \dot{m}_1 = 42.77$ kg /s

Table B.1.2 $h_3 = 251.38 + 0.9 \times 2358.33 = 2373.88$ kJ/kg

Energy Eq.: $0 = \dot{m}_1 h_1 - \dot{m}_2 h_2 - \dot{m}_3 h_3 - \dot{W}_T$

$$\dot{W}_T = \dot{m}_1 h_1 - \dot{m}_2 h_2 - \dot{m}_3 h_3$$
$$= 50.32 \times 3230.82 - 7.55 \times 2850.12 - 42.77 \times 2373.88$$
$$= \mathbf{39\ 525\ kW} = 39.5\ MW$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.144

In a glass factory a 2 m wide sheet of glass at 1500 K comes out of the final rollers that fix the thickness at 5 mm with a speed of 0.5 m/s. Cooling air in the amount of 20 kg/s comes in at 17°C from a slot 2 m wide and flows parallel with the glass. Suppose this setup is very long so the glass and air comes to nearly the same temperature (a co-flowing heat exchanger) what is the exit temperature?

Solution:

Energy Eq.: $\dot{m}_{glass} h_{glass\ 1} + \dot{m}_{air} h_{air\ 2} = \dot{m}_{glass} h_{glass\ 3} + \dot{m}_{air} h_{air\ 4}$

$\dot{m}_{glass} = \rho \dot{V} = \rho A V = 2500\ kg/m^3 \times 2\ m \times 0.005\ m \times 0.5\ m/s = 12.5\ kg/s$

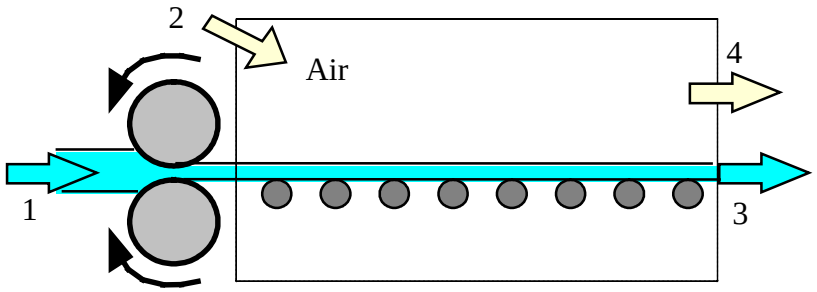
$\dot{m}_{glass} C_{glass} (T_3 - T_1) + \dot{m}_{air} C_{Pa} (T_4 - T_2) = \varnothing$

$T_4 = T_3$, $C_{glass} = 0.80\ kJ/kg\ K$, $C_{Pa} = 1.004\ kJ/kg\ K$

$$T_3 = \frac{\dot{m}_{glass} C_{glass}\ T_1 + \dot{m}_{air} C_{Pa}\ T_2}{\dot{m}_{glass} C_{glass} + \dot{m}_{air} C_{Pa}} = \frac{12.5 \times 0.80 \times 1500 + 20 \times 1.004 \times 290}{12.5 \times 0.80 + 20 \times 1.004}\ K$$

= **692.3 K**

We could use table A.7.1 for air, but then it will be trial and error



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.145

Assume a setup similar to the previous problem but the air flows in the opposite direction of the glass, it comes in where the glass goes out. How much air flow at 17°C is required to cool the glass to 450 K assuming the air must be at least 120 K cooler than the glass at any location?

Solution:

Energy Eq.: $\dot{m}_1 h_1 + \dot{m}_4 h_4 = \dot{m}_3 h_3 + \dot{m}_2 h_2$

$T_4 = 290$ K and $T_3 = 450$ K

$$\dot{m}_{glass} = \rho \dot{V} = \rho A V = 2500 \text{ kg/m}^3 \times 2 \text{ m} \times 0.005 \text{ m} \times 0.5 \text{ m/s} = 12.5 \text{ kg/s}$$

$$T_2 \leq T_1 - 120 \text{ K} = 1380 \text{ K}$$

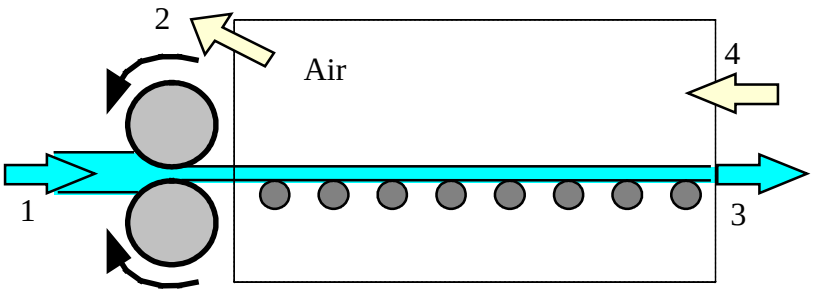
$$\dot{m} = \dot{m}_4 = \dot{m}_2 = \dot{m}_1 \frac{h_1 - h_3}{h_2 - h_4}$$

Let us check the limit and since T is high use table A.7.1 for air.

$h_4 = 290.43$ kJ/kg, $h_2 = 1491.33$ kJ/kg

$$\dot{m} = \dot{m}_4 = \dot{m}_2 = \dot{m}_1 \frac{h_1 - h_3}{h_2 - h_4} = \dot{m}_1 \frac{C_{glass}(T_1 - T_3)}{h_2 - h_4}$$

$$\dot{m} = 12.5 \text{ kg/s} \frac{0.8\ (1500 - 450)}{1491.33 - 290.43} = \mathbf{8.743\ kg/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.146

Two kg of water at 500 kPa, 20^{o}C is heated in a constant pressure process to 1700^{o}C. Find the best estimate for the heat transfer.

Solution:

C.V. Heater; steady state 1 inlet and exit, no work term, no ΔKE, ΔPE .

Continuity Eq.: $\dot{m}_{in} = \dot{m}_{ex} = \dot{m}$,

Energy Eq.4.13: $q + h_{in} = h_{ex} \Rightarrow q = h_{ex} - h_{in}$

steam tables only go up to 1300^{o}C so use an intermediate state at lowest pressure (closest to ideal gas) h_X(1300^{o}C, 10 kPa) from Table B.1.3 and table A.8 for the high T change Δh from 1300^{o}C to 1700^{o}C.

$h_{ex} - h_{in} = (h_{ex} - h_X) + (h_X - h_{in})$

$= (4515.55 – 3416.77) + (5409.7 - 83.96) = 6424.5$ kJ/kg

$Q = m(h_{ex} - h_{in}) = 2 \times 6424.5 =$ **12 849 kJ**

Why is it done this way? The two tables have different offset values for *h*. Once differences in h between two states are taken from the same table the offset goes out.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.147

A 500-L insulated tank contains air at 40°C, 2 MPa. A valve on the tank is opened, and air escapes until half the original mass is gone, at which point the valve is closed. What is the pressure inside then?

Solution:

State 1: ideal gas $m_1 = P_1V/RT_1 = \dfrac{2000 \times 0.5}{0.287 \times 313.2} = 11.125$ kg

Continuity eq.4.15: $m_e = m_1 - m_2$, $m_2 = m_1/2 \Rightarrow m_e = m_2 = 5.5625$ kg

Energy Eq.4.16: $m_2u_2 - m_1u_1 = - m_e h_{e\ avg}$

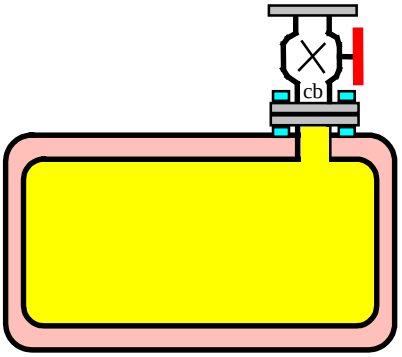
Substitute constant specific heat from table A.5 and evaluate the exit enthalpy as the average between the beginning and the end values

$$h_{e\ avg} \approx C_P\,(T_1 + T_2)/2$$

$$5.5625 \times 0.717\ T_2 - 11.125 \times 0.717 \times 313.2 = - 5.5625 \times 1.004\ (313.2 + T_2)/2$$

Solving, $T_2 = 239.4$ K

$$P_2 = \frac{m_2RT_2}{V} = \frac{5.5625 \times 0.287 \times 239.4}{0.5} = \mathbf{764\ kPa}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.148

Three air flows all at 200 kPa are connected to the same exit duct and mix without external heat transfer. Flow one has 1 kg/s at 400 K, flow two has 3 kg/s at 290 K and flow three has 2 kg/s at 700 K. Neglect kinetic energies and find the volume flow rate in the exit flow.

Solution:

Continuity Eq. $\dot{m}_1 + \dot{m}_2 + \dot{m}_3 = \dot{m}_4 h_4$

Energy Eq.: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 + \dot{m}_4 h_4$

$\dot{V}_4 = \dot{m}\, v_4$

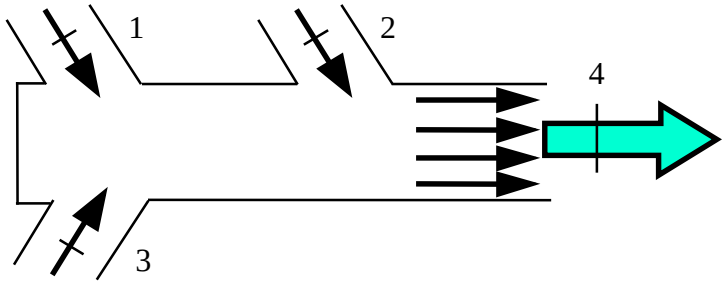
$$h_4 = \frac{\dot{m}_1}{\dot{m}_4} h_1 + \frac{\dot{m}_2}{\dot{m}_4} h_2 + \frac{\dot{m}_3}{\dot{m}_4} h_3 = \frac{1}{6} \times 401.3 + \frac{3}{6} \times 290.43 + \frac{2}{6} \times 713.56$$

$$= 449.95 \text{ kJ/kg}$$

$$T_4 = 440 + 20 \frac{449.95 - 441.93}{462.34 - 441.93} = 447.86 \text{ K}$$

$v_4 = RT_4 / P_4 = 0.287$ kJ/kg-K $\times$ 447.86 K/200 kPa = **0.643 m^3/kg**

$\dot{V}_4 = \dot{m}_4 v_4 = 6 \times 0.643 =$ **3.858 m^3/s**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.149

Consider the power plant as described in Problem 4.121.

a. Determine the temperature of the water leaving the intermediate pressure heater, T_{13}, assuming no heat transfer to the surroundings.

b. Determine the pump work, between states 13 and 16.

Solution:

a) Intermediate Pressure Heater

Continuity Eq.: $\dot{m}_{11} = \dot{m}_{13}$; $\dot{m}_{12} + \dot{m}_{15} = \dot{m}_{14}$ feedwater line closed

Energy Eq.4.10: $\dot{m}_{11}h_{11} + \dot{m}_{12}h_{12} + \dot{m}_{15}h_{15} = \dot{m}_{13}h_{13} + \dot{m}_{14}h_{14}$

$$\dot{m}_{14} = \dot{m}_{12} + \dot{m}_{15} = 8.064 + 4.662 = 12.726 \text{ kg/s}$$

$$75.6 \times 284.6 + 8.064 \times 2517 + 4.662 \times 584 = 75.6 \times h_{13} + 12.726 \times 349$$

$$h_{13} = 530.35 \text{ kJ/kg} \quad \rightarrow T_{13} = \mathbf{126.3°C}$$

b) The high pressure pump

Energy Eq.4.12: $\dot{m}_{13}h_{13} = \dot{m}_{16}h_{16} + \dot{W}_{Cv,P}$

$$\dot{W}_{Cv,P} = \dot{m}_{13}(h_{13} - h_{16}) = 75.6 \text{ kg/s } (530.35 - 565) \text{ kJ/kg} = \mathbf{-2620 \text{ kW}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.150

Consider the powerplant as described in Problem 4.121.

a. Find the power removed in the condenser by the cooling water (not shown).
b. Find the power to the condensate pump.
c. Do the energy terms balance for the low pressure heater or is there a heat transfer not shown?

Solution:

a) Condenser:

Continuity Eq.: $\dot{m}_5 + \dot{m}_{10} = \dot{m}_6$; also $\dot{m}_5 = \dot{m}_3 - \dot{m}_9 - \dot{m}_8$

Energy Eq.4.10: $\dot{Q}_{CV} + \dot{m}_5 h_5 + \dot{m}_{10} h_{10} = \dot{m}_6 h_6$

$$\dot{m}_{10} = \dot{m}_6 - \dot{m}_5 = \dot{m}_6 - (\dot{m}_3 - \dot{m}_9 - \dot{m}_8)$$
$$= 75.6 - (62.874 - 4.662 - 2.772) = 75.6 - 55.44 = 20.16 \text{ kg/s}$$

$$\dot{Q}_{CV} + 55.44 \times 2279 + 20.16 \times 142.51 = 75.6 \times 138.3$$

$$\dot{Q}_{CV} = -118\,765 \text{ kW} = \mathbf{-118.77\ MW}$$

b) The condensate pump

$$\dot{W}_{Cv,P} = \dot{m}_6(h_6 - h_7) = 75.6 \text{ kg/s } (138.31 - 140) \text{ kJ/kg} = \mathbf{-127.8\ kW}$$

c) Low pressure heater Assume no heat transfer

$$\dot{m}_{14} h_{14} + \dot{m}_8 h_8 + \dot{m}_7 h_7 + \dot{m}_9 h_9 = \dot{m}_{10} h_{10} + \dot{m}_{11} h_{11}$$

LHS = 12.726×349 + 2.772×2459 + 75.6×140 + 4.662×558 = 24 443 kW

RHS = (12.726 + 2.772 + 4.662) × 142.51 + 75.6 × 284.87 = 24 409 kW

A slight imbalance, but OK.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.151

A 1-m^3, 40-kg rigid steel tank contains air at 500 kPa, and both tank and air are at 20°C. The tank is connected to a line flowing air at 2 MPa, 20°C. The valve is opened, allowing air to flow into the tank until the pressure reaches 1.5 MPa and is then closed. Assume the air and tank are always at the same temperature and the final temperature is 35°C. Find the final air mass and the heat transfer.

Solution:

Control volume: Air and the steel tank.

Continuity Eq.4.15: $m_2 - m_1 = m_i$

Energy Eq.4.16: $(m_2u_2 - m_1u_1)_{AIR} + m_{ST}(u_2 - u_1)_{ST} = m_ih_i + {}_1Q_2$

$$m_{1\ AIR} = \frac{P_1V}{RT_1} = \frac{500 \times 1}{0.287 \times 293.2} = 5.94 \text{ kg}$$

$$m_{2\ AIR} = \frac{P_2V}{RT_2} = \frac{1500 \times 1}{0.287 \times 308.2} = \mathbf{16.96\ kg}$$

$$m_i = (m_2 - m_1)_{air} = 16.96 - 5.94 = 11.02 \text{ kg}$$

The energy equation now gives

$${}_1Q_2 = (m_2u_2 - m_1u_1)_{air} + m_{st}(u_2 - u_1)_{st} - m_ih_i$$

$$= m_1(u_2 - u_1) + m_i(u_2 - u_i - RT_i) + m_{st}C_{st}(T_2 - T_1)$$

$$\cong m_1C_v(T_2 - T_1) + m_i[C_v(T_2 - T_i) - RT_i] + m_{st}C_{st}(T_2 - T_1)$$

$$= 5.94 \times 0.717(35 - 20) + 11.02[0.717(35 - 20) - 0.287 \times 293.2]$$
$$+ 40 \times 0.46(35 - 20)$$

$$= 63.885 - 808.795 + 276$$

$$= \mathbf{-\ 468.9\ kJ}$$

4.152

A steam engine based on a turbine is shown in Fig. P4.152. The boiler tank has a volume of 100 L and initially contains saturated liquid with a very small amount of vapor at 100 kPa. Heat is now added by the burner, and the pressure regulator does not open before the boiler pressure reaches 700 kPa, which it keeps constant. The saturated vapor enters the turbine at 700 kPa and is discharged to the atmosphere as saturated vapor at 100 kPa. The burner is turned off when no more liquid is present in the boiler. Find the total turbine work and the total heat transfer to the boiler for this process.

Solution:

C.V. Boiler tank. Heat transfer, no work and flow out.

Continuity Eq.4.15: $m_2 - m_1 = - m_e$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = Q_{CV} - m_eh_e$

State 1: Table B.1.1, 100 kPa => $v_1 = 0.001\,043$, $u_1 = 417.36$ kJ/kg

=> $m_1 = V/v_1 = 0.1/0.001\,043 = 95.877$ kg

State 2: Table B.1.1, 700 kPa => $v_2 = v_g = 0.2729$, $u_2 = 2572.5$ kJ/kg

=> $m_2 = V/v_g = 0.1/0.2729 = 0.366$ kg,

Exit state: Table B.1.1, 700 kPa => $h_e = 2763.5$ kJ/kg

From continuity eq.: $m_e = m_1 - m_2 = 95.511$ kg

$$Q_{CV} = m_2u_2 - m_1u_1 + m_eh_e$$

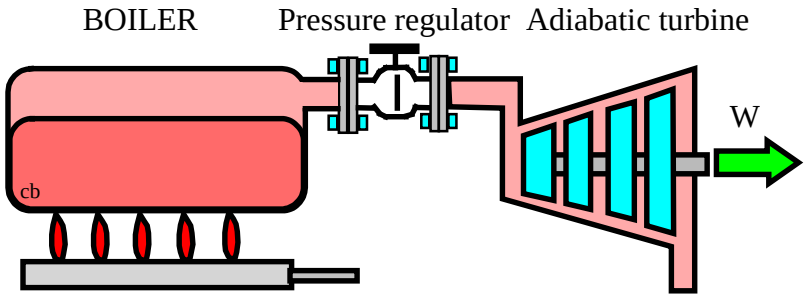
$$= 0.366 \times 2572.5 - 95.877 \times 417.36 + 95.511 \times 2763.5$$

$$= 224\,871 \text{ kJ} = \mathbf{224.9\ MJ}$$

C.V. Turbine, steady state, inlet state is boiler tank exit state.

Turbine exit state: Table B.1.1, 100 kPa => $h_e = 2675.5$ kJ/kg

$$W_{turb} = m_e (h_{in} - h_{ex}) = 95.511 \times (2763.5 - 2675.5) = \mathbf{8405\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.153

An insulated spring-loaded piston/cylinder, shown in Fig. P4.153, is connected to an air line flowing air at 600 kPa, 700 K by a valve. Initially the cylinder is empty and the spring force is zero. The valve is then opened until the cylinder pressure reaches 300 kPa. By noting that $u_2 = u_{line} + C_V(T_2 - T_{line})$ and $h_{line} - u_{line} = RT_{line}$ find an expression for T_2 as a function of P_2, P_o, T_{line}. With P = 100 kPa, find T_2.

Solution:

C.V. Air in cylinder, insulated so ${}_1Q_2 = 0$

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = m_{in}h_{line} - {}_1W_2$

$m_1 = 0 \Rightarrow m_{in} = m_2$; $m_2u_2 = m_2h_{line} - \frac{1}{2}(P_0 + P_2)m_2v_2$

$$\Rightarrow \quad u_2 + \tfrac{1}{2}(P_0 + P_2)v_2 = h_{line}$$

Use constant specific heat in the energy equation

$$C_V(T_2 - T_{line}) + u_{line} + \tfrac{1}{2}(P_0 + P_2)RT_2/P_2 = h_{line}$$

$$\left[\mathbf{C_V + \frac{1}{2}\frac{P_0 + P_2}{P_2}R}\right]\mathbf{T_2 = (R + C_V)T_{line}}$$

with #'s: $T_2 = \dfrac{R + C_V}{\frac{2}{3}R + C_V} T_{line}$; $C_V/R = 1/(k-1)$, $k = 1.4$

$$T_2 = \frac{k - 1 + 1}{\frac{2}{3}k - \frac{2}{3} + 1} T_{line} = \frac{3k}{2k + 1} T_{line} = 1.105\ T_{line} = \mathbf{773.7\ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.154

A mass-loaded piston/cylinder, shown in Fig. P4.154, containing air is at 300 kPa, 17°C with a volume of 0.25 m^3, while at the stops $V = 1\ m^3$. An air line, 500 kPa, 600 K, is connected by a valve that is then opened until a final inside pressure of 400 kPa is reached, at which point $T = 350$ K. Find the air mass that enters, the work, and heat transfer.

Solution:

C.V. Cylinder volume.

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = m_{in}h_{line} + Q_{CV} - {}_1W_2$

Process: P_1 is constant to stops, then constant V to state 2 at P_2

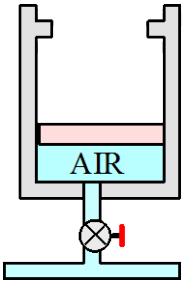
State 1: P_1, T_1 $\quad m_1 = \dfrac{P_1V}{RT_1} = \dfrac{300 \times 0.25}{0.287 \times 290.2} = 0.90$ kg

State 2:

Open to $P_2 = 400$ kPa, $T_2 = 350$ K

$$m_2 = \frac{400 \times 1}{0.287 \times 350} = 3.982 \text{ kg}$$

$m_i = 3.982 - 0.90 =$ **3.082 kg**



Only work while constant P

${}_1W_2 = P_1(V_2 - V_1) = 300(1 - 0.25) =$ **225 kJ**

Energy Eq.: $Q_{CV} + m_ih_i = m_2u_2 - m_1u_1 + {}_1W_2$

$Q_{CV} = 3.982 \times 0.717 \times 350 - 0.90 \times 0.717 \times 290.2 + 225$

$- 3.082 \times 1.004 \times 600 =$ **-819.2 kJ**

We could also have used the air tables A.7.1 for the u's and h_i.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.155

A 2-m^3 storage tank contains 95% liquid and 5% vapor by volume of liquified natural gas (LNG) at 160 K, as shown in Fig. P4.155. It may be assumed that LNG has the same properties as pure methane. Heat is transferred to the tank and saturated vapor at 160 K flows into a steady flow heater which it leaves at 300 K. The process continues until all the liquid in the storage tank is gone. Calculate the total amount of heat transfer to the tank and the total amount of heat transferred to the heater.

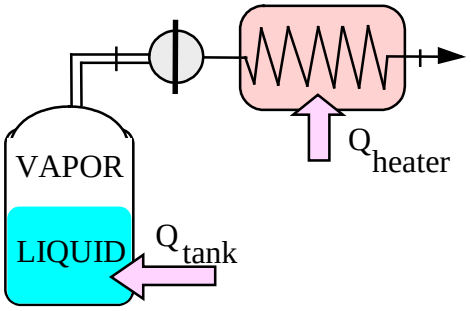
Solution:

CV: Tank, flow out, transient.

Continuity Eq.: $m_2 - m_1 = -m_e$

Energy Eq.:

$$Q_{Tank} = m_2u_2 - m_1u_1 + m_eh_e$$



At 160 K, from Table B.7:

$$m_f = V_f / v_f = \frac{0.95 \times 2}{0.00297} = 639.73 \text{ kg}, \quad m_g = V_g/v_g = \frac{0.05 \times 2}{0.03935} = 2.541 \text{ kg}$$

$m_1 = 642.271$ kg, $m_2 = V/v_{g2} = 2/0.03935 = 50.826$ kg

$m_1u_1 = 639.73(-106.35) + 2.541(207.7) = -67507$ kJ

$m_e = m_1 - m_2 = 591.445$ kg

$Q_{Tank} = 50.826 \times 207.7 - (-67\,507) + 591.445 \times 270.3$

$= \mathbf{+237\,931\ kJ}$

CV: Heater, steady flow, $P = P_{G\ 160\ K} = 1593$ kPa

$Q_{Heater} = m_{e\ Tank}(h_e - h_i)_{Heater}$

$= 591.445(612.9 - 270.3) = \mathbf{202\,629\ kJ}$

Continuity and Flow Rates

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.156E

Refrigerant R-410A at 100 psia, 60 F flows at 0.1 lbm/s in a 2.5 ft^2 cross sectional area pipe. Find the velocity and the volume flow rate.

$\dot{m} = A\mathbf{V}/v = \dot{V}/v$

Table F.9.2: $v = 0.6848\ ft^3/lbm$

$\dot{V} = v\,\dot{m} = 0.6848\ ft^3/lbm \times 0.1\ lbm/s =$ **$0.06848\ ft^3/s$**

$\mathbf{V} = \dot{V} / A = 0.06848\ (ft^3/s) / 2.5\ ft^2 =$ **$0.0274\ ft/s$**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.157E

Air at 95 F, 16 lbf/in.^{2}, flows in a 4 in. × 6 in. rectangular duct in a heating system. The volumetric flow rate is 30 cfm (ft^3/min). What is the velocity of the air flowing in the duct?

Solution:

Assume a constant velocity across the duct area with

$$A = 4 \times 6 \times \frac{1}{144} = 0.167 \text{ ft}^2$$

and the volumetric flow rate from Eq.4.3,

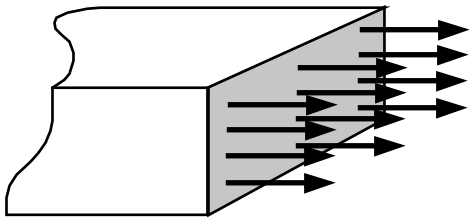
$$\dot{V} = \dot{m}v = A\mathbf{V}$$

$$\mathbf{V} = \frac{\dot{V}}{A} = \frac{30}{60 \times 0.167} = \mathbf{3.0 \text{ ft/s}}$$

Ideal gas so note:

$$\left(\text{note ideal gas:} \quad v = \frac{RT}{P} = \frac{53.34 \times 554.7}{16 \times 144} = 12.842 \text{ ft}^3/\text{lbm} \right)$$

$$\dot{m} = \frac{\dot{V}}{v} = \frac{30}{60 \times 12.842} = 0.0389 \text{ lbm/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.158E

A pool is to be filled with 2500 ft^3 water from a garden hose of 1 in. diameter flowing water at 6 ft/s. Find the mass flow rate of water and the time it takes to fill the pool.

Solution:
With constant velocity we have

$$\dot{V} = \dot{m}v = A\mathbf{V} = \pi \times (1/12)^2 \text{ ft}^2 \times 6 \text{ ft/s} = 0.1309 \text{ ft}^3/\text{s}$$

$$\Delta t = V / \dot{V} = 2500 \text{ ft}^3 / (0.1309 \text{ ft}^3/\text{s}) = 19\,098 \text{ s} = \mathbf{5\ h\ 18\ min\ 18\ s}$$

From table F.3 we get the water density

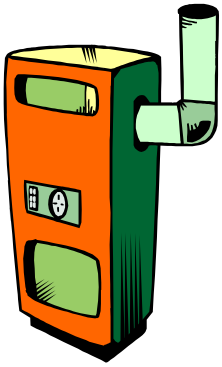
$$\dot{m} = \dot{V}/ v = \rho\dot{V} = 62.2 \text{ lbm/ ft}^3 \times 0.1309 \text{ ft}^3/\text{s} = \mathbf{8.14\ lbm/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.159E

A hot air home heating system takes 500 ft^3/min (cfm) air at 14.7 psia, 65 F into a furnace and heats it to 130 F and delivers the flow to a square duct 0.5 ft by 0.5 ft at 15 psia. What is the velocity in the duct?

Solution:



The inflate flow is given by a $\dot{m}_i$

Continuity Eq.: $\dot{m}_i = \dot{V}_i / v_i = \dot{m}_e = A_e \mathbf{V}_e / v_e$

Ideal gas: $v_i = \dfrac{RT_i}{P_i} = \dfrac{53.34 \times 525}{14.7 \times 144} = 13.23 \dfrac{ft^3}{lbm}$

$$v_e = \frac{RT_e}{P_e} = \frac{53.34 \text{ lbf-ft/lbm-R} \times (130 + 460) \text{ R}}{15 \text{ psi} \times 144 \text{ in}^2/\text{ft}^2}$$

$$= 14.57 \text{ ft}^3/\text{ lbm}$$

$$\dot{m}_i = \dot{V}_i / v_i = 500 \text{ (ft}^3\text{/min)} / [60 \text{ (s/min)} \times 13.23 \frac{ft^3}{lbm}] = 0.63 \text{ lbm/s}$$

$$\mathbf{V}_e = \dot{m}\, v_e / A_e = \frac{0.63 \times 14.57}{0.5 \times 0.5} \frac{ft^3/s}{ft^2} = \mathbf{36.7 \text{ ft/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.160E

Liquid water at 60 F flows out of a nozzle straight up 40 ft. What is nozzle $\mathbf{V}_{exit}$?

Energy Eq.4.13: $h_{exit} + \frac{1}{2}\mathbf{V}_{exit}^2 + gH_{exit} = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gH_2$

If the water can flow 40 ft up it has specific potential energy of gH_2 which must equal the specific kinetic energy out of the nozzle $\mathbf{V}_{exit}^2/2$. The water does not change P or T so h is the same.

$$\mathbf{V}_{exit}^2/2 = g(H_2 - H_{exit}) = gH \quad \Rightarrow$$
$$\mathbf{V}_{exit} = \sqrt{2gH} = \sqrt{2 \times 32.174 \times 40\ \text{ft}^2/\text{s}^2} = \mathbf{50.7\ ft/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.161E

A diffuser receives 0.2 lbm/s steam at 80 psia, 600 F. The exit is at 150 psia, 700 F with negligible kinetic energy and the flow is adiabatic. Find the diffuser inlet velocity and the inlet area.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$

State 1: Table F.7.2 $h_1 = 1330.66$ Btu/lbm, $v_1 = 7.794$ ft^3/lbm

State 2: $V_2 = 0$, Table F.7.2 $h_2 = 1376.55$ Btu/lbm

Then from the energy equation

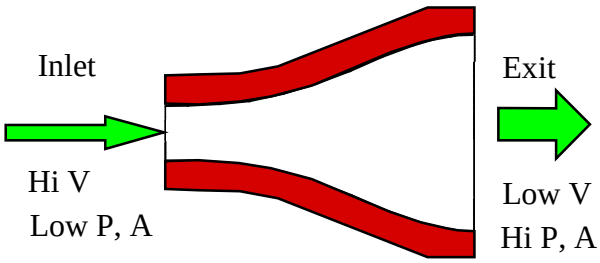
$$\frac{1}{2}\mathbf{V}_1^2 = h_2 - h_1 = 1376.55 - 1330.66 = 45.89 \text{ Btu/lbm}$$

$$\mathbf{V}_1 = \sqrt{2(h_2 - h_1)} = \sqrt{2 \times 32.174 \times 778 \times 45.89} = \mathbf{1515.7 \text{ ft/s}}$$

The mass flow rate from Eq.4.3

$$\dot{m} = \rho A\mathbf{V} = A\mathbf{V}/v$$

$$A = \dot{m}v/\mathbf{V} = 0.2 \text{ lbm/s} \times (7.794 \text{ ft}^3\text{/lbm}) / 1515.7 \text{ ft/s}$$
$$= 0.000103 \text{ ft}^2 = \mathbf{0.148 \text{ in.}^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.162E

Saturated vapor R-134a leaves the evaporator in a heat pump at 50 F, with a steady mass flow rate of 0.2 lbm/s. What is the smallest diameter tubing that can be used at this location if the velocity of the refrigerant is not to exceed 20 ft/s?

Solution:

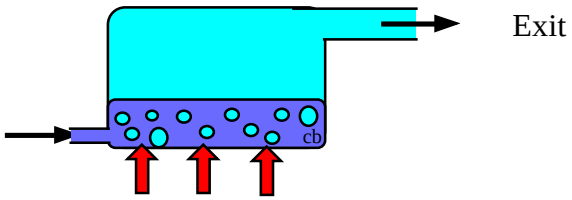
Mass flow rate Eq.4.3: $\dot{m} = \dot{V}/v = A\mathbf{V}/v$

Exit state Table F.10.1: (T = 50 F, x =1) => $v = v_g = 0.792$ ft^3/lbm

The minimum area is associated with the maximum velocity for given $\dot{m}$

$$A_{MIN} = \frac{\dot{m} v_g}{\mathbf{V}_{MAX}} = \frac{0.2 \text{ lbm/s} \times 0.792 \text{ ft}^3/\text{lbm}}{20 \text{ ft/s}} = 0.00792 \text{ ft}^2 = \frac{\pi}{4} D_{MIN}^2$$

D_{MIN} == **0.1004 ft** = **1.205 in**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Single Flow Devices

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.163E

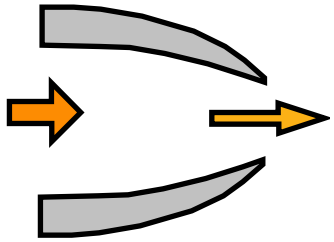
In a jet engine a flow of air at 1800 R, 30 psia and 90 ft/s enters a nozzle where the air exits at 1500 R, 13 psia, as shown in Fig. P.4.23. What is the exit velocity assuming no heat loss?

Solution:
C.V. nozzle. No work, no heat transfer
Continuity $\dot{m}_i = \dot{m}_e = \dot{m}$
Energy : $\dot{m}\,(h_i + \frac{1}{2}\mathbf{V}_i^2) = \dot{m}(h_e + \frac{1}{2}\mathbf{V}_e^2)$
Due to high T take h from table F.5

$$\tfrac{1}{2}\mathbf{V}_e^2 = \tfrac{1}{2}\,\mathbf{V}_i^2 + h_i - h_e$$

$$= \frac{90^2}{2 \times 32.174 \times 778} + 449.79 - 369.28$$

$$= 0.16 + 80.51 = 80.67 \text{ Btu/lbm}$$



$$\mathbf{V}_e = (2 \times 32.174 \text{ lbm-ft/s}^2\text{-lbf} \times 778 \text{ lbf-ft/Btu} \times 80.67 \text{ Btu/lbm})^{1/2}$$

$$= \mathbf{2010 \text{ ft/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.164E

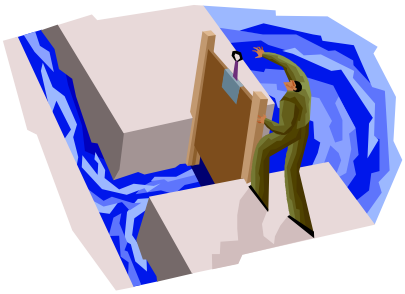
A sluice gate dams water up 15 ft. A 0.5 in. diameter hole at the bottom of the gate allows liquid water at 70 F to come out. Neglect any changes in internal energy and find the exit velocity and mass flow rate.

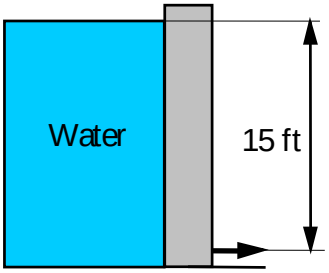
Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $h_1 = h_2$ both at P = 1 atm

$V_1 = 0$ $Z_1 = Z_2 + 15$ ft





$$\frac{1}{2}\mathbf{V}_2^2 = g\,(Z_1 - Z_2)$$

$$\mathbf{V}_2 = \sqrt{2g(Z_1 - Z_2)} = \sqrt{2 \times 32.174 \times 15} = \mathbf{31.07\ ft/s}$$

$$\dot{m} = \rho A\mathbf{V} = A\mathbf{V}/v = \frac{\pi}{4} D^2 \times (\mathbf{V}_2/v)$$

$$= \frac{\pi}{4} \times (0.5/12)^2\ \text{ft}^2 \times (31.07\ \text{ft/s}) / (0.01605\ \text{ft}^3/\text{lbm})$$

$$= \mathbf{2.639\ lbm/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.165E

A diffuser shown in Fig. P4.28 has air entering at 14.7 lbf/in.^{2}, 540 R, with a velocity of 600 ft/s. The inlet cross-sectional area of the diffuser is 0.2 in.^{2}. At the exit, the area is 1.75 in.^{2}, and the exit velocity is 60 ft/s. Determine the exit pressure and temperature of the air.

Solution:

Continuity Eq.4.3: $\dot{m}_i = A_i \mathbf{V}_i / v_i = \dot{m}_e = A_e \mathbf{V}_e / v_e$,

Energy Eq.(per unit mass flow) 4.13: $h_i + \frac{1}{2}\mathbf{V}_i^2 = h_e + \frac{1}{2}\mathbf{V}_e^2$

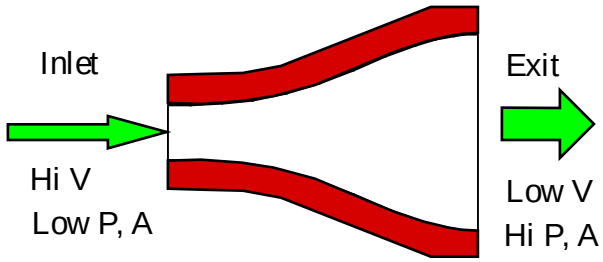
$$h_e - h_i = (1/2)\times(600^2 - 60^2)/(32.174 \times 778) = 7.119 \text{ Btu/lbm}$$

$$T_e = T_i + (h_e - h_i)/C_p = 540 \text{ R} + \frac{7.119 \text{ Btu/lbm}}{0.24 \text{ Btu/lbm-R}} = \mathbf{569.7\ R}$$

Now use the continuity equation and the ideal gas law

$$v_e = v_i \left(\frac{A_e \mathbf{V}_e}{A_i \mathbf{V}_i}\right) = (RT_i/P_i)\left(\frac{A_e \mathbf{V}_e}{A_i \mathbf{V}_i}\right) = RT_e/P_e$$

$$P_e = P_i \left(\frac{T_e}{T_i}\right)\left(\frac{A_i \mathbf{V}_i}{A_e \mathbf{V}_e}\right) = 14.7 \left(\frac{569.7}{540}\right)\left(\frac{0.2 \times 600}{1.75 \times 60}\right) = \mathbf{17.72\ lbf/in.^2}$$



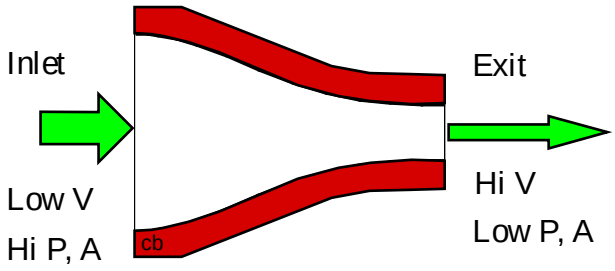
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.166E

Nitrogen gas flows into a convergent nozzle at 30 lbf/in.^{2}, 600 R and very low velocity. It flows out of the nozzle at 15 lbf/in.^{2}, 500 R. If the nozzle is insulated find the exit velocity.

Solution:

C.V. Nozzle steady state one inlet and exit flow, insulated so it is adiabatic.



Energy Eq.4.13: $h_1 + 0 = h_2 + \frac{1}{2}\mathbf{V}_2^2$

$$\mathbf{V}_2^2 = 2\,(h_1 - h_2) \cong 2\,C_{PN_2}\,(T_1 - T_2)$$

$$= 2 \times 0.249 \text{ Btu/lbm-R} \times (600 - 500) \text{ R}$$

$$= 24.9 \text{ Btu/lbm}$$

$$\mathbf{V}_2^2 = 2 \times 24.9 \text{ Btu/lbm} \times 778 \text{ lbf-ft/Btu} \times 32.174 \text{ lbm-ft/s}^2\text{-lbf}$$

$$= 1\,246\,562 \text{ ft}^2/\text{s}^2$$

$$\mathbf{V}_2 = \mathbf{1116 \text{ ft/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.167E

A meteorite hits the upper atmosphere at 10 000 ft/s, where the pressure is 0.1 atm and the temperature is –40 F. How hot does the air become right in front of the meteorite assuming no heat transfer in this adiabatic stagnation process?

Solution:

Energy Eq.: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2$

Process: $Z_1 = Z_2$ and $V_2 = 0$

$$h_2 = h_1 + \frac{1}{2}\mathbf{V}_1^2$$

$$T_2 = T_1 + \frac{1}{2}(\mathbf{V}_1^2/C_p) = 419.67 + \frac{1}{2} \times \frac{10\,000^2}{0.24 \times 778 \times 32.174} = \mathbf{8742\ R}$$

At this high temperature we cannot assume constant specific heats, so use F.5

$$h_2 = h_1 + \frac{1}{2}\mathbf{V}_1^2 = 100.4 + \frac{1}{2} \times \frac{10\,000^2}{778 \times 32.174} = 2097.9 \text{ Btu/lbm}$$

Table F.5 is listed to 5400 R so we have to extrapolate to get

$$T_2 = 5400 + 100\,\frac{2097.9 - 1515.632}{1515.632 - 1484.762} = \mathbf{7286\ R}$$

The value of C_p over 5400 R is 0.309 Btu/lbmR from the last two table entries. At this temperature there will be some chemical reactions that should be considered to have a more realistic temperature.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.168E

Refrigerant R-410A flows out of a cooler at 70 F, 220 psia after which it is throttled to 77 psia. Find the state (T, x) for the exit flow.

C.V. Throttle. Steady state,

Process with: $q = w = 0$; and $\mathbf{V}_i = \mathbf{V}_e$, $Z_i = Z_e$

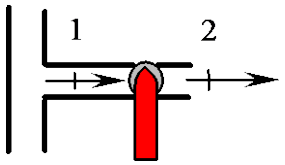
Energy Eq.4.13: $h_i = h_e$,

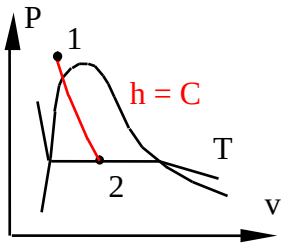
Inlet state: Table F.9.1 $h_i = 39.17$ Btu/lbm

Exit state: Table F.9.1 since $h < h_g = 118.21$ Btu/lbm

Interpolate: T = **10 F**, $h_f = 17.0$ Btu/lbm, $h_{fg} = 101.22$ Btu/lbm

$$x = (39.17 - 17.0) / 101.22 = \mathbf{0.219}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.169E

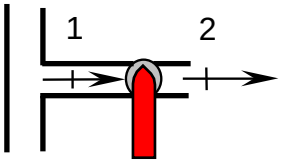
R-410A at 90 F, 300 psia is throttled so it becomes cold at 10 F. What is exit P?

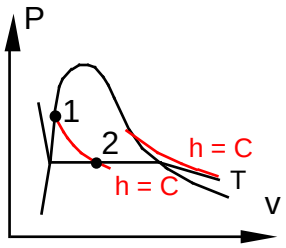
State 1 is slightly compressed liquid so

Table F.9.1: $h = h_f = 47.30$ Btu/lbm

At the lower temperature it becomes two-phase since the throttle flow has constant h and at 10 F: $h_g = 118.21$ Btu/lbm

$$P = P_{sat} = \mathbf{76.93\ psia}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.170E

Saturated liquid R-410A at 30 F is throttled to 40 psia in a refrigerator. What is the exit temperature? Find the percent increase in the volume flow rate.

Solution:
Steady throttle flow. Assume no heat transfer and no change in kinetic or potential energy.

$$h_e = h_i = h_{f\ 30\ F} = 24.11 \text{ Btu/lbm} = h_{f\ e} + x_e\, h_{fg\ e} \qquad \text{at 40 psia}$$

From table F.9.1 we get $T_e = T_{sat}$ (40 psia) = **-21 F**

$$x_e = \frac{h_e - h_{f\ e}}{h_{fg\ e}} = \frac{24.11 - 6.354}{108.776} = 0.1632$$

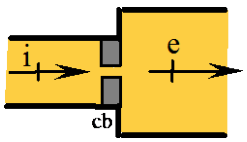
$$v_e = v_f + x_e\, v_{fg} = 0.01253 + x_e\, 1.47584 = 0.25338 \text{ ft}^3\text{/lbm}$$

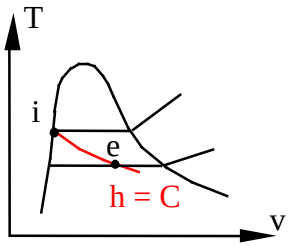
$$v_i = v_{f\ 30\ F} = 0.01364 \text{ ft}^3\text{/lbm}$$

$\dot{V} = \dot{m}v$ so the ratio becomes

$$\frac{\dot{V}_e}{\dot{V}_i} = \frac{\dot{m}v_e}{\dot{m}v_i} = \frac{v_e}{v_i} = \frac{0.25338}{0.01364} = \mathbf{18.58}$$

So the increase is 17.58 times or **1758 %**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.171E

Saturated vapor R-410A at 75 psia is throttled to 15 psia. What is the exit temperature. Repeat the question if you assumed it behaves like an ideal gas.

C.V. Throttle. Steady state,

Process with: $q = w = 0$; and $\mathbf{V}_i = \mathbf{V}_e$, $Z_i = Z_e$

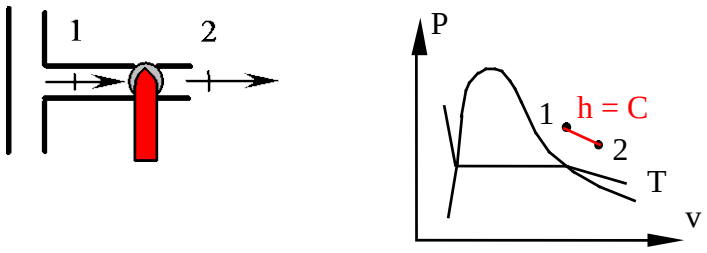
Energy Eq.4.13: $h_i = h_e$,

Inlet state: Table F.9.2 $h_i = 118.09$ Btu/lbm

Exit state: Table F.9.2 since $h > h_g$

Exit state very close to $T = \mathbf{-20\ F}$,

For an ideal gas h is only a function of T, so $T_e = T_i = \mathbf{8.71\ F}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.172E

Helium is throttled from 175 lbf/in.^{2}, 70 F, to a pressure of 15 lbf/in.^{2}. The. diameter of the exit pipe is so much larger than the inlet pipe that the inlet and exit velocities are equal. Find the exit temperature of the helium and the ratio of the pipe diameters.

C.V. Throttle. Steady state,

Process with: $q = w = 0$; and $\mathbf{V}_i = \mathbf{V}_e$, $Z_i = Z_e$

Energy Eq.4.13: $h_i = h_e$, Ideal gas => $T_i = T_e =$ **70 F**

$\dot{m} = \dfrac{A\mathbf{V}}{RT/P}$ But $\dot{m}$, $\mathbf{V}$, T are constant => $P_iA_i = P_eA_e$

$$\Rightarrow \quad \frac{D_e}{D_i} = \left(\frac{P_i}{P_e}\right)^{1/2} = \left(\frac{175}{15}\right)^{1/2} = \mathbf{3.416}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.173E

A liquid water turbine receives 4 lbm/s water at 300 psia, 77 F with a velocity of 50 ft/s. The exit is at 15 psia, 77 F with very low velocity. Find the specific work and the power produced.

Solution:

Energy Eq.4.13: $h_1 + \frac{1}{2}\mathbf{V}_1^2 + gZ_1 = h_2 + \frac{1}{2}\mathbf{V}_2^2 + gZ_2 + w_T$

Process: $Z_1 = Z_2$ and $\mathbf{V}_2 = 0$

State 1: Table F.7.1 $h_1 = 45.09$ Btu/lbm

Add $\Delta Pv = (300\text{-}0.464) \times 0.01606 \times 32.174/144 = 1.075$ Btu/lbm

State 2: Table F.7.1 $h_2 = 45.09$

Add $\Delta Pv = (15\text{-}0.464) \times 0.01606 \times 32.174/144 = 0.052$ Btu/lbm

$$w_T = h_1 + \frac{1}{2}\mathbf{V}_1^2 - h_2$$

$$= (45.09 + 1.075) + \frac{1}{2} \times \frac{50^2}{778 \times 32.174} - (45.09 + 0.052)$$

$$= \mathbf{1.073\ Btu/lbm}$$

$$\dot{W}_T = \dot{m} \times w_T = 4 \times 1.073 = \mathbf{4.29\ Btu/s}$$

Notice how insignificant the specific kinetic energy is (0.05 Btu/lbm).

The added ΔPv terms are due to P being higher than saturated P, see p.134.

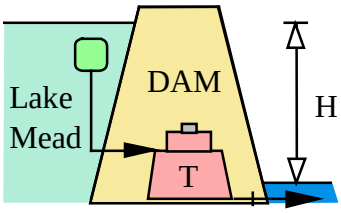
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.174E

Hoover Dam across the Colorado River dams up Lake Mead 600 ft higher than the river downstream, as shown in Fig. P4.47. The electric generators driven by water-powered turbines deliver 1.2×10^6 Btu/s. If the water is 65 F, find the minimum amount of water running through the turbines.

Solution:

C.V.: H_2O pipe + turbines,



Continuity: $\dot{m}_{in} = \dot{m}_{ex}$;

Energy Eq.4.13: $(h + \mathbf{V}^2/2 + gz)_{in} = (h + \mathbf{V}^2/2 + gz)_{ex} + w_T$

Water states: $h_{in} \cong h_{ex}$; $v_{in} \cong v_{ex}$

Now the specific turbine work becomes

$$w_T = gz_{in} - gz_{ex}$$

$$= 32.174 \text{ ft/s}^2 \times 600 \text{ ft}/(778 \text{ lbf-ft/Btu} \times 32.174 \text{ lbm-ft/s}^2\text{-lbf})$$

$$= 0.771 \text{ Btu/lbm}$$

$$\dot{m} = \dot{W}_T / w_T = 1.2 \times 10^6 \text{(Btu/s)} / 0.771 \text{ (Btu/lbm)} = 1.556 \times 10^6 \text{ lbm/s}$$

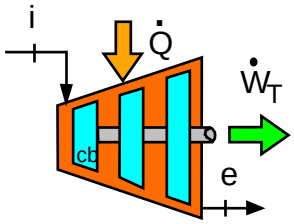
$$\dot{V} = \dot{m} v = 1.556 \times 10^6 \times 0.016043 = \mathbf{24\ 963\ ft^3/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.175E

A small expander (a turbine with heat transfer) has 0.1 lbm/s helium entering at 160 psia, 1000 R and it leaves at 40 psia, 540 R. The power output on the shaft is measured to 55 Btu/s. Find the rate of heat transfer neglecting kinetic energies.

Solution:



C.V. Expander. Steady operation

Continuity Eq.: $\dot{m}_i = \dot{m}_e = \dot{m}$

Energy Eq.: $\dot{m}h_i + \dot{Q} = \dot{m}h_e + \dot{W}$

$$\dot{Q} = \dot{m}\,(h_e - h_i) + \dot{W}$$

Use heat capacity from Table F.4: $C_{p\,He} = 1.24$ Btu/lbm R

$$\dot{Q} = \dot{m}C_p\,(T_e - T_i) + \dot{W}$$

$$= 0.1 \text{ lbm/s} \times 1.24 \text{ Btu/lbm-R} \times (540 - 1000) \text{ R} + 55 \text{ Btu/s}$$

$$= -57.04 + 55 = \mathbf{-2.0\ Btu/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.176E

A small, high-speed turbine operating on compressed air produces a power output of 0.1 hp. The inlet state is 60 lbf/in.^{2}, 120 F, and the exit state is 14.7 lbf/in.^{2}, –20 F. Assuming the velocities to be low and the process to be adiabatic, find the required mass flow rate of air through the turbine.

Solution:

C.V. Turbine, no heat transfer, no ΔKE, no ΔPE

Energy Eq.4.13: $h_{in} = h_{ex} + w_T$

Ideal gas so use constant specific heat from Table A.5

$$w_T = h_{in} - h_{ex} \cong C_p(T_{in} - T_{ex})$$

$$= 0.24(120 - (-20)) = 33.6 \text{ Btu/lbm}$$

$$\dot{W} = \dot{m} w_T \quad \Rightarrow$$

$$\dot{m} = \dot{W}/w_T = \frac{0.1 \text{ hp} \times 550 \text{ lbf-ft/s-hp}}{778 \text{ lbf-ft/Btu} \times 33.6 \text{ Btu/lbm}} = \mathbf{0.0021 \text{ lbm/s}} = \mathbf{7.57 \text{ lbm/h}}$$

The dentist's drill has a small air flow and is not really adiabatic.

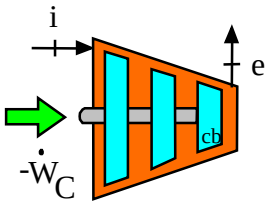
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.177E

A compressor in a commercial refrigerator receives R-410A at -10 F and x = 1. The exit is at 200 psia, 120 F. Neglect kinetic energies and find the specific work.

Solution:

C.V. Compressor, steady state, single inlet and exit flow. For this device we also assume no heat transfer and $Z_i = Z_e$



From Table F.9.1 : $h_i = 116.29$ Btu/lbm

From Table F.9.2 : $h_e = 137.02$ Btu/lbm

Energy Eq.4.13 reduces to

$$w_C = h_i - h_e = (116.29 - 137.02) = \mathbf{-20.73\ Btu/lbm}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.178E

A compressor in an industrial air-conditioner compresses ammonia from a state of saturated vapor at 20 psia to a pressure of 125 psia. At the exit the temperature is measured to be 200 F and the mass flow rate is 1 lbm/s. What is the required power input to this compressor?

Solution:

C.V. Compressor. Assume adiabatic and neglect kinetic energies.

Energy Eq.4.13: $w_C = h_1 - h_2$

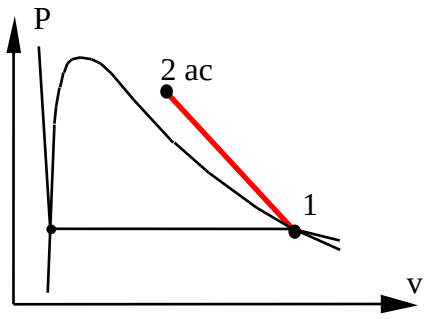
States: 1: F.8.2: $h_1 = 605.47$ Btu/lbm

2: F.8.2 $h_{2,AC} = 710.44$ Btu/lbm

Energy equation:

$$-w_C = h_2 - h_1 = 710.44 - 605.47 = 104.97 \text{ Btu/lbm}$$

$$\dot{W} = 1 \text{ lbm/s} \times 104.97 \text{ Btu/lbm} = \mathbf{105 \text{ Btu/s}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.179E

An exhaust fan in a building should be able to move 6 lbm/s air at 14.4 psia, 68 F through a 1.4 ft diameter vent hole. How high a velocity must it generate and how much power is required to do that?

Solution:

C.V. Fan and vent hole. Steady state with uniform velocity out.

Continuity Eq.: $\dot{m}$ = constant = $\rho A\mathbf{V} = A\mathbf{V} / v = A\mathbf{V}P/RT$

Ideal gas : $Pv = RT$, and area is $A = \frac{\pi}{4} D^2$

Now the velocity is found

$$\mathbf{V} = \dot{m}\, RT/(\frac{\pi}{4} D^2\, P) = \frac{6 \text{ lbm/s} \times 53.34 \text{ lbf-ft/lbm-R} \times (459.7 + 68) \text{ R}}{\frac{\pi}{4} \times 1.4^2 \times 14.4 \text{ psi} \times 144 \text{ in}^2/\text{ft}^2}$$

$$= \mathbf{52.908 \text{ ft/s}}$$

The kinetic energy out is

$$\tfrac{1}{2}\mathbf{V}_2^2 = \tfrac{1}{2} \times 52.908^2 / 32.174 = 43.502 \text{ lbf-ft/lbm}$$

which is provided by the work (only two terms in energy equation that does not cancel, we assume $\mathbf{V}_1 = 0$)

$$\dot{W}_{in} = \dot{m}\, \tfrac{1}{2}\mathbf{V}_2^2 = 6 \times 43.502 = \mathbf{261 \text{ lbf-ft/s}} = \mathbf{0.335 \text{ Btu/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.180E

An air flow is brought from 77 F, 14.7 psia to 150 psia, 620 F by an adiabatic compressor driven by a 50-kW motor. What are the mass flow rate and the exit volume flow rate of air?

C.V. Compressor. Assume adiabatic and neglect kinetic, potential energies.

Energy Eq.4.13: $w = h_1 - h_2$

$$-w_C = h_2 - h_1 \approx C_P\,(T_2 - T_1) = 0.24 \text{ Btu/lbm-R} \times (620 - 77) \text{ R}$$

$$= 130.32 \text{ Btu/lbm}$$

The mass flow rate scale the work term so

$$\dot{m} = \dot{W} / -w_C = \frac{(50/1.055) \text{ Btu/s}}{130.32 \text{ Btu/lbm}} = \mathbf{0.3637\ lbm/s}$$

$$\dot{V} = \dot{m}\, v = \dot{m}\, \frac{RT}{P} = 0.3637 \text{ lbm/s} \, \frac{53.34 \times (620 + 459.67) \text{ ft-lbf/lbm}}{150 \text{ lbf/in}^2 \times 144 \text{ (in/ft)}^2}$$

$$= \mathbf{2.666\ ft^3/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.181E

Carbon dioxide gas enters a steady-state, steady-flow heater at 45 lbf/in.^{2} 60 F, and exits at 40 lbf/in.^{2}, 1800 F. It is shown in Fig. P4.65 here changes in kinetic and potential energies are negligible. Calculate the required heat transfer per lbm of carbon dioxide flowing through the heater.

Solution:

C.V. Heater Steady state single inlet and exit flow.

Energy Eq.4.13: $q + h_i = h_e$

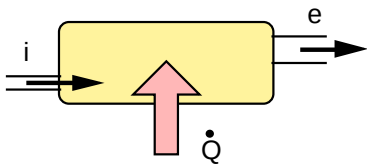


Table F.6 $q = h_e - h_i = \dfrac{20470.8 - (-143.4)}{44.01} =$ **468.4 Btu/lbm**

[If we use C_{P0} then $q \cong 0.203$ Btu/lbm-R (1800 - 60) R = 353.2 Btu/lbm]

Too large ΔT, T_{ave} to use C_{P0} at room temperature.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.182E

A condenser (cooler) receives 0.1 lbm/s of R-410A at 300 psia, 140 F and cools it to 70 F. Assume the exit properties are as for saturated liquid same T. What cooling capacity (Btu/h) must the condenser have?

Solution:

C.V. R-410A condenser. Steady state single flow, heat transfer out and no work.

Energy Eq.4.12: $\dot{m}\, h_1 = \dot{m}\, h_2 + \dot{Q}_{out}$

Inlet state: Table F.9.2 $h_1 = 137.34$ Btu/lbm,

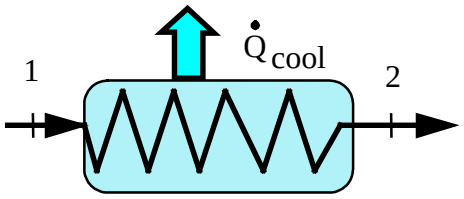
Exit state: Table F.9.1 $h_2 = 39.17$ Btu/lbm (compressed liquid)

Process: Neglect kinetic and potential energy changes.

Cooling capacity is taken as the heat transfer out i.e. positive out so

$$\dot{Q}_{out} = \dot{m}\,(h_1 - h_2) = 0.1 \text{ lbm/s } (137.34 - 39.17) \text{ Btu/lbm}$$

$$= \mathbf{9.82\ Btu/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.183E

In a steam generator, compressed liquid water at 1500 lbf/in.^{2}, 100 F, enters a 1-in. diameter tube at the rate of 5 ft^3/min. Steam at 1250 lbf/in.^{2}, 750 F exits the tube. Find the rate of heat transfer to the water.

Solution:

C.V. Steam generator. Steady state single inlet and exit flow.

Constant diameter tube: $A_i = A_e = \frac{\pi}{4}\left(\frac{1}{12}\right)^2 = 0.00545$ ft^2

Table B.1.4 $\dot{m} = \dot{V}_i/v_i = 5 \times 60/0.016058 = 18\,682$ lbm/h

$\mathbf{V}_i = \dot{V}_i/A_i = 5/(0.00545 \times 60) = 15.3$ ft/s

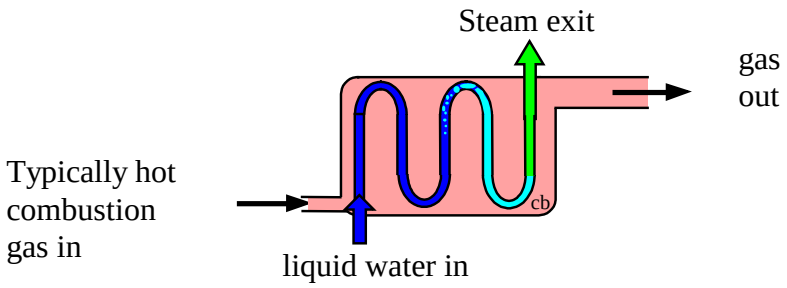
Exit state properties from Table F.7.2 and inlet from F.7.3

$\mathbf{V}_e = \mathbf{V}_i \times v_e/v_i = 15.3$ ft/s $\times$ (0.526/0.01605) = 501.4 ft/s

The energy equation Eq.4.12 is solved for the heat transfer as

$$\dot{Q} = \dot{m}\left[(h_e - h_i) + \left(\mathbf{V}_e^2 - \mathbf{V}_i^2\right)/2\right]$$

$$= 18\,682\left[1341.5 - 71.99 + \frac{501.4^2 - 15.3^2}{2 \times 32.174 \times 778}\right] = \mathbf{2.381 \times 10^7\ Btu/h}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.184E

An oven has five radiant heaters; each one is rated at 15 Btu/s. It should heat some 4-lbm steel plates from 77 F to 1400 R. How many of these plates per minute can it heat?

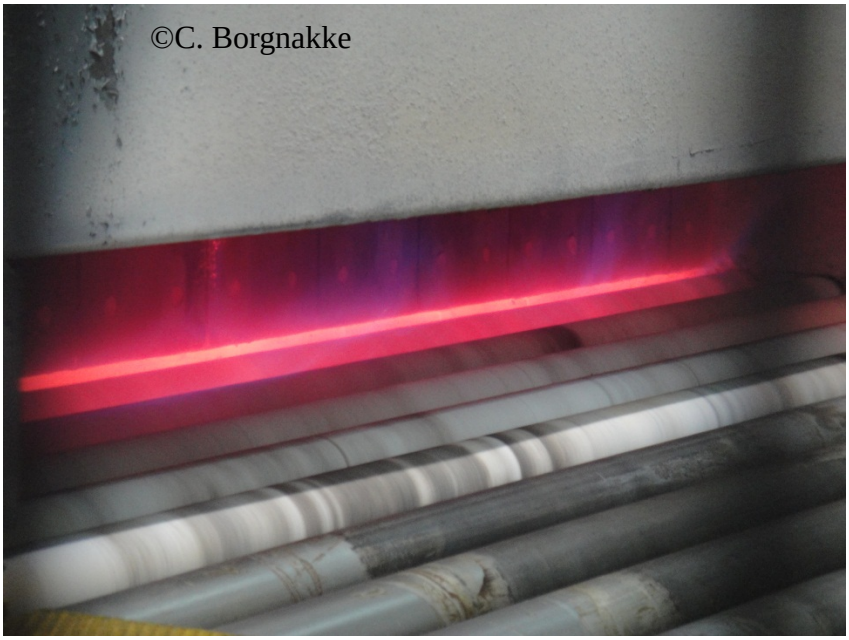
C.V. Oven, steady state operation. A flow of plates in (represents an $\dot{m}$**)**

Energy Eq.: $0 = \dot{m}\,(h_i - h_e) + \dot{Q}$

$$\dot{Q} = \dot{m}\,(h_e - h_i) = \dot{m}\,C\,(T_e - T_i)$$

$$\dot{m} = \dot{Q} / C\,(T_e - T_i) = \frac{5 \times 15 \text{ Btu/s}}{0.11\,(1400 - 536.7) \text{ Btu/lbm}} = 0.79 \text{ lbm/s}$$

$N = \dot{m}/m = (0.79 / 4)\ 1/s = 0.197$ per s = **11.85 per min**



Front end of oven with steel rollers to bring the plates in, a skirt hangs down to limit heat losses.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.185E

An evaporator has R-410A at 0 F and quality 20% flowing in, with the exit flow being saturated vapor at 0 F. Knowing that there is no work, find the specific heat transfer.

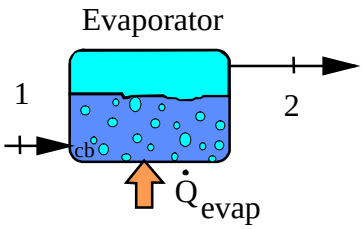
C.V. Heater Steady state single inlet and exit flow.

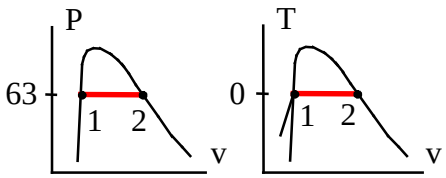
Energy Eq.4.13: $0 = q + h_1 - h_2$

Table F.9.1: $h_1 = 13.52 + 0.2 \times 103.76 = 34.27$ Btu/lbm

$h_2 = 117.28$ Btu/lbm

$q = h_2 - h_1 = 117.28 - 34.27 =$ **83.01 Btu/lbm**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.186E

A flow of liquid glycerine flows around an engine, cooling it as it absorbs energy. The glycerine enters the engine at 140 F and receives 13 hp of heat transfer. What is the required mass flow rate if the glycerine should come out at a maximum 200 F?

Solution:

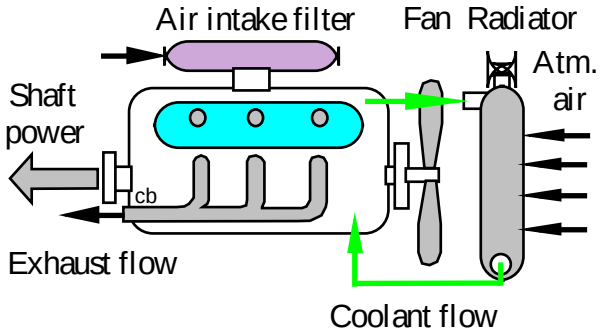
C.V. Liquid flow (glycerine is the coolant), steady flow. no work.

Energy Eq.: $\dot{m} h_i + \dot{Q} = \dot{m} h_e$

$$\dot{m} = \dot{Q}/(h_e - h_i) = \frac{\dot{Q}}{C_{gly} (T_e - T_i)}$$

From table F.3: $C_{gly} = 0.58$ Btu/lbm R

$$\dot{m} = \frac{13 \text{ hp} \times (2544.4/3600) \text{ btu/s-hp}}{0.58 \text{ btu/lbm-R } (200 - 140) \text{ R}} = \mathbf{0.264 \text{ lbm/s}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.187E

A small water pump is used in an irrigation system. The pump takes water in from a river at 50 F, 1 atm at a rate of 10 lbm/s. The exit line enters a pipe that goes up to an elevation 100 ft above the pump and river, where the water runs into an open channel. Assume the process is adiabatic and that the water stays at 50 F. Find the required pump work.

Solution:

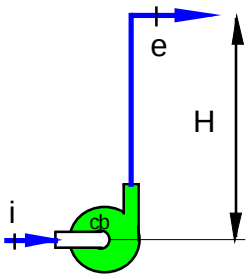
C.V. pump + pipe. Steady state , 1 inlet, 1 exit flow. Assume same velocity in and out, no heat transfer.

Continuity Eq.: $\dot{m}_{in} = \dot{m}_{ex} = \dot{m}$

Energy Eq.4.12:

$$\dot{m}(h_{in} + (1/2)\mathbf{V}_{in}^2 + gz_{in}) = \dot{m}(h_{ex} + (1/2)\,\mathbf{V}_{ex}^2 + gz_{ex}) + \dot{W}$$

States: $h_{in} = h_{ex}$ same (T, P)



$$\dot{W} = \dot{m}g(z_{in} - z_{ex}) = 10 \text{ lbm/s} \times \frac{32.174 \text{ ft/s}^2}{32.174 \text{ lbm ft/s}^2 \text{ /lbf}} \times (-100) \text{ ft}$$

$$= \mathbf{-1000 \text{ lbf-ft/s}} = \mathbf{-1.285 \text{ Btu/s}}$$

I.E. 1.285 Btu/s required input

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Multiple Flow Devices

4.188E

A steam turbine receives water at 2000 lbf/in.^{2}, 1200 F at a rate of 200 lbm/s as shown in Fig. P4.84. In the middle section 50 lbm/s is withdrawn at 300 lbf/in.^{2}, 650 F and the rest exits the turbine at 10 lbf/in.^{2}, 95% quality. Assuming no heat transfer and no changes in kinetic energy, find the total turbine work.

C.V. Turbine Steady state, 1 inlet and 2 exit flows.

Continuity Eq.4.9: $\dot{m}_1 = \dot{m}_2 + \dot{m}_3$; => $\dot{m}_3 = \dot{m}_1 - \dot{m}_2 = 150$ lbm/s

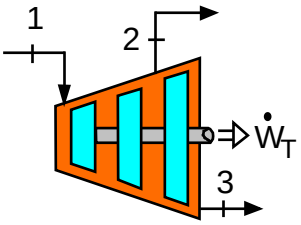
Energy Eq.4.10: $\dot{m}_1 h_1 = \dot{W}_T + \dot{m}_2 h_2 + \dot{m}_3 h_3$

Table F.7.2 $h_1 = 1598.6$ Btu/lbm,

$h_2 = 1341.6$ Btu/lbm

Table F.7.1 : $h_3 = h_f + x_3 h_{fg} = 161.2 + 0.95 \times 982.1$

$= 1094.2$ Btu/lbm



From the energy equation, Eq.4.10

$$\dot{W}_T = \dot{m}_1 h_1 - \dot{m}_2 h_2 - \dot{m}_3 h_3 = 200 \times 1598.6 - 50 \times 1341.6 - 150 \times 1094.2$$

$$= \mathbf{8.85 \times 10^4\ Btu/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.189E

A condenser, as the heat exchanger shown in Fig. P4.91, brings 1 lbm/s water flow at 1 lbf/in.^{2} from 500 F to saturated liquid at 1 lbf/in.^{2}. The cooling is done by lake water at 70 F that returns to the lake at 90 F. For an insulated condenser, find the flow rate of cooling water.

Solution:

C.V. Heat exchanger

Energy Eq.4.10: $\dot{m}_{cool} h_{70} + \dot{m}_{H_2O} h_{500} = \dot{m}_{cool} h_{90} + \dot{m}_{H_2O} h_{f\,1}$

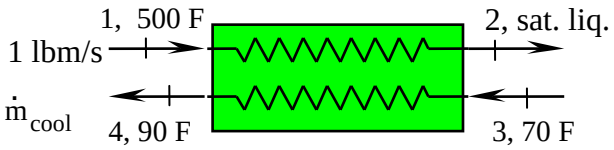


Table F.7.1: h_{70} = 38.09 Btu/lbm, h_{90} = 58.07 Btu/lbm, $h_{f,1}$ = 69.74 Btu/lbm

Table F.7.2: $h_{500,1}$ = 1288.5 btu/lbm

$$\dot{m}_{cool} = \dot{m}_{H_2O} \frac{h_{500} - h_{f,\,1}}{h_{90} - h_{70}} = 1 \text{ lbm/s} \times \frac{1288.5 - 69.74}{58.07 - 38.09} = \mathbf{61\ lbm/s}$$

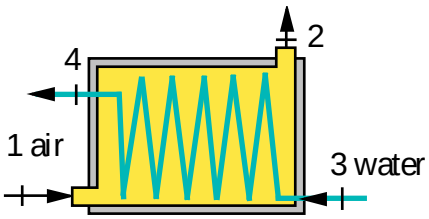
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.190E

A heat exchanger is used to cool an air flow from 1400 to 680 R, both states at 150 lbf/in.^{2}. The coolant is a water flow at 60 F, 15 lbf/in.^{2} and it is shown in Fig. P4.95. If the water leaves as saturated vapor, find the ratio of the flow rates $\dot{m}_{H_2O}/\dot{m}_{air}$.

Solution:

C.V. Heat exchanger, steady flow 1 inlet and 1 exit for air and water each. The two flows exchange energy with no heat transfer to/from the outside.



Continuity Eqs.: Each line has a constant flow rate through it.

Energy Eq.4.10: $\dot{m}_{air}h_1 + \dot{m}_{H_2O}h_3 = \dot{m}_{air}h_2 + \dot{m}_{H_2O}h_4$

Process: Each line has a constant pressure.

Table F.5: $h_1 = 343.016$ Btu/lbm, $h_2 = 162.86$ Btu/lbm

Table F.7: $h_3 = 28.08$ Btu/lbm, $h_4 = 1150.9$ Btu/lbm (at 15 psia)

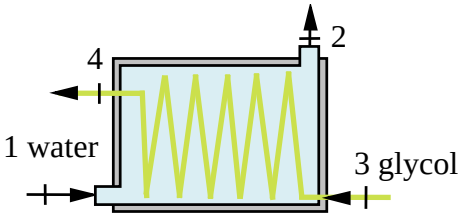
$$\dot{m}_{H_2O}/\dot{m}_{air} = \frac{h_1 - h_2}{h_4 - h_3} = \frac{343.016 - 162.86}{1150.9 - 28.08} = \mathbf{0.1604}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.191E

A dual-fluid heat exchanger has 10 lbm/s water entering at 100 F, 20 psia and leaving at 50 F, 20 psia. The other fluid is glycol, entering at 10 F, 22 psia and leaving at 50 F, 22 psia. Find the required mass flow rate of glycol and the rate of internal heat transfer.

C.V. Heat exchanger, steady flow 1 inlet and 1 exit for glycol and water each. The two flows exchange energy with no heat transfer to/from the outside.



Continuity Eqs.: Each line has a constant flow rate through it.

Energy Eq.4.10: $\dot{m}_{H_2O}\, h_1 + \dot{m}_{glycol}\, h_3 = \dot{m}_{H_2O}\, h_2 + \dot{m}_{glycol}\, h_4$

Process: Each line has a constant pressure.

Table F.7: $h_1 = 68.04$ Btu/lbm, $h_2 = 18.05$ Btu/lbm

Table F.3: $C_{P\ gly} = 0.58$ Btu/lbm-R so

$$h_4 - h_3 = C_{P\ gly}\,(T_4 - T_3) = 0.58\,[50 - 10] = 23.2 \text{ Btu/lbm}$$

$$\dot{m}_{glycol} = \dot{m}_{H_2O}\,\frac{h_1 - h_2}{h_4 - h_3} = 10 \text{ lbm/s}\,\frac{68.04 - 18.05}{23.2} = \mathbf{21.55\ lbm/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.192E

An automotive radiator has glycerine at 200 F enter and return at 130 F as shown in Fig. P4.100. Air flows in at 68 F and leaves at 77 F. If the radiator should transfer 33 hp what is the mass flow rate of the glycerine and what is the volume flow rate of air in at 15 psia?

Solution:

If we take a control volume around the whole radiator then there is no external heat transfer - it is all between the glycerin and the air. So we take a control volume around each flow separately.

Heat transfer: $\dot{Q} = 33 \text{ hp} = 33 \times 2544.4 / 3600 = 23.324 \text{ Btu/s}$

Glycerine energy: $\dot{m}h_i + (-\dot{Q}) = \dot{m}h_e$

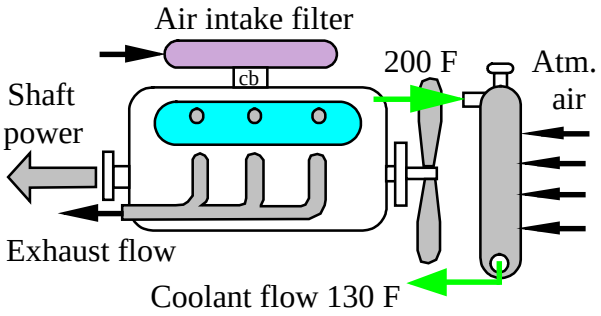
Table F.3: $\dot{m}_{gly} = \dfrac{-\dot{Q}}{h_e - h_i} = \dfrac{-\dot{Q}}{C_{gly}(T_e - T_i)} = \dfrac{-23.324}{0.58(130 - 200)} = \mathbf{0.574 \text{ lbm/s}}$

Air $\dot{m}h_i + \dot{Q} = \dot{m}h_e$

Table F.4: $\dot{m}_{air} = \dfrac{\dot{Q}}{h_e - h_i} = \dfrac{\dot{Q}}{C_{air}(T_e - T_i)} = \dfrac{23.324}{0.24(77 - 68)} = 8.835 \text{ lbm/s}$

$$\dot{V} = \dot{m}v_i \; ; \quad v_i = \frac{RT_i}{P_i} = \frac{53.34 \times 527.7}{15 \times 144} = 13.03 \text{ ft}^3/\text{lbm}$$

$$\dot{V}_{air} = \dot{m}v_i = 8.835 \times 13.03 = \mathbf{115 \text{ ft}^3/\text{s}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.193E

Steam at 80 psia, 600 F is used to heat cold water at 60 F to 170 F for domestic hot water supply. How much steam per lbm liquid water is needed if the steam should not condense?

Solution:
C.V. Each line separately. No work but there is heat transfer out of the steam flow and into the liquid water flow.

Water line energy Eq.: $\dot{m}_{liq} h_i + \dot{Q} = \dot{m}_{liq} h_e \Rightarrow \dot{Q} = \dot{m}_{liq}(h_e - h_i)$

For the liquid water look in Table F.7.1

$$\Delta h_{liq} = h_e - h_i = 137.96 - 28.08 = 109.88 \text{ btu/lbm}$$

$$(\cong C_p \Delta T = 1.0\ (170 - 60) = 110 \text{ btu/lbm})$$

Steam line energy has the same heat transfer but it goes out

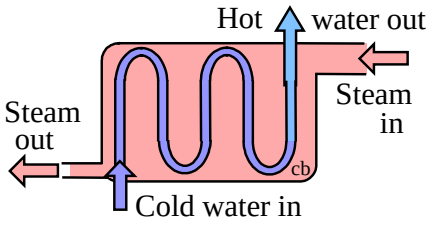
Steam Energy Eq.: $\dot{m}_{steam} h_i = \dot{Q} + \dot{m}_{steam} h_e \Rightarrow \dot{Q} = \dot{m}_{steam}(h_i - h_e)$

For the steam look in Table F.7.2 at 80 psia

$$\Delta h_{steam} = h_i - h_e = 1330.66 - 1183.61 = 147.05 \text{ btu/lbm}$$

Now the heat transfer for the steam is substituted into the energy equation for the water to give

$$\dot{m}_{steam} / \dot{m}_{liq} = \Delta h_{liq} / \Delta h_{steam} = \frac{109.88}{147.05} = \mathbf{0.747}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.194E

A copper wire has been heat treated to 1800 R and is now pulled into a cooling chamber that has 3 lbm/s air coming in at 70 F; the air leaves the other end at 120 F. If the wire moves 0.5 lbm/s copper, how hot is the copper as it comes out?

Solution:
C.V. Total chamber, no external heat transfer

Energy eq.: $\dot{m}_{cu}\, h_{i\,cu} + \dot{m}_{air}\, h_{i\,air} = \dot{m}_{cu}\, h_{e\,cu} + \dot{m}_{air}\, h_{e\,air}$

$$\dot{m}_{cu}\,(h_e - h_i)_{cu} = \dot{m}_{air}(h_i - h_e)_{air}$$

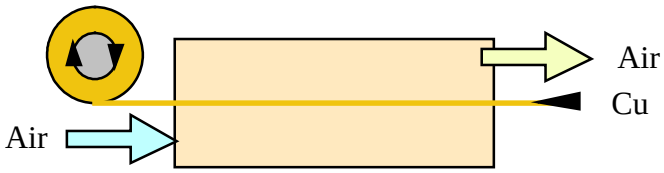
$$\dot{m}_{cu}\, C_{cu}\,(T_e - T_i)_{cu} = \dot{m}_{air}\, C_{p\,air}(T_e - T_i)_{air}$$

Heat capacities from F.2 for copper and F.4 for air

$$(T_e - T_i)_{cu} = \frac{\dot{m}_{air} C_{p\,air}}{\dot{m}_{cu} C_{cu}} (T_e - T_i)_{air}$$

$$= \frac{3 \times 0.24}{0.5 \times 0.1} (70 - 120)\ \text{R} = -720\ \text{R}$$

$$T_e = T_i - 720 = 1800 - 720 = \mathbf{1080\ R}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.195E

Two flows of air are both at 30 psia; one has 1 lbm/s at 720 R and the other has 2 lbm/s at 520 R. The two flows are mixed together in an insulated box to produce a single exit flow at 30 psia. Find the exit temperature.

Solution:

Cont.: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

Energy: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3$

$= (\dot{m}_1 + \dot{m}_2) h_3$

Mixing chamber

Solve for the exit enthalpy

$$h_3 = [\dot{m}_1 h_1 + \dot{m}_2 h_2 \,] / (\dot{m}_1 + \dot{m}_2)$$

since the T's are modest use constant specific heats

$$T_3 = [\dot{m}_1 T_1 + \dot{m}_2 T_2 \,] / (\dot{m}_1 + \dot{m}_2) = \tfrac{1}{3} \times 720 + \tfrac{2}{3} \times 520 = \mathbf{586.7\ R}$$

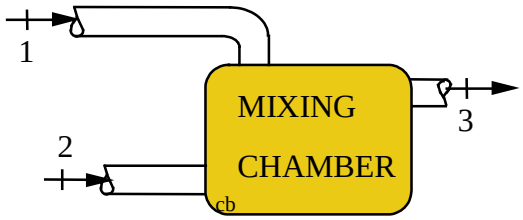
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.196E

A de-superheater has a flow of ammonia 3 lbm/s at 150 psia, 200 F which is mixed with another flow of ammonia at 80 F and quality 25% in an adiabatic mixing chamber. Find the flow rate of the second flow so the outgoing ammonia is saturated vapor at 150 psia.

C.V. Desuperheater.

No external $\dot{Q}$ or $\dot{W}$



Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$

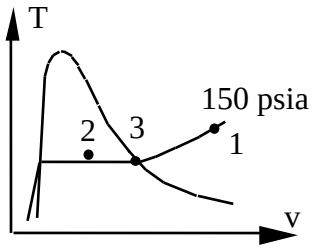
Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 h_3 = (\dot{m}_1 + \dot{m}_2) h_3$

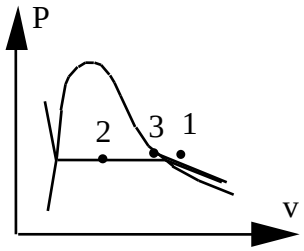
State 1: Table F.8.2 $h_1 = 707.96$ Btu/lbm

State 2: Table F.8.1 $h_2 = 131.68 + 0.25 \times 497.94 = 256.17$ Btu/lbm

State 3: Table F.8.2 $h_3 = 629.45$ Btu/lbm

$$\dot{m}_2 = \dot{m}_1 \times \frac{h_1 - h_3}{h_3 - h_2} = 3 \times \frac{707.96 - 629.45}{629.45 - 256.17} = \mathbf{0.631\ lbm/s}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.197E

An insulated mixing chamber receives 4 lbm/s R-134a at 150 lbf/in.^{2}, 220 F in a line with low velocity. Another line with R-134a as saturated liquid 130 F flows through a valve to the mixing chamber at 150 lbf/in.^{2} after the valve. The exit flow is saturated vapor at 150 lbf/in.^{2} flowing at 60 ft/s. Find the mass flow rate for the second line.

Solution:

C.V. Mixing chamber. Steady state, 2 inlets and 1 exit flow.

Insulated q = 0, No shaft or boundary motion w = 0.

Continuity Eq.4.9: $\dot{m}_1 + \dot{m}_2 = \dot{m}_3$;

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_3 (h_3 + \frac{1}{2}\mathbf{V}_3^2)$

$$\dot{m}_2 (h_2 - h_3 - \tfrac{1}{2}\mathbf{V}_3^2) = \dot{m}_1 (h_3 + \tfrac{1}{2}\mathbf{V}_3^2 - h_1)$$

State 1: Table F.10.1: 150 psia, 220 F, h_1 = 209.63 Btu/lbm

State 2: Table F.10.1: x = 0, 130 F, h_2 = 119.88 Btu/lbm

State 3: Table F.10.2: x = 1, 150 psia, h_3 = 180.61 Btu/lbm

$$\tfrac{1}{2}\mathbf{V}_3^2 = \tfrac{1}{2} \times 60^2 /(32.174 \times 778) = 0.072 \text{ Btu/lbm}$$

$$\dot{m}_2 = \dot{m}_1 (h_3 + \tfrac{1}{2}\mathbf{V}_3^2 - h_1)/ (h_2 - h_3 - \tfrac{1}{2}\mathbf{V}_3^2)$$

$$= 4 (180.61 + 0.072 - 209.63)/ (119.88 - 180.61 - 0.072) = \mathbf{1.904 \text{ lbm/s}}$$

Notice how kinetic energy was insignificant.

4.198E

The following data are for a simple steam power plant as shown in Fig. P4.118.

State	1	2	3	4	5	6	7
P psia	900	890	860	830	800	1.5	1.4
T F		115	350	920	900		110
h Btu/lbm	-	85.3	323	1468	1456	1029	78

State 6 has $x_6 = 0.92$, and velocity of 600 ft/s. The rate of steam flow is 200 000 lbm/h, with 400 hp input to the pump. Piping diameters are 8 in. from steam generator to the turbine and 3 in. from the condenser to the steam generator. Determine the power output of the turbine and the heat transfer rate in the condenser.

Turbine: $A_5 = \pi D_5^2/4 = 0.349\ \text{ft}^2, \quad v_5 = 0.964\ \text{ft}^3/\text{lbm}$

$$\mathbf{V}_5 = \dot{m}v_5/A_5 == \frac{200\,000 \times 0.964}{3600 \times 0.349} = 153\ \text{ft/s}$$

$$w = (h_5 + 0.5\mathbf{V}_5^2) - (h_6 + 0.5\mathbf{V}_6^2) = 1456 - 1029 - \frac{600^2 - 153^2}{2 \times 25\,037}$$

$$= 420.2\ \text{Btu/lbm}$$

Recall the conversion 1 Btu/lbm = 25 037 ft^2/s^2, 1 hp = 2544 Btu/h

$$\dot{W}_{TURB} = \frac{420.2 \times 200\,000}{2544} = \mathbf{33\,000\ hp}$$

Condenser: $A_7 = \pi D_7^2/4 = 0.0491\ \text{ft}^2, \quad v_7 = 0.01617\ \text{ft}^3/\text{lbm}$

$$\mathbf{V}_7 = \dot{m}v_7/A_7 = \frac{200000 \times 0.01617}{3600 \times 0.0491} = 18\ \text{ft/s}$$

$$q = 78.02 - 1028.7 + \frac{18^2 - 600^2}{2 \times 25\,037} = -957.9\ \text{Btu/lbm}$$

$$\dot{Q}_{COND} = 200\,000\ (-957.9) = \mathbf{-1.916 \times 10^8\ Btu/h}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.199E

For the same steam power plant as shown in Fig. P4.118 and Problem 4.198E determine the rate of heat transfer in the economizer which is a low temperature heat exchanger and the steam generator. Determine also the flow rate of cooling water through the condenser, if the cooling water increases from 55 to 75 F in the condenser.

Condenser: $A_7 = \pi D_7^2/4 = 0.0491$ ft^2, $v_7 = 0.01617$ ft^3/lbm

$$\mathbf{V}_7 = \dot{m}v_7/A_7 = \frac{200000 \times 0.01617}{3600 \times 0.0491} = 18 \text{ ft/s}$$

$$q = 78.02 - 1028.7 + \frac{18^2 - 600^2}{2 \times 25\,037} = -957.9 \text{ Btu/lbm}$$

$$\dot{Q}_{COND} = 200\,000\,(-957.9) = \mathbf{-1.916 \times 10^8\ Btu/h}$$

Economizer $\mathbf{V}_3 \approx \mathbf{V}_2$ since liquid v is constant: $v_3 \approx v_2$ and $A_3 = A_2$,

$$q = h_3 - h_2 = 323.0 - 85.3 = 237.7 \text{ Btu/lbm}$$

$$\dot{Q}_{ECON} = 200\,000\,(237.7) = \mathbf{4.75 \times 10^7\ Btu/h}$$

Generator: $A_4 = \pi D_4^2/4 = 0.349$ ft^2, $v_4 = 0.9595$ ft^3/lbm

$$\mathbf{V}_4 = \dot{m}v_4/A_4 = \frac{200\,000 \times 0.9505}{3600 \times 0.349} = 151 \text{ ft/s}$$

$A_3 = \pi D_3^2/4 = 0.349$ ft^2, $v_3 = 0.0491$ ft^3/lbm

$$\mathbf{V}_3 = \dot{m}v_3/A_3 = \frac{200\,000 \times 0.0179}{3600 \times 0.0491} = 20 \text{ ft/s},$$

$$q = 1467.8 - 323.0 + \frac{151^2 - 20^2}{2 \times 25\,037} = \mathbf{1145.2\ Btu/lbm}$$

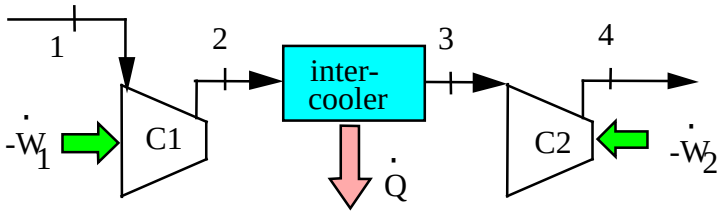
$$\dot{Q}_{GEN} = 200\,000 \times (1145.2) = \mathbf{2.291 \times 10^8\ Btu/h}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.200E

A two-stage compressor takes nitrogen in at 80 F, 20 psia and compresses it to 80 psia, 800 R. Then it flows through an intercooler, where it cools to 580 R, and the second stage compresses it to 400 psia, 1000 R. Find the specific work in each of the two compressor stages and the specific heat transfer in the intercooler.

The setup is like this:



C.V.: Stage 1 nitrogen, Steady flow

Process: adibatic: q = 0, reversible: $s_{gen} = 0$

Energy Eq. 4.13: $-w_{C1} = h_2 - h_1$,

Assume constant $C_{P0} = 0.249$ from F.4

$$w_{C1} = h_1 - h_2 = C_{P0}(T_1 - T_2) = 0.249 \text{ Btu/lbmR } (540 - 800) \text{ K}$$

$$= \mathbf{-64.74 \text{ Btu/lbm}}$$

C.V. Intercooler, no work and no changes in kinetic or potential energy.

$$q_{23} = h_3 - h_2 = C_{P0}(T_3 - T_2) = 0.249\ (800 - 580) = \mathbf{-135.5 \text{ Btu/lbm}}$$

C.V. Stage 2. Analysis the same as stage 1.

$$w_{C2} = h_3 - h_4 = C_{P0}(T_3 - T_4) = 0.249\ (580 - 1000) = \mathbf{-104.6 \text{ Btu/lbm}}$$

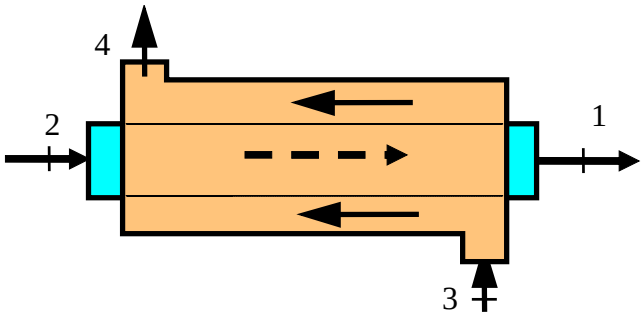
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.201E

The intercooler in the previous problem uses cold liquid water to cool the nitrogen. The nitrogen flow is 0.1 lbm/s, and the liquid water inlet is 77 F and is set up to flow in the opposite direction from the nitrogen, so the water leaves at 105 F. Find the flow rate of the water.

Solution:

C.V. Heat exchanger, steady 2 flows in and two flows out.



Continuity eq.: $\dot{m}_1 = \dot{m}_2 = \dot{m}_{H2O}$; $\dot{m}_3 = \dot{m}_4 = \dot{m}_{N2}$

Energy eq.: $0 = \dot{m}_{H2O}(h_3 - h_4) + \dot{m}_{N2}(h_2 - h_1)$

Due to the lower range of temperature we will use constant specific heats from F.4 and F.3 so the energy equation is approximated as

$$0 = \dot{m}_{H2O} C_{pH2O} (T_3 - T_4) + \dot{m}_{N2} C_p (T_2 - T_1)$$

Now solve for the water flow rate

$$\dot{m}_{H2O} = \dot{m}_{N2}\, C_{pN2} (T_2 - T_1) / [C_{pH2O} (T_4 - T_3)]$$

$$= 0.1 \text{ lbm/s} \times \frac{0.249 \text{ Btu/lbm-R} \times (800 - 580) \text{ R}}{1.0 \text{ Btu/lbm-R} \times (105 - 77) \text{ R}}$$

$$= \mathbf{0.196 \text{ lbm/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.202E

A R-410A heat pump cycle shown in Fig. P4.123 has a R-410A flow rate of 0.1 lbm/s with 4 Btu/s into the compressor. The following data are given

State	1	2	3	4	5	6
P, psia	410	405	400	62	60	58
T, F	220	200	110		10	14
h, Btu/lbm	154	150	56	-	120	122

Calculate the heat transfer from the compressor, the heat transfer from the R-410A in the condenser and the heat transfer to the R-410A in the evaporator.

Solution:

CV: Compressor

$$\dot{Q}_{COMP} = \dot{m}(h_1 - h_6) + \dot{W}_{COMP} = 0.1\ (154 - 122) - 4.0 = \mathbf{-0.8\ Btu/s}$$

CV: Condenser

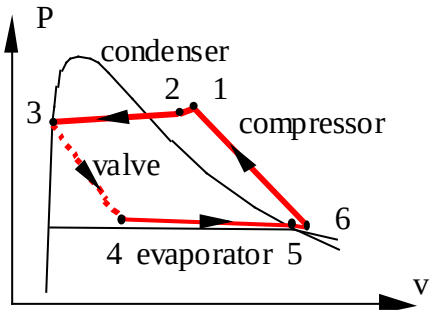
$$\dot{Q}_{COND} = \dot{m}(h_3 - h_2) = 0.1\ \text{lbm/s}\ (56 - 150)\ \text{Btu/lbm} = \mathbf{-9.4\ Btu/s}$$

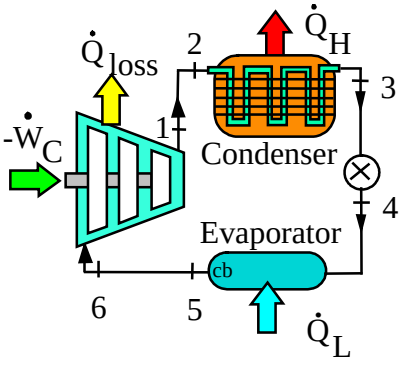
C.V. Valve:

$$h_4 = h_3 = 56\ \text{Btu/lbm}$$

CV: Evaporator

$$\dot{Q}_{EVAP} = \dot{m}\ (h_5 - h_4) = 0.1\ \text{lbm/s}\ (120 - 56)\ \text{Btu/lbm} = \mathbf{6.4\ Btu/s}$$



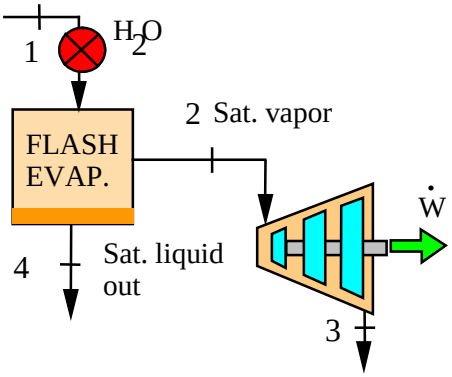


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.203E

A proposal is made to use a geothermal supply of hot water to operate a steam turbine, as shown in Fig. P4.125. The high pressure water at 200 lbf/in.^{2}, 350 F, is throttled into a flash evaporator chamber, which forms liquid and vapor at a lower pressure of 60 lbf/in.^{2}. The liquid is discarded while the saturated vapor feeds the turbine and exits at 1 lbf/in.^{2}, 90% quality. If the turbine should produce 1000 hp, find the required mass flow rate of hot geothermal water in pound-mass per hour.

Solution:



Separation of phases in flash-evaporator constant h in the valve flow so

Table F.7.3: $h_1 = 321.8$ Btu/lbm

$h_1 = 321.8 = 262.25 + x \times 915.8$

$\Rightarrow \quad x = 0.06503 = \dot{m}_2/\dot{m}_1$

Table F.7.2: $h_2 = 1178.0$ Btu/lbm;

Table F.7.1: $h_3 = 69.74 + 0.9 \times 1036 = 1002.1$ Btu/lbm

$$\dot{W} = \dot{m}_2(h_2 - h_3) \quad => \quad \dot{m}_2 = \frac{1000 \times 2545}{1178.0 - 1002.1} = 14\,472 \text{ lbm/h}$$

$\Rightarrow \quad \dot{m}_1 =$ **222 539 lbm/h**

Notice conversion 1 hp = 2445 Btu/h from Table A.1

Transient Processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.204E

A 1 Gallon tank initially is empty and we want to have 0.03 lbm of R-410A in it. The R-410A comes from a line with saturated vapor at 20 F. To end up with the desired amount we cool the can while we fill it in a slow process keeping the can and content at 20 F. Find the final pressure to reach before closing the valve and the heat transfer.

Solution:

C.V. Tank:

Continuity Eq.4.20: $m_2 - 0 = m_i$

Energy Eq.4.21: $m_2u_2 - 0 = m_ih_i + {}_1Q_2$

State 2: 20 F, $v_2 = V/m_2 = 1\ (231/12^3)/0.030 = 4.456\ ft^3/lbm$

From Table F.9.2 we locate the state between 15 and 20 psia.

$$P_2 = 15 + (20 - 15)\frac{4.456 - 4.6305}{3.4479 - 4.6305} = \mathbf{15.74\ psia}$$

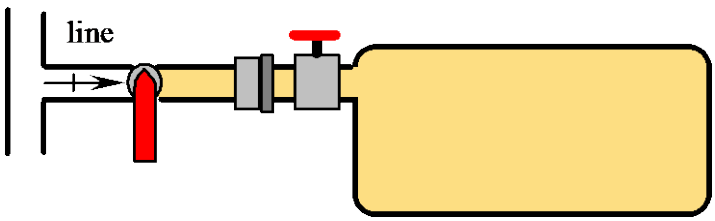
$u_2 = 112.68$ Btu/lbm,

State i Table F.9.1: $h_i = 119.07$ Btu/lbm

Now use the energy equation to solve for the heat transfer

$${}_1Q_2 = m_2u_2 - m_ih_i = m_2(u_2 - h_i)$$

$$= 0.03 \times (112.68 - 119.07) = \mathbf{-0.192\ Btu}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.205E

An initially empty cylinder is filled with air from 70 F, 15 psia until it is full. Assuming no heat transfer is the final temperature larger, equal to or smaller than 70 F? Does the final T depends on the size of the cylinder?

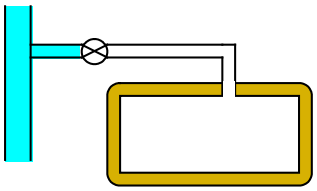
This is a transient problem with no heat transfer and no work. The balance equations for the tank as C.V. become

Continuity Eq.: $m_2 - 0 = m_i$

Energy Eq.: $m_2u_2 - 0 = m_ih_i + Q - W = m_ih_i + 0 - 0$

Final state: $u_2 = h_i$ & $P_2 = P_i$

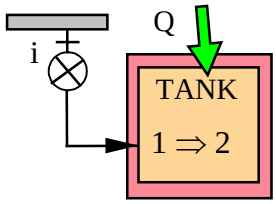
$T_2 > T_i$ and it does not depend on V



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.206E

A tank contains 10 ft^3 air at 15 psia, 540 R. A pipe flowing air at 150 psia, 540 R is connected to the tank and it is filled slowly to 150 psia. Find the heat transfer to reach a final temperature of 540 R.



C.V. The tank volume and the compressor.
This is a transient problem (filling of tank).

Continuity Eq.4.20: $m_2 - m_1 = m_{in}$

Energy Eq.4.21: $m_2u_2 - m_1u_1 = {}_1Q_2 - {}_1W_2 + m_{in}h_{in}$

Process: Constant volume ${}_1W_2 = 0$,

States: $u_1 = u_2 = u_{in} = u_{540}$; $h_{in} = u_{in} + RT_{in}$

$m_1 = P_1V_1/RT_1 = 15 \times 144 \times 10/(53.34 \times 540) = 0.75$ lbm

$m_2 = P_2V_2/RT_2 = 150 \times 144 \times 10/(53.34 \times 540) = 7.499$ lbm

Heat transfer from the energy equation

${}_1Q_2 = m_2u_2 - m_1u_1 - m_{in}h_{in} = (m_1 + m_{in})\, u_1 - m_1u_1 - m_{in}u_{in} - m_{in}RT_{in}$

$= m_1u_1 - m_1u_1 + m_{in}u_1 - m_{in}u_{in} - m_{in}RT_{in} = - m_{in}RT_{in}$

$= -(7.499 - 0.75)$ lbm $\times$ 53.34 ft-lbf/lbm-R $\times$ 540 R

$=$ **–194 395 ft-lbf = –250 Btu**

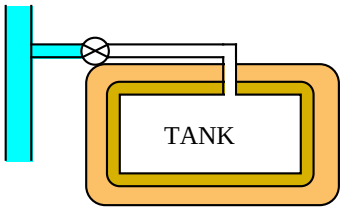
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.207E

A 1-ft^3 tank, shown in Fig. P4.136, that is initially evacuated is connected by a valve to an air supply line flowing air at 70 F, 120 lbf/in.^{2}. The valve is opened, and air flows into the tank until the pressure reaches 90 lbf/in.^{2}. Determine the final temperature and mass inside the tank, assuming the process is adiabatic. Develop an expression for the relation between the line temperature and the final temperature using constant specific heats.

Solution:

C.V. Tank:



Continuity Eq.4.20: $m_2 = m_i$

Energy Eq.4.21: $m_2 u_2 = m_i h_i$

Table F.5: $u_2 = h_i = 126.78$ Btu/lbm

$\Rightarrow T_2 =$ **740 R**

$$m_2 = \frac{P_2 V}{RT_2} = \frac{90 \times 144 \times 1}{53.34 \times 740} = \textbf{0.3283 lbm}$$

Assuming constant specific heat,

$$h_i = u_i + RT_i = u_2 , \quad RT_i = u_2 - u_i = C_{Vo}(T_2 - T_i)$$

$$C_{Vo}T_2 = (C_{Vo} + R)T_i = C_{Po}T_i \ ,$$

$$T_2 = \left(\frac{C_{Po}}{C_{vo}}\right) T_i = kT_i$$

For $T_i = 529.7$ R & constant C_{Po},

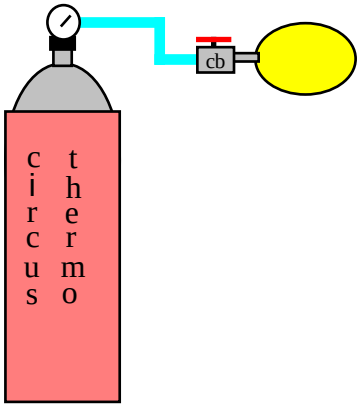
$T_2 = 1.40 \times 529.7 =$ **741.6 R**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.208E

Helium in a steel tank is at 40 psia, 540 R with a volume of 4 ft^3. It is used to fill a balloon. When the tank pressure drops to 24 psia the flow of helium stops by itself. If all the helium still is at 540 R how big a balloon did I get? Assume the pressure in the balloon varies linearly with volume from 14.7 psia (V = 0) to the final 24 psia. How much heat transfer did take place?

Solution:
Take a C.V. of all the helium.
This is a control mass, the tank mass changes density and pressure.



Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$
Process Eq.: $P = 14.7 + CV$
State 1: P_1, T_1, V_1
State 2: $P_2, T_2, V_2 = ?$

Ideal gas:

$$P_2 V_2 = mRT_2 = mRT_1 = P_1V_1$$

$$V_2 = V_1(P_1/P_2) = 4 \times (40/24) = 6.6667 \text{ ft}^3$$

$$V_{bal} = V_2 - V_1 = 6.6667 - 4 = 2.6667 \text{ ft}^3$$

$${}_1W_2 = \int P\, dV = \text{AREA} = \tfrac{1}{2} (P_1 + P_2)(V_2 - V_1)$$

$$= \tfrac{1}{2}(40 + 24) \times 2.6667 \times 144 = 12\,288 \text{ lbf-ft} = 15.791 \text{ Btu}$$

$$U_2 - U_1 = {}_1Q_2 - {}_1W_2 = m (u_2 - u_1) = mC_v (T_2 - T_1) = 0$$

so $${}_1Q_2 = {}_1W_2 = \mathbf{15.79 \text{ Btu}}$$

Remark: The process is transient, but you only see the flow mass if you select the tank or the balloon as a control volume. That analysis leads to more terms that must be elliminated between the tank control volume and the balloon control volume.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.209E

A 20-ft^3 tank contains ammonia at 20 lbf/in.^{2}, 80 F. The tank is attached to a line flowing ammonia at 180 lbf/in.^{2}, 140 F. The valve is opened, and mass flows in until the tank is half full of liquid, by volume at 80 F. Calculate the heat transferred from the tank during this process.

Solution:

C.V. Tank. Transient process as flow comes in.

$m_1 = V/v_1 = 20/16.765 = 1.193$ lbm

$m_{f2} = V_{f2}/v_{f2} = 10/0.026677 = 374.855$ lbm,

$m_{g2} = V_{g2}/v_{g2} = 10/1.9531 = 5.120$ lbm

$m_2 = m_{f2} + m_{g2} = 379.975$ lbm => $x_2 = m_{g2}/ m_2 = 0.013475$

Table F.8.1, $u_2 = 130.9 + 0.013475 \times 443.4 = 136.9$ Btu/lbm

$u_1 = 595.0$ Btu/lbm, $h_i = 667.0$ Btu/lbm

Continuity Eq,: $m_i = m_2 - m_1 = 378.782$ lbm ,

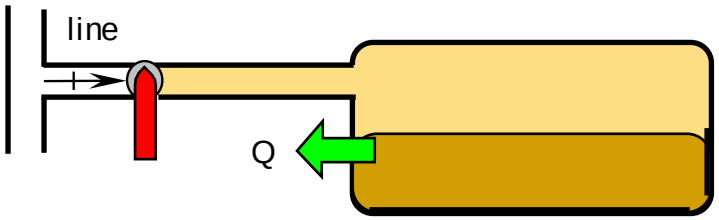
From continuity equation

$m_i = m_2 - m_1 = 379.975 - 1.193 = 378.782$ lbm

Energy eq.: $Q_{CV} + m_i h_i = m_2 u_2 - m_1 u_1$

$Q_{CV} = 379.975 \times 136.9 - 1.193 \times 595.0 - 378.782 \times 667.0$

$= \mathbf{-201\ 339\ Btu}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.210E

A nitrogen line, 540 R, and 75 lbf/in.^{2}, is connected to a turbine that exhausts to a closed initially empty tank of 2000 ft^3, as shown in Fig. P4.137. The turbine operates to a tank pressure of 75 lbf/in.^{2}, at which point the temperature is 450 R. Assuming the entire process is adiabatic, determine the turbine work.

C.V. turbine & tank $\Rightarrow$ Transient problem

Conservation of mass: $m_i = m_2 = m$

Energy Eq.: $m_i h_i = m_2 u_2 + W_{CV}$; $W_{CV} = m(h_i - u_2)$

Inlet state: $P_i = 75$ lbf/in^2, $T_i = 540$ R

Final state 2: $P_2 = 75$ lbf/in^2, $T_2 = 450$ R

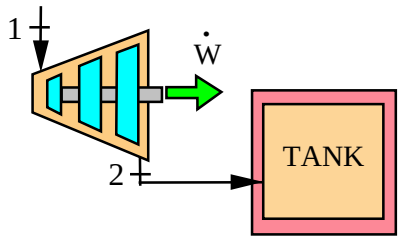
$$v_2 = RT_2/P_2 = 55.15 \times 450/(75 \times 144) = 2.298 \text{ ft}^3/\text{lbm}$$

$$m_2 = V/v_2 = 2000/2.298 = 870.32 \text{ lbm}$$

$$h_i - u_2 = u_i + RT_i - u_2 = RT_i + C_v (T_i - T_2)$$

$$= \frac{55.15}{778.17} 540 + 0.178 (540 - 450) = 38.27 + 16.02 = 54.29 \frac{\text{Btu}}{\text{lbm}}$$

$$W_{CV} = 870.32 \times 54.29 = \mathbf{47\ 250\ Btu}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

4.211E

A mass-loaded piston/cylinder containing air is at 45 lbf/in.^{2}, 60 F with a volume of 9 ft^3, while at the stops $V = 36$ ft^3. An air line, 75 lbf/in.^{2}, 1100 R, is connected by a valve, as shown in Fig. P4.154. The valve is then opened until a final inside pressure of 60 lbf/in.^{2} is reached, at which point T = 630 R. Find the air mass that enters, the work, and heat transfer.

Solution:

C.V. Cylinder volume.

Continuity Eq.4.20: $m_2 - m_1 = m_{in}$

Energy Eq.4.21: $m_2u_2 - m_1u_1 = m_{in}h_{line} + {}_1Q_2 - {}_1W_2$

Process: P_1 is constant to stops, then constant V to state 2 at P_2

State 1: P_1, T_1 $\quad m_1 = \dfrac{P_1V}{RT_1} = \dfrac{45 \times 9 \times 144}{53.34 \times 519.7} = 2.104$ lbm

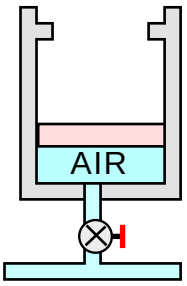
State 2: Open to: $P_2 = 60$ lbf/in^2, $T_2 = 630$ R

Table F.5:

$h_i = 266.13$ btu/lbm

$u_1 = 88.68$ Btu/lbm

$u_2 = 107.62$ Btu/lbm



${}_1W_2 = \int PdV = P_1(V_{stop} - V_1) = 45 \times (36 - 9)\dfrac{144}{778} =$ **224.9 Btu**

$m_2 = P_2V_2/RT_2 = 60 \times 36 \times 144 / (53.34 \times 630) = 9.256$ lbm

$m_i = m_2 - m_1 = 9.256 - 2.104 = 7.152$ lbm

${}_1Q_2 = m_2u_2 - m_1u_1 - m_i\, h_i + {}_1W_2$

$= 9.256 \times 107.62 - 2.104 \times 88.68 - 7.152 \times 266.13 + 224.9$

$=$ **-868.9 Btu**

In-Text Concept Questions

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.a

Electrical appliances (TV, stereo) use electric power as input. What happens to the power? Are those heat engines? What does the second law say about those devices?

Most electric appliances such as TV, VCR, stereo and clocks dissipate power in electrical circuits into internal energy (they get warm) some power goes into light and some power into mechanical energy. The light is absorbed by the room walls, furniture etc. and the mechanical energy is dissipated by friction so all the power eventually ends up as internal energy in the room mass of air and other substances.

These are not heat engines, just the opposite happens, namely electrical power is turned into internal energy and redistributed by heat transfer. These are irreversible processes.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.b

Geothermal underground hot water or steam can be used to generate electric power. Does that violate the second law?

No.
Since the earth is not uniform we consider the hot water or steam supply as coming from one energy source (the high T) and we must reject heat to a low temperature reservoir as the ocean, a lake or the atmosphere which is another energy reservoir.

Iceland uses a significant amount of steam to heat buildings and to generate electricity. Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.c

A windmill produces power on a shaft taking kinetic energy out of the wind. Is it a heat engine? Is it a perpetual machine? Explain.

Since the wind is generated by a complex system driven by solar heat input and radiation out to space it is a kind of heat engine.

Microsoft clipart.

Within our lifetime it looks like it is perpetual. However with a different time scale the climate will change, the sun will grow to engulf the earth as it burns out of fuel. There is a storage effect and a non-uniform distribution of states in the system that drives this.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.d

heat engines and heat pumps (refrigerators) are energy conversion devices altering amounts of energy transfer between Q and W. Which conversion direction (Q → W or W → Q) is limited and which is unlimited according to the second law.

The work output of a heat engine is limited (Q to W).
You can transform W to Q unlimited (a heat pump that does not work well or you may think about heat generated by friction).

5.e

Ice cubes in a glass of liquid water will eventually melt and all the water approach room temperature. Is this a reversible process? Why?

There is heat transfer from the warmer ambient to the water as long as there is a temperature difference. Eventually the temperatures approach each other and there is no more heat transfer. This is irreversible, as we cannot make ice-cubes out of the water unless we run a refrigerator and that requires a work from the surroundings, which does not leave the surroundings unchanged.

Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.f

Does a process become more or less reversible with respect to heat transfer if it is fast rather than slow? *Hint*: Recall from Chapter 3 that $\dot{Q} = CA\,\Delta T$.

If the higher heat transfer rate is caused by a larger ΔT then the process is more irreversible so as the process would be slower due to a lower ΔT then it approaches a reversible process. If the rate of heat transfer is altered due to the factor CA with the same ΔT then it is irreversible to the same degree.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.g

If you generated hydrogen from, say, solar power, which of these would be more efficient: (1) transport it and then burn it in an engine or (2) convert the solar power to electricity and transport that? What else would you need to know in order to give a definite answer?

Case (1):
First there is a certain efficiency when converting solar power to hydrogen. Then the transport and packaging of hydrogen has some energy expenditures associated with it. The hydrogen could be compressed to a high pressure (typically 70 MPa) which is expensive in terms of work input and then stored in a tank. One alternative would be to cool it down to become a liquid to have a much smaller volume but the temperature at which this happens is very low so the cooling and continued cooling under transport requires a significant work input also. Certain materials like metal-hydrides, boron salt slurries and nano-carbon fibers allows storage of hydrogen at more modest pressures and are all currently under investigation as other alternative storage methods. After the hydrogen is transported to an engine then the engine efficiency determines the work output.

Case (2):
If the solar power is located where there is access to electrical transmission lines then it can be used in solar panels, solar heating of water or other substance to run a heat engine cycle like a power plant to generate electricity. All of these processes have a certain efficiency that must be evaluated to estimate the overall efficiency. To make new transmission lines is costly and has an impact on the environment that must be considered.

You also need to look at the time of day/year at which the power is required and when it is available. The end use also presents some limitations like if the power should be used for a car then the energy must be stored temporarily like in a battery.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.1

Two heat engines operate between the same two energy reservoirs and both receives the same Q_H. One engine is reversible and the other is not. What can you say about the two Q_L's?

The reversible heat engine can produce more work (has a higher efficiency) than the irreversible heat engine and due to the energy conservation it then gives out a smaller Q_L compared to the irreversible heat engine.

$$W_{rev} = Q_H - Q_{L\,rev} \quad > \quad W_{irrev} = Q_H - Q_{L\,irrev}$$

$$\Rightarrow \quad Q_{L\,rev} < Q_{L\,irrev}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.2

Compare two domestic heat pumps (A and B) running with the same work input. If A is better than B which one heats the house most?

The statement that A is better means it has a higher COP and since

$$Q_{H\,A} = COP_A\, W \quad > \quad Q_{H\,B} = COP_B\, W$$

it can thus provide more heat to the house. The higher heat comes from the higher Q_L it is able to draw in.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.3

Suppose we forget the model for heat transfer as $\dot{Q} = CA\ \Delta T$, can we draw some information about direction of Q from the second law?

One of the classical statements of the second law is the Clausius statement saying that you cannot have heat transfer from a lower temperature domain to a higher temperature domain without work input.

The opposite, namely a transfer of heat from a high temperature domain towards a lower temperature domain can happen (which is a heat engine with zero efficiency). That is the only direction the heat transfer can have namely from the high T towards the low T environment.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.4

A combination of two heat engines is shown in Fig. P5.4. Find the overall thermal efficiency as a function of the two individual efficiencies.

The overall efficiency

$$\eta_{TH} = \dot{W}_{net} / \dot{Q}_H = (\dot{W}_1 + \dot{W}_2) / \dot{Q}_H = \eta_1 + \dot{W}_2 / \dot{Q}_H$$

For the second heat engine and the energy Eq. for the first heat engine

$$\dot{W}_2 = \eta_2 \dot{Q}_M = \eta_2 (1 - \eta_1) \dot{Q}_H$$

so the final result is

$$\eta_{TH} = \eta_1 + \eta_2 (1 - \eta_1)$$

5.5

Compare two heat engines receiving the same Q, one at 1200 K and the other at 1800 K; they both reject heat at 500 K. Which one is better?

The maximum efficiency for the engines are given by the Carnot heat engine efficiency as

$$\eta_{TH} = \dot{W}_{net} / \dot{Q}_H = 1 - \frac{T_L}{T_H}$$

Since they have the same low temperature the one with the highest T_H will have a higher efficiency and thus presumably better.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.6

A car engine takes atmospheric air in at 20°C, no fuel, and exhausts the air at –20°C producing work in the process. What do the first and the second laws say about that?

Energy Eq.: $W = Q_H - Q_L$ = change in energy of air. **OK**

2nd law: Exchange energy with only one reservoir. **NOT OK**. This is a violation of the statement of Kelvin-Planck.

Remark: You cannot create and maintain your own energy reservoir.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.7

A combination of two refrigerator cycles is shown in Fig. P5.7. Find the overall COP as a function of COP_1 and COP_2.

The overall COP becomes

$$COP = \beta = \frac{\dot{Q}_L}{\dot{W}_{tot}} = \frac{\dot{Q}_L}{\dot{W}_1}\frac{\dot{W}_1}{\dot{W}_{tot}} = COP_1 \frac{\dot{W}_1}{\dot{W}_{tot}} = COP_1 \frac{1}{1 + \dot{W}_2/\dot{W}_1}$$

where we used $\dot{W}_{tot} = \dot{W}_1 + \dot{W}_2$. Use definition of COP_2 and energy equation for refrigerator 1 to eliminate $\dot{Q}_M$ as

$$COP_2 = \dot{Q}_M / \dot{W}_2 \qquad \text{and} \qquad \dot{Q}_M = \dot{W}_1 + \dot{Q}_L$$

so we have

$$\dot{W}_2 = \dot{Q}_M / COP_2 = (\dot{W}_1 + \dot{Q}_L) / COP_2$$

and then

$$\dot{W}_2 / \dot{W}_1 = (1 + \dot{Q}_L/\dot{W}_1) / COP_2 = (1 + COP_1) / COP_2$$

Finally substitute into the first equation and rearrange a little to get

$$COP = \beta = \frac{COP_1\, COP_2}{COP_1 + COP_2 + 1}$$

5.8

After you have returned from a car trip the car engine has cooled down and is thus back to the state in which it started. What happened to all the energy released in the burning of the gasoline? What happened to all the work the engine gave out?

Solution:
All the energy from the fuel generates heat and work out of the engine. The heat is directly dissipated in the atmosphere and the work is turned into kinetic energy and internal energy by all the frictional forces (wind resistance, rolling resistance, brake action). Eventually the kinetic energy is lost by braking the car so in the end all the energy is absorbed by the environment increasing its internal energy.

5.9

Does a reversible heat engine burning coal (which, in practice, cannot be done reversibly) have impacts on our world other than depletion of the coal reserve?

Solution:

When you burn coal you form carbon dioxide CO_2 which is a greenhouse gas. It absorbs energy over a wide spectrum of wavelengths and thus traps energy in the atmosphere that otherwise would go out into space.

Coal from various locations also has sulfur and other substances like heavy metals in it. The sulfur generates sulfuric acid (resulting in acid rain) in the atmosphere and can damage the forests.

Microsoft clipart.

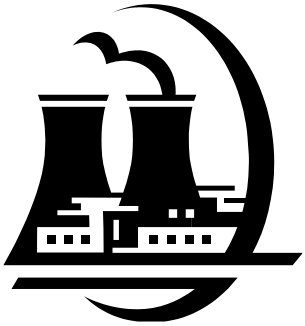
5.10

If the efficiency of a power plant goes up as the low temperature drops, why do power plants not just reject energy at say -40^{o}C?

In order to reject heat the ambient must be at the low temperature. Only if we moved the plant to the North Pole would we see such a low T.

Remark: You cannot create and maintain your own energy reservoir.



Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.11

If the efficiency of a power plant goes up as the low temperature drops why not let the heat rejection go to a refrigerator at, say, -10^{o}C instead of ambient 20^{o}C?

The refrigerator must pump the heat up to 20^{o}C to reject it to the ambient. The refrigerator must then have a work input that will exactly offset the increased work output of the power plant, if they are both ideal. As we can not build ideal devices the actual refrigerator will require more work than the power plant will produce extra.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

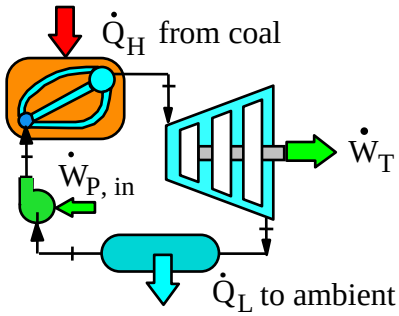
5.12

A coal-fired power plant operates with a high T of 600^{o}C whereas a jet engine has about 1400 K. Does that mean we should replace all power plants with jet engines?

The thermal efficiency is limited by the Carnot heat engine efficiency.

That is, the low temperature is also important. Here the power plant has a much lower T in the condenser than the jet engine has in the exhaust flow so the jet engine does not necessarily have a higher efficiency than the power plant.

Gas-turbines are used in power plants where they can cover peak power demands needed for shorter time periods and their high temperature exhaust can be used to boil additional water for the steam cycle.



Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.13

A heat transfer requires a temperature difference, see chapter 3, to push the $\dot{Q}$. What implications does that have for a real heat engine? A refrigerator?

This means that there are temperature differences between the source of energy and the working substance so T_H is smaller than the source temperature. This lowers the maximum possible efficiency. As heat is rejected the working substance must have a higher temperature T_L than the ambient receiving the $\dot{Q}_L$, which lowers the efficiency further.

For a refrigerator the high temperature must be higher than the ambient to which the $\dot{Q}_H$ is moved. Likewise the low temperature must be lower than the cold space temperature in order to have heat transfer from the cold space to the cycle substance. So the net effect is the cycle temperature difference is larger than the reservoir temperature difference and thus the COP is lower than that estimated from the cold space and ambient temperatures.

Both of these situations and statements are illustrated in Fig.5.27.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.14

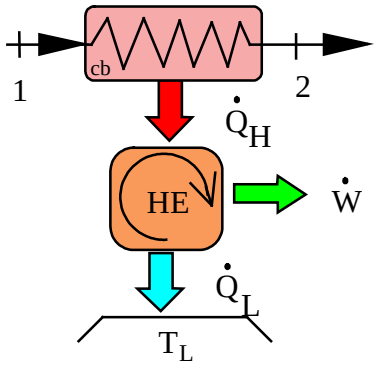
Hot combustion gases (air) at 1500 K are used as the heat source in a heat engine where the gas is cooled to 750 K and the ambient is at 300 K. This is not a constant T source. How does that affect the efficiency?

Solution:

If the efficiency is written as

$$\eta_{TH} = \dot{W}_{net} / \dot{Q}_H = 1 - \frac{T_L}{T_H}$$

then T_H is somewhere between 1500 K and 750 K and it is not a linear average.



After studying chapter 6 and 7 we can solve this problem and find the proper average high temperature based on properties at states 1 and 2.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Heat Engines and Refrigerators

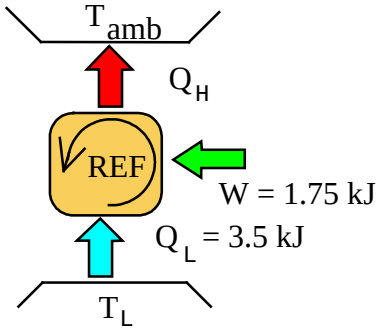
5.15

A window mounted air conditioner removes 3.5 kJ from the inside of a home using 1.75 kJ work input. How much energy is released outside and what is its coefficient of performance?

C.V. A/C unit. The energy Q_H goes into the outside air.

Energy Eq.: $Q_H = W + Q_L = 1.75 + 3.5 =$ **5.25 kJ**

COP: $\beta = \dfrac{Q_L}{W} = 3.5 / 1.75 =$ **2**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

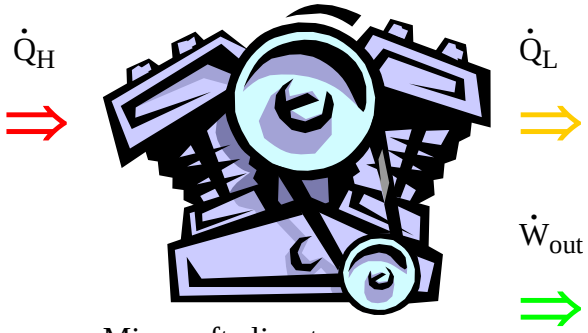
5.16

A lawnmower tractor engine produces 18 hp using 40 kW of heat transfer from burning fuel. Find the thermal efficiency and the rate of heat transfer rejected to the ambient?

Conversion Table A.1: 18 hp = 18 × 0.7457 kW = 13.423 kW

Efficiency: $\eta_{TH} = \dot{W}_{out}/\dot{Q}_H = \frac{13.423}{40} = \mathbf{0.33}$

Energy equation: $\dot{Q}_L = \dot{Q}_H - \dot{W}_{out} = 40 - 13.423 = \mathbf{26.6\ kW}$



Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.17

Calculate the thermal efficiency of the steam power plant cycle described in Example 4.9.

Solution:

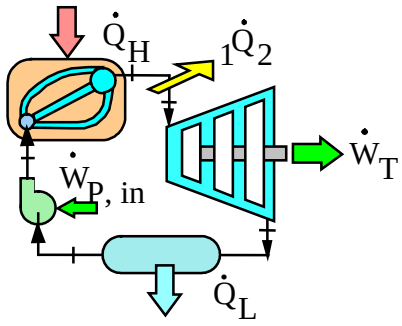
From solution to Example 4.9,

$$w_{net} = w_t + w_p = 640.7 - 4$$

$$= 636.7 \text{ kJ/kg}$$

$$q_H = q_b = 2831 \text{ kJ/kg}$$

$$\eta_{TH} = w_{net}/q_H = \frac{636.7}{2831} = \mathbf{0.225}$$



Notice we cannot write $w_{net} = q_H - q_L$ as there is an extra heat transfer $_1\dot{Q}_2$ as a loss in the line. This needs to be accounted for in the overall energy equation.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.18

Assume we have a refrigerator operating at steady state using 500 W of electric power with a COP of 2.5. What is the net effect on the kitchen air?

Take a C.V. around the whole kitchen. The only energy term that crosses the control surface is the work input $\dot{W}$ apart from energy exchanged with the kitchen surroundings. That is the kitchen is being heated with a rate of $\dot{W}$.

Remark: The two heat transfer rates are both internal to the kitchen. $\dot{Q}_H$ goes into the kitchen air and $\dot{Q}_L$ actually leaks from the kitchen into the refrigerated space, which is the reason we need to drive it out again.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.19

A room is heated with a 1500 W electric heater. How much power can be saved if a heat pump with a COP of 2.5 is used instead?

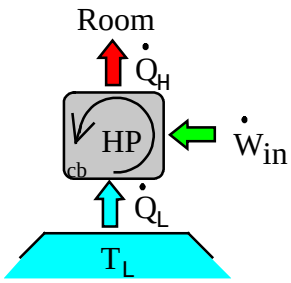
Assume the heat pump has to deliver 1500 W as the $\dot{Q}_H$.

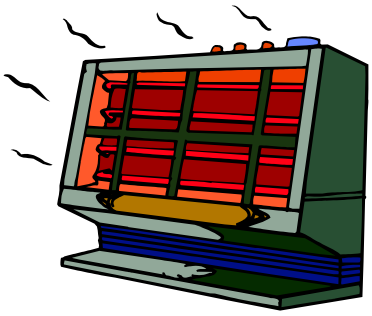
Heat pump: $\beta' = \dot{Q}_H / \dot{W}_{IN}$

$$\dot{W}_{IN} = \dot{Q}_H / \beta' = \frac{1500}{2.5} = 600 \text{ W}$$

So the heat pump requires an input of 600 W thus saving the difference

$$\dot{W}_{saved} = 1500 \text{ W} - 600 \text{ W} = \mathbf{900\ W}$$





Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.20

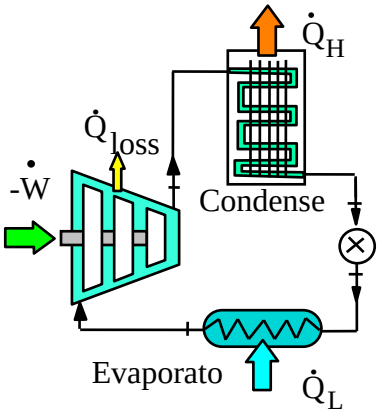
Calculate the coefficient of performance of the R-134a refrigerator given in Example 4.8.

Solution:

From the definition

$$\beta = Q_L/W_{IN} = \frac{14.54}{5} = 2.91$$

Notice we cannot write $W_{IN} = Q_H - Q_L$ as there is a small Q in the compressor. This needs to be accounted for in the overall energy equation.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.21

Calculate the thermal efficiency of the steam power plant cycle described in Problem 4.118.

From solution to Problem 4.118,

Turbine $A_5 = (\pi/4)(0.2)^2 = 0.03142\ m^2$

$$\mathbf{V}_5 = \dot{m}v_5/A_5 = 25\ kg/s \times 0.06163\ m^3/kg\ /\ 0.03142\ m^2 = 49\ m/s$$

$$h_6 = 191.83 + 0.92 \times 2392.8 = 2393.2\ kJ/kg$$

$$w_T = 3404 - 2393.2 - (200^2 - 49^2)/(2 \times 1000) = 992\ kJ/kg$$

$$\dot{W}_T = \dot{m}w_T = 25 \times 992 = 24\ 800\ kW$$

$$\dot{W}_{NET} = 24800 - 300 = 24\ 500\ kW$$

From the solution to Problem 4.120

Economizer $A_7 = \pi D_7^2/4 = 0.004\ 418\ m^2$, $v_7 = 0.001\ 008\ m^3/kg$

$$\mathbf{V}_2 = \mathbf{V}_7 = \dot{m}v/A_7 = 25 \times 0.001008\ /\ 0.004418 = 5.7\ m/s,$$

$$\mathbf{V}_3 = (v_3/v_2)\mathbf{V}_2 = (0.001\ 118\ /\ 0.001\ 008)\ 5.7 = 6.3\ m/s \approx \mathbf{V}_2$$

so kinetic energy change is unimportant

$$q_{ECON} = h_3 - h_2 = 744 - 194 = 550.0\ kJ/kg$$

$$\dot{Q}_{ECON} = \dot{m}q_{ECON} = 25\ (550.0) = 13\ 750\ kW$$

Generator $A_4 = \pi D_4^2/4 = 0.031\ 42\ m^2$, $v_4 = 0.060\ 23\ m^3/kg$

$$\mathbf{V}_4 = \dot{m}v_4/A_4 = 25 \times 0.060\ 23/0.031\ 42 = 47.9\ m/s$$

$$q_{GEN} = 3426 - 744 + (47.9^2 - 6.3^2)/(2\times1000) = 2683\ kJ/kg$$

$$\dot{Q}_{GEN} = 25 \times (2683) = 67\ 075\ kW$$

The total added heat transfer is

$$\dot{Q}_H = 13\ 758 + 67\ 075 = 80\ 833\ kW$$

$$\Rightarrow \eta_{TH} = \dot{W}_{NET}/\dot{Q}_H = \frac{24500}{80833} = \mathbf{0.303}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.22

A large coal fired power plant has an efficiency of 45% and produces net 1,500 MW of electricity. Coal releases 25 000 kJ/kg as it burns so how much coal is used per hour?

From the definition of the thermal efficiency and the energy release by the combustion called heating value HV we get

$$\dot{W} = \eta \, \dot{Q}_H = \eta \cdot \dot{m} \cdot HV$$

then

$$\dot{m} = \frac{\dot{W}}{\eta \times HV} = \frac{1500 \text{ MW}}{0.45 \times 25000 \text{ kJ/kg}} = \frac{1500 \times 1000 \text{ kJ/s}}{0.45 \times 25000 \text{ kJ/kg}}$$

$$= 133.33 \text{ kg/s} = \mathbf{480\ 000\ kg/h}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.23

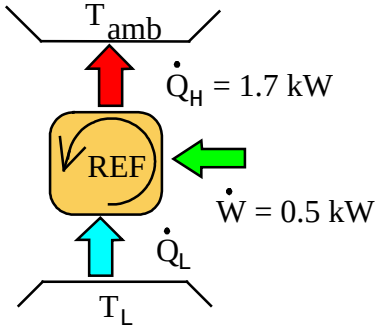
A window air-conditioner discards 1.7 kW to the ambient with a power input of 500 W. Find the rate of cooling and the coefficient of performance.

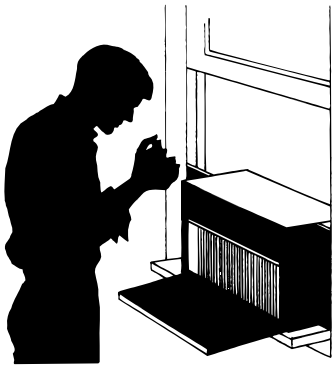
Solution:

In this case $\dot{Q}_H$ = 1.7 kW goes to the ambient so

Energy Eq. : $\dot{Q}_L = \dot{Q}_H - \dot{W} = 1.7 - 0.5 =$ **1.2 kW**

$$\beta_{REFRIG} = \frac{\dot{Q}_L}{\dot{W}} = \frac{1.2}{0.5} = \mathbf{2.4}$$





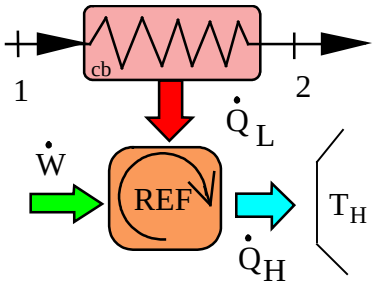
Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.24

An industrial machine is being cooled by 0.4 kg/s water at 15°C that is chilled from 35°C by a refrigeration unit with a COP of 3. Find the rate of cooling required and the power input to the unit.

Energy equation for heat exchanger



$$\dot{Q}_L = \dot{m}(h_1 - h_2) = \dot{m}\, C_P\, (T_1 - T_2)$$

$$= 0.4 \text{ kg/s} \times 4.18 \text{ kJ/kg-K} \times (35 - 15) \text{ K}$$

$$= 33.44 \text{ kW}$$

$$\beta = \text{COP} = \dot{Q}_L / \dot{W} \quad \Rightarrow$$

$$\dot{W} = \dot{Q}_L / \beta = 33.44 / 3 = \mathbf{11.15\ kW}$$

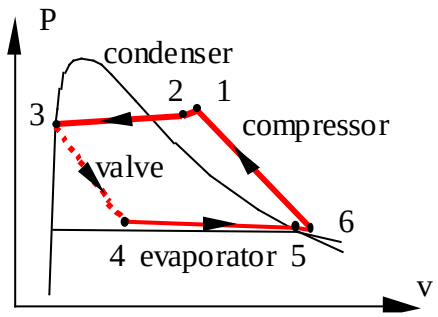
Comment: An outside cooling tower is often used for this, see Chapter 11.

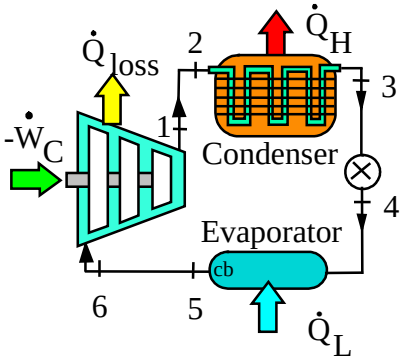
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.25

Calculate the COP of the R-410A heat pump cycle described in Problem 4.123.

The cycle is given by the following states:





Where

$$\dot{Q}_H = \dot{m}\,(h_2 - h_3) = 0.05 \text{ kg/s } (367 - 134) \text{ kJ/k} = 11.65 \text{ kW}$$

The COP is

$$\beta' = \text{COP} = \dot{Q}_H / \dot{W}_{IN} = \frac{11.65 \text{ kW}}{5 \text{ kW}} = \mathbf{2.33}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

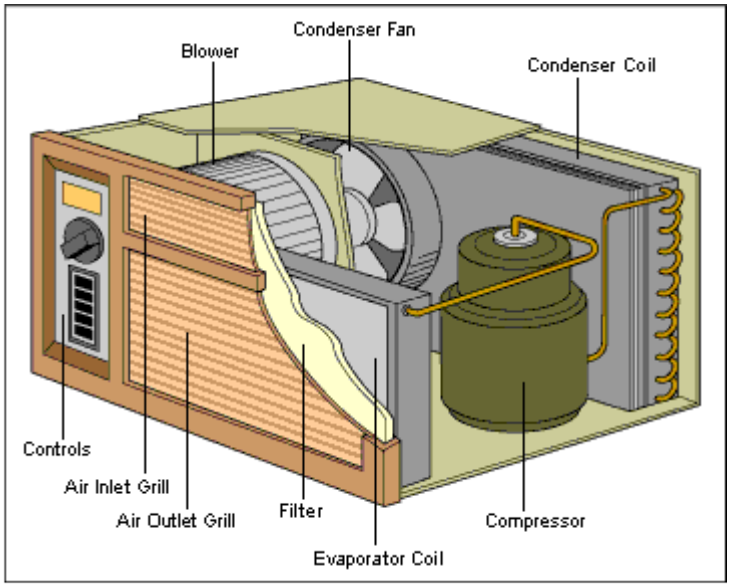
5.26

A window air-conditioner unit is placed on a laboratory bench and tested in cooling mode using 750 W of electric power with a COP of 1.75. What is the cooling power capacity and what is the net effect on the laboratory?

Definition of COP: $\beta = \dot{Q}_L / \dot{W}$

Cooling capacity: $\dot{Q}_L = \beta \dot{W} = 1.75 \times 750 =$ **1313 W**

For steady state operation the $\dot{Q}_L$ comes from the laboratory and $\dot{Q}_H$ goes to the laboratory giving a net to the lab of $\dot{W} = \dot{Q}_H - \dot{Q}_L = 750$ W, that is heating it.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.27

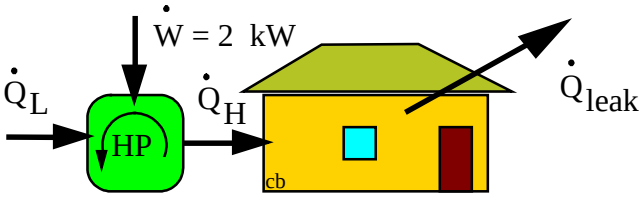
A farmer runs a heat pump with a 2 kW motor. It should keep a chicken hatchery at 30°C, which loses energy at a rate of 10 kW to the colder ambient T_{amb}. What is the minimum coefficient of performance that will be acceptable for the heat pump?

Solution:

Power input: $\dot{W} = 2$ kW

Energy Eq. for hatchery: $\dot{Q}_H = \dot{Q}_{Loss} = 10$ kW

Definition of COP: $$\beta = COP = \frac{\dot{Q}_H}{\dot{W}} = \frac{10}{2} = \mathbf{5}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.28

A sports car engine delivers 100 hp to the driveshaft with a thermal efficiency of 25%. The fuel has a heating value of 40 000 kJ/kg. Find the rate of fuel consumption and the combined power rejected through the radiator and exhaust.

Solution:

Heating value (HV): $\dot{Q}_H = \dot{m} \cdot HV$

From the definition of the thermal efficiency

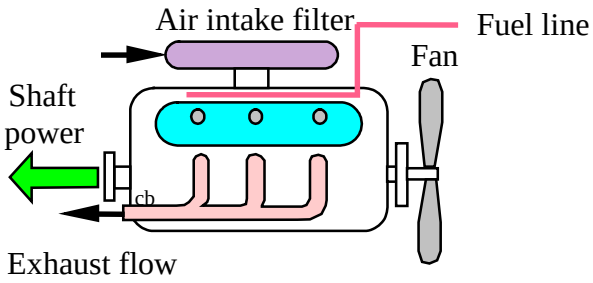
$$\dot{W} = \eta \, \dot{Q}_H = \eta \cdot \dot{m} \cdot HV$$

$$\dot{m} = \frac{\dot{W}}{\eta \cdot HV} = \frac{100 \times 0.7355}{0.25 \times 40\,000} = 0.00736 \text{ kg/s} = \mathbf{7.36 \text{ g/s}}$$

Conversion of power from hp to kW in Table A.1.

$$\dot{Q}_L = \dot{Q}_H - \dot{W} = (\dot{W}/\eta - \dot{W}) = (\frac{1}{\eta} - 1)\dot{W}$$

$$= (\frac{1}{0.25} - 1)\ 100 \text{ hp} \times 0.7355 \text{ kW/hp} = \mathbf{221 \text{ kW}}$$

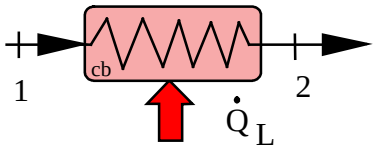


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.29

R-410A enters the evaporator (the cold heat exchanger) in an A/C unit at -20°C, x = 28% and leaves at -20°C, x = 1. The COP of the refrigerator is 1.5 and the mass flow rate is 0.003 kg/s. Find the net work input to the cycle.

Energy equation for heat exchanger



$$\dot{Q}_L = \dot{m}(h_2 - h_1) = \dot{m}[h_g - (h_f + x_1\, h_{fg})]$$

$$= \dot{m}[h_{fg} - x_1\, h_{fg}] = \dot{m}\,(1 - x_1)h_{fg}$$

$$= 0.003 \text{ kg/s} \times 0.72 \times 243.65 \text{ kJ/kg} = 0.5263 \text{ kW}$$

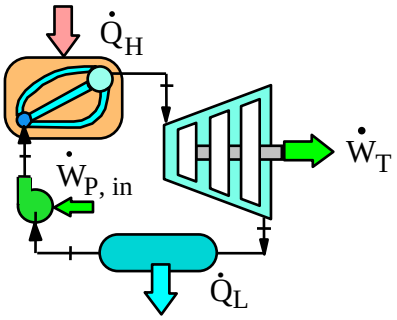
$$\beta = \text{COP} = \dot{Q}_L / \dot{W} \quad \Rightarrow \quad \dot{W} = \dot{Q}_L / \beta = 0.5263 / 1.5 = \mathbf{0.35\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.30

In a Rankine cycle steam power plant 0.9 MW is taken out in the condenser, 0.63 MW is taken out in the turbine, and the pump work is 0.03 MW. Find the plant thermal efficiency. If everything could be reversed find the COP as a refrigerator.

Solution:



CV. Total plant:

Energy Eq.:

$$\dot{Q}_H + \dot{W}_{P,in} = \dot{W}_T + \dot{Q}_L$$

$$\dot{Q}_H = \dot{W}_T + \dot{Q}_L - \dot{W}_{P,in}$$

$$= 0.63 + 0.9 - 0.03 = 1.5 \text{ MW}$$

$$\eta_{TH} = \frac{\dot{W}_T - \dot{W}_{P,in}}{\dot{Q}_H} = \frac{0.63 - 0.03}{1.5} = \mathbf{0.40}$$

$$\beta = \frac{\dot{Q}_L}{\dot{W}_T - \dot{W}_{P,in}} = \frac{0.9}{0.63 - 0.03} = \mathbf{1.5}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.31

An experimental power plant generates 130 MW of electrical power. It uses a supply of 1200 MW from a geothermal source and rejects energy to the atmosphere. Find the power to the air and how much air should be flowed to the cooling tower (kg/s) if its temperature cannot be increased more than 12°C.

Solution:

C.V. Total power plant.

Energy equation gives the amount of heat rejection to the atmosphere as

$$\dot{Q}_L = \dot{Q}_H - \dot{W} = 1200 - 130 = \mathbf{1070\ MW}$$

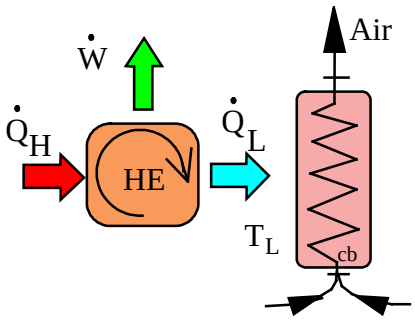
The energy equation for the air flow that absorbs the energy is

$$\dot{Q}_L = \dot{m}_{air}\,\Delta h = \dot{m}_{air}\,C_p\,\Delta T$$

$$\dot{m}_{air} = \frac{\dot{Q}_L}{C_p \Delta T} = \frac{1070 \times 1000}{1.004 \times 12}\,\frac{\text{MW}}{(\text{kJ/kg-K}) \times \text{K}} = \mathbf{88\ 811\ kg/s}$$

This is too large to make, so some cooling by liquid water or evaporative cooling should be used, see chapter 11.

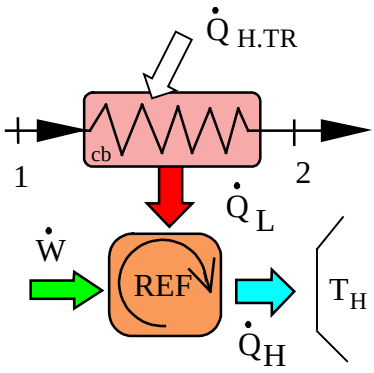
Microsoft clipart.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.32

A water cooler for drinking water should cool 25 L/h water from 18°C to 10°C while the water reservoir also gains 60 W from heat transfer. Assume a small refrigeration unit with a COP of 2.5 does the cooling. Find the total rate of cooling required and the power input to the unit.



The mass flow rate is

$$\dot{m} = \rho\dot{V} = \frac{25 \times 10^{-3}}{0.001002}\frac{1}{3600}\ \text{kg/s} = 6.93\ \text{g/s}$$

Energy equation for heat exchanger

$$\dot{Q}_L = \dot{m}(h_1 - h_2) + \dot{Q}_{H\,TR}$$

$$= \dot{m}\, C_P\, (T_1 - T_2) + \dot{Q}_{H\,TR}$$

$$= 6.93 \times 10^{-3}\ \text{kg/s} \times 4.18\ \text{kJ/kg-K} \times (18 - 10)\ \text{K} + 60\ \text{W}$$
$$= 291.8\ \text{W}$$

$$\beta = \text{COP} = \dot{Q}_L / \dot{W} \quad \Rightarrow \quad \dot{W} = \dot{Q}_L / \beta = 291.8 / 2.5 = \mathbf{116.7\ W}$$

Comment: The unit does not operate continuously so the instantaneous power is higher during the periods it does operate.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.33

A large stationary diesel engine produces 5 MW with a thermal efficiency of 40%. The exhaust gas, which we assume is air, flows out at 800 K and the intake air is 290 K. How large a mass flow rate is that, assuming this is the only way we reject heat? Can the exhaust flow energy be used?

Heat engine: $\dot{Q}_H = \dot{W}_{out}/\eta_{TH} = \dfrac{5}{0.4} = 12.5$ MW

Energy equation: $\dot{Q}_L = \dot{Q}_H - \dot{W}_{out} = 12.5 - 5 = 7.5$ MW

Exhaust flow: $\dot{Q}_L = \dot{m}_{air}(h_{800} - h_{290})$

$$\dot{m}_{air} = \frac{\dot{Q}_L}{h_{800} - h_{290}} = \frac{7.5 \times 1000}{822.2 - 290.43} \frac{\text{kW}}{\text{kJ/kg}} = \mathbf{14.1\ kg/s}$$

The flow of hot gases can be used to heat a building or it can be used to heat water in a steam power plant since that operates at lower temperatures.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.34

For each of the cases below determine if the heat engine satisfies the first law (energy equation) and if it violates the second law.

a. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 4$ kW, $\dot{W} = 2$ kW

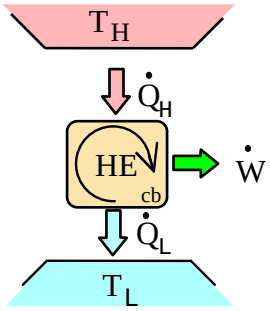
b. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 0$ kW, $\dot{W} = 6$ kW

c. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 2$ kW, $\dot{W} = 5$ kW

d. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 6$ kW, $\dot{W} = 0$ kW

Solution:

	1st. law	2nd law
a	Yes	Yes (possible)
b	Yes	No, impossible Kelvin - Planck
c	No	Yes, but energy not conserved
d	Yes	Yes (Irreversible $\dot{Q}$ over ΔT)



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.35

For each of the cases in problem 5.34 determine if a heat pump satisfies the first law (energy equation) and if it violates the second law.

a. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 4$ kW, $\dot{W} = 2$ kW

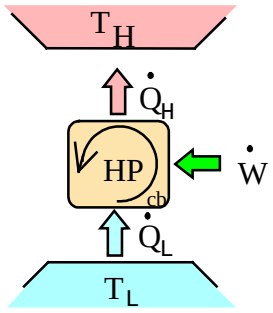
b. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 0$ kW, $\dot{W} = 6$ kW

c. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 2$ kW, $\dot{W} = 5$ kW

d. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 6$ kW, $\dot{W} = 0$ kW

Solution:

	1st. law	2nd law
a	Satisfied	Does not violate
b	Satisfied	Does not violate
c	Violated	Does not violate, but 1st law
d	Satisfied	Does violate, Clausius



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.36

Calculate the amount of work input a refrigerator needs to make ice cubes out of a tray of 0.25 kg liquid water at 10^{o}C. Assume the refrigerator has $\beta = 3.5$ and a motor-compressor of 750 W. How much time does it take if this is the only cooling load?

C.V. Water in tray. We neglect tray mass.

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : $P = \text{constant} = P_o$

${}_1W_2 = \int P\, dV = P_o m(v_2 - v_1)$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$

Tbl. B.1.1 : $h_1 = 41.99$ kJ/kg, Tbl. B.1.5 : $h_2 = -333.6$ kJ/kg

${}_1Q_2 = 0.25(-333.4 - 41.99) = -93.848$ kJ

Consider now refrigerator

$\beta = Q_L/W$

$W = Q_L/\beta = -{}_1Q_2/\beta = 93.848/3.5 =$ **26.81 kJ**

For the motor to transfer that amount of energy the time is found as

$$W = \int \dot{W}\, dt = \dot{W}\, \Delta t$$

$$\Delta t = W/\dot{W} = (26.81 \times 1000)\text{J}/750\text{ W} = \textbf{35.75 s}$$

Comment: We neglected a baseload of the refrigerator so not all the 750 W are available to make ice, also our coefficient of performance is very optimistic and finally the heat transfer is a transient process. All this means that it will take much more time to make ice-cubes.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Second Law and Processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.37

Prove that a cyclic device that violates the Kelvin–Planck statement of the second law also violates the Clausius statement of the second law.

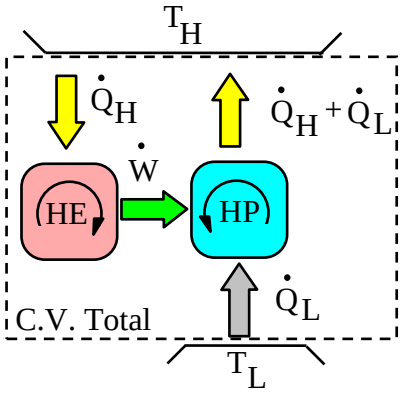
Solution: Proof very similar to the proof in section 5.2.

H.E. violating Kelvin receives Q_H from T_H and produces net $W = Q_H$.

This W input to H.P. receiving Q_L from T_L.

H.P. discharges $Q_H + Q_L$ to T_H .

Net Q to T_H is : $-Q_H + Q_H + Q_L = Q_L$.



H.E. + H.P. together transfers Q_L from T_L to T_H with no W thus violates Clausius.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.38

Discuss the factors that would make the power plant cycle described in Problem 4.118 an irreversible cycle.

Solution:

General discussion, but here are a few of the most significant factors.

1. Combustion process that generates the hot source of energy.
2. Heat transfer over finite temperature difference in boiler.
3. Flow resistance and friction in turbine results in less work out.
4. Flow friction and heat loss to/from ambient in all pipes.
5. Heat transfer over finite temperature difference in condenser.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.39

Discuss the factors that would make the heat pump described in Problem 4.123 an irreversible cycle.

Solution:

General discussion but here are a few of the most significant factors.

1. Unwanted heat transfer in the compressor.
2. Pressure loss (back flow leak) in compressor
3. Heat transfer and pressure drop in line 1 => 2.
4. Pressure drop in all lines.
5. Throttle process 3 => 4.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.40

Assume a cyclic machine that exchanges 6 kW with a 250^{o}C reservoir and has

a. $\dot{Q}_L$ = 0 kW, $\dot{W}$ = 6 kW

b. $\dot{Q}_L$ = 6 kW, $\dot{W}$ = 0 kW

and $\dot{Q}_L$ is exchanged with a 30^{o}C ambient. What can you say about the processes in the two cases a and b if the machine is a heat engine? Repeat the question for the case of a heat pump.

Solution:

Heat engine

a. Since $\dot{Q}_L = 0$ impossible Kelvin – Planck

b. Possible, irreversible, $\eta_{eng} = 0$

Heat pump

a. Possible, irreversible (like an electric heater)

b. Impossible, $\beta \to \infty$, Clausius

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.41

Consider a heat engine and heat pump connected as shown in figure P5.41. Assume $T_{H1} = T_{H2} > T_{amb}$ and determine for each of the three cases if the setup satisfy the first law and/or violates the 2nd law.

	$\dot{Q}_{H1}$	$\dot{Q}_{L1}$	$\dot{W}_1$	$\dot{Q}_{H2}$	$\dot{Q}_{L2}$	$\dot{W}_2$
a	6	4	2	3	2	1
b	6	4	2	5	4	1
c	3	2	1	4	3	1

Solution:

	1st. law	2nd law
a	Yes	Yes (possible)
b	Yes	No, combine Kelvin - Planck
c	Yes	No, combination clausius

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.42

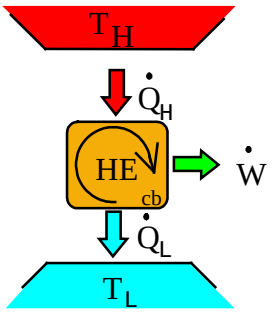
Consider the four cases of a heat engine in problem 5.34 and determine if any of those are perpetual machines of the first or second kind.

a. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 4$ kW, $\dot{W} = 2$ kW

b. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 0$ kW, $\dot{W} = 6$ kW

c. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 2$ kW, $\dot{W} = 5$ kW

d. $\dot{Q}_H = 6$ kW, $\dot{Q}_L = 6$ kW, $\dot{W} = 0$ kW



Solution:

	1st. law	2nd law
a	Yes	Yes (possible)
b	Yes	No, impossible Kelvin - Planck Perpetual machine second kind It violates the 2nd law converts all $\dot{Q}$ to $\dot{W}$
c	No	Yes, but energy not conserved Perpetual machine first kind It generates energy inside
d	Yes	Yes (Irreversible $\dot{Q}$ over ΔT)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.43

The simple refrigeration cycle is shown in Problem 5.23 and in Fig. 5.6. Mention a few of the processes that are expected to be irreversible.

The throttling process is highly irreversible.

Both of the heat transfer processes are externally irreversible, large ΔT between the working substance and the source or sink energy reservoir.

Both of the heat transfer processes are also internally irreversible, smaller ΔT in the substance so there is not a single uniform T across the flow cross sectional area. This is necessary to redistribute the energy uniformly in the working substance.

The compressor has friction and flow losses so not all of the shaft work goes into raising the substance pressure. Such an effect is described by a device efficiency in chapter 7.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Carnot Cycles and Absolute Temperature

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.44

Calculate the thermal efficiency of a Carnot cycle heat engine operating between reservoirs at 300°C and 45°C. Compare the result to that of Example 4.7.

Solution:

$$\eta_{TH} = W_{net} / Q_H = 1 - \frac{T_L}{T_H} = 1 - \frac{45 + 273}{300 + 273} = \mathbf{0.445} \text{ (Carnot)}$$

$$\eta_{EX\ 4.7} = w_{net} / q_H = \frac{640.8 - 4}{2831.1} = 0.225$$

(efficiency about ½ of the Carnot)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.45

An ideal (Carnot) heat engine has an efficiency of 40%. If the high temperature is raised 15% what is the new efficiency keeping the same low temperature?

Solution:

$$\eta_{TH} = W_{net} / Q_H = 1 - \frac{T_L}{T_H} = 0.4 \qquad \Rightarrow \qquad \frac{T_L}{T_H} = 0.6$$

so if T_H is raised 15% the new ratio becomes

$$\frac{T_L}{T_{H\,new}} = 0.6 / 1.15 = 0.5217 \quad \Rightarrow \qquad \eta_{TH\,new} = 1 - 0.5217 = \mathbf{0.478}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.46

At a few places where the air is very cold in the winter, like –30°C it is possible to find a temperature of 13°C down below ground. What efficiency will a heat engine have operating between these two thermal reservoirs?

Solution:

$$\eta_{TH} = 1 - \frac{T_L}{T_H}$$

The ground becomes the hot source and the atmosphere becomes the cold side of the heat engine

$$\eta_{TH} = 1 - \frac{273 - 30}{273 + 13} = 1 - \frac{243}{286} = \mathbf{0.15}$$

This is low because of the modest temperature difference.

Microsoft clipart.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.47

Consider the combination of a heat engine and a heat pump, as in Problem 5.41, with a low temperature of 400 K. What should the high temperature be so that the heat engine is reversible? For that temperature what is the COP for a reversible heat pump?

For all three cases of the heat engine the ratio between the heat transfers and the work term is the same as:

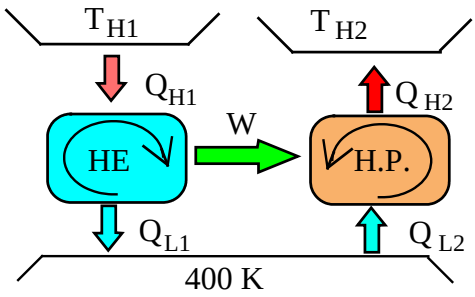
$$\dot{Q}_H : \dot{Q}_L : \dot{W} \quad = \quad 6:4:2 \quad = \quad 3:2:1$$

For a reversible heat engine we must have the heat transfer ratio equal to the temperature ratio so

$$\frac{\dot{Q}_H}{\dot{Q}_L} = \frac{T_H}{T_L} = \frac{3}{2} = \frac{T_H}{400\ \text{K}} \quad \Rightarrow \quad T_H = (3/2)\ 400\ \text{K} = \mathbf{600\ K}$$

The COP is

$$COP_{HP} = \dot{Q}_H / \dot{W} = \frac{3}{1} = \mathbf{3} \quad \left(= \frac{T_H}{T_H - T_L} = \frac{600}{600 - 400} \right)$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.48

Find the power output and the low T heat rejection rate for a Carnot cycle heat engine that receives 6 kW at 250^{o}C and rejects heat at 30^{o}C as in Problem 5.40.

Solution:
From the definition of the absolute temperature Eq. 5.4

$$\eta_{carnot} = 1 - \frac{T_L}{T_H} = 1 - \frac{303}{523} = 0.42$$

Definition of the heat engine efficiency gives the work as

$$\dot{W} = \eta \, \dot{Q}_H = 0.42 \times 6 = \mathbf{2.52\ kW}$$

Apply the energy equation

$$\dot{Q}_L = \dot{Q}_H - \dot{W} = 6 - 2.52 = \mathbf{3.48\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.49

A large heat pump should upgrade 4 MW of heat at 65°C to be delivered as heat at 145°C. What is the minimum amount of work (power) input that will drive this?

For the minimum work we assume a Carnot heat pump and $\dot{Q}_L$ = 4 MW.

$$\beta_{HP} = \frac{\dot{Q}_H}{\dot{W}_{in}} = \frac{T_H}{T_H - T_L} = \frac{273.15 + 145}{145 - 65} = 5.227$$

$$\beta_{REF} = \beta_{HP} - 1 = \frac{\dot{Q}_L}{\dot{W}_{in}} = 4.227$$

Now we can solve for the work

$$\dot{W}_{in} = \dot{Q}_L/\beta_{REF} = 4/4.227 = \mathbf{0.946\ MW}$$

This is a domestic or small office building size A/C unit, much smaller than the 4 MW in this problem.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.50

A temperature of about 0.01 K can be achieved by magnetic cooling. In this process a strong magnetic field is imposed on a paramagnetic salt, maintained at 1 K by transfer of energy to liquid helium boiling at low pressure. The salt is then thermally isolated from the helium, the magnetic field is removed, and the salt temperature drops. Assume that 1 mJ is removed at an average temperature of 0.1 K to the helium by a Carnot-cycle heat pump. Find the work input to the heat pump and the coefficient of performance with an ambient at 300 K.

Solution:

$$\beta = \frac{Q_L}{W_{in}} = \frac{T_L}{T_H - T_L} = \frac{0.1}{299.9} = \mathbf{0.00033}$$

$$W_{in} = \frac{Q_L}{\beta} = \frac{1 \times 10^{-3}}{0.00033} = \mathbf{3\ J}$$

Remark: This is an extremely large temperature difference for a heat pump. A real one is built as a refrigerator within a refrigerator etc.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.51

The lowest temperature that has been achieved is about 1×10^{-6} K. To achieve this an additional stage of cooling is required beyond that described in the previous problem, namely nuclear cooling. This process is similar to magnetic cooling, but it involves the magnetic moment associated with the nucleus rather than that associated with certain ions in the paramagnetic salt. Suppose that 10 μJ is to be removed from a specimen at an average temperature of 10^{-5} K (ten micro-joules is about the potential energy loss of a pin dropping 3 mm). Find the work input to a Carnot heat pump and its coefficient of performance to do this assuming the ambient is at 300 K.

Solution:

The heat removed from the cold space is

$$Q_L = 10\ \mu J = 10\times10^{-6}\ J \qquad \text{at } T_L = 10^{-5}\ K$$

Carnot heat pump satisfies Eq.7.4

$$\Rightarrow Q_H = Q_L \times \frac{T_H}{T_L} = 10 \times 10^{-6}\ J \times \frac{300}{10^{-5}} = 300\ J$$

From the energy equation for the heat pump

$$W_{in} = Q_H - Q_L = 300 - 10 \times 10^{-6} \cong \mathbf{300\ J}$$

$$\beta = \frac{Q_L}{W_{in}} = \frac{10\times10^{-6}}{300} = \mathbf{3.33\times10^{-8}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.52

Consider the setup with two stacked (temperature wise) heat engines as in Fig. P5.4. Let T_H = 850 K, T_M = 600 K and T_L = 350 K. Find the two heat engine efficiencies and the combined overall efficiency assuming Carnot cycles.

The individual efficiencies

$$\eta_1 = 1 - \frac{T_M}{T_H} = 1 - \frac{600}{850} = \mathbf{0.294}$$

$$\eta_2 = 1 - \frac{T_L}{T_M} = 1 - \frac{350}{600} = \mathbf{0.417}$$

The overall efficiency

$$\eta_{TH} = \dot{W}_{net} / \dot{Q}_H = (\dot{W}_1 + \dot{W}_2) / \dot{Q}_H = \eta_1 + \dot{W}_2 / \dot{Q}_H$$

For the second heat engine and the energy Eq. for the first heat engine

$$\dot{W}_2 = \eta_2 \dot{Q}_M = \eta_2 (1 - \eta_1) \dot{Q}_H$$

so the final result is

$$\eta_{TH} = \eta_1 + \eta_2 (1 - \eta_1) = 0.294 + 0.417 (1 - 0.294) = \mathbf{0.588}$$

Comment: It matches a single heat engine $\eta_{TH} = 1 - \frac{T_L}{T_H} = 1 - \frac{350}{850} = 0.588$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.53

Find the maximum coefficient of performance for the refrigerator in your kitchen, assuming it runs in a Carnot cycle.

Solution:

The refrigerator coefficient of performance is

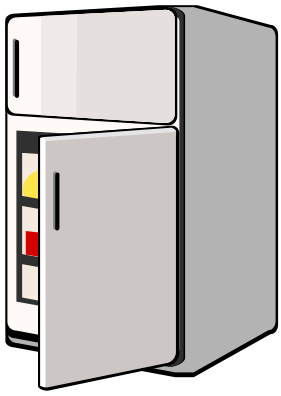
$$\beta = Q_L/W = Q_L/(Q_H - Q_L) = T_L/(T_H - T_L)$$

Assuming $T_L \sim 0°C$, $T_H \sim 35°C$,

$$\beta \leq \frac{273.15}{35 - 0} = \mathbf{7.8}$$

Actual working fluid temperatures must be such that

$$T_L < T_{refrigerator} \quad \text{and} \quad T_H > T_{room}$$



A refrigerator does not operate in a Carnot cycle. The actual vapor compression cycle is examined in Chapter 9.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.54

A car engine burns 5 kg fuel (equivalent to addition of Q_H) at 1500 K and rejects energy to the radiator and the exhaust at an average temperature of 750 K. If the fuel provides 40 000 kJ/kg what is the maximum amount of work the engine can provide?

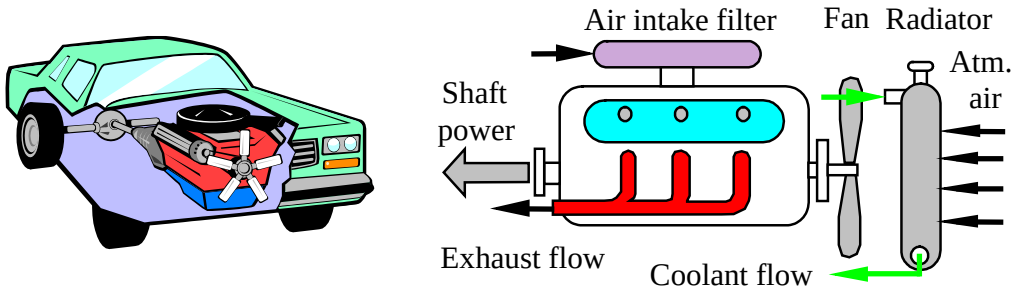
Solution:

A heat engine $Q_H = m\, q_{fuel} = 5\ kg \times 40\ 000\ kJ/kg = 200\ 000\ kJ$

Assume a Carnot efficiency (maximum theoretical work)

$$\eta = 1 - \frac{T_L}{T_H} = 1 - \frac{750}{1500} = 0.5$$

$$W = \eta\, Q_H = \mathbf{100\ 000\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.55

An air-conditioner provides 1 kg/s of air at 15°C cooled from outside atmospheric air at 35°C. Estimate the amount of power needed to operate the air-conditioner. Clearly state all assumptions made.

Solution:

Consider the cooling of air which needs a heat transfer as

$$\dot{Q}_{air} = \dot{m}\,\Delta h \cong \dot{m}\,C_p\Delta T = 1\ \text{kg/s} \times 1.004\ \text{kJ/kg K} \times 20\ \text{K} = 20\ \text{kW}$$

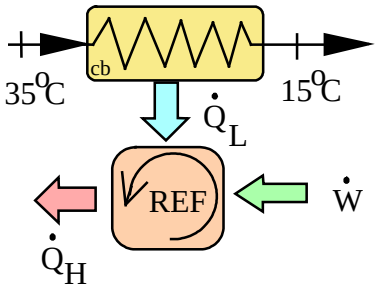
Assume Carnot cycle refrigerator

$$\beta = \frac{\dot{Q}_L}{\dot{W}} = \dot{Q}_L / (\dot{Q}_H - \dot{Q}_L) \cong \frac{T_L}{T_H - T_L} = \frac{273 + 15}{35 - 15} = 14.4$$

$$\dot{W} = \dot{Q}_L / \beta = \frac{20.0}{14.4} = \mathbf{1.39\ kW}$$

This estimate is the theoretical maximum performance. To do the required heat transfer $T_L \cong 5°C$ and $T_H = 45°C$ are more likely; secondly

$$\beta < \beta_{carnot}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.56

A refrigerator should remove 400 kJ from some food. Assume the refrigerator works in a Carnot cycle between –15°C and 45°C with a motor-compressor of 400 W. How much time does it take if this is the only cooling load?

Assume Carnot cycle refrigerator

$$\beta = \frac{\dot{Q}_L}{\dot{W}} = \dot{Q}_L / (\dot{Q}_H - \dot{Q}_L) \cong \frac{T_L}{T_H - T_L} = \frac{273 - 15}{45 - (-15)} = 4.3$$

This gives the relation between the low T heat transfer and the work as

$$\dot{Q}_L = \frac{Q}{t} = \beta \dot{W} = 4.3 \dot{W}$$

$$t = \frac{Q}{\beta \dot{W}} = \frac{400 \times 1000}{4.3 \times 400} \frac{J}{W} = \mathbf{233\ s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.57

Calculate the amount of work input a refrigerator needs to make ice cubes out of a tray of 0.25 kg liquid water at 10°C. Assume the refrigerator works in a Carnot cycle between –8°C and 35°C with a motor-compressor of 600 W. How much time does it take if this is the only cooling load?

Solution:

C.V. Water in tray. We neglect tray mass.

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : $P = \text{constant} + P_o$

${}_1W_2 = \int P\, dV = P_o m(v_2 - v_1)$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$

Tbl. B.1.1 : $h_1 = 41.99$ kJ/kg, Tbl. B.1.5 : $h_2 = -333.6$ kJ/kg

${}_1Q_2 = 0.25 \text{ kg } (-333.4 - 41.99) \text{ kJ/kg} = -93.848 \text{ kJ}$

Consider now refrigerator

$$\beta = \frac{Q_L}{W} = \frac{Q_L}{Q_H - Q_L} = \frac{T_L}{T_H - T_L} = \frac{273 - 8}{35 - (-8)} = 6.16$$

$$W = \frac{Q_L}{\beta} = -\frac{{}_1Q_2}{\beta} = \frac{93.848}{6.16} = 15.24 \text{ kJ}$$

For the motor to transfer that amount of energy the time is found as

$$W = \int \dot{W}\, dt = \dot{W}\, \Delta t$$

$$\Delta t = \frac{W}{\dot{W}} = \frac{15.24 \times 1000}{600} \frac{J}{W} = \mathbf{25.4\ s}$$

Comment: We neglected a baseload of the refrigerator so not all the 600 W are available to make ice, also our coefficient of performance is very optimistic and finally the heat transfer is a transient process. All this means that it will take much more time to make ice-cubes.

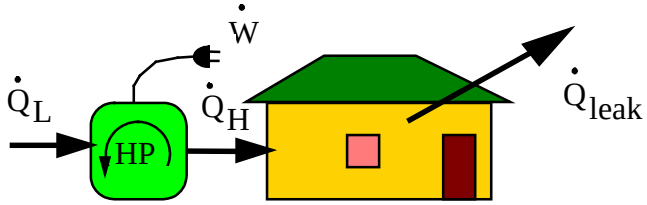
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.58

We propose to heat a house in the winter with a heat pump. The house is to be maintained at 20°C at all times. When the ambient temperature outside drops to –10°C, the rate at which heat is lost from the house is estimated to be 25 kW. What is the minimum electrical power required to drive the heat pump?

Solution:

Minimum power if we assume a Carnot cycle



Energy equation for the house (steady state): $\dot{Q}_H = \dot{Q}_{leak} = 25$ kW

$$\beta' = \frac{\dot{Q}_H}{\dot{W}_{IN}} = \frac{T_H}{T_H - T_L} = \frac{293.2}{20 - (-10)} = 9.773 \quad \Rightarrow \quad \dot{W}_{IN} = \frac{25}{9.773} = \mathbf{2.56\ kW}$$

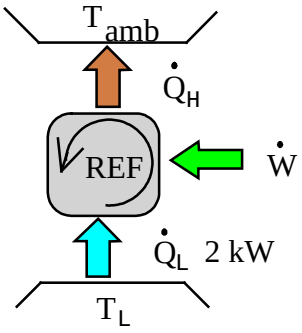
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.59

A household freezer operates in a room at 20°C. Heat must be transferred from the cold space at a rate of 2 kW to maintain its temperature at –30°C. What is the theoretically smallest (power) motor required to operate this freezer?

Solution:

Assume a Carnot cycle between T_L = -30°C and T_H = 20°C:



$$\beta = \frac{\dot{Q}_L}{\dot{W}_{in}} = \frac{T_L}{T_H - T_L} = \frac{273.15 - 30}{20 - (-30)} = 4.86$$

$$\dot{W}_{in} = \dot{Q}_L/\beta = 2/4.86 = \mathbf{0.41\ kW}$$

This is the theoretical minimum power input.
Any actual machine requires a larger input.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.60

A thermal storage is made with a rock (granite) bed of 2 m^3 which is heated to 400 K using solar energy. A heat engine receives a Q_H from the bed and rejects heat to the ambient at 290 K. The rock bed therefore cools down and as it reaches 290 K the process stops. Find the energy the rock bed can give out. What is the heat engine efficiency at the beginning of the process and what is it at the end of the process?

Solution:

Assume the whole setup is reversible and that the heat engine operates in a Carnot cycle. The total change in the energy of the rock bed is

$u_2 - u_1 = q = C\,\Delta T = 0.89$ kJ/kgK × (400 - 290) K = 97.9 kJ/kg

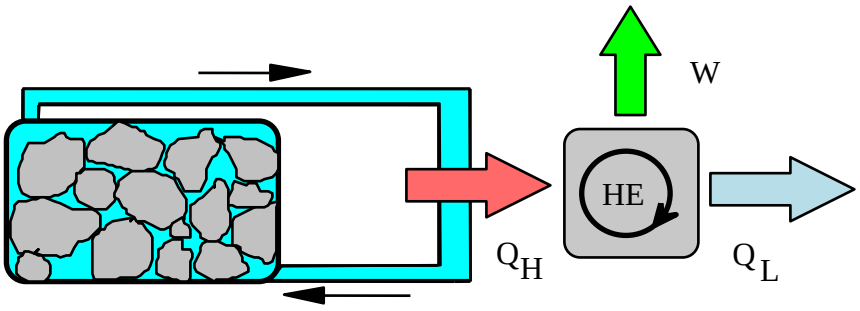
$m = \rho V = 2750$ kg/m^3 × 2 m^3 = 5500 kg ,

$Q = mq = 5500$ kg × 97.9 kJ/kg = **538 450 kJ**

To get the efficiency use the CARNOT cycle result as

$\eta = 1 - T_o/T_H = 1 - 290/400 =$ **0.275** at the beginning of process

$\eta = 1 - T_o/T_H = 1 - 290/290 =$ **0.0** at the end of process



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.61

It is proposed to build a 1000-MW electric power plant with steam as the working fluid. The condensers are to be cooled with river water (see Fig. P5.61). The maximum steam temperature is 550°C, and the pressure in the condensers will be 10 kPa. Estimate the temperature rise of the river downstream from the power plant.

Solution:

$$\dot{W}_{NET} = 10^6 \text{ kW}, \quad T_H = 550°C = 823.3 \text{ K}$$

$$P_{COND} = 10 \text{ kPa} \rightarrow T_L = T_G \text{ (P = 10 kPa)} = 45.8°C = 319 \text{ K}$$

$$\eta_{TH\ CARNOT} = \frac{T_H - T_L}{T_H} = \frac{823.2 - 319}{823.2} = 0.6125$$

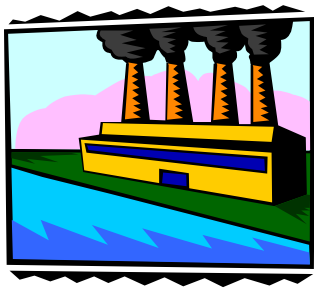
$$\Rightarrow \dot{Q}_{L\ MIN} = 10^6 \left(\frac{1 - 0.6125}{0.6125} \right) = 0.6327 \times 10^6 \text{ kW}$$

But $\dot{m}_{H_2O} = \dfrac{60 \times 8 \times 10/60}{0.001} = 80\ 000$ kg/s having an energy flow of

$$\dot{Q}_{L\ MIN} = \dot{m}_{H_2O}\, \Delta h = \dot{m}_{H_2O}\, C_{P\ LIQ\ H_2O}\, \Delta T_{H_2O\ MIN}$$

$$\Rightarrow \Delta T_{H_2O\ MIN} = \frac{\dot{Q}_{L\ MIN}}{\dot{m}_{H_2O} C_{P\ LIQ\ H_2O}} = \frac{0.6327 \times 10^6}{80000 \times 4.184} \frac{\text{kW}}{\text{kg/s} \times \text{kJ/kg-K}}$$

$$= \mathbf{1.9°C}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.62

A certain solar-energy collector produces a maximum temperature of 100°C. The energy is used in a cyclic heat engine that operates in a 10°C environment. What is the maximum thermal efficiency? If the collector is redesigned to focus the incoming light, what should the maximum temperature be to produce a 25% improvement in engine efficiency?

Solution:

$$\text{For } T_H = 100°C = 373.2 \text{ K} \quad \& \quad T_L = 283.2 \text{ K}$$

$$\eta_{th\ max} = \frac{T_H - T_L}{T_H} = \frac{90}{373.2} = \mathbf{0.241}$$

The improved efficiency is

$$\eta_{th\ max} = 0.241 \times 1.25 = 0.301$$

With the Carnot cycle efficiency

$$\eta_{th\ max} = \frac{T_H - T_L}{T_H} = 1 - \frac{T_L}{T_H} = 0.301$$

Then

$$T_H = T_L / (1 - 0.301) = 405 \text{ K} = \mathbf{132°C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.63

A constant temperature of −125°C must be obtained in a cryogenic experiment, although it gains 120 W due to heat transfer. What is the smallest motor you would need for a heat pump absorbing heat from the container and rejecting heat to the room at 20°C?

Solution:

We do not know the actual device so find the work for a Carnot cycle

$$\beta_{REF} = \dot{Q}_L / \dot{W} = \frac{T_L}{T_H - T_L} = \frac{148.15}{20 - (-125)} = 1.022$$

$$\Rightarrow \qquad \dot{W} = \dot{Q}_L / \beta_{REF} = 120 \text{ W}/1.022 = \mathbf{117.4\ W}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.64

Helium has the lowest normal boiling point of any of the elements at 4.2 K. At this temperature the enthalpy of evaporation is 83.3 kJ/kmol. A Carnot refrigeration cycle is analyzed for the production of 1 kmol of liquid helium at 4.2 K from saturated vapor at the same temperature. What is the work input to the refrigerator and the coefficient of performance for the cycle with an ambient at 300 K?

Solution:

For the Carnot cycle the ratio of the heat transfers is the ratio of temperatures

$$Q_L = n\,\bar{h}_{fg} = 1 \text{ kmol} \times 83.3 \text{ kJ/kmol} = 83.3 \text{ kJ}$$

$$Q_H = Q_L \times \frac{T_H}{T_L} = 83.3 \times \frac{300}{4.2} = 5950 \text{ kJ}$$

$$W_{IN} = Q_H - Q_L = 5950 - 83.3 = \mathbf{5886.7\ kJ}$$

$$\beta = \frac{Q_L}{W_{IN}} = \frac{83.3}{5886.7} = \mathbf{0.0142} \qquad \left[= \frac{T_L}{T_H - T_L} \right]$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.65

R-134a fills a 0.1-m^3 capsule at 20°C, 200 kPa. It is placed in a deep freezer, where it is cooled to −10°C. The deep freezer sits in a room with ambient temperature of 20°C and has an inside temperature of −10°C. Find the amount of energy the freezer must remove from the R-134a and the extra amount of work input to the freezer to perform the process.

Solution:

C.V. R-134a out to the -10°C space.

Energy equation: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : V = Const => $v_2 = v_1$ => ${}_1W_2 = 0$

Table B.5.2: $v_1 = 0.11436$ m^3/kg, $u_1 = 395.27$ kJ/kg

$m = V/v_1 = 0.87443$ kg

State 2: $v_2 = v_1 > v_g = 0.09921$ m^3/kg Table B.5.1 => sup vap

(T,v) interpolate between 150 kPa and 200 kPa in B.5.2

$$P_2 = 150 + 50 \frac{0.11436 - 0.13602}{0.10013 - 0.13602} = 150 + 50 \times 0.6035 = 180 \text{ kPa}$$

$u_2 = 373.44 + 0.6035 \times (372.31 - 373.44) = 372.76$ kJ/kg

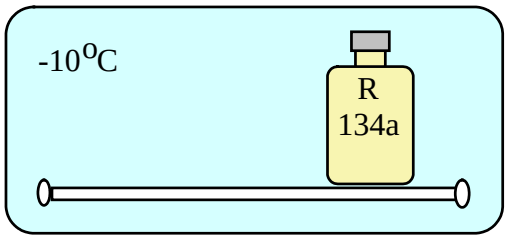
${}_1Q_2 = m(u_2 - u_1) = 0.87443 \text{ kg} \times (372.76 - 395.27) \text{ kJ/kg}$

= **- 19.68 kJ**

Consider the freezer and assume Carnot cycle

$$\beta = \frac{Q_L}{W} = \frac{Q_L}{Q_H - Q_L} = \frac{T_L}{T_H - T_L} = \frac{273 - 10}{20 - (-10)} = 8.767$$

$W_{in} = Q_L / \beta = 19.68 \text{ kJ} / 8.767 =$ **2.245 kJ**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.66

A heat engine has a solar collector receiving 0.2 kW per square meter inside which a transfer media is heated to 450 K. The collected energy powers a heat engine which rejects heat at 40°C. If the heat engine should deliver 2.5 kW what is the minimum size (area) solar collector?

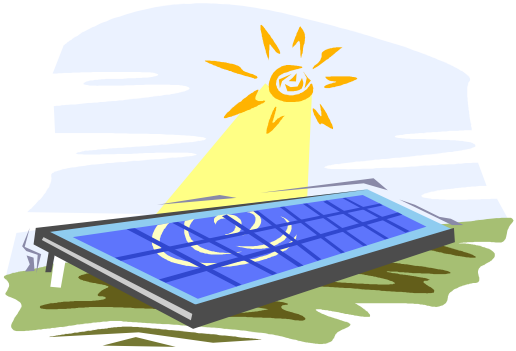
Solution:

$$T_H = 450 \text{ K} \qquad T_L = 40^{o}\text{C} = 313.15 \text{ K}$$

$$\eta_{HE} = 1 - \frac{T_L}{T_H} = 1 - \frac{313.15}{450} = 0.304$$

$$\dot{W} = \eta \, \dot{Q}_H \quad \Rightarrow \quad \dot{Q}_H = \frac{\dot{W}}{\eta} = \frac{2.5}{0.304} \text{ kW} = 8.224 \text{ kW}$$

$$\dot{Q}_H = 0.2 \text{ (kW/m}^2\text{) A} \quad \Rightarrow \quad A = \frac{\dot{Q}_H}{0.2} = \mathbf{41 \ m^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.67

A heat pump is driven by the work output of a heat engine as shown in figure P5.67. If we assume ideal devices find the ratio of the total power $\dot{Q}_{L1} + \dot{Q}_{H2}$ that heats the house to the power from the hot energy source $\dot{Q}_{H1}$ in terms of the temperatures.

$$\beta_{HP} = \dot{Q}_{H2}/\dot{W} = \dot{Q}_{H2}/(\dot{Q}_{H2} - \dot{Q}_{L2}) = \frac{T_{room}}{T_{room} - T_{amb}}$$

$$\dot{W} = \eta_{HE} \cdot \dot{Q}_{H1} = (1 - \frac{T_{room}}{T_H})\, \dot{Q}_{H1}$$

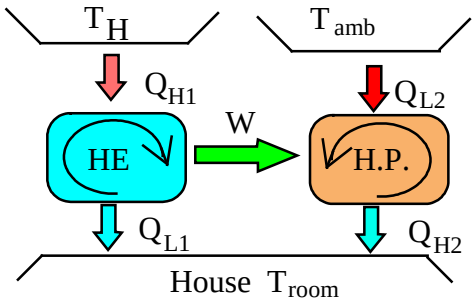
$$\dot{W} = \dot{Q}_{H2}/\beta_{HP} = \frac{T_{room}}{T_{room} - T_{amb}}\, \dot{Q}_{H2}$$

$$\dot{Q}_{L1} = \dot{Q}_{H1} - \dot{W} = [1 - 1 + \frac{T_{room}}{T_H}]\, \dot{Q}_{H1}$$

$$\frac{\dot{Q}_{H2} + \dot{Q}_{L1}}{\dot{Q}_{H1}} = 1 - 1 + \frac{T_{room}}{T_H} + \frac{1 - \frac{T_{room}}{T_H}}{\frac{T_{room} - T_{amb}}{T_{room}}} = \frac{T_{room}}{T_H} + \frac{T_{room} - T^2_{room}/T_H}{T_{room} - T_{amb}}$$

$$= T_{room} [\frac{1}{T_H} + \frac{1 - \frac{T_{room}}{T_H}}{T_{room} - T_{amb}}] = \frac{T_{room}}{T_H} [1 + \frac{T_H - T_{room}}{T_{room} - T_{amb}}]$$

$$= \mathbf{\frac{T_{room}}{T_H} \left[\frac{T_H - T_{amb}}{T_{room} - T_{amb}} \right]}$$



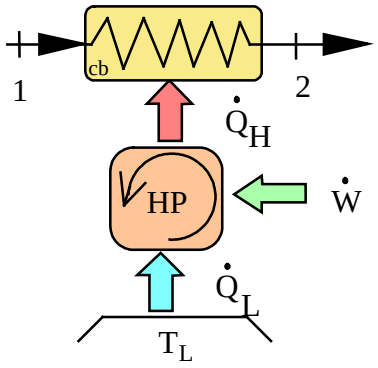
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.68

Sixty kilograms per hour of water runs through a heat exchanger, entering as saturated liquid at 200 kPa and leaving as saturated vapor. The heat is supplied by a Carnot heat pump operating from a low-temperature reservoir at 16°C with a COP of half that of a similar Carnot unit. Find the rate of work into the heat pump.

Solution:

C.V. Heat exchanger



$\dot{m}_1 = \dot{m}_2$; $\dot{m}_1 h_1 + \dot{Q}_H = \dot{m}_1 h_2$

Table B.1.2: $h_1 = 504.7$ kJ/kg,

$h_2 = 2706.7$ kJ/kg

$T_H = T_{sat}(P) = 120.93 + 273.15$

$= 394.08$ K

$$\dot{Q}_H = \frac{60}{3600}(2706.7 - 504.7) = 36.7 \text{ kW}$$

First find the COP of a Carnot heat pump.

$$\beta' = \dot{Q}_H/\dot{W} = T_H / (T_H - T_L) = 394.08 / (394.08 - 289.15) = 3.76$$

Now we can do the actual one as $\beta'_H = 3.76/2 = 1.88$

$$\dot{W} = \dot{Q}_H/\beta'_H = 36.7 \text{ kW} / 1.88 = \mathbf{19.52\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.69

A power plant with a thermal efficiency of 40% is located on a river similar to Fig. P5.61. With a total river mass flow rate of 1×10^5 kg/s at 15°C find the maximum power production allowed if the river water should not be heated more than 1 degree.

The maximum heating allowed determines the maximum $\dot{Q}_L$ as

$$\dot{Q}_L = \dot{m}_{H_2O} \Delta h = \dot{m}_{H_2O} C_{P\,LIQ\,H_2O} \Delta T_{H_2O}$$

$$= 1 \times 10^5 \text{ kg/s} \times 4.18 \text{ kJ/kg-K} \times 1 \text{ K} = 418 \text{ MW}$$

$$= \dot{W}_{NET}(1/\eta_{TH\,ac} - 1)$$

$$\dot{W}_{NET} = \dot{Q}_L / (1/\eta_{TH\,ac} - 1) = \dot{Q}_L \frac{\eta_{TH\,ac}}{1 - \eta_{TH\,ac}}$$

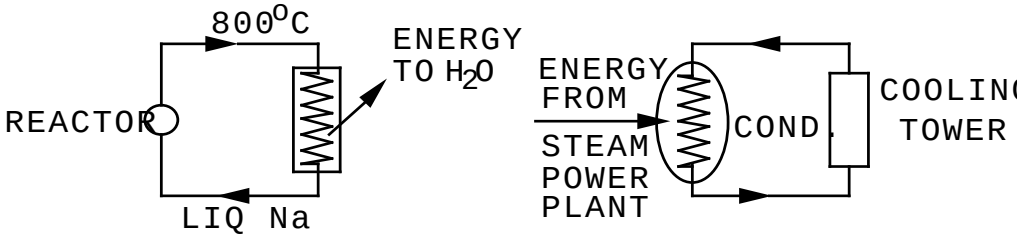
$$= 418 \text{ MW} \times \frac{0.4}{1 - 0.4} = \mathbf{279\ MW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.70

Liquid sodium leaves a nuclear reactor at 800°C and is used as the energy source in a steam power plant. The condenser cooling water comes from a cooling tower at 15°C. Determine the maximum thermal efficiency of the power plant. Is it misleading to use the temperatures given to calculate this value?

Solution:



$T_H = 800°C = 1073.2\ K, \quad T_L = 15°C = 288.2\ K$

$$\eta_{TH\ MAX} = \frac{T_H - T_L}{T_H} = \frac{1073.2 - 288.2}{1073.2} = \mathbf{0.731}$$

It might be misleading to use 800°C as the value for T_H, since there is not a supply of energy available at a constant temperature of 800°C (liquid Na is cooled to a lower temperature in the heat exchanger).

$\Rightarrow$ The Na cannot be used to boil H_2O at 800°C.

Similarly, the H_2O leaves the cooling tower and enters the condenser at 15°C, and leaves the condenser at some higher temperature.

$\Rightarrow$ The water does not provide for condensing steam at a constant temperature of 15°C.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.71

The management of a large factory cannot decide which of two fuels to purchase. The selected fuel will be used in a heat engine operating between the fuel burning temperature and a low exhaust temperature. of. Fuel A burns at 2200 K and exhausts at 450 K, delivering 30 000 kJ/kg, and costs $1.50/kg. Fuel B burns at 1200 K and exhausts at 350 K, delivering 40 000 kJ/kg and costs $1.30/kg. Which fuel would you buy and why?

Solution:

Fuel A: $\eta_{TH,A} = 1 - \frac{T_L}{T_H} = 1 - \frac{450}{2200} = 0.795$

$W_A = \eta_{TH,A} \times Q_A = 0.795 \times 30\,000 = 23\,850$ kJ/kg

$W_A/\$_A = 23\,850/1.5 = 15\,900$ kJ/$

Fuel B: $\eta_{TH,B} = 1 - \frac{T_L}{T_H} = 1 - \frac{350}{1200} = 0.708$

$W_B = \eta_{TH,B} \times Q_B = 0.708 \times 40\,000 = 28\,320$ kJ/kg

$W_B/\$_B = 28\,320/1.3 = 21\,785$ kJ/$

Select fuel B for more work per dollar though it has a lower thermal efficiency.

5.72

A sales person selling refrigerators and deep freezers will guarantee a minimum coefficient of performance of 4.5 year round. How would you evaluate that? Are they all the same?

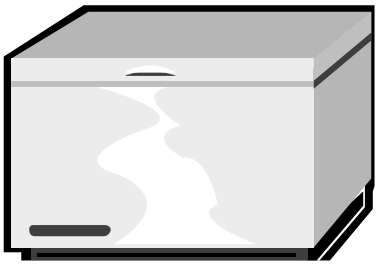
Solution:

Assume a high temperature of 35°C. If a freezer compartment is included T_L ~ -20°C (deep freezer) and fluid temperature is then T_L ~ -30°C

$$\beta_{\text{deep freezer}} \leq \frac{T_L}{T_H - T_L} = \frac{273.15 - 30}{35 - (-30)} = 3.74$$

A hot summer day may require a higher T_H to push Q_H out into the room, so even lower β.

Claim is possible for a refrigerator, but not for a deep freezer.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.73

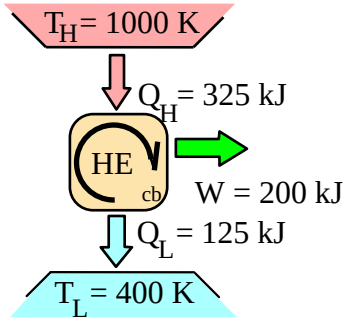
A cyclic machine, shown in Fig. P5.73, receives 325 kJ from a 1000 K energy reservoir. It rejects 125 kJ to a 400 K energy reservoir and the cycle produces 200 kJ of work as output. Is this cycle reversible, irreversible, or impossible?

Solution:

$$\eta_{Carnot} = 1 - \frac{T_L}{T_H} = 1 - \frac{400}{1000} = 0.6$$

$$\eta_{eng} = \frac{W}{Q_H} = \frac{200}{325} = 0.615 > \eta_{Carnot}$$

This is **impossible.**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

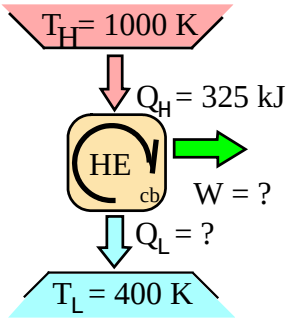
5.74

Consider the previous problem and assume the temperatures and heat input are as given. If the actual machine has an efficiency that is half that of the corresponding Carnot cycle, find the work out and the rejected heat transfer.

$$\eta_{Carnot} = 1 - \frac{T_L}{T_H} = 1 - \frac{400}{1000} = 0.6$$

$$\eta_{eng} = \eta_{Carnot}/2 = 0.3 = \frac{W}{Q_H}$$

$$W = 0.3\, Q_H = 0.3 \times 325 = \mathbf{97.5\ kJ}$$



$$Q_L = Q_H - W = (325 - 97.5)\ \text{kJ} = \mathbf{227.5\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.75

Repeat problem 5.61 using a more realistic thermal efficiency of 45%.

$$\dot{W}_{NET} = 10^6 \text{ kW} = \eta_{TH\ ac}\, \dot{Q}_H, \qquad \eta_{TH\ ac} = 0.45$$

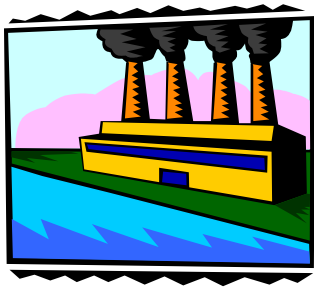
$$\Rightarrow \dot{Q}_L = \dot{Q}_H - \dot{W}_{NET} = \dot{W}_{NET}/\eta_{TH\ ac} - \dot{W}_{NET} = \dot{W}_{NET}(1/\eta_{TH\ ac} - 1)$$

$$= 10^6 \text{ kW} \left(\frac{1 - 0.45}{0.45}\right) = 1.222 \times 10^6 \text{ kW}$$

But $\dot{m}_{H_2O} = \dfrac{60 \times 8 \times 10/60}{0.001} = 80\ 000$ kg/s having an energy flow of

$$\dot{Q}_L = \dot{m}_{H_2O}\, \Delta h = \dot{m}_{H_2O}\, C_{P\ LIQ\ H_2O}\, \Delta T_{H_2O}$$

$$\Rightarrow \Delta T_{H_2O} = \frac{\dot{Q}_L}{\dot{m}_{H_2O} C_{P\ LIQ\ H_2O}} = \frac{1.222 \times 10^6}{80\ 000 \times 4.18} \frac{\text{kW}}{\text{kg/s} \times \text{kJ/kg-K}} = \mathbf{3.65°C}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

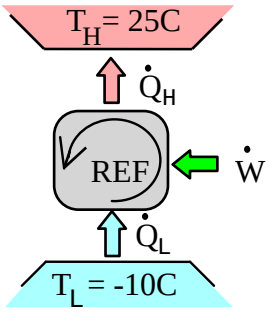
5.76

An inventor has developed a refrigeration unit that maintains the cold space at –10°C, while operating in a 25°C room. A coefficient of performance of 8.5 is claimed. How do you evaluate this?

Solution:

$$\beta_{Carnot} = \frac{Q_L}{W_{in}} = \frac{T_L}{T_H - T_L} = \frac{263.15}{25 - (-10)} = 7.52$$

$8.5 > \beta_{Carnot} \Rightarrow$ **impossible claim**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.77

A heat pump receives energy from a source at 80^{o}C and delivers energy to a boiler that operates at 350 kPa. The boiler input is saturated liquid water and the exit is saturated vapor both at 350 kPa. The heat pump is driven by a 2.5 MW motor and has a COP that is 60% of a Carnot heat pump COP. What is the maximum mass flow rate of water the system can deliver?

$$T_H = T_{sat} = 138.88^{o}C = 412\ K, \quad h_{fg} = 2148.1\ kJ/kg$$

$$\beta_{HP\ Carnot} = \frac{\dot{Q}_H}{\dot{W}_{in}} = \frac{T_H}{T_H - T_L} = \frac{412}{138.88 - 80} = 7$$

$$\beta_{HP\ ac} = 0.6 \times 7 = 4.2 = \dot{Q}_H/\dot{W}_{in}$$

$$\dot{Q}_H = 4.2\ \dot{W}_{in} = 4.2 \times 2.5\ MW = 10.5\ MW = \dot{m}\ h_{fg}$$

$$\dot{m} = \dot{Q}_H / h_{fg} = 10\ 500\ kW / 2148.1\ kJ/kg = \mathbf{4.89\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.78

In a remote location, you run a heat engine to provide power to run a refrigerator. The input to the heat engine is 800 K and the low T is 400 K; it has an actual efficiency equal to half of that of the corresponding Carnot unit. The refrigerator has T_L = -10°C and T_H = 35°C, with a cop that is one-third that of the corresponding Carnot unit. Assume a cooling capacity of 2 kW is needed and find the rate of heat input to the heat engine.

Heat engine: $\eta_{Carnot} = 1 - \frac{T_L}{T_H} = 1 - \frac{400}{800} = 0.5$; $\eta_{ac} = 0.25$

Refrigerator: $\beta_{ref.\ Carnot} = \frac{T_L}{T_H - T_L} = \frac{273 - 10}{35 - (-10)} = 5.844$; $\beta_{ref.\ ac} = 1.95$

Cooling capacity: $\dot{Q}_L = 2\ kW = \beta_{ref.\ ac}\ \dot{W}$; $\dot{W} = 2\ kW/1.95 = 1.026\ kW$

This work must be provided by the heat engine $\dot{W} = \eta_{ac}\ \dot{Q}_H$

$$\dot{Q}_H = \dot{W} / \eta_{ac} = 1.026\ kW / 0.25 = \mathbf{4.1\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.79

A car engine with a thermal efficiency of 33% drives the air-conditioner unit (a refrigerator) besides powering the car and other auxiliary equipment. On a hot (35^{o}C) summer day the A/C takes outside air in and cools it to 5^{o}C sending it into a duct using 2 kW of power input and it is assumed to be half as good as a Carnot refrigeration unit. Find the rate of fuel (kW) being burned extra just to drive the A/C unit and its COP. Find the flow rate of cold air the A/C unit can provide.

$$\dot{W}_{extra} = \eta\, \dot{Q}_{H\,extra} \quad \Rightarrow \quad \dot{Q}_{H\,extra} = \dot{W}_{extra} / \eta = 2\ \text{kW} / 0.33 = \mathbf{6\ kW}$$

$$\beta = \frac{Q_L}{W_{IN}} = 0.5\, \beta_{Carnot} = 0.5\, \frac{T_L}{T_H - T_L} = 0.5\, \frac{5 + 273.15}{35 - 5} = 4.636$$

$$\dot{Q}_L = \beta\, \dot{W} = 4.636 \times 2\ \text{kW} = 9.272\ \text{kW} = \dot{m}_{air}\, C_{P\,air}\, \Delta T_{air}$$

$$\dot{m}_{air} = \dot{Q}_L / [C_{P\,air}\, \Delta T_{air}\,] = \frac{9.272\ \text{kW}}{1.004\ \text{kJ/kg-K} \times (35 - 5)\ \text{K}} = \mathbf{0.308\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.80

A large heat pump should upgrade 5 MW of heat at 85°C to be delivered as heat at 150°C. Suppose the actual heat pump has a COP of 2.5 how much power is required to drive the unit. For the same COP how high a high temperature would a Carnot heat pump have assuming the same low T?

This is an actual COP for the heat pump as

$$\beta_{HP} = COP = \dot{Q}_H/\dot{W}_{in} = 2.5 \quad \Rightarrow \quad \dot{Q}_L/\dot{W}_{in} = 1.5$$

$$\dot{W}_{in} = \dot{Q}_L / 1.5 = 5 / 1.5 = \mathbf{3.333\ MW}$$

The Carnot heat pump has a COP given by the temperatures as

$$\beta_{HP} = \dot{Q}_H/\dot{W}_{in} = \frac{T_H}{T_H - T_L} = 2.5 \quad \Rightarrow \quad T_H = 2.5\, T_H - 2.5\, T_L$$

$$\Rightarrow \qquad T_H = \frac{2.5}{1.5} T_L = \frac{5}{3}(85 + 273.15) = \mathbf{597\ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Finite ΔT Heat Transfer

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.81

A refrigerator keeping 5°C inside is located in a 30°C room. It must have a high temperature ΔT above room temperature and a low temperature ΔT below the refrigerated space in the cycle to actually transfer the heat. For a ΔT of 0, 5 and 10°C respectively calculate the COP assuming a Carnot cycle.

Solution:

From the definition of COP and assuming Carnot cycle

$$\beta = \frac{Q_L}{W_{IN}} = \frac{T_L}{T_H - T_L} \quad \text{when T's are absolute temperatures}$$

	ΔT	T_H °C	T_H K	T_L °C	T_L K	β
a	0	30	303	5	278	11.1
b	5	35	308	0	273	7.8
c	10	40	313	-5	268	5.96

Notice how the COP drops significantly with the increase in ΔT.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.82

The ocean near Havaii has 20°C near the surface and 5°C at some depth. A power plant based on this temperature difference is being planned. How large an efficiency could it have? If the two heat transfer terms (Q_H and Q_L) both require a 2 degree difference to operate what is the maximum efficiency then?

Solution:

$T_H = 20°C = 293.2\ K; \qquad T_L = 5°C = 278.2\ K$

$$\eta_{TH\ MAX} = \frac{T_H - T_L}{T_H} = \frac{293.2 - 278.2}{293.2} = \mathbf{0.051}$$

$$\eta_{TH\ mod} = \frac{T_{H'} - T_{L'}}{T_{H'}} = \frac{291.2 - 280.2}{291.2} = \mathbf{0.038}$$

This is a very low efficiency so it has to be done on a very large scale to be economically feasible and then it will have some environmental impact.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.83

A house is cooled by a heat pump driven by an electric motor using the inside as the low-temperature reservoir. The house gains energy in direct proportion to the temperature difference as $\dot{Q}_{gain} = K(T_H - T_L)$. Determine the minimum electric power to drive the heat pump as a function of the two temperatures.

Solution:

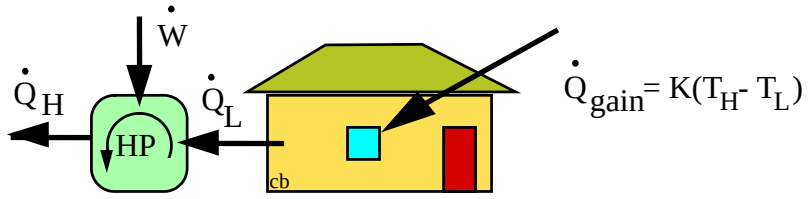
Refrigerator COP: $\beta = \dot{Q}_L/\dot{W}_{in} \leq T_L/(T_H - T_L)$;

Heat gain must be removed: $\dot{Q}_L = \dot{Q}_{gain} = K(T_H - T_L)$

Solve for required work and substitute in for β

$$\dot{W}_{in} = \dot{Q}_L/\beta \geq K(T_H - T_L) \times (T_H - T_L)/T_L$$

$$\dot{W}_{in} \geq K(T_H - T_L)^2/T_L$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.84

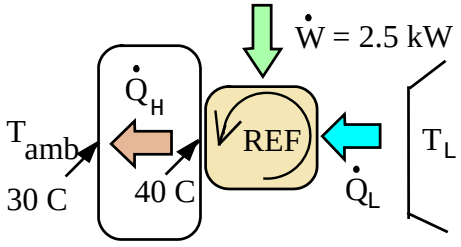
An air conditioner in a very hot region uses a power input of 2.5 kW to cool a 5°C space with the high temperature in the cycle as 40°C. The Q_H is pushed to the ambient air at 30°C in a heat exchanger where the transfer coefficient is 50 W/m^2K. Find the required minimum heat transfer area.

Solution:

$$\dot{W} = 2.5 \text{ kW} = \dot{Q}_H / \beta_{HP}; \qquad \beta_{HP} = T_H/(T_H - T_L) = \frac{273 + 40}{40 - 5} = 8.943$$

$$\dot{Q}_H = \dot{W} \times \beta_{HP} = 2.5 \times 8.943 = 22.36 \text{ kW} = h\, A\, \Delta T$$

$$A = \frac{\dot{Q}_H}{h\, \Delta T} = \frac{22.36 \times 10^3}{50 \times (40 - 30)} = \mathbf{44.72\ m^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.85

A small house is kept at 20°C inside loses 12 kW to the outside ambient at 0°C. A heat pump is used to help heat the house together with possible electric heat. The heat pump is driven by a motor of 2.5 kW and it has a COP that is ¼ of a Carnot heat pump unit. Find the actual COP for the heat pump and the amount of electric heat that must be used (if any) to maintain the house temperature.

CV. House Energy: $0 = \dot{Q}_H + \dot{W}_{el.} - \dot{Q}_{Loss}$

Definition of COP: $\beta' = COP_{HP} = \dfrac{\dot{Q}_H}{\dot{W}} = \dfrac{1}{4}\dfrac{T_H}{T_H - T_L} = \dfrac{1}{4}\dfrac{293.15}{20 - 0} = \mathbf{3.664}$

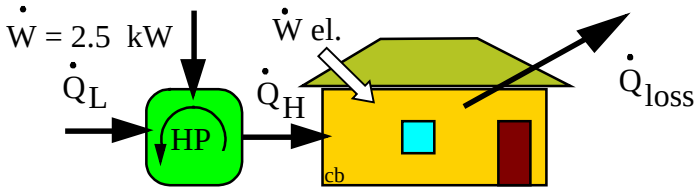
$\dot{Q}_H = COP_{HP}\, \dot{W}_{HP} = 3.664 \times 2.5 \text{ kW} = 9.16 \text{ kW}$

$\dot{W}_{el.} = \dot{Q}_{Loss} - \dot{Q}_H = 12 - 9.16 = \mathbf{2.84\ kW}$

C.V. Total Energy: $\dot{Q}_L = \dot{Q}_H - \dot{W}_{HP} = 9.16 - 2.5 = 6.66 \text{ kW}$

Entropy: $0 = \dot{Q}_L/T_L - \dot{Q}_{loss}/T_L + \dot{S}_{gen}$

$\dot{S}_{gen} = (\dot{Q}_{loss} - \dot{Q}_L)/T_L = \dfrac{12 - 6.66}{273.15} = 0.0195 \text{ kW/K}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

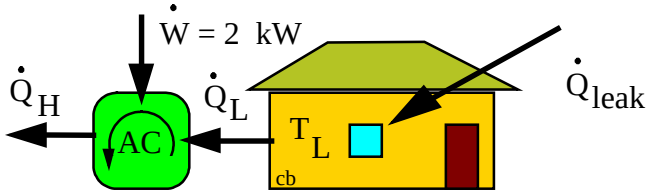
5.86

Consider a room at 20°C that is cooled by an air conditioner with a COP of 3.2 using a power input of 2 kW and the outside is at 35°C. What is the constant in the heat transfer Eq. 5.14 for the heat transfer from the outside into the room?

Definition of the coefficient of performance, Eq.5.2 and Eq.5.14

$$\dot{Q}_L = \beta_{AC}\dot{W} = 3.2 \times 2 \text{ kW} = 6.4 \text{ kW} = \dot{Q}_{\text{leak in}} = CA\ \Delta T$$

$$CA = \dot{Q}_L / \Delta T = \frac{6.4 \text{ kW}}{(35 - 20) \text{ K}} = \mathbf{0.427\ kW/K}$$



Here:

$T_L = T_{house} = 20^oC$

$T_H = T_{amb} = 35^oC$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.87

A car engine operates with a thermal efficiency of 35%. Assume the air-conditioner has a coefficient of performance of $\beta = 3$ working as a refrigerator cooling the inside using engine shaft work to drive it. How much fuel energy should be spend extra to remove 1 kJ from the inside?

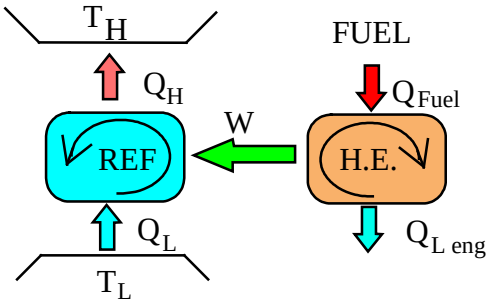
Solution:

Car engine: $W = \eta_{eng} Q_{fuel}$

Air conditioner: $\beta = \dfrac{Q_L}{W}$

$$W = \eta_{eng} Q_{fuel} = \frac{Q_L}{\beta}$$

$$Q_{fuel} = Q_L / (\eta_{eng} \beta) = \frac{1}{0.35 \times 3} = \mathbf{0.952\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.88

Arctic explorers are unsure if they can use a 5-kW motor driven heat pump to stay warm. It should keep their shelter at 15°C. The shelter losses energy at a rate of 0.5 kW per degree difference to the colder ambient. The heat pump has a COP that is 50% of a Carnot heat pump. If the ambient temperature can fall to -25°C at night, would you recommend this heat pump to the explorers?

CV Heat pump.
The heat pump should deliver a rate of heating that equals the heat loss to the ambient for steady inside temperature.

$$\text{COP} = \beta' = \dot{Q}_H/\dot{W} = 0.5\ \beta'_{\text{Carnot}} = \frac{1}{2} \times \frac{T_H}{T_H - T_L} = \frac{1}{2} \times \frac{273 + 15}{15 - (-25)} = 3.6$$

The heat pump can then provide a heating capacity of

$$\dot{Q}_H = \beta' \dot{W} = 3.6 \times 5 \text{ kW} = 18 \text{ kW}$$

The heat loss is

$$\dot{Q}_{\text{leak out}} = \text{CA}\ \Delta T = 0.5 \text{ kW/K} \times [15 - (-25)] \text{ K} = 20 \text{ kW}$$

The heat pump is not sufficient to cover the loss and **not recommended**.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.89

Using the given heat pump in the previous problem, how warm would it make the shelter in the arctic night?

The high is now an unknown so both the heat loss and the heat pump performance depends on that. The energy balance around the shelter then gives

$$\dot{Q}_H = \beta' \dot{W} = \dot{Q}_{\text{leak out}} = CA\ \Delta T$$

Substitute the expression for β' and CA ΔT to give

$$\frac{1}{2} \times \frac{T_H}{T_H - T_L} \dot{W} = 0.5\ \text{kW/K} \times [T_H - T_L]$$

Multiply with the temperature difference, factor 2 and divide by the work to get

$$T_H = \frac{0.5 \times 2}{5\ \text{K}} [T_H - T_L]^2 = \frac{0.2}{\text{K}} [T_H - T_L]^2$$

Solve this equation like $0.2\ x^2 - x - T_L = 0$, with $x = T_H - T_L$ and $T_L = 248.15$ K

$$x = T_H - T_L = 37.81\ \text{K} \qquad \text{(negative root discarded)}$$

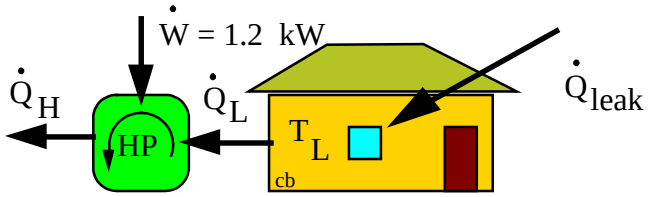
$$T_H = x + T_L = 37.81 - 25 = \mathbf{12.8°C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.90

An air conditioner cools a house at $T_L = 20°C$ with a maximum of 1.2 kW power input. The house gains 0.6 kW per degree temperature difference to the ambient and the refrigeration COP is $\beta = 0.6\ \beta_{Carnot}$. Find the maximum outside temperature, T_H, for which the air conditioner provides sufficient cooling.

Solution:



Here:
$T_L = T_{house}$
$T_H = T_{amb}$

In this setup the low temperature space is the house and the high temperature space is the ambient. The heat pump must remove the gain or leak heat transfer to keep it at a constant temperature.

$\dot{Q}_{leak} = 0.6\ (T_{amb} - T_{house}) = \dot{Q}_L$ which must be removed by the heat pump.

$$\beta = \dot{Q}_L / \dot{W} = 0.6\ \beta_{carnot} = 0.6\ T_{house} / (T_{amb} - T_{house})$$

Substitute in for $\dot{Q}_L$ and multiply with $(T_{amb} - T_{house})\dot{W}$:

$$0.6\ (T_{amb} - T_{house})^2 = 0.6\ T_{house}\ \dot{W}$$

Since $T_{house} = 293.15$ K and $\dot{W} = 1.2$ kW it follows

$$(T_{amb} - T_{house})^2 = T_{house}\ \dot{W} = 293.15 \times 1.2 = 351.78\ K^2$$

Solving $\Rightarrow$ $(T_{amb} - T_{house}) = 18.76$ $\Rightarrow$ $T_{amb} =$ **311.9 K = 38.8 °C**

Comment: We did assume here that $\beta = 0.6\ \beta_{carnot}$, the statement could also have been understood as $\beta' = 0.6\ \beta'_{carnot}$ which would lead to a slightly different result.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.91

A house is cooled by an electric heat pump using the outside as the high-temperature reservoir. For several different summer outdoor temperatures, estimate the percent savings in electricity if the house is kept at 25°C instead of 20°C. Assume that the house is gaining energy from the outside directly proportional to the temperature difference as in Eq. 5.14.

Solution:

Air-conditioner (Refrigerator) $\dot{Q}_{LEAK} \propto (T_H - T_L)$

Max Perf. $\dfrac{\dot{Q}_L}{\dot{W}_{IN}} = \dfrac{T_L}{T_H - T_L} = \dfrac{K(T_H - T_L)}{\dot{W}_{IN}}, \quad \dot{W}_{IN} = \dfrac{K(T_H - T_L)^2}{T_L}$

A: $T_{L_A} = 20°C = 293.2$ K B: $T_{L_B} = 25°C = 298.2$ K

T_H,°C	$\dot{W}_{IN_A}$/K	$\dot{W}_{IN_B}$/K	% saving
45	2.132	1.341	37.1 %
40	1.364	0.755	44.6 %
35	0.767	0.335	56.3 %

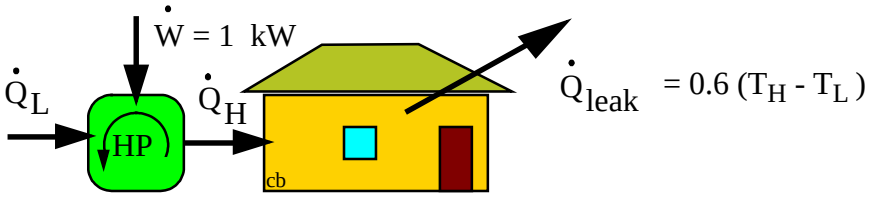
5.92

A heat pump has a coefficient of performance that is 50% of the theoretical maximum. It maintains a house at 20°C, which leaks energy of 0.6 kW per degree temperature difference to the ambient. For a maximum of 1.0 kW power input find the minimum outside temperature for which the heat pump is a sufficient heat source.

Solution:



C.V. House. For constant 20°C the heat pump must provide $\dot{Q}_{leak} = 0.6\ \Delta T$

$$\dot{Q}_H = \dot{Q}_{leak} = 0.6\ (T_H - T_L\ ) = \beta'\ \dot{W}$$

C.V. Heat pump. Definition of the coefficient of performance and the fact that the maximum is for a Carnot heat pump.

$$\beta' = \frac{\dot{Q}_H}{\dot{W}} = \frac{\dot{Q}_H}{\dot{Q}_H - \dot{Q}_L} = 0.5\ \beta'_{Carnot} = 0.5 \times \frac{T_H}{T_H - T_L}$$

Substitute into the first equation to get

$$0.6\ (T_H - T_L\ ) = [\ 0.5 \times T_H / (T_H - T_L\ )\ ]\ 1 \quad =>$$

$$(T_H - T_L\ )^2 = (0.5 / 0.6)\ T_H \times 1 = 0.5 / 0.6 \times 293.15 = 244.29$$

$$T_H - T_L = 15.63 \quad => \quad T_L = 20 - 15.63 = \mathbf{4.4\ °C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.93

The room in problem 5.90 has a combined thermal mass of 2000 kg wood, 250 kg steel, and 500 kg drywall (gypsum). Estimate how quickly the room heats up if the air conditioner is turned off on a day when it is 35^{o}C outside.

Without the air-conditioner the house gains heat and the energy equation for the house becomes

$$m\,C\,\frac{dT}{dt} = \dot{Q}_{in}$$

The gain is due to the temperature difference as

$$\dot{Q}_{in} = 0.6\,(T_H - T_L) = 0.6\ \text{kW/K}\ (35 - 20)\ \text{K} = 9\ \text{kW}$$

The combined (mC) is using an estimate C for gypsum as 1 kJ/kg-K

$$mC = [2000 \times 1.38 + 250 \times 0.46 + 500 \times 1\ ]\ \text{kJ/K} = 3375\ \text{kJ/K}$$

$$\frac{dT}{dt} = \dot{Q}_{in}\ /mC = 9\ \text{kW}/\ 3375\ \text{kJ/K} = \mathbf{0.00267\ K/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.94

A window air conditioner cools a room at $T_L = 22^oC$, with a maximum of 1.2 kW power input possible. The room gains 0.6 kW per degree temperature difference to the ambient, and the refrigeration COP is $\beta = 0.6\ \beta_{Carnot}$. Find the actual power required on a day when the temperature is 30^oC outside.

COP refrigerator: $$\beta = \frac{Q_L}{W_{IN}} = 0.6\ \beta_{Carnot} = 0.6\ \frac{T_L}{T_H - T_L} = \frac{273.15 + 22}{30 - 22} = 22.1$$

Heat gain: $$\dot{Q}_L = 0.6\ (T_H - T_L) = 0.6\ \text{kW/K} \times (30 - 22)\ \text{K} = 4.8\ \text{kW}$$

$$\dot{W} = \dot{Q}_L/\beta = 4.8\ \text{kW}/22.1 = \mathbf{0.217\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.95

On a cold (–10°C) winter day a heat pump provides 20 kW to heat a house maintained at 20°C and it has a COP_{HP} of 4. How much power does the heat pump require? The next day a winter storm brings the outside to -15°C, assuming the same COP and the same house heat transfer coefficient for the heat loss to the outside air. How much power does the heat pump require then?

If we look at the heat loss for the house we have

$$\dot{Q}_{loss} = 20 \text{ kW} = CA\ \Delta T \qquad \Rightarrow \qquad CA = \frac{20 \text{ kW}}{20 - (-10) \text{ K}} = 0.667 \text{ kW/K}$$

So now with the new outdoor temperature we get

$$\dot{Q}_{loss} = CA\ \Delta T = 0.667 \text{ kW/K} \times [20 - (-15)] \text{ K} = 23.3 \text{ kW}$$

$$\dot{Q}_{loss} = \dot{Q}_H = COP\ \dot{W} \quad \Rightarrow \quad \dot{W} = \dot{Q}_{loss}/COP = \frac{23.3 \text{ kW}}{4} = \mathbf{5.83\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.96

In the previous problem, it was assumed that the COP will be the same when the outside temperature drops. Given the temperatures and the actual COP at the -10^{o} C winter day, give an estimate for a more realistic COP for the outside at -15^{o}C case.

As the outside T drops the temperature in the low temperature heat exchanger drops and it will be harder for the heat pump. A reasonable assumption is then that the reduced COP will follow the ideal (Carnot cycle) COP.

$$\text{At } = -10^{o}\text{C:} \qquad \beta_{\text{Carnot}} = \frac{T_H}{T_H - T_L} = \frac{293.15}{20 - (-10)} = 9.772; \quad \text{COP} = 4$$

$$\text{At } = -15^{o}\text{C:} \qquad \beta_{\text{Carnot}} = \frac{T_H}{T_H - T_L} = \frac{293.15}{20 - (-15)} = 8.376$$

$$\text{COP} = \frac{8.376}{9.772} \times 4 = \mathbf{3.43}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Ideal Gas Carnot Cycles

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.97

Hydrogen gas is used in a Carnot cycle having an efficiency of 60% with a low temperature of 300 K. During the heat rejection the pressure changes from 90 kPa to 120 kPa. Find the high and low temperature heat transfer and the net cycle work per unit mass of hydrogen.

Solution:

As the efficiency is known, the high temperature is found as

$$\eta = 0.6 = 1 - \frac{T_L}{T_H} \quad => T_H = T_L / (1 - 0.6) = 750 \text{ K}$$

Now the volume ratio needed for the heat transfer, $T_3 = T_4 = T_L$, is

$$v_3 / v_4 = (RT_3 / P_3) / (RT_4 / P_4) = P_4 / P_3 = 120 / 90 = 1.333$$

so from Eq.5.9 we have with R = 4.1243 kJ/kg-K from Table A.5

$$q_L = RT_L \ln (v_3/v_4) = \mathbf{355.95\ kJ/kg}$$

Using the efficiency from Eq.5.5 then

$$q_H = q_L / (1 - 0.6) = \mathbf{889.9\ kJ/kg}$$

The net work equals the net heat transfer

$$w = q_H - q_L = \mathbf{533.9\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.98

Carbon dioxide is used in an ideal gas refrigeration cycle, reverse of Fig. 5.24. Heat absorption is at 250 K and heat rejection is at 325 K where the pressure changes from 1200 kPa to 2400 kPa. Find the refrigeration COP and the specific heat transfer at the low temperature.

The analysis is the same as for the heat engine except the signs are opposite so the heat transfers move in the opposite direction.

$$\beta = \dot{Q}_L / \dot{W} = \beta_{carnot} = T_L / (T_H - T_L) = \frac{250}{325 - 250} = \mathbf{3.33}$$

$$q_H = RT_H \ln(v_2/v_1) = RT_H \ln\left(\frac{P_1}{P_2}\right) = 0.1889 \text{ kJ/kg-K} \times 325 \text{ K} \ln\left(\frac{2400}{1200}\right)$$

$$= 42.55 \text{ kJ/kg}$$

$$q_L = q_H T_L / T_H = 42.55 \text{ kJ/kg} \times 250 / 325 = \mathbf{32.73 \text{ kJ/kg}}$$

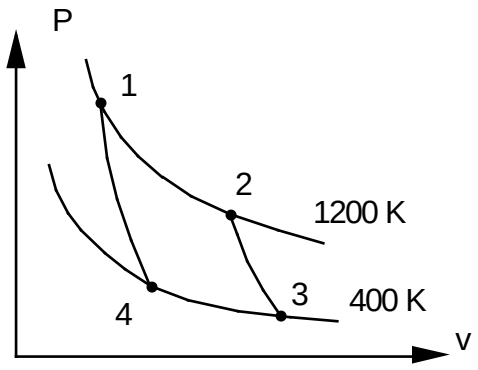
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.99

An ideal gas Carnot cycle with air in a piston cylinder has a high temperature of 1000 K and a heat rejection at 400 K. During the heat addition the volume triples. Find the two specific heat transfers (q) in the cycle and the overall cycle efficiency.

Solution:

The P-v diagram of the cycle is shown to the right.
From the integration along the process curves done in the main text we have Eq.5.7



$$q_H = R\, T_H \ln(v_2/v_1)$$
$$= 0.287 \text{ kJ/kg} \times 1000 \ln(3)$$
$$= \mathbf{315.3\ kJ/kg}$$

Since it is a Carnot cycle the knowledge of the temperatures gives the cycle efficiency as

$$\eta_{TH} = 1 - \frac{T_L}{T_H} = 1 - \frac{400}{1000} = \mathbf{0.6}$$

from which we can get the other heat transfer from Eq.5.4

$$q_L = q_H\, T_L / T_H = 315.3 \times 400 / 1000 = \mathbf{126.1\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.100

Air in a piston/cylinder goes through a Carnot cycle with the P-v diagram shown in Fig. 5.24. The high and low temperatures are 600 K and 300 K respectively. The heat added at the high temperature is 250 kJ/kg and the lowest pressure in the cycle is 75 kPa. Find the specific volume and pressure after heat rejection and the net work per unit mass.

Solution:

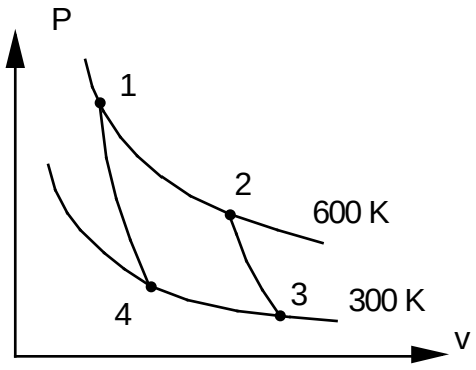
$q_H = 250$ kJ/kg , $T_H = 600$ K, $T_L = 300$ K, $P_3 = 75$ kPa

The states as shown in figure 5.24

1: 600 K , 2: 600 K, 3: 75 kPa, 300 K 4: 300 K

Since this is a Carnot cycle and we know the temperatures the efficiency is

$$\eta = 1 - \frac{T_L}{T_H} = 1 - \frac{300}{600} = 0.5$$



and the net work becomes

$$w_{NET} = \eta q_H = 0.5 \times 250$$

$$= \mathbf{125\ kJ/kg}$$

The heat rejected is

$$q_L = q_H - w_{NET} = 125 \text{ kJ/kg}$$

After heat rejection is state 4. From equation 5.9

$3 \rightarrow 4$ Eq.5.9 : $q_L = RT_L \ln (v_3/v_4)$

$v_3 = RT_3 / P_3 = 0.287$ kJ/kg-K $\times$ 300 K / 75 kPa = 1.148 m^3/kg

$v_4 = v_3 \exp(-q_L/RT_L) = 1.148$ m^3/kg $\exp(-125/0.287 \times 300)$

$= \mathbf{0.2688\ m^3/kg}$

$P_4 = RT_4 / v_4 = 0.287$ kJ/kg-K $\times$ 300 K/ 0.2688 m^3/kg = **320 kPa**

5.101

A 4L jug of milk at 25°C is placed in your refrigerator where it is cooled down to 5°C. The high temperature in the Carnot refrigeration cycle is 45°C, the low temperature is -5°C and the properties of milk are the same as for liquid water. Find the amount of energy that must be removed from the milk and the additional work needed to drive the refrigerator.

Solution:

C.V milk + out to the 5 °C refrigerator space

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : P = constant = 1 atm => ${}_1W_2 = Pm\,(v_2 - v_1)$

State 1: Table B.1.1, $v_1 \cong v_f = 0.001003\ m^3/kg$, $h_1 \cong h_f = 104.87\ kJ/kg$

$m_2 = m_1 = V_1/v_1 = 0.004 / 0.001003 = 3.988\ kg$

State 2: Table B.1.1, $h_2 \cong h_f = 20.98\ kJ/kg$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(u_2 - u_1) + Pm\,(v_2 - v_1) = m(h_2 - h_1)$

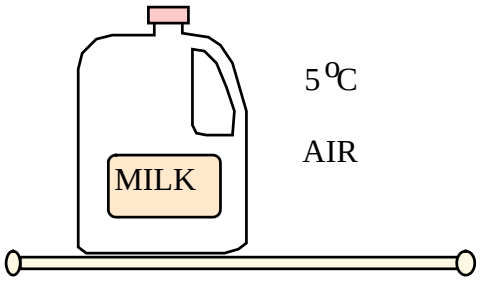
${}_1Q_2 = 3.998\,(20.98 - 104.87) = -3.988 \times 83.89 =$ **- 334.55 kJ**

C.V. Refrigeration cycle $T_L = -5$ °C ; $T_H = 45$ °C, assume Carnot

Ideal : $\beta = Q_L / W = Q_L / (Q_H - Q_L) = T_L / (T_H - T_L)$

$= 278.15 / [45 - (-5)] = 5.563$

$W = Q_L / \beta = 334.55\ kJ / 5.563 =$ **60.14 kJ**



Remark: If you calculate the work term ${}_1W_2$ you will find that it is very small, the volume does not change (liquid). The heat transfer could then have been done as $m(u_2 - u_1)$ without any change in the numbers.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.102

Consider the combination of the two heat engines as in Fig. P5.4. How should the intermediate temperature be selected so the two heat engines have the same efficiency assuming Carnot cycle heat engines.

Heat engine 1: $\eta_{TH\,1} = 1 - \dfrac{T_M}{T_H}$

Heat engine 2: $\eta_{TH\,2} = 1 - \dfrac{T_L}{T_M}$

$$\eta_{TH\,1} = \eta_{TH\,2} \Rightarrow 1 - \frac{T_M}{T_H} = 1 - \frac{T_L}{T_M} \Rightarrow \frac{T_M}{T_H} = \frac{T_L}{T_M}$$

$$\Rightarrow T_M = \sqrt{T_L T_H}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.103

Consider a combination of a gas turbine power plant and a steam power plant as shown in Fig. P5.4. The gas turbine operates at higher temperatures (thus called a topping cycle) than the steam power plant (then called a bottom cycle). Assume both cycles have a thermal efficiency of 32%. What is the efficiency of the overall combination assuming Q_L in the gas turbine equals Q_H to the steam power plant?

Let the gas turbine be heat engine number 1 and the steam power plant the heat engine number 2. Then the overall efficiency

$$\eta_{TH} = \dot{W}_{net} / \dot{Q}_H = (\dot{W}_1 + \dot{W}_2) / \dot{Q}_H = \eta_1 + \dot{W}_2 / \dot{Q}_H$$

For the second heat engine and the energy Eq. for the first heat engine

$$\dot{W}_2 = \eta_2 \dot{Q}_M = \eta_2 (1 - \eta_1) \dot{Q}_H$$

so the final result is

$$\eta_{TH} = \eta_1 + \eta_2 (1 - \eta_1)$$
$$= 0.32 + 0.32(1 - 0.32) = \mathbf{0.538}$$

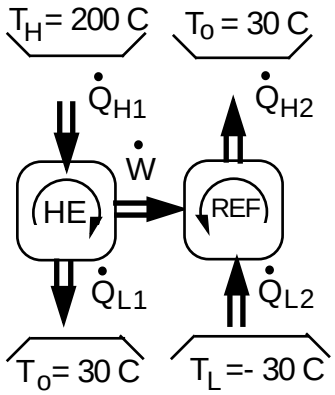
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.104

We wish to produce refrigeration at –30°C. A reservoir, shown in Fig. P5.104, is available at 200°C and the ambient temperature is 30°C. Thus, work can be done by a cyclic heat engine operating between the 200°C reservoir and the ambient. This work is used to drive the refrigerator. Determine the ratio of the heat transferred from the 200°C reservoir to the heat transferred from the –30°C reservoir, assuming all processes are reversible.

Solution:

Equate the work from the heat engine to the refrigerator.



$$\dot{W} = \dot{Q}_{H1}\left(\frac{T_H - T_0}{T_H}\right)$$

also

$$\dot{W} = \dot{Q}_{L2}\left(\frac{T_0 - T_L}{T_L}\right)$$

$$\dot{Q}_{H1} / \dot{Q}_{L2} = \left(\frac{T_0 - T_L}{T_L}\right)\left(\frac{T_H}{T_H - T_0}\right) = \left(\frac{60}{243.2}\right)\left(\frac{473.2}{170}\right) = \mathbf{0.687}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.105

Redo the previous problem, assuming the actual devices both have a performance that is 60% of the theoretical maximum.

For the heat engine this means:

$$\dot{W} = 0.6\, \dot{Q}_{H1} \left(\frac{T_H - T_0}{T_H} \right)$$

For the refrigerator it means:

$$\dot{W} = \dot{Q}_{L2} \left(\frac{T_0 - T_L}{T_L} \right) / 0.6$$

The ratio of the two heat transfers becomes

$$\dot{Q}_{H1} / \dot{Q}_{L2} = \left(\frac{T_o - T_L}{T_L} \right) \times \frac{1}{0.6} \times \left(\frac{T_H}{T_H - T_o} \right) \times \frac{1}{0.6}$$

$$= \left(\frac{60}{243.2} \right) \left(\frac{473.2}{170} \right) \frac{1}{0.36} = \mathbf{1.91}$$

As the heat engine delivers less work and the refrigerator requires more work energy from the high T source must increase significantly.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.106

A house should be heated by a heat pump, $\beta' = 2.2$, and maintained at 20°C at all times. It is estimated that it loses 0.8 kW per degree the ambient is lower than the inside. Assume an outside temperature of –10°C and find the needed power to drive the heat pump?

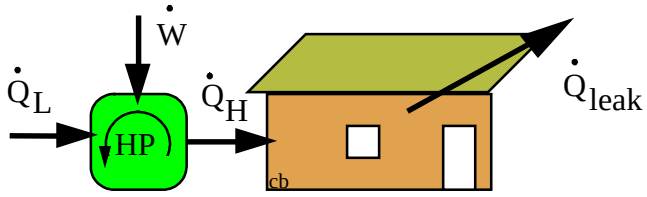
Solution : Ambient $T_L = -10^{o}C$

Heat pump : $\beta' = \dot{Q}_H / \dot{W}$

House : $\dot{Q}_H = \dot{Q}_{leak} = 0.8 \, (T_H - T_L)$

$$\dot{W} = \dot{Q}_H / \beta' = \dot{Q}_{leak} / \beta' = 0.8 \, (T_H - T_L) / \beta'$$

$$= 0.8[20 - (-10)] / 2.2 = \mathbf{10.91\ kW}$$



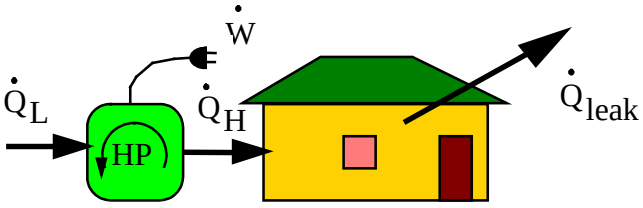
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.107

Give an estimate for the COP in the previous problem and the power needed to drive the heat pump when the outside temperature drops to -15°C.

Solution:

Minimum power if we assume a Carnot cycle



We assume the heat transfer coefficient stays the same

$$\dot{Q}_H = \dot{Q}_{leak} = 25 \text{ kW} = CA\ \Delta T = CA\ [20 - (-10)] \quad \Rightarrow \quad CA = \frac{5}{6} \text{ kW/K}$$

$$\dot{Q}_{leak\ new} = CA\ \Delta T = \frac{5}{6}[20 - (-15)] = 29.167 \text{ kW}$$

$$\beta' = \frac{\dot{Q}_H}{\dot{W}_{IN}} = \frac{T_H}{T_H - T_L} = \frac{293.15}{35} = 8.3757 \quad \Rightarrow \quad \dot{W}_{IN} = \frac{29.167}{8.3757} = \mathbf{3.48\ kW}$$

Comment. Leak heat transfer increases and COP is lower when T outside drops.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.108

A farmer runs a heat pump with a motor of 2 kW. It should keep a chicken hatchery at 30°C which loses energy at a rate of 0.5 kW per degree difference to the colder ambient. The heat pump has a coefficient of performance that is 50% of a Carnot heat pump. What is the minimum ambient temperature for which the heat pump is sufficient?

Solution:
C.V. Hatchery, steady state.
To have steady state at 30°C for the hatchery

Energy Eq.: $\dot{Q}_H = \dot{Q}_{Loss} = \beta_{AC} \dot{W}$

Process Eq.: $\dot{Q}_{Loss} = 0.5\ (T_H - T_{amb})$; $\beta_{AC} = ½\ \beta_{CARNOT}$

COP for the reference Carnot heat pump

$$\beta_{CARNOT} = \frac{\dot{Q}_H}{\dot{W}} = \frac{\dot{Q}_H}{\dot{Q}_H - \dot{Q}_L} = \frac{T_H}{T_H - T_L} = \frac{T_H}{T_H - T_{amb}}$$

Substitute the process equations and this β_{CARNOT} into the energy Eq.

$$0.5\ \text{kW/K}\ (T_H - T_{amb}) = ½ \frac{T_H}{T_H - T_{amb}} \dot{W}$$

$$(T_H - T_{amb})^2 = ½\ T_H \dot{W}/0.5\ \text{kW/K} = T_H \dot{W} = (273 + 30)\ \text{K} \times 2\ \text{K} = 606\ \text{K}^2$$

$$T_H - T_{amb} = 24.62\ \text{K}$$

$$T_{amb} = 30 - 24.62 = \mathbf{5.38^oC}$$

Comment: That of course is not a very low temperature and the size of the system is not adequate for most locations.

5.109

An air-conditioner with a power input of 1.2 kW is working as a refrigerator (β = 3) or as a heat pump (β' = 4). It maintains an office at 20°C year round which exchanges 0.5 kW per degree temperature difference with the atmosphere. Find the maximum and minimum outside temperature for which this unit is sufficient.

Solution:

Analyze the unit in heat pump mode

Replacement heat transfer equals the loss: $\dot{Q} = 0.5$ kW/K $(T_H - T_{amb})$

$$\dot{W} = \frac{\dot{Q}_H}{\beta'} = 0.5 \text{ kW/K } \frac{T_H - T_{amb}}{4}$$

$$T_H - T_{amb} = 4 \frac{\dot{W}}{0.5} = 9.6 \text{ K}$$

Heat pump mode: Minimum $T_{amb} = 20 - 9.6 =$ **10.4 °C**

The unit as a refrigerator must cool with rate: $\dot{Q} = 0.5 (T_{amb} - T_{house})$

$$\dot{W} = \frac{\dot{Q}_L}{\beta}$$**Error! Bookmark not defined.** $= 0.5$ kW/K $(T_{amb} - T_{house}) / 3$

$$T_{amb} - T_{house} = 3 \frac{\dot{W}}{0.5} = 7.2 \text{ K}$$

Refrigerator mode: Maximum $T_{amb} = 20 + 7.2 =$ **27.2 °C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.110

An air-conditioner on a hot summer day removes 8 kW of energy from a house at 21°C and pushes energy to the outside which is at at 31°C. The house has 15 000 kg mass with an average specific heat of 0.95 kJ/kgK. In order to do this the cold side of the air-conditioner is at 5°C and the hot side is at 40°C. The air-conditioner (refrigerator) has a COP that is 60% of a corresponding Carnot refrigerator. Find the actual COP of the air-conditioner and the power required to run it.

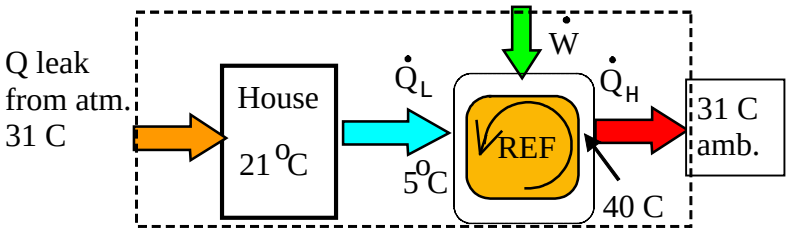
A steady state refrigerator definition of COP

$$\text{COP} = \beta_{REF} = \dot{Q}_L / \dot{W} = \dot{Q}_L / (\dot{Q}_H - \dot{Q}_L) = 0.6\, \beta_{Carnot}$$

Carnot:
$$\beta_{Carnot} = \frac{T_L}{T_H - T_L} = \frac{5 + 273.15}{40 - 5} = 7.95$$

$$\beta_{REF} = 0.6 \times 7.95 = \mathbf{4.77}$$

$$\Rightarrow \quad \dot{W} = \dot{Q}_L / \beta_{REF} = 8 \text{ kW} / 4.77 = \mathbf{1.68\ kW}$$



Any heat transfer must go from a higher to a lower T domain.

5.111

The air-conditioner in the previous problem is turned off. How quickly does the house heat up in degrees per second (^{o}C/s)?

Once the A/C unit is turned off we do not cool the house so heat leaks in from the atm. at a rate of 8 kW (that is what we had to remove to keep steady state).

Energy Eq.: $$\dot{E}_{CV} = \dot{Q}_{leak} = 8 \text{ kW} = m_{house} C_P \frac{dT}{dt}$$

$$\frac{dT}{dt} = \dot{Q}_{leak} / m_{house} C_P$$

$$= \frac{8 \text{ kW}}{15\,000 \times 0.95 \text{ kJ/K}} = \mathbf{0.56 \times 10^{-3} \text{ K/s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.112

Air in a rigid 1 m^3 box is at 300 K, 200 kPa. It is heated to 600 K by heat transfer from a reversible heat pump that receives energy from the ambient at 300 K besides the work input. Use constant specific heat at 300 K. Since the coefficient of performance changes write $dQ = m_{air} C_v dT$ and find dW. Integrate dW with temperature to find the required heat pump work.

Solution:

$$\text{COP:} \qquad \beta' = \frac{Q_H}{W} = \frac{Q_H}{Q_H - Q_L} \cong \frac{T_H}{T_H - T_L}$$

$$m_{air} = P_1 V_1 / RT_1 = 200 \times 1 / 0.287 \times 300 = 2.322 \text{ kg}$$

$$dQ_H = m_{air} C_v dT_H = \beta' dW \cong \frac{T_H}{T_H - T_L} dW$$

$$\Rightarrow \qquad dW = m_{air} C_v \left[\frac{T_H}{T_H - T_L} \right] dT_H$$

$$_1W_2 = \int m_{air} C_v \left(1 - \frac{T_L}{T} \right) dT = m_{air} C_v \int \left(1 - \frac{T_L}{T} \right) dT$$

$$= m_{air} C_v \left[T_2 - T_1 - T_L \ln \frac{T_2}{T_1} \right]$$

$$= 2.322 \text{ kg} \times 0.717 \text{ kJ/kg-K} \left[600 - 300 - 300 \ln \frac{600}{300} \right] \text{K} = \mathbf{153.1\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.113

A Carnot heat engine, shown in Fig. P5.113, receives energy from a reservoir at T_{res} through a heat exchanger where the heat transferred is proportional to the temperature difference as $\dot{Q}_H = K(T_{res} - T_H)$. It rejects heat at a given low temperature T_L. To design the heat engine for maximum work output show that the high temperature, T_H, in the cycle should be selected as $T_H = \sqrt{T_{res} T_L}$

Solution:

$$W = \eta_{TH} Q_H = \frac{T_H - T_L}{T_H} \times K(T_{res} - T_H) ; \quad \text{maximize } W(T_H) \Rightarrow \frac{\delta W}{\delta T_H} = 0$$

$$\frac{\delta W}{\delta T_H} = K(T_{res} - T_H) T_L T_H^{-2} - K(1 - T_L/T_H) = 0$$

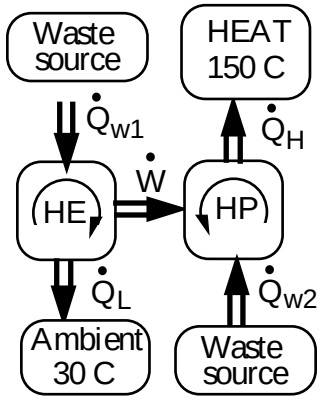
$$\Rightarrow \mathbf{T_H = \sqrt{T_{res} T_L}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.114

A combination of a heat engine driving a heat pump (see Fig. P5.114) takes waste energy at 50°C as a source Q_{w1} to the heat engine rejecting heat at 30°C. The remainder Q_{w2} goes into the heat pump that delivers a Q_H at 150°C. If the total waste energy is 5 MW find the rate of energy delivered at the high temperature.

Solution:



Waste supply: $\dot{Q}_{w1} + \dot{Q}_{w2} = 5$ MW

Heat Engine:

$$\dot{W} = \eta \dot{Q}_{w1} = (1 - T_{L1} / T_{H1}) \dot{Q}_{w1}$$

Heat pump:

$$\dot{W} = \dot{Q}_H / \beta_{HP} = \dot{Q}_{W2} / \beta'$$

$$= \dot{Q}_{w2} / [T_{H1} / (T_H - T_{H1})]$$

Equate the two work terms:

$$(1 - T_{L1} / T_{H1}) \dot{Q}_{w1} = \dot{Q}_{w2} \times (T_H - T_{H1}) / T_{H1}$$

Substitute $\dot{Q}_{w1} = 5 \text{ MW} - \dot{Q}_{w2}$

$$(1 - 303.15/323.15)(5 - \dot{Q}_{w2}) = \dot{Q}_{w2} \times (150 - 50) / 323.15$$

$$20 (5 - \dot{Q}_{w2}) = \dot{Q}_{w2} \times 100 \quad \Rightarrow \quad \dot{Q}_{w2} = 0.8333 \text{ MW}$$

$$\dot{Q}_{w1} = 5 - 0.8333 = 4.1667 \text{ MW}$$

$$\dot{W} = \eta \dot{Q}_{w1} = 0.06189 \times 4.1667 = 0.258 \text{ MW}$$

$$\dot{Q}_H = \dot{Q}_{w2} + \dot{W} = \mathbf{1.09\ MW}$$

(For the heat pump $\beta' = 423.15 / 100 = 4.23$)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.115

A furnace, shown in Fig. P5.115, can deliver heat, Q_{H1} at T_{H1} and it is proposed to use this to drive a heat engine with a rejection at T_{atm} instead of direct room heating. The heat engine drives a heat pump that delivers Q_{H2} at T_{room} using the atmosphere as the cold reservoir. Find the ratio Q_{H2}/Q_{H1} as a function of the temperatures. Is this a better set-up than direct room heating from the furnace?

Solution:

C.V.: Heat Eng.: $\dot{W}_{HE} = \eta \dot{Q}_{H1}$ where $\eta = 1 - T_{atm}/T_{H1}$

C.V.: Heat Pump: $\dot{W}_{HP} = \dot{Q}_{H2}/\beta'$ where $\beta' = T_{rm}/(T_{rm} - T_{atm})$

Work from heat engine goes into heat pump so we have

$$\dot{Q}_{H2} = \beta' \dot{W}_{HP} = \beta' \eta \dot{Q}_{H1}$$

and we may substitute T's for β', η. If furnace is used directly $\dot{Q}_{H2} = \dot{Q}_{H1}$, so if $\beta'\eta > 1$ this proposed setup is better. Is it? For $T_{H1} > T_{atm}$ formula shows that it is good for Carnot cycles. In actual devices it depends whether $\beta'\eta > 1$ is obtained.

5.116

Consider the rock bed thermal storage in Problem 5.60. Use the specific heat so you can write dQ_H in terms of dT_{rock} and find the expression for dW out of the heat engine. Integrate this expression over temperature and find the total heat engine work output.

Solution:

The rock provides the heat Q_H

$$dQ_H = -dU_{rock} = -mC\ dT_{rock}$$

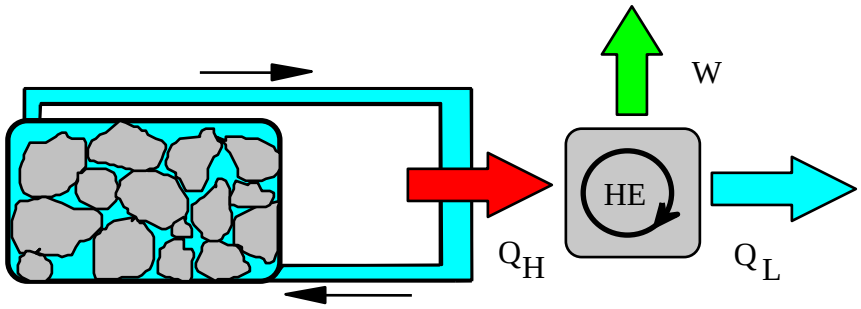
$$dW = \eta dQ_H = -\left(1 - \frac{T_o}{T_{rock}}\right) mC\ dT_{rock}$$

$$m = \rho V = 2750\ kg/m^3 \times 2\ m^3 = 5500\ kg$$

$$_1W_2 = \int -\left(1 - \frac{T_o}{T_{rock}}\right) mC\ dT_{rock} = -mC\ [T_2 - T_1 - T_o \ln \frac{T_2}{T_1}]$$

$$= -5500\ kg \times 0.89\ kJ/kg\text{-}K\ [\ 290 - 400 - 290 \ln \frac{290}{400}\ ]\ K$$

$$= \mathbf{81\ 945\ kJ}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.117

Consider a Carnot cycle heat engine operating in outer space. Heat can be rejected from this engine only by thermal radiation, which is proportional to the radiator area and the fourth power of absolute temperature, $\dot{Q}_{rad} \sim KAT^4$. Show that for a given engine work output and given T_H, the radiator area will be minimum when the ratio $T_L/T_H = 3/4$.

Solution:

$$\dot{W}_{NET} = \dot{Q}_H \left(\frac{T_H - T_L}{T_H} \right) = \dot{Q}_L \left(\frac{T_H - T_L}{T_L} \right); \qquad \text{also} \quad \dot{Q}_L = KAT_L^4$$

$$\frac{\dot{W}_{NET}}{KT_H^4} = \frac{AT_L^4}{T_H^4} \left(\frac{T_H}{T_L} - 1 \right) = A \left[\left(\frac{T_L}{T_H} \right)^3 - \left(\frac{T_L}{T_H} \right)^4 \right] = \text{const}$$

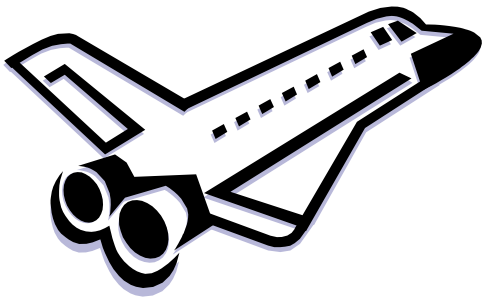
Differentiating,

$$dA \left[\left(\frac{T_L}{T_H} \right)^3 - \left(\frac{T_L}{T_H} \right)^4 \right] + A \left[3 \left(\frac{T_L}{T_H} \right)^2 - 4 \left(\frac{T_L}{T_H} \right)^3 \right] d\left(\frac{T_L}{T_H} \right) = 0$$

$$\frac{dA}{d(T_L/T_H)} = - A \left[3 \left(\frac{T_L}{T_H} \right)^2 - 4 \left(\frac{T_L}{T_H} \right)^3 \right] \Big/ \left[\left(\frac{T_L}{T_H} \right)^3 - \left(\frac{T_L}{T_H} \right)^4 \right] = 0$$

$$\frac{T_L}{T_H} = \frac{3}{4} \qquad \text{for min. A}$$

Check that it is minimum and not maximum with the 2nd derivative > 0.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.118

A Carnot heat engine operating between a high T_H and low T_L energy reservoirs has an efficiency given by the temperatures. Compare this to two combined heat engines one operating between T_H and an intermediate temperature T_M giving out work W_A and the other operating between T_M and T_L giving out W_B. The combination must have the same efficiency as the single heat engine so the heat transfer ratio $Q_H/Q_L = \psi(T_H,T_L) = [Q_H/Q_M]\,[Q_M/Q_L]$. The last two heat transfer ratios can be expressed by the same function $\psi()$ involving also the temperature T_M. Use this to show a condition the function $\psi()$ must satisfy.

The overall heat engine is a Carnot heat engine so

$$\dot{Q}_H / \dot{Q}_L = \frac{T_H}{T_L} = \psi(T_H,T_L)$$

The individual heat engines

$$\dot{Q}_H / \dot{Q}_M = \psi(T_H,T_M) \quad \text{and} \quad \dot{Q}_M / \dot{Q}_L = \psi(T_M,T_L)$$

Since an identity is

$$\dot{Q}_H / \dot{Q}_L = [\dot{Q}_H / \dot{Q}_M]\;\; [\dot{Q}_M / \dot{Q}_L] = \psi(T_H,T_L)$$

it follows that we have

$$\psi(T_H,T_L) = \psi(T_H,T_M) \times \;\psi(T_M,T_L)$$

Notice here that the product of the two functions must cancel the intermediate temperature T_M, this shows a condition the function $\psi()$ must satisfy. The Kelvin and Rankine temperature scales are determined by the choice of the function

$$\psi(T_H,T_L) = \;T_H / T_L = \dot{Q}_H / \dot{Q}_L$$

satisfying the above restriction.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.119

On a cold (-10°C) winter day a heat pump provides 20 kW to heat a house maintained at 20°C and it has a COP_{HP} of 4 using the maximum power available.

The next day a winter storm brings the outside to -15°C, assuming that the COP_{HP} changes by the same percentage as a Carnot unit and that the house loses heat to the outside air. How cold is the house then?

If we look at the heat loss for the house we have

$$\dot{Q}_{loss} = 20 \text{ kW} = \text{CA } \Delta T \quad \Rightarrow \quad \text{CA} = \frac{20 \text{ kW}}{20 - (-10) \text{ K}} = 0.667 \text{ kW/K}$$

$$\dot{Q}_{loss} = \dot{Q}_H = \text{COP } \dot{W} \quad \Rightarrow \quad \dot{W} = \dot{Q}_{loss}/\text{COP} = \frac{20 \text{ kW}}{4} = 5 \text{ kW}$$

$$\text{At } = -10^{o}\text{C:} \qquad \beta'_{\text{Carnot 1}} = \frac{T_H}{T_H - T_{L1}} = \frac{293.15}{20 - (-10)} = 9.772$$

With a changed COP we get

$$\text{COP}_{HP} = 4\, \beta'_{\text{Carnot 2}}/\beta'_{\text{Carnot 1}} = (4/9.772)\, \beta'_{\text{Carnot 2}}$$

At the new unknown temperature of the house, T_H, we have

$$\beta'_{\text{Carnot 2}} = \frac{T_H}{T_H - T_{L2}}; \qquad \dot{Q}_{loss} = \text{CA } (T_H - T_{L2})$$

The energy equation for the house becomes $\dot{Q}_{loss} = \dot{Q}_H$ and substitution gives

$$0.667 \text{ kW/K } (T_H - T_{L2}) = \text{COP}_{HP}\ \dot{W} = (4/9.772)\, \frac{T_H}{T_H - T_{L2}}\, 5 \text{ kW}$$

or $$(T_H - T_{L2})^2 = \frac{4 \times 5 \text{ kW}}{9.772 \times 0.667 \text{ kW/K}}\, T_H = 3.07 \text{ K} \times T_H$$

Solve with $x = T_H - T_{L2}$, $x^2 - 3.07\, x - 3.07(273.15 - 15) = 0$,

$$x = 3.07/2 + [\, (3.07/2)^2 + 792.52\,]^{1/2} = 29.729$$

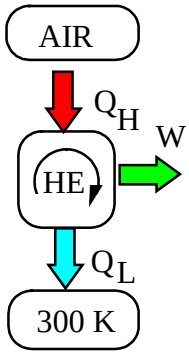
$$T_H = x + T_{L2} = 29.729 - 15 = \mathbf{14.7^{o}C}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.120

A 10-m^3 tank of air at 500 kPa, 600 K acts as the high-temperature reservoir for a Carnot heat engine that rejects heat at 300 K. A temperature difference of 25°C between the air tank and the Carnot cycle high temperature is needed to transfer the heat. The heat engine runs until the air temperature has dropped to 400 K and then stops. Assume constant specific heat capacities for air and find how much work is given out by the heat engine.

Solution:



$$T_H = T_{air} - 25°C, \quad T_L = 300 \text{ K}$$

$$m_{air} = \frac{P_1 V}{R T_1} = \frac{500 \times 10}{0.287 \times 600} = 29.04 \text{ kg}$$

$$dW = \eta dQ_H = \left(1 - \frac{T_L}{T_{air} - 25}\right) dQ_H$$

$$dQ_H = -m_{air} du = -m_{air} C_v dT_{air}$$

$$W = \int dW = -m_{air} C_v \int \left[1 - \frac{T_L}{T_a - 25}\right] dT_a$$

$$= -m_{air} C_v \left[T_{a2} - T_{a1} - T_L \ln \frac{T_{a2} - 25}{T_{a1} - 25}\right]$$

$$= -29.04 \text{ kg} \times 0.717 \text{ kJ/kg-K} \times \left[400 - 600 - 300 \ln \frac{375}{575}\right] \text{K}$$

$$= \mathbf{1494.3 \text{ kJ}}$$

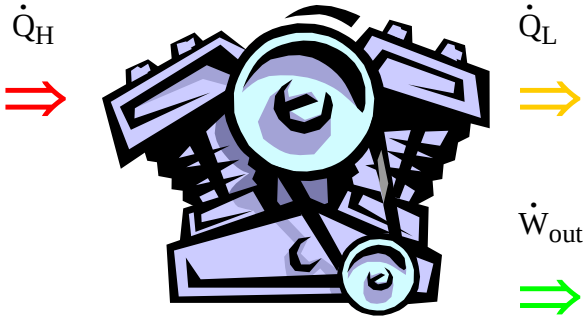
5.122E

A lawnmower tractor engine produces 18 hp using 40 Btu/s of heat transfer from burning fuel. Find the thermal efficiency and the rate of heat transfer rejected to the ambient?

Conversion Table A.1: 18 hp = 18 × (2544.4/3600) Btu/s = 12.722 Btu/s

Efficiency: $\eta_{TH} = \dot{W}_{out}/\dot{Q}_H = \frac{12.722}{40} =$ **0.318**

Energy equation: $\dot{Q}_L = \dot{Q}_H - \dot{W}_{out} = 40 - 12.72 =$ **27.3 Btu/s**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.123E

Calculate the thermal efficiency of the steam power plant cycle described in Problem 4.198.

Solution:

From solution to problems 4.198, 199

$$\dot{W}_{NET} = 33\,000 - 400 = 32\,600 \text{ hp} = 8.3 \times 10^7 \text{ Btu/h}$$

$$\dot{Q}_{H,tot} = \dot{Q}_{econ} + \dot{Q}_{gen}$$

$$= 4.75 \times 10^7 + 2.291 \times 10^8 = 2.766 \times 10^8 \text{ Btu/h};$$

$$\eta = \frac{\dot{W}}{\dot{Q}_H} = \frac{8.3 \times 10^7}{2.766 \times 10^8} = \mathbf{0.30}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.124E

A large coal fired power plant has an efficiency of 45% and produces net 1500 MW of electricity. Coal releases 12 500 Btu/lbm as it burns so how much coal is used per hour?

From the definition of the thermal efficiency and the energy release by the combustion called heating value HV we get

$$\dot{W} = \eta \, \dot{Q}_H = \eta \cdot \dot{m} \cdot HV$$

then

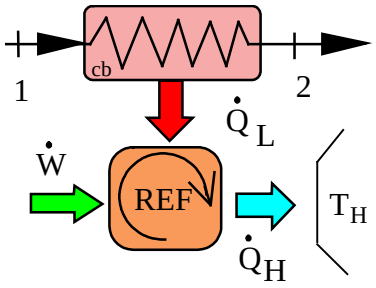
$$\dot{m} = \frac{\dot{W}}{\eta \times HV} = \frac{1500 \text{ MW}}{0.45 \times 12\,500 \text{ btu/lbm}} = \frac{1500 \times (1000/1.055) \text{ Btu/s}}{0.45 \times 12\,500 \text{ Btu/lbm}}$$

$$= 252.765 \text{ lbm/s} = \mathbf{909\,950 \text{ lbm/h}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.125E

An industrial machine is being cooled by 0.8 lbm/s water at 60 F which is chilled from 95 F by a refrigeration unit with a COP of 3. Find the rate of cooling required and the power input to the unit.



Energy equation for heat exchanger

$$\dot{Q}_L = \dot{m}(h_1 - h_2) = \dot{m}\, C_P\, (T_1 - T_2)$$

$$= 0.8 \text{ lbm/s} \times 1 \text{ Btu/lbm-R} \times (95 - 60) \text{ R}$$

$$= 28 \text{ Btu/s}$$

$$\beta = \text{COP} = \dot{Q}_L / \dot{W} \quad \Rightarrow$$

$$\dot{W} = \dot{Q}_L / \beta = 28 / 3 = \mathbf{9.33\ Btu/s}$$

Comment: An outside cooling tower is often used for this, see Chapter 11.

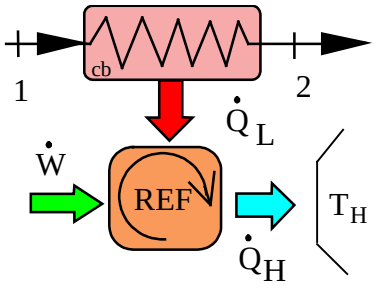
5.126E

A water cooler for drinking water should cool 10 gal/h water from 65 F to 50 F using a small refrigeration unit with a COP of 2.5. Find the rate of cooling required and the power input to the unit.



The mass flow rate is

$$\dot{m} = \rho\dot{V} = \frac{10 \times 231/12^3}{0.01603}\frac{1}{3600}\ \text{lbm/s} = 0.0232\ \text{lbm/s}$$

Energy equation for heat exchanger

$$\dot{Q}_L = \dot{m}(h_1 - h_2) = \dot{m}\, C_P\, (T_1 - T_2)$$

$$= 0.0232 \times 1.0 \times (65 - 50) = 0.348\ \text{Btu/s}$$

$$\beta = \text{COP} = \dot{Q}_L / \dot{W} \quad \Rightarrow \quad \dot{W} = \dot{Q}_L / \beta = 0.348\ (\text{Btu/s}) / 2.5 = \mathbf{0.139\ Btu/s}$$

Comment: The unit does not operate continuously.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

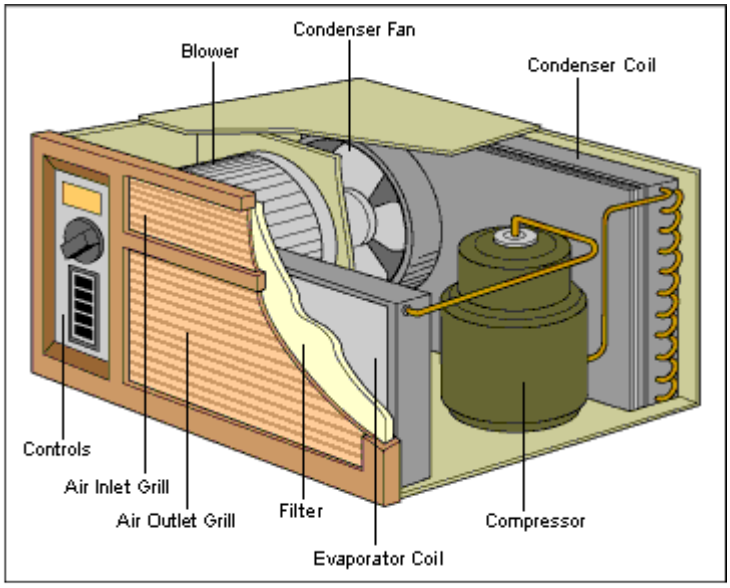
5.127E

A window air-conditioner unit is placed on a laboratory bench and tested in cooling mode using 0.75 Btu/s of electric power with a COP of 1.75. What is the cooling power capacity and what is the net effect on the laboratory?

Definition of COP: $\beta = \dot{Q}_L / \dot{W}$

Cooling capacity: $\dot{Q}_L = \beta \dot{W} = 1.75 \times 0.75 =$ **1.313 Btu/s**

For steady state operation the $\dot{Q}_L$ comes from the laboratory and $\dot{Q}_H$ goes to the laboratory giving a net to the lab of $\dot{W} = \dot{Q}_H - \dot{Q}_L = 0.75$ Btu/s, that is heating it.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

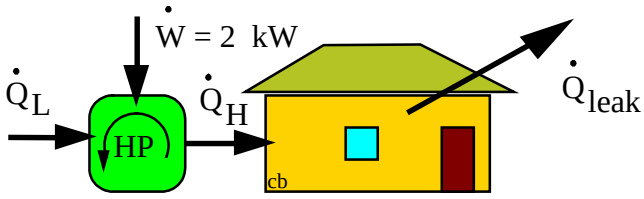
5.128E

A farmer runs a heat pump with a 2 kW motor. It should keep a chicken hatchery at 90 F, which loses energy at a rate of 10 Btu/s to the colder ambient T_{amb}. What is the minimum coefficient of performance that will be acceptable for the heat pump?

Power input: $\dot{W} = 2$ kW $= 2 \times 2544.4 / 3600 = 1.414$ Btu/s

Energy Eq. for hatchery: $\dot{Q}_H = \dot{Q}_{Loss} = 10$ Btu/s

Definition of COP: $\beta = COP = \dfrac{\dot{Q}_H}{\dot{W}} = \dfrac{10}{1.414} = \mathbf{7.07}$

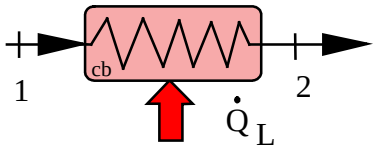


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.129E

R-410A enters the evaporator (the cold heat exchanger) in an A/C unit at 0 F, x = 28% and leaves at 0 F, x = 1. The COP of the refrigerator is 1.5 and the mass flow rate is 0.006 lbm/s. Find the net work input to the cycle.

Energy equation for heat exchanger



$$\dot{Q}_L = \dot{m}(h_2 - h_1) = \dot{m}[h_g - (h_f + x_1\, h_{fg})]$$

$$= \dot{m}[h_{fg} - x_1\, h_{fg}] = \dot{m}\,(1 - x_1)h_{fg}$$

$$= 0.006 \text{ lbm/s} \times 0.72 \times 103.76 \text{ Btu/lbm} = 0.448 \text{ Btu/s}$$

$$\beta = \text{COP} = \dot{Q}_L / \dot{W} \quad \Rightarrow \quad \dot{W} = \dot{Q}_L / \beta = 0.448 / 1.5 = \mathbf{0.3\ Btu/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.130E

A large stationary diesel engine produces 2 000 hp with a thermal efficiency of 40%. The exhaust gas, which we assume is air, flows out at 1400 R and the intake is 520 R. How large a mass flow rate is that if that accounts for half the $\dot{Q}_L$? Can the exhaust flow energy be used?

Power $\quad 2\ 000\ \text{hp} = 2\ 000 \times 2544.4 / 3600 = 1413.6\ \text{Btu/s}$

Heat engine: $\quad \dot{Q}_H = \dot{W}_{out}/\eta_{TH} = \dfrac{14\ 136}{0.4} = 3534\ \text{Btu/s}$

Energy equation: $\quad \dot{Q}_L = \dot{Q}_H - \dot{W}_{out} = 3534 - 1413.6 = 2120.4\ \text{Btu/s}$

Exhaust flow: $\quad \frac{1}{2}\dot{Q}_L = \dot{m}_{air}(h_{1400} - h_{520})$

$$\dot{m}_{air} = \frac{1}{2}\frac{\dot{Q}_L}{h_{1400} - h_{520}} = \frac{1}{2}\frac{2120.4}{343.02 - 124.38} = \mathbf{4.85\ lbm/s}$$

The flow of hot gases can be used to heat a building or it can be used to heat water in a steam power plant since it operates at lower temperatures.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.131E

Calculate the amount of work input a refrigerator needs to make ice cubes out of a tray of 0.5 lbm liquid water at 50 F. Assume the refrigerator has $\beta = 3.5$ and a motor-compressor of 750 W. How much time does it take if this is the only cooling load?

Solution:

C.V. Water in tray. We neglect tray mass.

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process : $P = \text{constant} = P_o$

${}_1W_2 = \int P\, dV = P_o m(v_2 - v_1)$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$

Tbl. F.7.1 : $h_1 = 18.05$ Btu/lbm, Tbl. F.7.4 : $h_2 = -143.34$ Btu/lbm

${}_1Q_2 = 0.5(-143.34 - 18.05) = -80.695$ Btu

Consider now refrigerator

$\beta = Q_L/W$

$W = Q_L/\beta = -{}_1Q_2/\beta = 80.695/3.5 =$ **23.06 Btu**

For the motor to transfer that amount of energy the time is found as

$W = \int \dot{W}\, dt = \dot{W}\, \Delta t$

$\Delta t = W/\dot{W} = (23.06 \times 1055)/750 =$ **32.4 s**

Comment: We neglected a baseload of the refrigerator so not all the 750 W are available to make ice, also our coefficient of performance is very optimistic and finally the heat transfer is a transient process. All this means that it will take much more time to make ice-cubes.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Carnot Cycles and Absolute T

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.132E

Calculate the thermal efficiency of a Carnot-cycle heat engine operating between reservoirs at 920 F and 110 F. Compare the result with that of Problem 5.123.

Solution:

$$T_H = 920 \text{ F}, \quad T_L = 110 \text{ F}$$

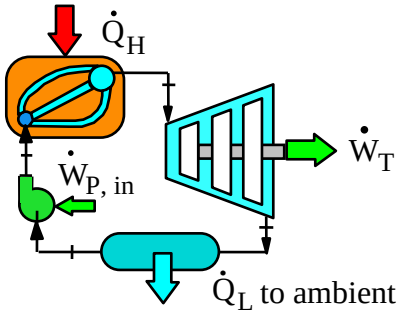
$$\eta_{Carnot} = 1 - \frac{T_L}{T_H} = 1 - \frac{110 + 459.67}{920 + 459.67} = \mathbf{0.587}$$ (about twice 5.123: 0.3)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.133E

A steam power plant has 1200 F in the boiler, 630 Btu/s work out of turbine, 900 Btu/s is taken out at 100 F in the condenser and the pump work is 30 Btu/s. Find the plant thermal efficiency. Assume the same pump work and heat transfer to the boiler, how much is the turbine power if the plant is running in a Carnot cycle?

Solution:



CV. Total plant:

Energy Eq.:

$$\dot{Q}_H + \dot{W}_{P,in} = \dot{W}_T + \dot{Q}_L$$

$$\dot{Q}_H = 630 + 900 - 30 = 1500 \text{ Btu/s}$$

$$\eta_{TH} = \frac{\dot{W}_T - \dot{W}_{P,in}}{\dot{Q}_H}$$ **Error! Bookmark not defined.** $= \frac{600}{1500} =$ **0.40**

$$\eta_{carnot} = \dot{W}_{net}/\dot{Q}_H = 1 - T_L/T_H = 1 - \frac{100 + 459.67}{1200 + 459.67} = 0.663$$

$$\dot{W}_T - \dot{W}_{P,in} = \eta_{carnot}\dot{Q}_H = 0.663 \times 1500 \text{ Btu/s} = 995 \text{ Btu/s}$$

$$\Rightarrow \quad \dot{W}_T = 995 + 30 = \mathbf{1025}\ \frac{\mathbf{Btu}}{\mathbf{s}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.134E

A large heat pump should upgrade 4000 Btu/s of heat at 175 F to be delivered as heat at 280 F. What is the minimum amount of work (power) input that will drive this?

For the minimum work we assume a Carnot heat pump and $\dot{Q}_L$ = 4000 Btu/s.

$$\beta_{HP} = \frac{\dot{Q}_H}{\dot{W}_{in}} = \frac{T_H}{T_H - T_L} = \frac{459.7 + 280}{280 - 175} = 7.04$$

$$\beta_{REF} = \beta_{HP} - 1 = \frac{\dot{Q}_L}{\dot{W}_{in}} = 6.04$$

Now we can solve for the work

$$\dot{W}_{in} = \dot{Q}_L / \beta_{REF} = 4000/6.04 = \mathbf{662\ Btu/s}$$

This is a domestic or small office building size A/C unit, much smaller than the 4000 Btu/s in this problem.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.135E

A car engine burns 10 lbm of fuel (equivalent to addition of Q_H) at 2600 R and rejects energy to the radiator and the exhaust at an average temperature of 1300 R. If the fuel provides 17 200 Btu/lbm what is the maximum amount of work the engine can provide?

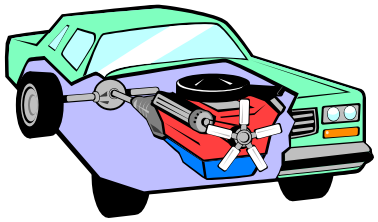
Solution:

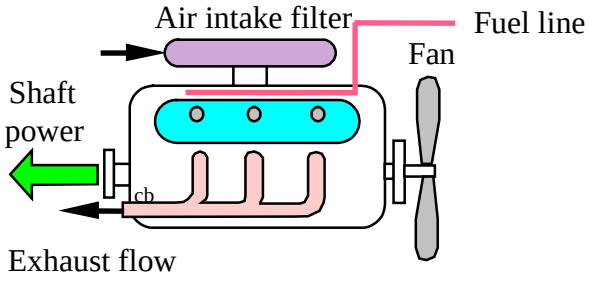
A heat engine $Q_H = m\, q_{fuel} = 10 \times 17200 = 170\ 200$ Btu

Assume a Carnot efficiency (maximum theoretical work)

$$\eta = 1 - \frac{T_L}{T_H} = 1 - \frac{1300}{2600} = 0.5$$

$$W = \eta\, Q_H = 0.5 \times 170\ 200 = \mathbf{85\ 100\ Btu}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.136E

Consider the combination of a heat engine and a heat pump as given in problem 5.41 with a low temperature of 720 R. What should the high temperature be so the heat engine is reversible? For that temperature what is the COP for a reversible heat pump?

For all three cases of the heat engine the ratio between the heat transfers and the work term is the same as:

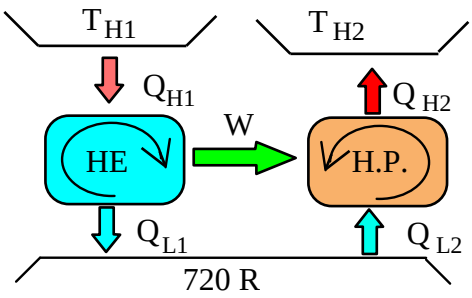
$$\dot{Q}_H : \dot{Q}_L : \dot{W} \quad = \quad 6:4:2 \quad = \quad 3:2:1$$

For a reversible heat engine we must have the heat transfer ratio equal to the temperature ratio so

$$\frac{\dot{Q}_H}{\dot{Q}_L} = \frac{T_H}{T_L} = \frac{3}{2} = \frac{T_H}{720\ R} \quad \Rightarrow \quad T_H = (3/2)\ 720\ R = \mathbf{1080\ R}$$

The COP is

$$COP_{HP} = \dot{Q}_H / \dot{W} = \frac{3}{1} = \mathbf{3} \quad \left(= \frac{T_H}{T_H - T_L} = \frac{1080}{1080 - 720} \right)$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.137E

An air-conditioner provides 1 lbm/s of air at 60 F cooled from outside atmospheric air at 95 F. Estimate the amount of power needed to operate the air-conditioner. Clearly state all assumptions made.

Solution:

Consider the cooling of air which needs a heat transfer as

$$\dot{Q}_{air} = \dot{m}\,\Delta h \cong \dot{m}\,C_p\,\Delta T = 1 \text{ lbm/s} \times 0.24 \text{ Btu/lbm-R} \times (95 - 60) \text{ R}$$

$$= 8.4 \text{ Btu/s}$$

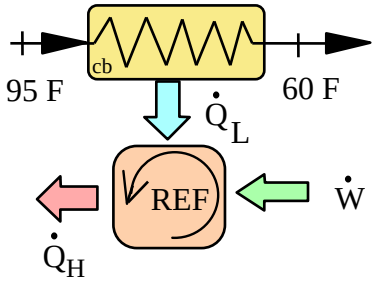
Assume Carnot cycle refrigerator

$$\beta = \frac{\dot{Q}_L}{\dot{W}} = \dot{Q}_L / (\dot{Q}_H - \dot{Q}_L) \cong \frac{T_L}{T_H - T_L} = \frac{60 + 459.67}{95 - 60} = 14.8$$

$$\dot{W} = \dot{Q}_L / \beta = \frac{8.4}{14.8} = \mathbf{0.57\ Btu/s}$$

This estimate is the theoretical maximum performance. To do the required heat transfer $T_L \cong 40$ F and $T_H = 110$ F are more likely; secondly

$$\beta < \beta_{carnot}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

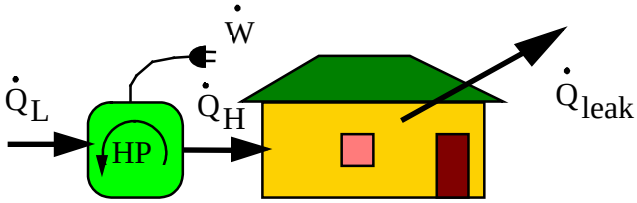
5.138E

We propose to heat a house in the winter with a heat pump. The house is to be maintained at 68 F at all times. When the ambient temperature outside drops to 15 F, the rate at which heat is lost from the house is estimated to be 80 000 Btu/h. What is the minimum electrical power required to drive the heat pump?

Solution:

Minimum power if we assume a Carnot cycle

$\dot{Q}_H = \dot{Q}_{leak} = 80\ 000$ Btu/h



$$\beta' = \frac{\dot{Q}_H}{\dot{W}_{IN}} = \frac{T_H}{T_H - T_L} = \frac{527.7}{68 - 15} = 9.957$$

$$\Rightarrow \dot{W}_{IN} = 80\ 000 / 9.957 = 8035 \text{ Btu/h} = \mathbf{2.355\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.139E

Consider the setup with two stacked (temperature wise) heat engines as in Fig. P5.4. Let T_H = 1500 R, T_M = 1000 R and T_L = 650 R. Find the two heat engine efficiencies and the combined overall efficiency assuming Carnot cycles.

The individual efficiencies

$$\eta_1 = 1 - \frac{T_M}{T_H} = 1 - \frac{1000}{1500} = \mathbf{0.333}$$

$$\eta_2 = 1 - \frac{T_L}{T_M} = 1 - \frac{650}{1000} = \mathbf{0.35}$$

The overall efficiency

$$\eta_{TH} = \dot{W}_{net} / \dot{Q}_H = (\dot{W}_1 + \dot{W}_2) / \dot{Q}_H = \eta_1 + \dot{W}_2 / \dot{Q}_H$$

For the second heat engine and the energy Eq. for the first heat engine

$$\dot{W}_2 = \eta_2 \dot{Q}_M = \eta_2 (1 - \eta_1) \dot{Q}_H$$

so the final result is

$$\eta_{TH} = \eta_1 + \eta_2 (1 - \eta_1) = 0.333 + 0.35 (1 - 0.333) = \mathbf{0.566}$$

Comment: It matches a single heat engine $\eta_{TH} = 1 - \frac{T_L}{T_H} = 1 - \frac{650}{1500} = 0.567$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.140E

A thermal storage is made with a rock (granite) bed of 70 ft^3 which is heated to 720 R using solar energy. A heat engine receives a Q_H from the bed and rejects heat to the ambient at 520 R. The rock bed therefore cools down and as it reaches 520 R the process stops. Find the energy the rock bed can give out. What is the heat engine efficiency at the beginning of the process and what is it at the end of the process?

Solution:

Assume the whole setup is reversible and that the heat engine operates in a Carnot cycle. The total change in the energy of the rock bed is

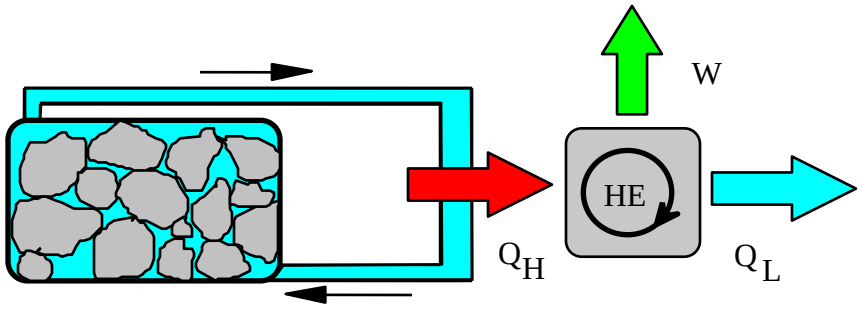
$$u_2 - u_1 = q = C\,\Delta T = 0.21 \text{ Btu/lbm-R } (720 - 520) \text{ R} = 42 \text{ Btu/lbm}$$

$$m = \rho V = 172 \text{ lbm/ft}^3 \times 70 \text{ ft}^3 = 12040 \text{ lbm};$$

$$Q = mq = 12040 \text{ lbm} \times 42 \text{ Btu/lbm} = \mathbf{505\ 680\ Btu}$$

To get the efficiency assume a Carnot cycle device

$$\eta = 1 - T_o / T_H = 1 - 520/720 = \mathbf{0.28} \quad \text{at the beginning of process}$$
$$\eta = 1 - T_o / T_H = 1 - 520/520 = \mathbf{0} \quad \text{at the end of process}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.141E

A heat engine has a solar collector receiving 600 Btu/h per square foot inside which a transfer media is heated to 800 R. The collected energy powers a heat engine which rejects heat at 100 F. If the heat engine should deliver 8500 Btu/h what is the minimum size (area) solar collector?

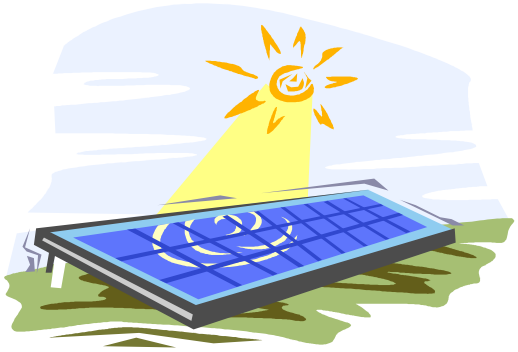
Solution:

$T_H = 800$ R $T_L = 100 + 459.67 = 560$ R

$$\eta_{HE} = 1 - \frac{T_L}{T_H} = 1 - \frac{560}{800} = 0.30$$

$$\dot{W} = \eta \dot{Q}_H \quad => \quad \dot{Q}_H = \frac{\dot{W}}{\eta} = \frac{8500}{0.30} = 28\,333 \text{ Btu/h}$$

$$\dot{Q}_H = 600 \text{ A} \quad => \quad A = \frac{\dot{Q}_H}{600} = \mathbf{47\ ft^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.142E

Six-hundred pound-mass per hour of water runs through a heat exchanger, entering as saturated liquid at 250 F and leaving as saturated vapor. The heat is supplied by a Carnot heat pump operating from a low-temperature reservoir at 60 F with a COP of half of the similar carnot unit. Find the rate of work into the heat pump.

Solution:

C.V. Heat exchanger

$\dot{m}_1 = \dot{m}_2$; $\dot{m}_1 h_1 + \dot{Q}_H = \dot{m}_1 h_2$

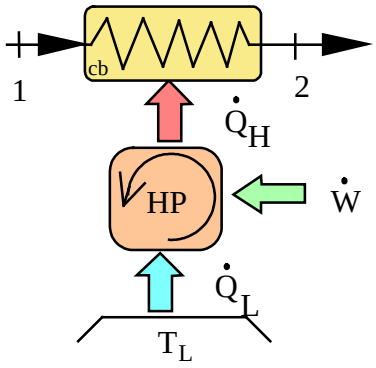


Table F.7.1: h_1 = 218.58 Btu/lbm

h_2 = 1164.19 Btu/lbm

$$\dot{Q}_H = \frac{600}{3600}(1164.19 - 218.58) = 157.6 \text{ Btu/s}$$

For the Carnot heat pump, T_H = 250 F = 710 R.

$$\beta = \dot{Q}_H/\dot{W} = \frac{T_H}{T_H - T_L} = \frac{710}{190} = 3.737$$

$$\beta_{ac} = 3.737/2 = 1.87$$

$$\dot{W} = \dot{Q}_H/\beta_{ac} = 157.6/1.87 = \mathbf{84.3\ Btu/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.143E

A power plant with a thermal efficiency of 40% is located on a river similar to Fig. P5.61. With a total river mass flow rate of 2×10^5 lbm/s at 60 F find the maximum power production allowed if the river water should not be heated more than 2 F.

The maximum heating allowed determines the maximum $\dot{Q}_L$ as

$$\dot{Q}_L = \dot{m}_{H_2O}\, \Delta h = \dot{m}_{H_2O}\, C_{P\ LIQ\ H_2O}\, \Delta T_{H_2O}$$

$$= 2 \times 10^5 \text{ lbm/s} \times 1.0 \text{ Btu/lbm-R} \times 2 \text{ R} = 4 \times 10^5 \text{ Btu/s}$$

$$= \dot{W}_{NET}(1/\eta_{TH\ ac} - 1)$$

$$\dot{W}_{NET} = \dot{Q}_L / (1/\eta_{TH\ ac} - 1) = \dot{Q}_L \frac{\eta_{TH\ ac}}{1 - \eta_{TH\ ac}}$$

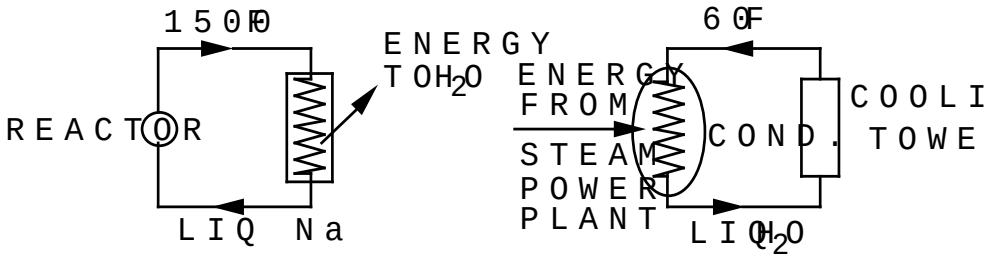
$$= 4 \times 10^5 \text{ Btu/s} \times \frac{0.4}{1 - 0.4} = \mathbf{2.67 \times 10^5\ Btu/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.144E

A nuclear reactor provides a flow of liquid sodium at 1500 F, which is used as the energy source in a steam power plant. The condenser cooling water comes from a cooling tower at 60 F. Determine the maximum thermal efficiency of the power plant. Is it misleading to use the temperatures given to calculate this value?

Solution:



T_H = 1500 F = 1960 R, T_L = 60 F = 520 R

$$\eta_{TH\ MAX} = \frac{T_H - T_L}{T_H} = \frac{1960 - 520}{19860} = 0.735$$

It might be misleading to use 1500 F as the value for T_H, since there is not a supply of energy available at a constant temperature of 1500 F (liquid Na is cooled to a lower temperature in the heat exchanger).

$\Rightarrow$ The Na cannot be used to boil H_2O at 1500 F.

Similarly, the H_2O leaves the cooling tower and enters the condenser at 60 F, and leaves the condenser at some higher temperature.

$\Rightarrow$ The water does not provide for condensing steam at a constant temperature of 60 F.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

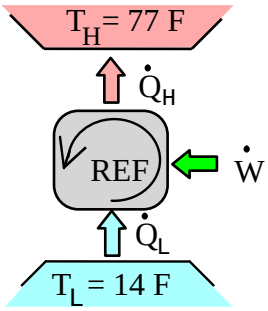
5.145E

An inventor has developed a refrigeration unit that maintains the cold space at 14 F, while operating in a 77 F room. A coefficient of performance of 8.5 is claimed. How do you evaluate this?

Solution:

Assume Carnot cycle then

$$\beta_{Carnot} = \frac{Q_L}{W_{in}} = \frac{T_L}{T_H - T_L} = \frac{14 + 459.67}{77 - 14} = 7.5$$



$8.5 > \beta_{Carnot} \Rightarrow$ **impossible claim**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Finite ΔT Heat Transfer

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.146E

A car engine operates with a thermal efficiency of 35%. Assume the air-conditioner has a coefficient of performance that is one third of the theoretical maximum and it is mechanically pulled by the engine. How much fuel energy should you spend extra to remove 1 Btu at 60 F when the ambient is at 95 F?

Solution:

Air conditioner

$$\beta = \frac{Q_L}{W} = \frac{T_L}{T_H - T_L} = \frac{60 + 459.67}{95 - 60} = 14.8$$

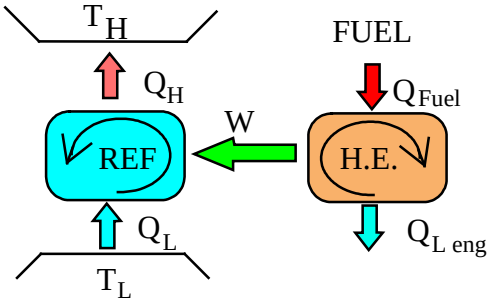
$$\beta_{actual} = \beta / 3 = 4.93$$

$$W = Q_L / \beta = 1 / 4.93 = 0.203 \text{ Btu}$$

Work from engine

$$W = \eta_{eng} Q_{fuel} = 0.203 \text{ Btu}$$

$$Q_{fuel} = W / \eta_{eng} = \frac{0.203}{0.35} = \mathbf{0.58\ Btu}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.147E

In a remote location you run a heat engine to provide the power to run a refrigerator. The input to the heat engine is at 1450 R and the low T is 700 R, it has an actual efficiency equal to ½ of the corresponding Carnot unit. The refrigerator has a T_L = 15 F and T_H = 95 F with a COP that is 1/3 of the corresponding Carnot unit. Assume a cooling capacity of 7000 Btu/h is needed and find the rate of heat input to the heat engine.

Heat engine: $\eta_{Carnot} = 1 - \dfrac{T_L}{T_H} = 1 - \dfrac{700}{1450} = 0.517; \quad \eta_{ac} = 0.259$

Refrigerator: $\beta_{ref.\ Carnot} = \dfrac{T_L}{T_H - T_L} = \dfrac{459.7 + 15}{95 - 15} = 5.934; \quad \beta_{ref.\ ac} = 1.978$

Cooling capacity: $\dot{Q}_L = 7000$ Btu/h $= \beta_{ref.\ ac}\, \dot{W}$;

$$\dot{W} = 7000 \text{ Btu/h} / 1.978 = 3538.9 \text{ Btu/h}$$

This work must be provided by the heat engine $\dot{W} = \eta_{ac}\, \dot{Q}_H$

$$\dot{Q}_H = \dot{W} / \eta_{ac} = 3538.9 \text{ (Btu/h)} / 0.259 = 13\,664 \text{ Btu/h}$$

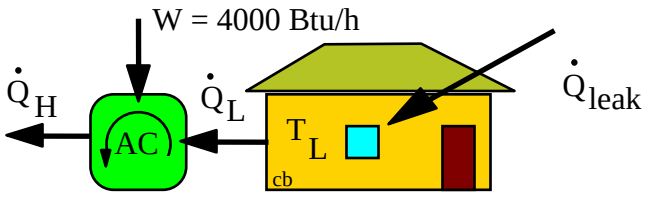
$$= \mathbf{3.796\ Btu/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.148E

A heat pump cools a house at 70 F with a maximum of 4000 Btu/h power input. The house gains 2000 Btu/h per degree temperature difference to the ambient and the heat pump coefficient of performance is 60% of the theoretical maximum. Find the maximum outside temperature for which the heat pump provides sufficient cooling.

Solution:



Here:
$T_L = T_{house}$
$T_H = T_{amb}$

In this setup the low temperature space is the house and the high temperature space is the ambient. The heat pump must remove the gain or leak heat transfer to keep it at a constant temperature.

$$\dot{Q}_{leak} = 2000\ (T_{amb} - T_{house}) = \dot{Q}_L$$

which must be removed by the heat pump.

$$\beta' = \dot{Q}_H / \dot{W} = 1 + \dot{Q}_L / \dot{W} = 0.6\ \beta'_{carnot} = 0.6\ T_{amb} / (T_{amb} - T_{house})$$

Substitute in for $\dot{Q}_L$ and multiply with $(T_{amb} - T_{house})$:

$$(T_{amb} - T_{house}) + 2000\ (T_{amb} - T_{house})^2 / \dot{W} = 0.6\ T_{amb}$$

Since $T_{house} = 529.7$ R and $\dot{W} = 4000$ Btu/h it follows

$$T_{amb}^2 - 1058.6\ T_{amb} + 279522.7 = 0$$

Solving => $T_{amb} =$ **554.5 R = 94.8 F**

Comment: We did assume here that $\beta' = 0.6\ \beta'_{carnot}$, the statement could also have been understood as $\beta = 0.6\ \beta_{carnot}$ which would lead to a slightly different result.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.149E

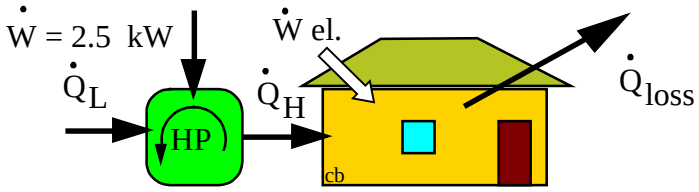
A small house is kept at 77 F inside looses 12 Btu/s to the outside ambient at 32 F. A heat pump is used to help heat the house together with possible electric heat. The heat pump is driven by a motor of 2.5 kW and it has a COP that is ¼ of a Carnot heat pump unit. Find the actual COP for the heat pump and the amount of electric heat that must be used (if any) to maintain the house temperature.

CV. House Energy: $0 = \dot{Q}_H + \dot{W}_{el.} - \dot{Q}_{Loss}$

Definition of COP: $\beta' = COP_{HP} = \dfrac{\dot{Q}_H}{\dot{W}} = \dfrac{1}{4}\dfrac{T_H}{T_H - T_L} = \dfrac{1}{4}\dfrac{536.7}{77 - 32} = \mathbf{2.982}$

$$\dot{Q}_H = COP_{HP}\,\dot{W}_{HP} = 2.982 \times (2.5/1.055)\ \text{Btu/s} = 7.066\ \text{Btu/s}$$

$$\dot{W}_{el.} = \dot{Q}_{Loss} - \dot{Q}_H = 12 - 7.066 = \mathbf{4.934\ Btu/s}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.150E

A house is cooled by an electric heat pump using the outside as the high-temperature reservoir. For several different summer outdoor temperatures estimate the percent savings in electricity if the house is kept at 77 F instead of 68 F. Assume that the house is gaining energy from the outside directly proportional to the temperature difference.

Solution:

Air-conditioner (Refrigerator) $\dot{Q}_{LEAK} \propto (T_H - T_L)$

Max Perf. $\dfrac{\dot{Q}_L}{\dot{W}_{in}} = \dfrac{T_L}{T_H - T_L} = \dfrac{K(T_H - T_L)}{\dot{W}_{in}}, \quad \dot{W}_{in} = \dfrac{K(T_H - T_L)^2}{T_L}$

A: T_{L_A} = 68 F = 527.7 R B: T_{L_B} = 77 F = 536.7 R

T_H, F	$\dot{W}_{IN_A}/K$	$\dot{W}_{IN_B}/K$	% saving
115	4.186	2.691	35.7 %
105	2.594	1.461	43.7 %
95	1.381	0.604	56.3 %

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.151E

Arctic explorers are unsure if they can use a 5 kW motor driven heat pump to stay warm. It should keep their shelter at 60 F which loses energy at a rate of 0.3 Btu/s per degree difference to the colder ambient. The heat pump has a COP that is 50% of a Carnot heat pump. If the ambient temperature can fall to -10 F at night, would you recommend this heat pump to the explorers?

CV Heat pump.
The heat pump should deliver a rate of heating that equals the heat loss to the ambient for steady inside temperature.

$$\text{COP} = \beta' = \dot{Q}_H/\dot{W} = 0.5\ \beta'_{\text{Carnot}} = \frac{1}{2} \times \frac{T_H}{T_H - T_L} = \frac{1}{2} \times \frac{459.7 + 60}{60 - (-10)} = 3.7$$

The heat pump can then provide a heating capacity of

$$\dot{Q}_H = \beta'\ \dot{W} = 3.7 \times 5\ \text{kW} = 18.5\ \text{kW} = 17.53\ \text{Btu/s}$$

The heat loss is

$$\dot{Q}_{\text{leak out}} = \text{CA}\ \Delta T = 0.3\ \text{Btu/s-R} \times [60 - (-10)]\ \text{R} = 21\ \text{Btu/s}$$

The heat pump is not sufficient to cover the loss and **not recommended**.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.152E

Using the given heat pump in the previous problem how warm could it make the shelter in the arctic night?

The high is now an unknown so both the heat loss and the heat pump performance depends on that. The energy balance around the shelter then gives

$$\dot{Q}_H = \beta' \dot{W} = \dot{Q}_{\text{leak out}} = CA\ \Delta T$$

Substitute the expression for β' and CA ΔT to give

$$\frac{1}{2} \times \frac{T_H}{T_H - T_L} \dot{W} = 0.3 \text{ Btu/s-R} \times [T_H - T_L]$$

Multiply with the temperature difference, factor 2 and divide by the work,
5 kW = (5/1.055) Btu/s, so we get

$$T_H = \frac{0.3 \times 2}{5/1.055\ \text{R}} [T_H - T_L]^2 = \frac{0.1137}{\text{R}} [T_H - T_L]^2$$

Solve this equation like $0.1137\ x^2 - x - T_L = 0$, with $x = T_H - T_L$ and
$T_L = 459.7 - 10 = 449.7$ R

$$x = T_H - T_L = 67.44 \text{ R} \qquad \text{(negative root discarded)}$$

$$T_H = x + T_L = 67.44 - 10 = \mathbf{57.4\ F}$$

Ideal Gas Garnot Cycle

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.153E

Carbon dioxide is used in an ideal gas refrigeration cycle, reverse of Fig. 5.24. Heat absorption is at 450 R and heat rejection is at 585 R where the pressure changes from 180 psia to 360 psia. Find the refrigeration COP and the specific heat transfer at the low temperature.

The analysis is the same as for the heat engine except the signs are opposite so the heat transfers move in the opposite direction.

$$\beta = \dot{Q}_L / \dot{W} = \beta_{carnot} = T_L / (T_H - T_L) = \frac{450}{585 - 450} = \mathbf{3.33}$$

$$q_H = RT_H \ln(v_2/v_1) = RT_H \ln\left(\frac{P_1}{P_2}\right) = 35.1 \text{ ft-lbf/lbm-R} \times 585 \text{ R} \times \ln\left(\frac{360}{180}\right)$$

$$= 14\,232.7 \text{ ft-lbf/lbm} = 18.29 \text{ Btu/lbm}$$

$$q_L = q_H T_L / T_H = 18.29 \times 450 / 585 = \mathbf{14.07 \text{ Btu/lbm}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.154E

Air in a piston/cylinder goes through a Carnot cycle with the P-v diagram shown in Fig. 5.24. The high and low temperatures are 1200 R and 600 R respectively. The heat added at the high temperature is 100 Btu/lbm and the lowest pressure in the cycle is 10 lbf/in.^{2}. Find the specific volume and pressure at all 4 states in the cycle assuming constant specific heats at 80 F.

Solution:

q_H = 100 Btu/lbm, T_H = 1200 R, T_L = 600 R, P_3 = 10 lbf/in.^{2}

C_v = 0.171 Btu/lbm R ; R = 53.34 ft-lbf/lbm-R

The states as shown in figure 5.24

1: 1200 R , 2: 1200 R, 3: 10 psi, 600 R 4: 600 R

As we know state 3 we can work backwards towards state 1

$v_3 = RT_3 / P_3 = 53.34 \times 600 /(10 \times 144) = 22.225$ ft^3/lbm

Process 2→3 from Eq.5.8 & C_v = constant

$=> C_v \ln (T_L / T_H) + R \ln (v_3/v_2) = 0$

$=> \ln (v_3/v_2) = - (C_v / R) \ln (T_L / T_H)$

$= - (0.171/53.34) \ln (600/1200) = 1.7288$

$=> v_2 = v_3 / \exp (1.7288) = 22.225/5.6339 = 3.9449$ ft^3/lbm

Process 1→2 and Eq.5.7: $q_H = RT_H \ln (v_2 / v_1)$

$\ln (v_2 / v_1) = q_H /RT_H = 100 \times 778/(53.34 \times 1200) = 1.21547$

$v_1 = v_2 / \exp (1.21547) = 1.1699$ ft^3/lbm

$v_4 = v_1 \times v_3 / v_2 = 1.1699 \times 22.225/3.9449 = 6.591$ ft^3/lbm

$P_1 = RT_1 / v_1 = 53.34 \times 1200/(1.1699 \times 144) = 379.9$ psia

$P_2 = RT_2 / v_2 = 53.34 \times 1200/(3.9449 \times 144) = 112.7$ psia

$P_4 = RT_4 / v_4 = 53.34 \times 600/(6.591 \times 144) = 33.7$ psia

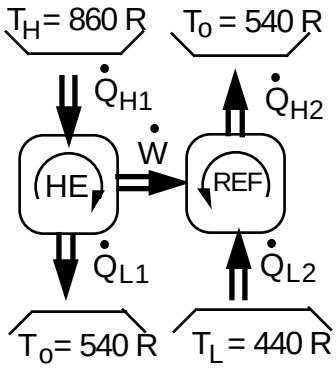
5.155E

We wish to produce refrigeration at −20 F. A reservoir is available at 400 F and the ambient temperature is 80 F, as shown in Fig. P5.104. Thus, work can be done by a cyclic heat engine operating between the 400 F reservoir and the ambient. This work is used to drive the refrigerator. Determine the ratio of the heat transferred from the 400 F reservoir to the heat transferred from the −20 F reservoir, assuming all processes are reversible.

Solution: Equate the work from the heat engine to the refrigerator.



$$\dot{W} = \dot{Q}_{H1}\left(\frac{T_H - T_0}{T_H}\right)$$

also

$$\dot{W} = \dot{Q}_{L2}\left(\frac{T_0 - T_L}{T_L}\right)$$

$$\dot{Q}_{H1} / \dot{Q}_{L2} = \left(\frac{T_O - T_L}{T_L}\right)\left(\frac{T_H}{T_H - T_O}\right) = \frac{100}{440} \times \frac{860}{320} = \mathbf{0.611}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.156E

An air-conditioner on a hot summer day removes 8 Btu/s of energy from a house at 70 F and pushes energy to the outside which is at 88 F. The house has 30 000 lbm mass with an average specific heat of 0.23 Btu/lbm-R. In order to do this the cold side of the air-conditioner is at 40 F and the hot side is 100 F. The air conditioner (refrigerator) has a COP that is 60% of a corresponding Carnot refrigerator. Find the actual air-conditioner COP and the required power to run it.

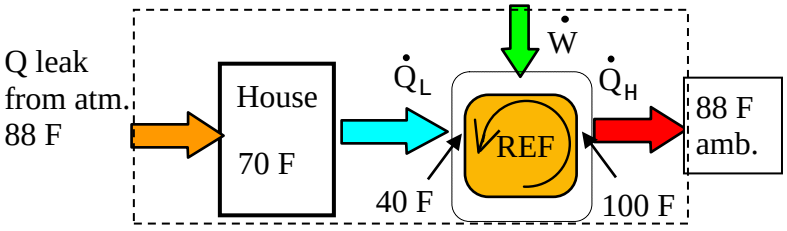
A steady state refrigerator definition of COP

$$\text{COP} = \beta_{REF} = \dot{Q}_L / \dot{W} = \dot{Q}_L / (\dot{Q}_H - \dot{Q}_L) = 0.6\, \beta_{Carnot}$$

Carnot:
$$\beta_{Carnot} = \frac{T_L}{T_H - T_L} = \frac{40 + 459.7}{100 - 40} = 8.328$$

$$\beta_{REF} = 0.6 \times 8.328 = \mathbf{5}$$

$$\Rightarrow \quad \dot{W} = \dot{Q}_L / \beta_{REF} = 8 \text{ Btu/s} / 5 = \mathbf{1.6\ Btu/s}$$



Any heat transfer must go from a higher to a lower T domain.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.157E

The air conditioner in the previous problem is turned off. How fast does the house heat up in degrees per second (F/s)?

Once the A/C unit is turned off we do not cool the house so heat leaks in from the atm. at a rate of 8 Btu/s (that is what we had to remove to keep steady state).

Energy Eq.: $$\dot{E}_{CV} = \dot{Q}_{leak} = 8 \text{ Btu/s} = m_{house}\, C_P \frac{dT}{dt}$$

$$\frac{dT}{dt} = \dot{Q}_{leak} / m_{house}\, C_P$$

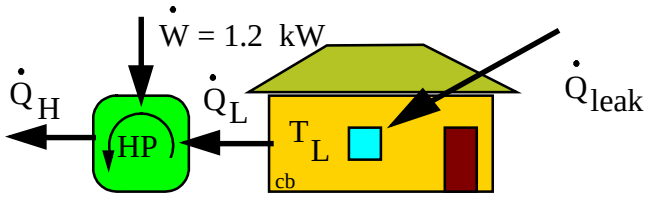
$$= \frac{8 \text{ Btu/s}}{30\,000 \times 0.23 \text{ Btu/R}} = \mathbf{1.16 \times 10^{-3}\ R/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.158E

A window air conditioner cools a room at T_L = 68 F with a maximum of 1.2 kW power input. The room gains 0.33 Btu/s per degree temperature difference to the ambient and the refrigeration COP is $\beta = 0.6\ \beta_{Carnot}$. Find the maximum outside temperature, T_H, for which the air conditioner provides sufficient cooling.

Solution:



Here:

$T_L = T_{house}$

$T_H = T_{amb}$

In this setup the low temperature space is the house and the high temperature space is the ambient. The heat pump must remove the gain or leak heat transfer to keep it at a constant temperature.

$$\dot{Q}_{leak} = 0.33\ (T_{amb} - T_{house}) = \dot{Q}_L$$

which must be removed by the heat pump.

$$\beta = \dot{Q}_L / \dot{W} = 0.6\ \beta_{carnot} = 0.6\ T_{house} / (T_{amb} - T_{house})$$

Substitute in for $\dot{Q}_L$ and multiply with $(T_{amb} - T_{house})\dot{W}$:

$$0.33\ (T_{amb} - T_{house})^2 = 0.6\ T_{house}\ \dot{W}$$

Since T_{house} = 459.7 + 68 = 527.7 R and $\dot{W}$ = 1.2 kW = 1.1374 Btu/s, it follows

$$(T_{amb} - T_{house})^2 = (0.6/0.33) \times 527.7 \times 1.1374 = 1091.28\ R^2$$

Solving $\Rightarrow (T_{amb} - T_{house}) = 33.03 \Rightarrow T_{amb} =$ **560.73 R = 101 F**

Comment: We did assume here that $\beta = 0.6\ \beta_{carnot}$, the statement could also have been understood as $\beta' = 0.6\ \beta'_{carnot}$ which would lead to a slightly different result.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.159E

The room in problem 5.158E has a combined thermal mass of 4 000 lbm wood, 500 lbm steel and 1000 lbm plaster board. Estimate how fast the room heats up if the air-conditioner is turned off on a day it is 95 F outside.

Without the air-conditioner the house gains heat and the energy equation for the house becomes

$$m\,C\,\frac{dT}{dt} = \dot{Q}_{in}$$

The gain is due to the temperature difference as

$$\dot{Q}_{in} = 0.33\,(T_H - T_L) = 0.33\ \text{Btu/s-R}\ (95 - 68)\ \text{R} = 8.91\ \text{Btu/s}$$

The combined (mC) is using an estimate C for gypsum as 0.24 Btu/lbm-R

$$mC = [4000 \times 0.33 + 500 \times 0.11 + 1000 \times 0.24\ ]\ \text{Btu/R} = 1615\ \text{Btu/R}$$

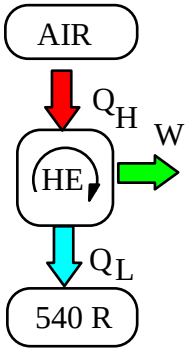
$$\frac{dT}{dt} = \dot{Q}_{in}\ /mC = 8.91\ (\text{Btu/s}) / 1615\ \text{Btu/R} = \mathbf{0.0055\ R/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

5.160E

A 350-ft^3 tank of air at 80 lbf/in.^{2}, 1080 R acts as the high-temperature reservoir for a Carnot heat engine that rejects heat at 540 R. A temperature difference of 45 F between the air tank and the Carnot cycle high temperature is needed to transfer the heat. The heat engine runs until the air temperature has dropped to 700 R and then stops. Assume constant specific heat capacities for air and find how much work is given out by the heat engine.

Solution:



$$T_H = T_{air} - 45\,, \quad T_L = 540 \text{ R}$$

$$m_{air} = \frac{P_1 V}{R T_1} = \frac{80 \times 350 \times 144}{53.34 \times 1080} = 69.991 \text{ lbm}$$

$$dW = \eta dQ_H = \left(1 - \frac{T_L}{T_{air} - 45}\right) dQ_H$$

$$dQ_H = -m_{air} du = -m_{air} C_V dT_{air}$$

$$W = \int dW = -m_{air}\, C_V \int \left[1 - \frac{T_L}{T_a - 45}\right] dT_a$$

$$= -m_{air}\, C_V \left[T_{a2} - T_{a1} - T_L \ln \frac{T_{a2} - 45}{T_{a1} - 45}\right]$$

$$= -69.991 \text{ lbm} \times 0.171 \text{ Btu/lbm-R} \times \left[700 - 1080 - 540 \ln \frac{655}{1035}\right] \text{R}$$

$$= \mathbf{1591 \text{ Btu}}$$

5.161E

Air in a rigid 40 ft^3 box is at 540 R, 30 lbf/in.^{2}. It is heated to 1100 R by heat transfer from a reversible heat pump that receives energy from the ambient at 540 R besides the work input. Use constant specific heat at 540 R. Since the coefficient of performance changes write $dQ = m_{air} C_v dT$ and find dW. Integrate dW with temperature to find the required heat pump work.

Solution:

$$\text{COP:} \quad \beta' = \frac{Q_H}{W} = \frac{Q_H}{Q_H - Q_L} \cong \frac{T_H}{T_H - T_L}$$

$$m_{air} = P_1 V_1 / RT_1 = (30 \times 40 \times 144) / (540 \times 53.34) = 6.0 \text{ lbm}$$

$$dQ_H = m_{air} C_v dT_H = \beta' dW \cong \frac{T_H}{T_H - T_L} dW$$

$$\Rightarrow \quad dW = m_{air} C_v \left[\frac{T_H}{T_H - T_L} \right] dT_H$$

$$_1W_2 = \int m_{air} C_v \left(1 - \frac{T_L}{T} \right) dT = m_{air} C_v \int \left(1 - \frac{T_L}{T} \right) dT$$

$$= m_{air} C_v \left[T_2 - T_1 - T_L \ln \frac{T_2}{T_1} \right]$$

$$= 6.0 \text{ lbm} \times 0.171 \text{ Btu/lbm-R} \times \left[1100 - 540 - 540 \ln \left(\frac{1100}{540} \right) \right] \text{R}$$

$$= \mathbf{180.4 \text{ Btu}}$$

In-Text Concept Questions

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.a

Does Clausius say anything about the sign for $\oint dQ$?

No.

The total (net) heat transfer can be coming in like in a heat engine ($W_{out} = Q_H - Q_L$) in which case it is positive. It can also be net going out like in a refrigerator or heat pump ($W_{in} = Q_H - Q_L$) in which case the sign is negative. Finally if you look at a transmission gearbox there could be no heat transfer (first approximation) in which case the integral is zero.

6.b

Does the statement of Clausius require a constant T for the heat transfer as in a Carnot cycle?

No.

The statement for a cycle involves an integral of dQ/T so T can vary, which it does during most processes in actual devices. This just means that you cannot that easily get a closed expression for the integral.

6.c

How can you change s of a substance going through a reversible process?

From the definition of entropy

$$ds = \frac{dq}{T}$$

for a reversible process. Thus only heat transfer gives a change in s, expansion/compression involving work does not give such a contribution.

6.d

A reversible process adds heat to a substance. If T is varying does that influence the change in s?

Yes.

$$\text{Reversible:} \quad ds = \frac{dq}{T}$$

So if T goes up it means that s changes less per unit of dq, and the opposite if T decreases then s changes more per unit of dq.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.e

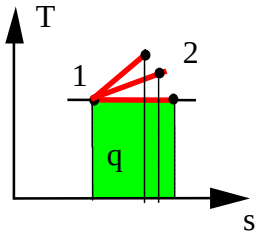
Water at 100 kPa, 150^{o}C receives 75 kJ/kg in a reversible process by heat transfer. Which process changes s the most: constant T, constant v or constant P?

$$ds = \frac{dq}{T}$$

Look at the constant property lines in a T-s diagram, Fig. 6.5. The constant v line has a higher slope than the constant P line also at positive slope. Thus both the constant P and v processes have an increase in T. As T goes up the change in s is smaller for the same area (heat transfer) under the process curve in the T-s diagram as compared with the constant T process.

The constant T (isothermal) process therefore changes s the most.

In a reversible process the area below the process curve in the T-s diagram is the heat transfer.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.f

A liquid is compressed in a reversible adiabatic process. What is the change in T?

If the process is reversible then s is constant, $ds = \frac{dq}{T} = 0$

Change in s for a liquid (an incompressible substance) is

Eq. 6.10: $ds = \frac{C}{T} dT$

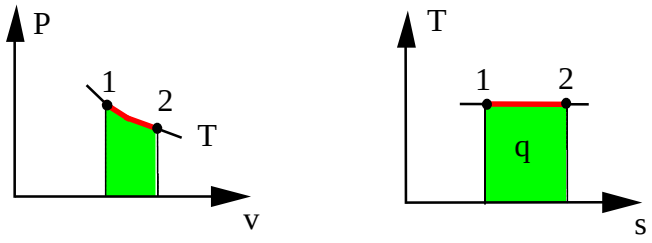
From this it follows that if ds = 0 then **T is constant**.

6.g

An ideal gas goes through a constant T reversible heat addition process. How do the properties (v, u, h, s, P) change (up, down or constant)?

Ideal gas: u(T), h(T) so they are both constant

Eq. 6.2 gives:	ds = dq/T > 0	so s goes up by q/T
Eq. 6.12 gives:	ds = (R/v) dv	so v increases
Eq. 6.14 gives:	ds = -(R/P) dP	so P decreases



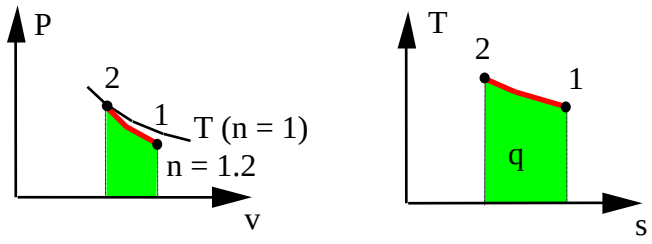
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.h

Carbon dioxide is compressed to a smaller volume in a polytropic process with n = 1.2. How do the properties (u, h, s, P, T) change (up, down or constant)?

For carbon dioxide Table A.5 k = 1.289 so we have n < k and the process curve can be recognized in Figure 8.13. From this we see a smaller volume means moving to the left in the P-v diagram and thus also up.

From P-v diagram: P up, T up
From T-s diagram Since T is up then s down.
As T is up so is h and u.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.i

A substance has heat transfer out. Can you say anything about changes in s if the process is reversible? If it is irreversible?

Reversible: $ds = \frac{dq}{T} < 0$ since $dq < 0$

Irreversible: $ds = \frac{dq}{T} + ds_{gen} = ?$ $dq < 0$ but $ds_{gen} > 0$

You cannot say, ds depends on the magnitude of dq/T versus ds_{gen}

6.j

A substance is compressed adiabatically so P and T go up. Does that change s?

If the process is reversible then s is constant, $ds = \frac{dq}{T} = 0$

If the process is irreversible then s goes up, $ds = \frac{dq}{T} + ds_{gen} = ds_{gen} > 0$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.1

When a substance has completed a cycle, v, u, h, and s are unchanged. Did anything happen? Explain.

Yes.

During various parts of the cycle work and heat transfer may be transferred. That happens at different P and T. The net work out equals the net heat transfer in (energy conservation) so dependent upon the sign it is a heat engine or a heat pump (refrigerator). The net effect is thus a conversion of energy from one storage location to another and it may also change nature, some Q was changed to W or the opposite.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.2

Assume a heat engine with a given Q_H. Can you say anything about Q_L if the engine is reversible? If it is irreversible?

For a reversible heat engine it must be that:

$$\oint \frac{dQ}{T} = 0 = \frac{Q_H}{T_H} - \frac{Q_L}{T_L} \qquad \text{or integrals if T not constant}$$

So as T_L is lower than T_H then Q_L must be correspondingly lower than Q_H to obtain the net zero integral.

For an irreversible heat engine we have

$$\oint \frac{dQ}{T} = \frac{Q_H}{T_H} - \frac{Q_L}{T_L} < 0$$

This means that Q_L is larger than before (given Q_H and the T's). The irreversible heat engine rejects more energy and thus gives less out as work.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.3

CV A is the mass inside a piston/cylinder, CV B is that plus part of the wall out to a source of $_1Q_2$ at T_s. Write the entropy equation for the two control volumes assuming no change of state of the piston mass or walls.

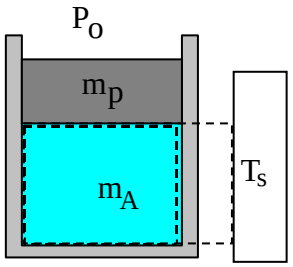


Fig. P6.3

The general entropy equation for a control mass is Eq.6.37

$$S_2 - S_1 = \int_1^2 \frac{dQ}{T} + {}_1S_{2\ gen}$$

The left hand side is storage so that depends of what is inside the C.V. and the integral is summing the dQ/T that crosses the control volume surface while the process proceeds from 1 to 2.

C.V. A: $$m_A\,(s_2 - s_1) = \int_1^2 \frac{dQ}{T_A} + {}_1S_{2\ gen\ CV\ A}$$

C.V. B: $$m_A\,(s_2 - s_1) = \int_1^2 \frac{dQ}{T_s} + {}_1S_{2\ gen\ CV\ B}$$

In the first equation the temperature is that of mass m_A which possibly changes from 1 to 2 whereas in the second equation it is the reservoir temperature T_s. The two entropy generation terms are also different the second one includes the first one plus any s generated in the walls that separate the mass m_A from the reservoir and there is a Q over a finite temperature difference. When the storage effect in the walls are neglected the left hand sides of the two equations are equal.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.4

Consider the previous set-up with the mass m_A and the piston cylinder of mass m_p starting out at two different temperatures. After a while the temperature becomes uniform without any external heat transfer. Write the entropy equation storage term ($S_2 - S_1$) for the total mass.

In this case the storage effect must be summed up over all the mass inside the control volume.

$$S_2 - S_1 = m_A (s_2 - s_1)_A + m_P (s_2 - s_1)_P$$
$$\approx m_A (s_2 - s_1)_A + m_P C_P \ln \left(\frac{T_2}{T_{1\,P}} \right)$$

The last equation assumed a constant specific heat for the solid material of the piston, a common assumption. There is only a single temperature T_2, but there are two different temperatures for state 1: $T_{1\,A}$ and $T_{1\,P}$. The temperature T_2 would be found from the energy equation.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.5

Water at 100^{o}C, quality 50% in a rigid box is heated to 110^{o}C. How do the properties (P, v, x, u and s) change? (increase, stay about the same, or decrease)

A fixed mass in a rigid box give a constant v process. So

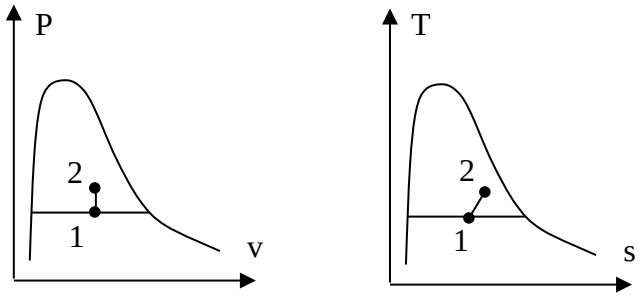
P goes up (in the two-phase region P = P_{sat} at given T)

v stays constant.

x goes up (we get closer to the saturated vapor state see P-v diagram)

u goes up (Q in and no work)

s goes up (Q in)



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

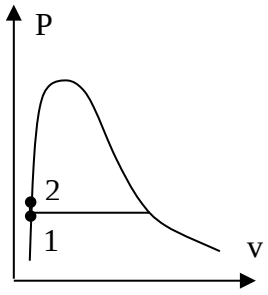
6.6

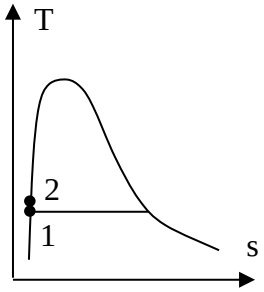
Liquid water at 20^{o}C, 100 kPa is compressed in a piston/cylinder without any heat transfer to a pressure of 200 kPa. How do the properties (T, v, u, and s) change? (increase, stay about the same, or decrease)

Adiabatic dq = 0: dq = T ds = 0;
Incompressible dv = 0: dw = P dv = 0

(T, v, u, and s) they are all constant.
Only the pressure and enthalpy goes up.

In the T-s diagram the two states are in the same location as T does not go up for v constant.

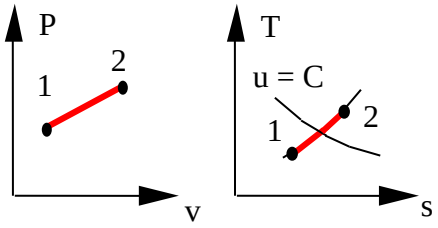




Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.7

A reversible process in a piston/cylinder is shown in Fig. P6.7. Indicate the storage change $u_2 - u_1$ and transfers ${}_1w_2$ and ${}_1q_2$ as positive, zero, or negative



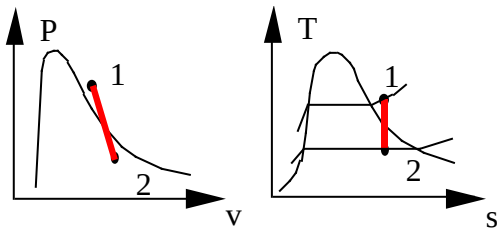
${}_1w_2 = \int P\, dv > 0$; ${}_1q_2 = \int T\, ds > 0$

$u_2 - u_1 > 0$ from general shape of the constant u curves. Further out in the ideal gas region the constant u curve become horizontal (u = fct(T) only).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.8

A reversible process in a piston/cylinder is shown in Fig. P6.8. Indicate the storage change $u_2 - u_1$ and transfers ${}_1w_2$ and ${}_1q_2$ as positive, zero, or negative



${}_1w_2 = \int P\, dv > 0$; ${}_1q_2 = \int T\, ds = 0$

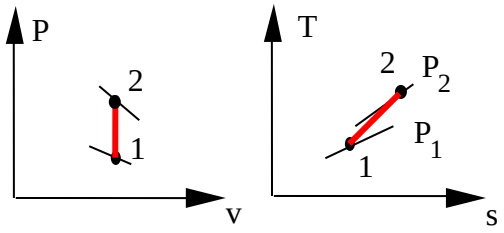
$u_2 - u_1 = {}_1q_2 - {}_1w_2 < 0$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.9

Air at 290 K, 100 kPa in a rigid box is heated to 325 K. How do the properties (P, v, u and s) change? (increase, stay about the same, or decrease)

Rigid box: v = constant, (P, u, and s) all increases.

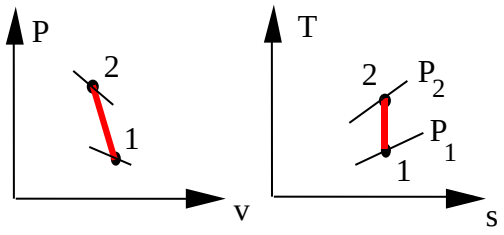


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.10

Air at 20^{o}C, 100 kPa is compressed in a piston/cylinder without any heat transfer to a pressure of 200 kPa. How do the properties (T, v, u and s) change? (increase, about the same or decrease)

T goes up,
v goes down
u goes up (work in, q = 0)
s = constant



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

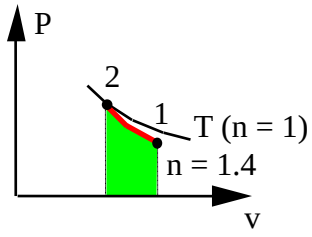
6.11

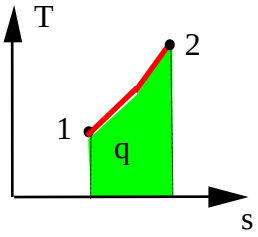
Carbon dioxide is compressed to a smaller volume in a polytropic process with n = 1.4. How do the properties (u, h, s, P, T) change (up, down or constant)?

For carbon dioxide Table A.5 k = 1.289 so we have n > k and the process curve can be recognized in Figure 6.13. From this we see a smaller volume means moving to the left in the P-v diagram and thus also up.

P up, T up. As T is up so is h and u.

From the T-s diagram as n > k then we move to larger T means s is up.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.12

Process A: Air at 300 K, 100 kPa is heated to 310 K at constant pressure.
Process B: Heat air at 1300 K to 1310 K at constant 100 kPa.
Use the table below to compare the property changes.

	Property	$\Delta_A > \Delta_B$	$\Delta_A \approx \Delta_B$	$\Delta_A < \Delta_B$
a	$\Delta = v_2 - v_1$		√	
b	$\Delta = h_2 - h_1$			√
c	$\Delta = s_2 - s_1$	√		

a. Ideal gas $Pv = RT$ so v goes with absolute T
$\Delta v = (R/P)\,\Delta T$ thus the same

b. Since $dh = C_P\,dT$ and C_P increases with T

c. At constant P: $ds = (C_P/T)\,dT$
C_P is only 15% higher at 1300 K compared to 300 K (see Fig. 3.11)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.13

Why do we write ΔS or $S_2 - S_1$ whereas we write $\int dQ/T$ and ${}_1S_{2\ gen}$?

This is similar to the terms in the continuity equation $m_2 - m_1$ versus m_i, m_e and the energy equation $E_2 - E_1$ versus ${}_1Q_2$, ${}_1W_2$. The first part is the **change in the storage** $S_2 - S_1$ of entropy in the mass and the second part is the transfer or generation during the process from 1 to 2. The storage terms correspond to the left hand side of the balance equation for entropy. The integral $\int dQ/T$ represents a **transfer** of entropy **across the control volume surface** during the process from 1 to 2 and the ${}_1S_{2\ gen}$ expresses the total amount of entropy being generated **inside** the control volume and both are on the right hand side of the balance equation.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.14

A reversible heat pump has a flux of s entering as $\dot{Q}_L/T_L$. What can you say about the exit flux of s at T_H?

For the entropy equation 6.3 and 6.42, the rate of storage is zero and the generation term is zero. Thus the entropy equation becomes

$$0 = \frac{\dot{Q}_L}{T_L} - \frac{\dot{Q}_H}{T_H} + 0$$

So: $$\frac{\dot{Q}_L}{T_L} = \frac{\dot{Q}_H}{T_H} = \text{flux of s}$$

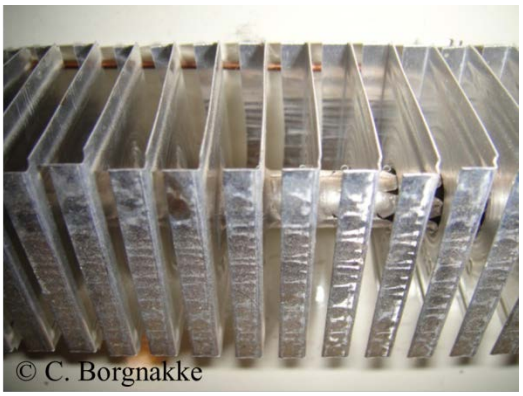
We have the same flux of s in as out matching the result in chapter 5.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.15

An electric baseboard heater receives 1500 W of electrical power that heats the room air which loses the same amount out through the walls and windows. Specify exactly where entropy is generated in that process.

a Electrical heating wire (electrical work turned into internal energy, leaving as heat transfer).
b Heat transfer from hot wire to cooler room air, i.e. in the wire coverings
c Room air to walls
d Inside walls and windows, heat transfer over a finite ΔT
e from outside wall surface to ambient T



The electric wire is inside the pipe and surrounded by sand to electrically isolate it. The pipe has fins mounted to increase the surface area.

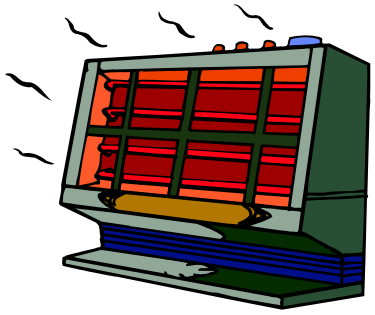
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.16

A 500 W electric space heater with a small fan inside heats air by blowing it over a hot electrical wire. For each control volume: a) wire at T_{wire} only b) all the room air at T_{room} and c) total room plus the heater, specify the storage, entropy transfer terms and entropy generation as rates (neglect any $\dot{Q}$ through the room walls or windows).

	Storage	$\dot{Q}/T$	$\dot{S}_{gen}$
C.V. Wire only	0	$\frac{-500\ W}{T_{wire}}$	$\frac{500\ W}{T_{wire}}$
C.V. Room air	$\frac{500\ W}{T_{room}}$	$\frac{500\ W}{T_{wire}}$	$500\ W\ (\frac{1}{T_{room}} - \frac{1}{T_{wire}})$
C.V. Total room	$\frac{500\ W}{T_{room}}$	0	$\frac{500\ W}{T_{room}}$

Remark: Room only receives the electrical power input of 500 W.



Some of the heaters can be radiant heaters in which case the fan is not needed.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Inequality of Clausius

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.17

Consider the steam power plant in Example 4.7 and assume an average T in the line between 1 and 2. Show that this cycle satisfies the inequality of Clausius.

Solution:

Show Clausius: $\int \frac{dQ}{T} \leq 0$

For this problem we have three heat transfer terms:

$q_b = 2831$ kJ/kg, $q_{loss} = 21$ kJ/kg, $q_c = 2173.3$ kJ/kg

$$\int \frac{dq}{T} = \frac{q_b}{T_b} - \frac{q_{loss}}{T_{avg\ 1\text{-}2}} - \frac{q_c}{T_c}$$

$$= \frac{2831}{573} - \frac{21}{568} - \frac{2173.3}{318}$$

$$= -1.93 \text{ kJ/kg K} < 0 \quad \textbf{OK}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.18

A heat engine receives 6 kW from a 250°C source and rejects heat at 30°C. Examine each of three cases with respect to the inequality of Clausius.

a. $\dot{W}$ = 6 kW b. $\dot{W}$ = 0 kW c. Carnot cycle

Solution:

$T_H = 250 + 273 = 523$ K ; $T_L = 30 + 273 = 303$ K

Case a) $\int \frac{d\dot{Q}}{T} = \frac{6000}{523} - \frac{0}{303} = 11.47$ kW/K > 0 **Impossible**

b) $\int \frac{d\dot{Q}}{T} = \frac{6000}{523} - \frac{6000}{303} = -8.33$ kW/K < 0 **OK**

c) $\int \frac{d\dot{Q}}{T} = 0 = \frac{6000}{523} - \frac{\dot{Q}_L}{303}$ $\Rightarrow$

$$\dot{Q}_L = \frac{303}{523} \times 6 \text{ kW} = 3.476 \text{ kW}$$

$$\dot{W} = \dot{Q}_H - \dot{Q}_L = 2.529 \text{ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.19

Use the inequality of Clausius to show that heat transfer from a warm space towards a colder space without work is a possible process i.e. a heat engine with no work output.

$$\text{Clausius:} \quad \int \frac{dQ}{T} \leq 0 \qquad \text{or} \qquad \int \frac{d\dot{Q}}{T} \leq 0$$

Take C.V. as the space separating the warm and cold space. It is the same Q that crosses each surface (from energy equation) so

$$\int \frac{dQ}{T} = \frac{Q}{T_{warm}} - \frac{Q}{T_{cold}} = Q \left(\frac{1}{T_{warm}} - \frac{1}{T_{cold}} \right) < 0 \qquad \text{OK}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.20

Use the inequality of Clausius to show that heat transfer from a cold space towards a warmer space without work is an impossible process i.e. a heat pump with no work input.

$$\text{Clausius:} \quad \int \frac{dQ}{T} \leq 0 \qquad \text{or} \qquad \int \frac{d\dot{Q}}{T} \leq 0$$

Take C.V. as the space separating the warm and cold space. It is the same Q that crosses each surface (from energy equation) so

$$\int \frac{dQ}{T} = \frac{Q}{T_{cold}} - \frac{Q}{T_{warm}} = Q \left(\frac{1}{T_{cold}} - \frac{1}{T_{warm}} \right) > 0 \quad \text{Impossible!}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.21

Assume the heat engine in Problem 5.34 has a high temperature of 1000 K and a low temperature of 400 K. What does the inequality of Clausius say about each of the four cases?

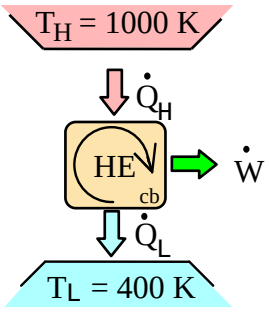
Solution:

Cases a) $\int \frac{\dot{dQ}}{T} = \frac{6}{1000} - \frac{4}{400} = -0.004$ kW/K < 0 **OK**

b) $\int \frac{\dot{dQ}}{T} = \frac{6}{1000} - \frac{0}{400} = 0.006$ kW/K > 0 **Impossible**

c) $\int \frac{\dot{dQ}}{T} = \frac{6}{1000} - \frac{2}{400} = 0.001$ kW/K > 0 **Impossible**

d) $\int \frac{\dot{dQ}}{T} = \frac{6}{1000} - \frac{6}{400} = -0.009$ kW/K < 0 **OK**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.22

Let the steam power plant in Problem 5.30 have 700°C in the boiler and 40°C during the heat rejection in the condenser. Does that satisfy the inequality of Clausius? Repeat the question for the cycle operated in reverse as a refrigerator.

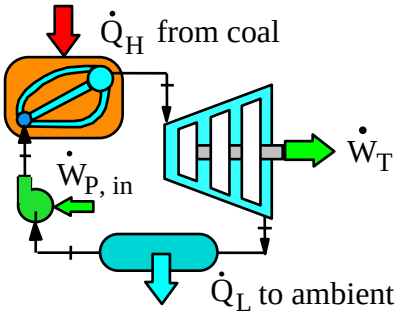
Solution:

$$\dot{Q}_H = 1 \text{ MW} \qquad \dot{Q}_L = 0.58 \text{ MW}$$

$$\int \frac{d\dot{Q}}{T} = \frac{1000}{973} - \frac{580}{313} = -0.82 \text{ kW/K} < 0 \qquad \textbf{OK}$$

Refrigerator

$$\int \frac{d\dot{Q}}{T} = \frac{580}{313} - \frac{1000}{973} = 0.82 > 0 \qquad \textbf{Cannot be possible}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

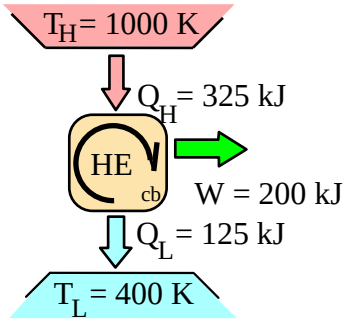
6.23

Examine the heat engine given in Problem 5.74 to see if it satisfies the inequality of Clausius.

Solution:

$$Q_H = 325 \text{ kJ} \quad \text{at} \quad T_H = 1000 \text{ K}$$
$$Q_L = 125 \text{ kJ} \quad \text{at} \quad T_L = 400 \text{ K}$$

$$\int \frac{dQ}{T} = \frac{325}{1000} - \frac{125}{400} = 0.0125 \text{ kJ/K} > 0 \qquad \textbf{Impossible}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Entropy of a pure substance

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.24

Determine the entropy for these states:

a. Nitrogen, P = 2000 kPa, 120 K

b. Nitrogen, 120 K, $v = 0.005$ m^3/kg

c. R-410A, T = 25°C, $v = 0.01$ m^3/kg

Solution:

a) Table B.6.1: $P < P_{sat} = 2513$ kPa so superheated vapor.

B.6.2 at 2000 kPa: s = **4.8116 kJ/kg-K**

b) Table B.6.1: $v_f < v < v_g = 0.00799$ m^3/kg so two-phase L + V

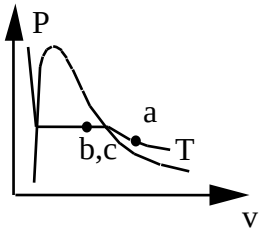
$$x = (v - v_f)/v_{fg} = \frac{0.005 - 0.001915}{0.00608} = 0.5074$$

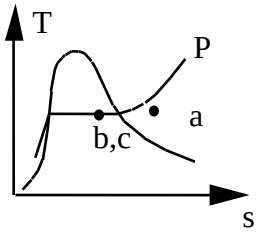
$$s = s_f + x\, s_{fg} = 3.8536 + x\ 0.7659 = \mathbf{4.2422\ kJ/kg}\ \text{K}$$

c) Table B.4.1 $v_f < v < v_g = 0.01514$ m^3/kg so two-phase L + V

$$x = (v - v_f)/v_{fg} = \frac{0.01 - 0.000944}{0.01420} = 0.63775$$

$$s = s_f + x\, s_{fg} = 0.3631 + x\ 0.6253 = \mathbf{0.7619\ kJ/kg}\ \text{K}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.25

Determine the missing property among P, T, s, and x for R-410A at:

a. $T = -20^{o}C$, $v = 0.1377\ m^3/kg$

b. $T = 20^{o}C$, $v = 0.01377\ m^3/kg$

c. $P = 200$ kPa, $s = 1.409$ kJ/kgK

a) B.4.1: $v > v_g = 0.0648\ m^3/kg$ =>

B.4.2 superheated vapor so x is undefined

very close to 200 kPa, $s = 1.1783$ kJ/kg-K

b) B.4.1: $0.000923 = v_f < v < v_g = 0.01758\ m^3/kg$ => Two-phase

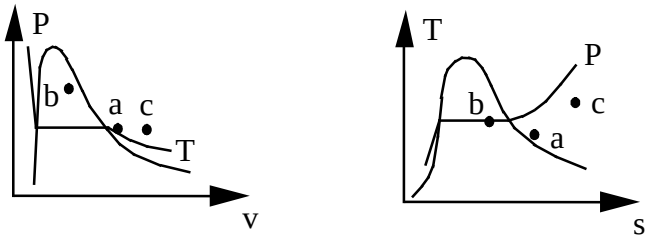
$P = P_{sat} = 1444.2$ kPa

$$x = (v - v_f)/v_{fg} = \frac{0.01377 - 0.000923}{0.01666} = 0.77113$$

$s = s_f + x\, s_{fg} = 0.3357 + 0.77113 \times 0.6627 = 0.8467$ kJ/kg-K

c) Table B.4.2 at 200 kPa, $s > s_g$ so superheated vapor,

x is undefined, and we find the state at $T = 60^{o}C$.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.26

Find the missing properties of *P, v, s* and *x* for ammonia (NH_3) at

a. $T = 65°C$, $P = 600$ kPa

b. $T = 20°C$, $u = 800$ kJ/kg

c. $T = 50°C$, $v = 0.1185$ m^3/kg

a) B.2.2 average between 60°C and 70°C

v = (0.25981 + 0.26999)/2 = 0.26435 m^3/kg

s = (5.6383 + 5.7094)/2 = 5.6739 kJ/kgK

b) B.2.1: $u < u_g = 1332.2$ kJ/kg => $P = P_{sat} = 857.5$ kPa

$$x = (u - u_f)/u_{fg} = \frac{800 - 272.89}{1059.3} = 0.49666$$

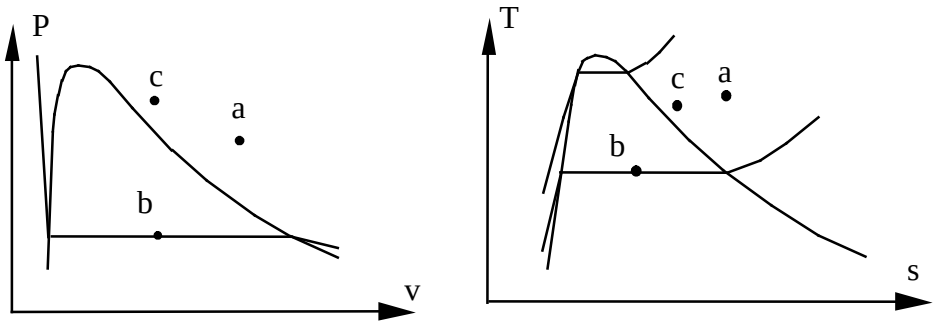
v = 0.001638 + x × 0.14758 = 0.07494 m^3/kg,

s = 1.0408 + x × 4.0452 = 3.04989 kJ/kg-K

c) B.2.1: $v > v_g = 0.06337$ m^3/kg =>

B.2.2 superheated vapor so x is undefined

very close to 1200 kPa, s = 5.1497 kJ/kgK



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.27

Find the entropy for the following water states and indicate each state on a T-s diagram relative to the two-phase region.

a. 250^{o}C, v = 0.02 m^3/kg

b. 250^{o}C, 2000 kPa

c. -2^{o}C, 100 kPa

Solution:

a) Table B.1.1: $0.001251 = v_f < v < v_g = 0.05013$ m^3/kg => Two-phase

$$x = \frac{0.02 - 0.001251}{0.04887} = 0.38365$$

$$s = s_f + x\, s_{fg} = 2.7927 + 0.38365 \times 3.2802 = \mathbf{4.05\ kJ/kg\ K}$$

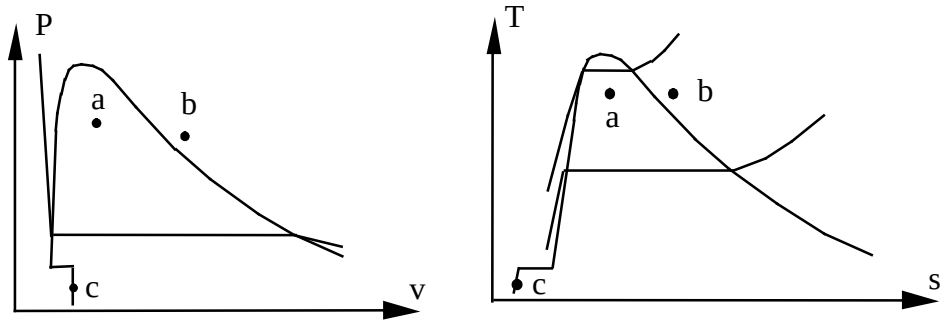
b) Table B.1.1: $P < P_{sat} = 3973$ kPa => superheated vapor B.1.3

s = 6.5452 kJ/kg K

c) Table B.1.1 $T < T_{tripple} = 0.01^{o}$C so goto B.1.5

Table B.1.5: $P > P_{sat} = 0.5177$ kPa so compressed solid

s = –1.2369 kJ/kg K



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.28

Determine the missing property among P, v, s, and x for CO_2 and indicate each state on a T-s diagram relative to the two-phase region.

a. T = –20°C, P = 2000 kPa

b. T = 20°C, s = 1.49 kJ/kgK

c. T = –10°C, s = 1 kJ/kgK

a) Table B.3.1 at -20°C: $P > P_{sat}$ = 1969.6 kPa => Compressed liquid

$v = v_f = 0.000969\ m^3/kg$

$s = s_f = 0.1672$ kJ/kg-K, x is undefined

b) Table B.3.1: $s > s_g$ = 1.0406 kJ/kg-K => superheated vapor

Table B.3.2 located between 1400 kPa and 2000 kPa

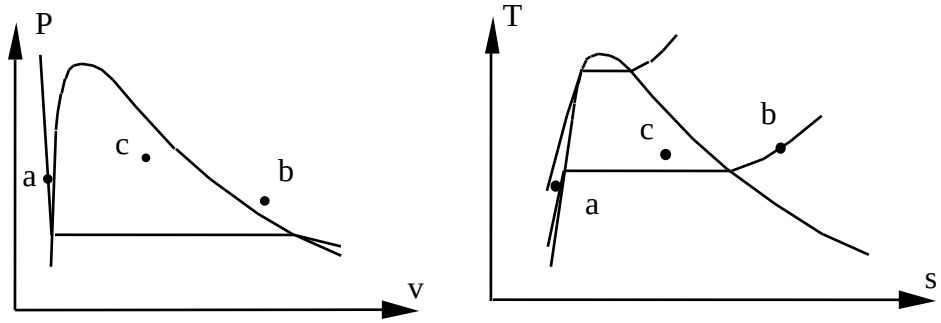
$$P = 1400 + 600\,\frac{1.49 - 1.5283}{1.4438 - 1.5283} = 1400 + 600 \times 0.4532 = 1672 \text{ kPa}$$

$$v = 0.03648 + (0.02453 - 0.03648)\ 0.4532 = 0.03106\ m^3/kg$$

c) Table B.3.1: $0.2501 = s_f < s < s_g = 1.2328$ kJ/kgK => Two-phase

$$x = \frac{s - s_f}{s_{fg}} = \frac{1 - 0.2501}{0.9828} = 0.763; \quad P = P_{sat} = 2648.7 \text{ kPa}$$

$$v = v_f + x\, v_{fg} = 0.001017 + 0.763 \times 0.01303 = 0.01096\ m^3/kg$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.29

Determine the missing property among (T, P, v, s)

a. H_2O 20^oC, v = 0.01000 m^3/kg

b. R-410A 400 kPa, s = 1.17 kJ/kgK

c. NH_3 10^oC, v = 0.1 m^3/kg

d. N_2 101.3 kPa, s = 3.5 kJ/kg-K

a) Table B.1.1 at 20^oC: $v < v_f = 0.001002$ m^3/kg => Compr. Liquid

B.1.4: at about **5000 kPa,** s = **0.2955 kJ/kg-K**

b) Table B.4.1: $s > s_g = 1.0779$ kJ/kg-K => Sup. vapor

Table B.4.2: $$T = 0 + 20 \times \frac{1.17 - 1.1483}{1.2108 - 1.1483} = 20 \times 0.3472 = \mathbf{6.94^oC}$$

$$v = 0.07227 + (0.07916 - 0.07227)\ 0.3472 = \mathbf{0.07466\ m^3/kg}$$

c) Table B.2.1: $v_f < v < v_g = 0.20541$ so two-phase L + V, P = **615.2 kPa**

$$x = \frac{v - v_f}{v_{fg}} = \frac{0.1 - 0.0016}{0.20381} = 0.4828$$

$$s = s_f + x\, s_{fg} = 0.8778 + x \times 4.3266 = \mathbf{2.9667\ kJ/kg\text{-}K}$$

d) Table B.6.1: $s_f < s < s_g = 5.4033$ kJ/kgK so two-phase, T = **77.3 K**

$$x = \frac{s - s_f}{s_{fg}} = \frac{3.5 - 2.8326}{2.5707} = 0.25962$$

$$v = v_f + x\, v_{fg} = 0.00124 + x \times 0.21515 = 0.0571\ \mathbf{m^3/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.30

Two kg water at 120°C with a quality of 25% has its temperature raised 20°C in a constant volume process. What are the new quality and specific entropy?

Solution:

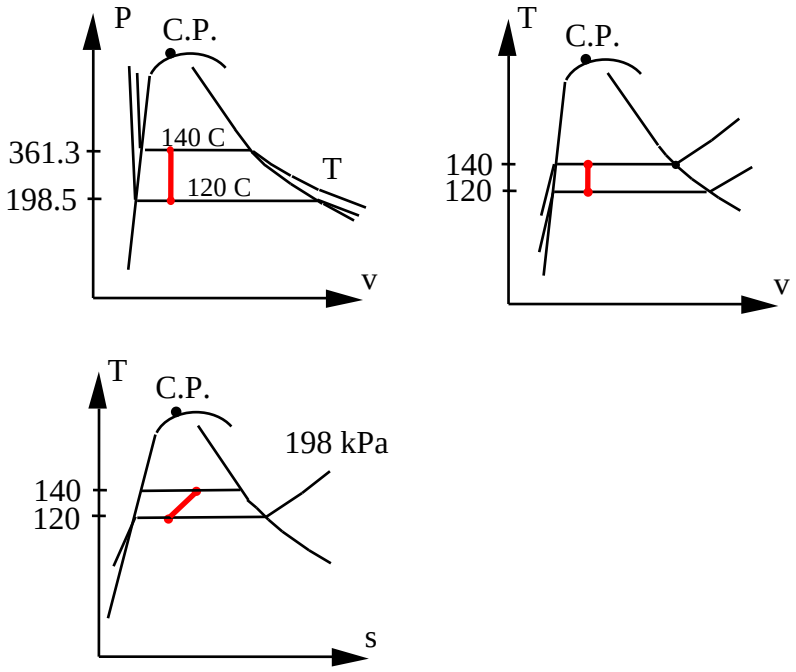
State 1 from Table B.1.1 at 120°C

$$v = v_f + x\, v_{fg} = 0.001060 + 0.25 \times 0.8908 = 0.22376 \text{ m}^3/\text{kg}$$

State 2 has same v at 140°C also from Table B.1.1

$$x = \frac{v - v_f}{v_{fg}} = \frac{0.22376 - 0.00108}{0.50777} = \mathbf{0.4385}$$

$$s = s_f + x\, s_{fg} = 1.739 + 0.4385 \times 5.1908 = \mathbf{4.015\ kJ/kg\ K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.31

Two kg water at 400 kPa with a quality of 25% has its temperature raised 20°C in a constant pressure process. What is the change in entropy?

Solution:

State 1 from Table B.1.2 at 400 kPa

$$s = s_f + x\, s_{fg} = 1.7766 + 0.25 \times 5.1193 = 3.0564 \text{ kJ/kg}$$

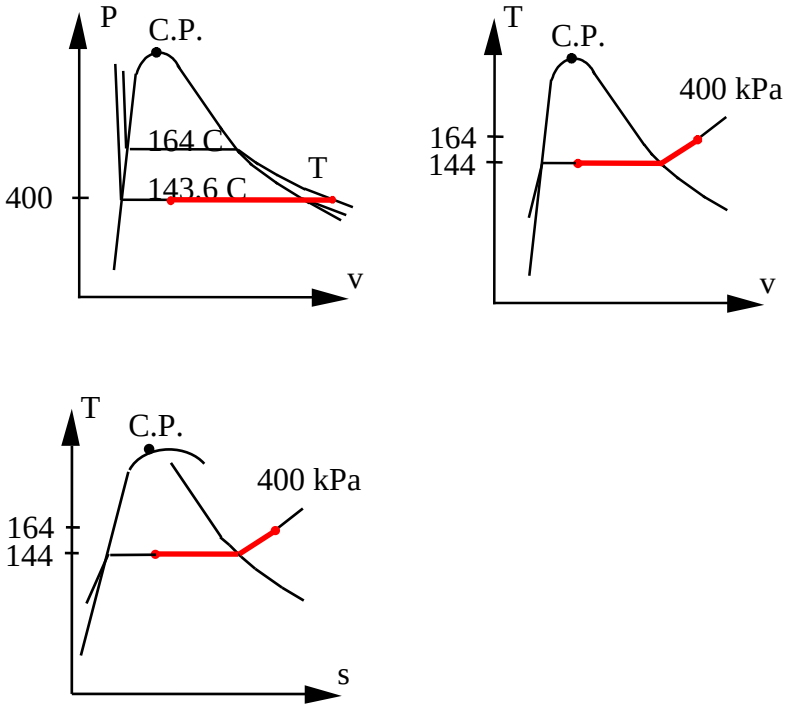
State 2 has same P from Table B.1.2 at 400 kPa

$$T_2 = T_{sat} + 20 = 143.63 + 20 = 163.63^{o}C$$

so state is superheated vapor look in B.1.3 and interpolate between 150 and 200 C in the 400 kPa superheated vapor table.

$$s_2 = 6.9299 + (7.1706 - 6.9299)\frac{163.63 - 150}{200 - 150} = 6.9955 \text{ kJ/kgK}$$

$$s_2 - s_1 = 6.9955 - 3.0564 = \mathbf{3.9391\ kJ/kgK}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.32

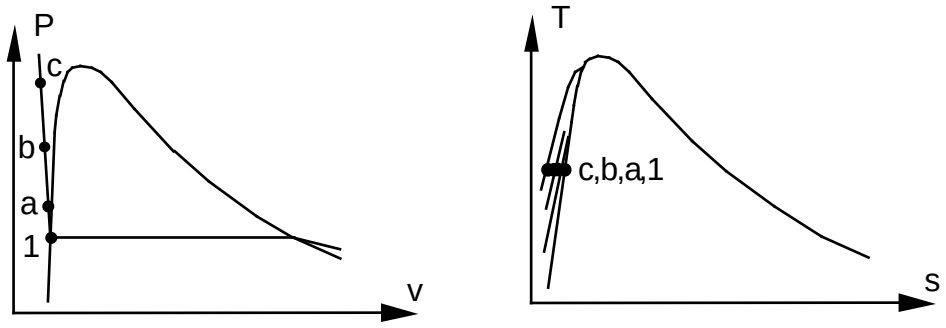
Saturated liquid water at 20°C is compressed to a higher pressure with constant temperature. Find the changes in u and s when the final pressure is

a. 500 kPa b. 2000 kPa c. 20 000 kPa

Solution:

	kJ/kg	kJ/kg K		
B.1.1:	$u_1 = 83.94$	$s_1 = 0.2966$		
B.1.4:	$u_a = 83.91$	$s_a = 0.2965$	$\Delta u = -0.03$	$\Delta s = -0.0001$
B.1.4:	$u_b = 83.82$	$s_b = 0.2962$	$\Delta u = -0.12$	$\Delta s = -0.0004$
B.1.4:	$u_c = 82.75$	$s_c = 0.2922$	$\Delta u = -1.19$	$\Delta s = -0.0044$

Nearly constant u and s, incompressible media



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.33

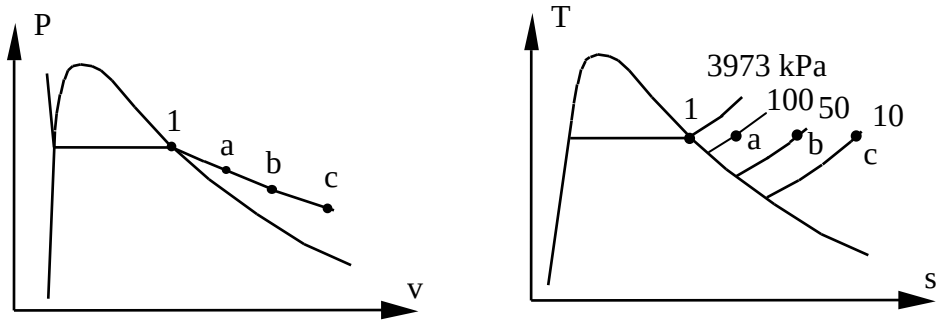
Saturated vapor water at 250^{o}C is expanded to a lower pressure with constant temperature. Find the changes in u and s when the final pressure is

a. 100 kPa b. 50 kPa c. 10 kPa

Solution:

Table B.1.1 for the first state then B.1.3 for the a, b and c states.

kJ/kg	kJ/kg K	kJ/kg	kJ/kg K
u_1= 2602.37	s_1= 6.0729		
u_a = 2733.73	s_a = 8.0332	Δu = 131.36	Δs = 1.9603
u_b = 2734.97	s_b = 8.3555	Δu = 132.6	Δs = 2.2826
u_c = 2735.95	s_c = 9.1002	Δu = 133.58	Δs = 3.0273



Remark: You approach ideal gas as P drops so u is u(T) but s is still s(T,P).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.34

Determine the missing property among *P, T, s, x* for the following states:

a. Ammonia 25°C, v = 0.10 m^3/kg
b. Ammonia 1000 kPa, s = 5.2 kJ/kg K
c. R-410A 500 kPa, s = 1.4 kJ/kg K
d. R-410A 50°C, s = 0.8 kJ/kg K

Solution:

	Table	**P kPa**	**T °C**	**s kJ/kg K**	**x**
a)	B2.1	1003	25	4.1601	0.7776
b)	B2.2	1000	42.53	5.2	-----
c)	B4.2	500	100	1.4	-----
d)	B4.1	3065	50	0.8	0.6973

a) $x = (0.1 - 0.001658)/0.12647 =$ **0.7776**

$s = s_f + x\, s_{fg} = 1.121 + x \times 3.9083 =$ **4.1601 kJ/kg K**

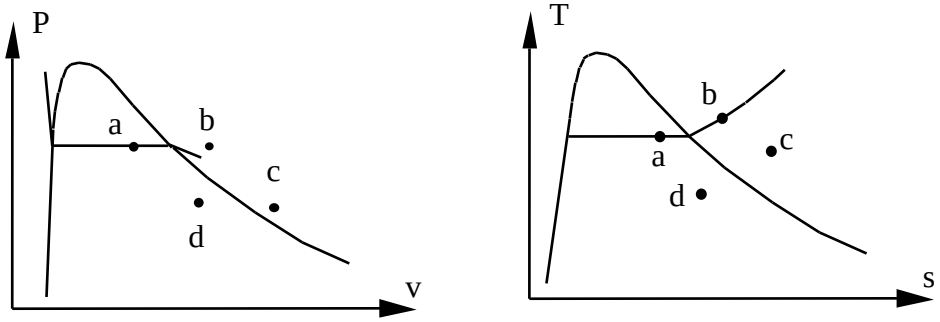
b) $T = 40 + 10 \times (5.2 - 5.1778)/(5.2654 - 5.1778) =$ **42.53°C**

superheated vapor so x is undefined

c) $s > s_g = 1.0647$ so superheated vapor found close to 100°C

d) $s_f < s < s_g$ so two-phase $P = P_{sat} = 3065.2$ kPa

$x = (0.8 - 0.5067)/0.4206 = 0.69734$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

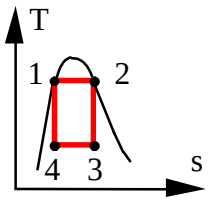
Reversible processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.35

In a Carnot engine with ammonia as the working fluid, the high temperature is 60°C and as Q_H is received, the ammonia changes from saturated liquid to saturated vapor. The ammonia pressure at the low temperature is 190 kPa. Find T_L**,** the cycle thermal efficiency, the heat added per kilogram, and the entropy, *s*, at the beginning of the heat rejection process.

Solution:



Constant T $\Rightarrow$ constant P from 1 to 2, Table B.2.1

$$q_H = \int T ds = T\,(s_2 - s_1) = T\, s_{fg}$$

$$= h_2 - h_1 = h_{fg} = \mathbf{997.0\ kJ/kg}$$

States 3 & 4 are two-phase, Table B.2.1

$$\Rightarrow \quad T_L = T_3 = T_4 = T_{sat}(P) = \mathbf{-20°C}$$

$$\eta_{cycle} = 1 - \frac{T_L}{T_H} = 1 - \frac{253.2}{333.2} = \mathbf{0.24}$$

Table B.2.1: $s_3 = s_2 = s_g(60°C) = \mathbf{4.6577\ kJ/kg\ K}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.36

Consider a Carnot-cycle heat pump with R-410A as the working fluid. Heat is rejected from the R-410A at 35°C, during which process the R-410A changes from saturated vapor to saturated liquid. The heat is transferred to the R-410A at 0°C.

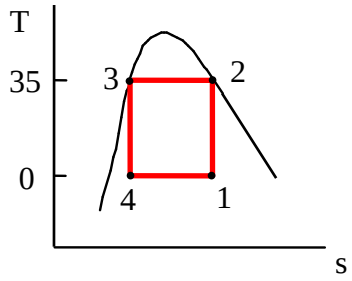
a. Show the cycle on a *T–s* diagram.

b. Find the quality of the R-410A at the beginning and end of the isothermal heat addition process at 0°C.

c. Determine the COP for the cycle.

Solution:

a)



b) From Table B.4.1, state 3 is saturated liquid

$s_4 = s_3 = 0.4189$ kJ/kg K

$= 0.2264 + x_4(0.8104)$

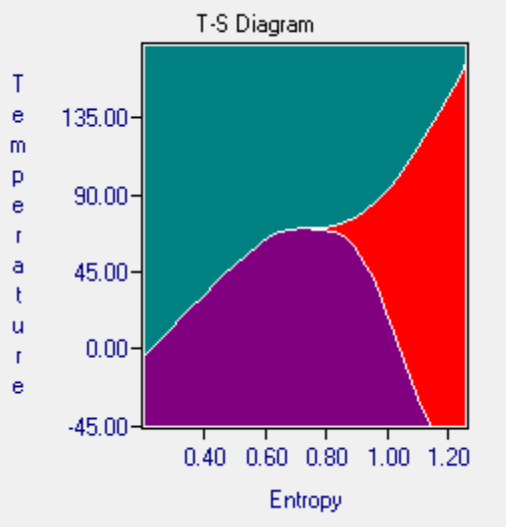
=> $x_4 = \mathbf{0.2375}$

State 2 is saturated vapor so from Table B.4.1

$s_1 = s_2 = 0.9671$ kJ/kg K $= 0.2264 + x_1(0.8104)$

=> $x_1 = \mathbf{0.914}$

c) $$\beta' = \frac{q_H}{w_{IN}} = \frac{T_H}{T_H - T_L} = \frac{308.15}{35} = \mathbf{8.8}$$



T-s diagram from CATT3 for R-410A

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.37

Do Problem 6.36 using refrigerant R-134a instead of R-410A.

Consider a Carnot-cycle heat pump with R-410A as the working fluid. Heat is rejected from the R-410A at 35°C, during which process the R-410A changes from saturated vapor to saturated liquid. The heat is transferred to the R-410A at 0°C.

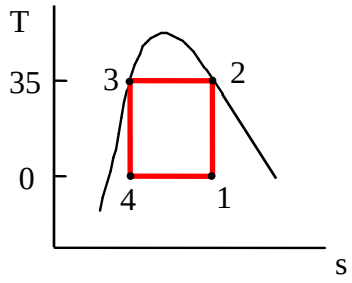
a. Show the cycle on a *T*–*s* diagram.

b. Find the quality of the R-410A at the beginning and end of the isothermal heat addition process at 0°C.

c. Determine the coefficient of performance for the cycle.

Solution:

a)



b) From Table B.5.1, state 3 is saturated liquid

$s_4 = s_3 = 1.1673$ kJ/kg K

$= 1.0 + x_4(0.7262)$

=> $x_4 =$ **0.2303**

State 2 is saturated vapor so from Table B.5.1

$s_1 = s_2 = 1.7139$ kJ/kg K $= 1.0 + x_1(0.7262)$

=> $x_1 =$ **0.983**

c) $$\beta' = \frac{q_H}{w_{IN}} = \frac{T_H}{T_H - T_L} = \frac{308.15}{35} = \mathbf{8.8}$$

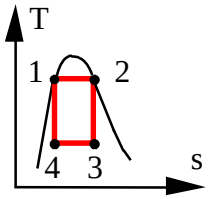
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.38

Water is used as the working fluid in a Carnot cycle heat engine, where it changes from saturated liquid to saturated vapor at 200°C as heat is added. Heat is rejected in a constant pressure process (also constant T) at 20 kPa. The heat engine powers a Carnot cycle refrigerator that operates between –15°C and +20°C. Find the heat added to the water per kg water. How much heat should be added to the water in the heat engine so the refrigerator can remove 1 kJ from the cold space?

Solution:

Carnot cycle heat engine:



Constant T $\Rightarrow$ constant P from 1 to 2, Table B.2.1

$$q_H = \int T ds = T\,(s_2 - s_1) = T\,s_{fg} = h_{fg}$$

$$= 473.15\ (4.1014) = \mathbf{1940\ kJ/kg}$$

States 3 & 4 are two-phase, Table B.2.1

$$\Rightarrow \quad T_L = T_3 = T_4 = T_{sat}(P) = 60.06^{o}C$$

Carnot cycle refrigerator (T_L and T_H are different from above):

$$\beta_{ref} = \frac{Q_L}{W} = \frac{T_L}{T_H - T_L} = \frac{273 - 15}{20 - (-15)} = \frac{258}{35} = 7.37$$

$$W = \frac{Q_L}{\beta} = \frac{1}{7.37} = 0.136\ \text{kJ}$$

The needed work comes from the heat engine

$$W = \eta_{HE}\, Q_{H\,H2O}\ ; \qquad \eta_{HE} = 1 - \frac{T_L}{T_H} = 1 - \frac{333}{473} = 0.296$$

$$Q_{H\,H2O} = \frac{W}{\eta_{HE}} = \frac{0.136}{0.296} = \mathbf{0.46\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.39

Water at 1 MPa, 250°C is expanded in a piston/cylinder to 200 kPa, x = 1.0 in a reversible process. Find the sign for the work and the sign for the heat transfer.

Solution:

The process is not specified, but the beginning and end states are and we assume a unidirectional process so v keeps decreasing.

State 1: Table B.1.3:

$v_1 = 0.23268\ m^3/kg$; $u_1 = 2709.9\ kJ/kg$; $s_1 = 6.9246\ kJ/kg\ K$

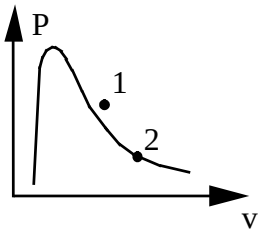
State 2: Table B.1.1:

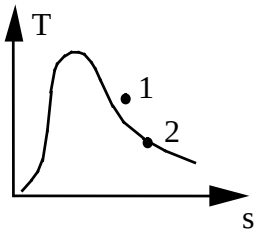
$v_2 = 0.8857\ m^3/kg$; $u_2 = 2529.5\ kJ/kg$; $s_2 = 7.1271\ kJ/kg\ K$

Reversible process: $dw = P\,dv$ $\quad dq = T\,ds$

$v_2 > v_1 \Rightarrow {}_1w_2 = \int P\,dv > 0$

$s_2 > s_1 \Rightarrow {}_1q_2 = \int T\,ds > 0$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.40

R-410A at 1 MPa and 60^{o}C is expanded in a piston cylinder to 500 kPa, 40^{o}C in a reversible process. Find the sign for both the work and the heat transfer for this process.

Solution**:**

The process is not specified, but the beginning and end states are and we assume a unidirectional process so v keeps increasing.

$_1w_2 = \int P\, dv$ so sign dv

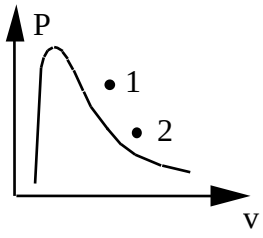
$_1q_2 = \int T\, ds$ so sign ds

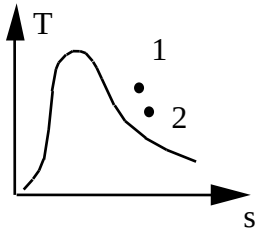
State 1: B.4.2 $v_1 = 0.03470$ m^3/kg $s_1 = 1.2019$ kJ/kg K

State 2: B.4.2 $v_2 = 0.06775$ m^3/kg $s_2 = 1.2398$ kJ/kg K

dv > 0 => **w is positive**

ds > 0 => **q is positive**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.41

A piston/cylinder compressor takes R-410A as saturated vapor 500 kPa and compresses it in a reversible adiabatic process to 3000 kPa. Find the final temperature and the specific compression work.

CV R-410A, this is a control mass

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T = {}_1q_2 /T$

Process: Adiabatic and reversible $\Rightarrow$ ${}_1q_2 = 0$ so then $s_2 = s_1$

State 1: P_1, x = 1, $u_1 = 248.29$ kJ/kg, $s_1 = 1.0647$ kJ/kgK

State 2: P_2, $s_2 = s_1$

$$T_2 = 60 + 20 \times \frac{1.0647 - 0.9933}{1.0762 - 0.9933} = 60 + 20 \times 0.8613 = \mathbf{77.2^oC}$$

$$u_2 = 274.96 + (298.38 - 274.96) \times 0.8613 = 295.13 \text{ kJ/kg}$$

Now the work becomes

$${}_1w_2 = u_1 - u_2 = 248.29 - 295.13 = \mathbf{-46.84\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.42

A piston/cylinder receives R-410A at 500 kPa and compresses it in a reversible adiabatic process to 1800 kPa, 60°C. Find the initial temperature.

CV R-410A, this is a control mass

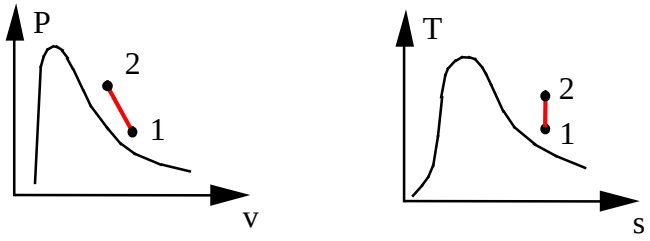
Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T = {}_1q_2 /T$

Process: Adiabatic and reversible $\Rightarrow$ ${}_1q_2 = 0$ so then $s_2 = s_1$

State 1: P_1, $s_1 = s_2 = 1.1076$ kJ/kgK =>

$$T_1 = -13.89 + 13.89 \times \frac{1.1076 - 1.0647}{1.1155 - 1.0647} = \mathbf{-2.16^oC}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.43

Compression and heat transfer brings carbon dioxide in a piston/cylinder from 1400 kPa, 20°C to saturated vapor in an isothermal process. Find the specific heat transfer and the specific work.

Solution:

m = constant

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T = {}_1q_2 /T$

Process: T = C and assume reversible $\Rightarrow$ ${}_1q_2 = T\,(s_2 - s_1)$

State 1: Table B.4.2:

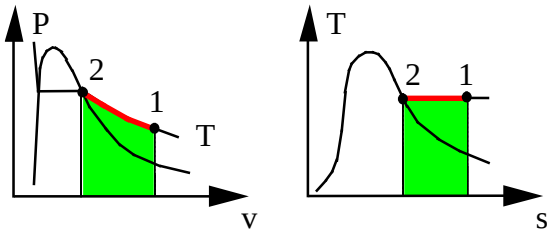
u_1 = 259.18 kJ/kg,

s_1 = 1.0057 kJ/kg K

State 2: Table B.4.1

u_2 = 258.16 kJ/kg,

s_2 = 0.9984 kJ/kg K



${}_1q_2 = (273 + 20) \times (0.9984 - 1.0057) = -\mathbf{2.14\ kJ/kg}$

${}_1w_2 = {}_1q_2 + u_1 - u_2 = -2.14 + 259.18 - 258.16$

$= -\mathbf{1.12\ kJ/kg}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.44

A piston cylinder maintaining constant pressure contains 0.1 kg saturated liquid water at 100°C. It is now boiled to become saturated vapor in a reversible process. Find the work term and then the heat transfer from the energy equation. Find the heat transfer from the entropy equation, is it the same?

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m(s_2 - s_1) = \int \frac{dq}{T} + 0 = \frac{{}_1Q_2}{T}$

Process: $P = C \Rightarrow {}_1W_2 = m\,P(v_2 - v_1) = m\,P\,v_{fg}$

$= 0.1\ \text{kg} \times 101.3\ \text{kPa} \times 1.67185\ \text{m}^3/\text{kg} =$ **16.936 kJ**

From the energy equation we get

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m\,u_{fg} + {}_1W_2$

$= 0.1 \times 2087.58 + 16.936 = 225.7\ \text{kJ}$

or $= m(h_2 - h_1) = m\,h_{fg} = 0.1 \times 2257.03 =$ **225.7 kJ**

From the entropy equation we can get

${}_1Q_2 = mT(s_2 - s_1) = m\,T\,s_{fg} = 0.1 \times 373.15 \times 6.048 =$ **225.68 kJ**

So they are equal to within round off errors.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.45

A piston cylinder contains 0.25 kg of R-134a at 100 kPa. It will be compressed in an adiabatic reversible process to 400 kPa and should be 70^{o}C. What should the initial temperature be?

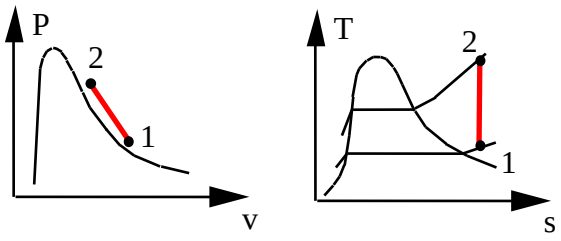
C.V. R-134a which is a control mass.

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T = 0$

State 2: $s_2 = s_1 = 1.9051$ kJ/kgK

Work backwards from state 2 to state 1

State 1: 100 kPa & s_1 => T_1 = **26.4°C**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.46

A piston/cylinder contains 0.5 kg of water at 200 kPa, 300°C, and it now cools to 150°C in an isobaric process. The heat goes into a heat engine that rejects heat to the ambient at 25°C (shown in Fig. P.6.46), and the whole process is assumed to be reversible. Find the heat transfer out of the water and the work given out by the heat engine.

C.V. H_2O

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T + 0$

Process: $P = C \Rightarrow W = \int P\, dV = P(V_2 - V_1) = m\, P\, (v_2 - v_1)$

State 1: B.1.3 $s_1 = 7.8926$ kJ/kg-K, $h_1 = 3071.79$ kJ/kg

State 2: B.1.3 $s_2 = 7.2795$ kJ/kg K, $h_2 = 2768.8$ kJ/kg

From the process equation and the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1) = 0.5(2768.8 - 3071.79)$$

$$= \mathbf{-151.495\ kJ}$$

CV Total

Energy Eq.3.5: $m(u_2 - u_1) = -Q_L - {}_1W_2 - W_{HE}$

Entropy Eq.6.3: $m(s_2 - s_1) = -Q_L/T_{amb} + 0$

$$Q_L = mT_{amb}(s_1 - s_2) = 0.5 \text{ kg } 298.15 \text{ K } (7.8926 - 7.2795) \text{ kJ/kgK}$$

$$= 91.398 \text{ kJ}$$

Now the energy equation for the heat engine gives

$$W_{HE} = -{}_1Q_2 - Q_L = 151.495 - 91.398 = \mathbf{60.1\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.47

A cylinder fitted with a piston contains ammonia at 50°C, 20% quality with a volume of 1 L. The ammonia expands slowly, and during this process heat is transferred to maintain a constant temperature. The process continues until all the liquid is gone. Determine the work and heat transfer for this process.

Solution:

C.V. Ammonia in the cylinder.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T + 0$

Process: T = constant to $x_2 = 1.0$, P = constant = 2.033 MPa

$\Rightarrow W = \int P\, dV = P(V_2 - V_1) = m\, P\, (v_2 - v_1)$

$\Rightarrow \int dQ/T = {}_1Q_2 / T$

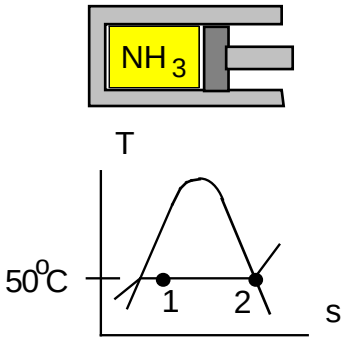


Table B.2.1: $T_1 = 50°C$, $x_1 = 0.20$, $V_1 = 1$ L

$v_1 = 0.001777 + 0.2 \times 0.06159 = 0.014095\ m^3/kg$

$s_1 = 1.5121 + 0.2 \times 3.2493 = 2.1620$ kJ/kg K

$m = V_1/v_1 = 0.001/0.014095 = 0.071$ kg

$v_2 = v_g = 0.06336\ m^3/kg$,

$s_2 = s_g = 4.7613$ kJ/kg K

${}_1W_2 = Pm(v_2 - v_1) = 2033 \times 0.071 \times (0.06336 - 0.014095) =$ **7.11 kJ**

From the entropy equation

${}_1Q_2 = Tm\,(s_2 - s_1) = 323.2\ K \times 0.071\ kg\ (4.7613 - 2.1620)\ kJ/kg\text{-}K$

= **59.65 kJ**

or ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1)$

$h_1 = 421.48 + 0.2 \times 1050.01 = 631.48$ kJ/kg, $h_2 = 1471.49$ kJ/kg

${}_1Q_2 = 0.071\ kg\ (1471.49 - 631.48)\ kJ/kg =$ **59.65 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.48

Water in a piston/cylinder at 400^{o}C, 2000 kPa is expanded in a reversible adiabatic process. The specific work is measured to be 415.72 kJ/kg out. Find the final P and T and show the P-v and the T-s diagram for the process.

Solution:

C.V. Water, which is a control mass. Adiabatic so: $_1q_2 = 0$

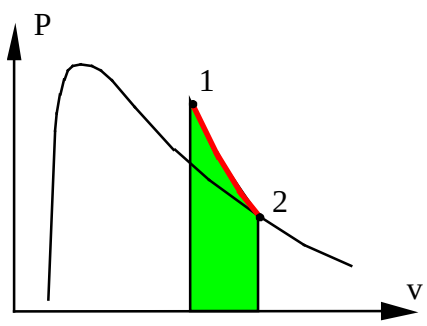
Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2 = -{}_1w_2$

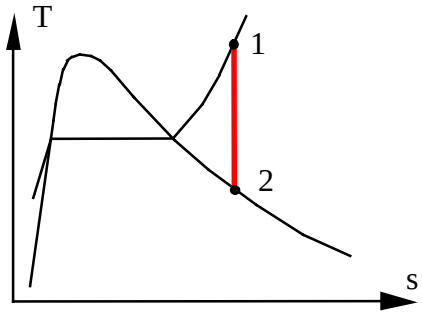
Entropy Eq.6.3: $s_2 - s_1 = \int dq/T = 0$ (= since reversible)

State 1: Table B.1.3 $u_1 = 2945.21$ kJ/kg; $s_1 = 7.127$ kJ/kg K

State 2: (s, u): $u_2 = u_1 - {}_1w_2 = 2945.21 - 415.72 = 2529.49$ kJ/kg

=> **sat. vapor 200 kPa, T = 120.23°C**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.49

A piston/cylinder has 2 kg water at 1000 kPa, 200°C which is now cooled with a constant loading on the piston. This isobaric process ends when the water has reached a state of saturated liquid. Find the work and heat transfer and sketch the process in both a P-v and a T-s diagram.

Solution:

C.V. H_2O

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$

Process: $P = C \Rightarrow W = \int P\, dV = P(V_2 - V_1)$

State 1: B.1.3 $v_1 = 0.20596\ m^3/kg$, $s_1 = 6.6939$ kJ/kg-K, $u_1 = 2621.90$ kJ/kg

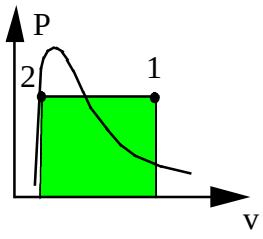
State 2: B.1.2 $v_2 = 0.001127\ m^3/kg$, $s_2 = 2.1386$ kJ/kg K, $u_2 = 761.67$ kJ/kg

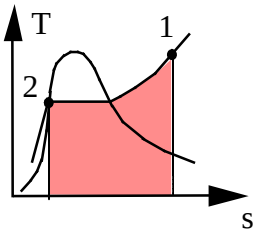
From the process equation

${}_1W_2 = m\, P\, (v_2 - v_1) = 2 \times 1000\ (0.001127 - 0.20596) =$ **-409.7 kJ**

From the energy equation we get

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 2\ (761.67 - 2621.90) - 409.7 =$ **-4130.2 kJ**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.50

One kilogram of water at 300°C expands against a piston in a cylinder until it reaches ambient pressure, 100 kPa, at which point the water has a quality of 90.2%. It may be assumed that the expansion is reversible and adiabatic. What was the initial pressure in the cylinder and how much work is done by the water?

Solution:

C.V. Water. Process: Rev., Q = 0

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = -{}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$

Process: Adiabatic Q = 0 and reversible => $s_2 = s_1$

State 2: $P_2 = 100$ kPa, $x_2 = 0.902$ from Table B.1.2

$s_2 = 1.3026 + 0.902 \times 6.0568 = 6.7658$ kJ/kg K

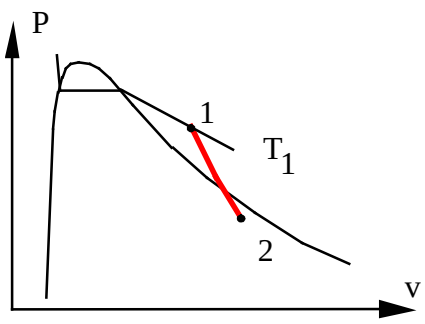
$u_2 = 417.36 + 0.902 \times 2088.7 = 2301.4$ kJ/kg

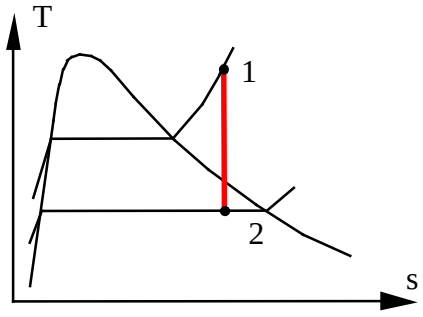
State 1 At $T_1 = 300$°C, $s_1 = 6.7658$ Find it in Table B.1.3

$\Rightarrow$ $P_1 =$ **2000 kPa,** $u_1 = 2772.6$ kJ/kg

From the energy equation

${}_1W_2 = m(u_1 - u_2) = 1(2772.6 - 2301.4) =$ **471.2 kJ**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.51

Water at 1000 kPa, 250°C is brought to saturated vapor in a rigid container, shown in Fig. P8.54. Find the final T and the specific heat transfer in this isometric process.

Solution:

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T$

Process: v = constant => ${}_1w_2 = 0$

State 1: (T, P) Table B.1.3 $u_1 = 2709.91$ kJ/kg, $v_1 = 0.23268$ m^3/kg

State 2: x = 1 and $v_2 = v_1$ so from Table B.1.1 we see $P_2 \cong 800$ kPa

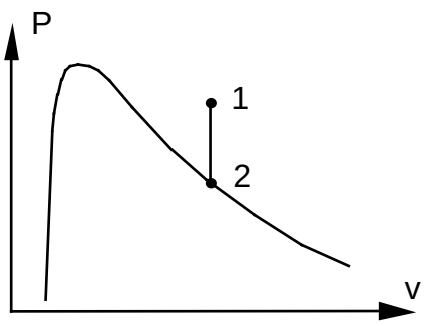
$T_2 = 170 + 5 \times (0.23268 - 0.24283)/(0.2168 - 0.24283)$

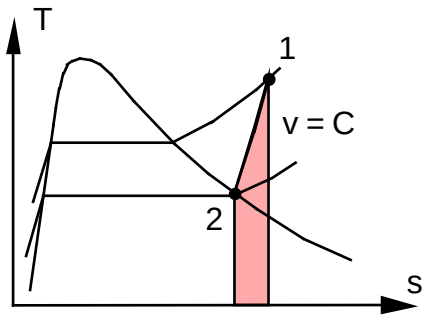
$= 170 + 5 \times 0.38993 =$ **171.95°C**

$u_2 = 2576.46 + 0.38993 \times (2580.19 - 2576.46) = 2577.9$ kJ/kg

From the energy equation

${}_1q_2 = u_2 - u_1 = 2577.9 - 2709.91 =$ **–132 kJ/kg**





Notice to get ${}_1q_2 = \int T\,ds$ we must know the function T(s) which we do not readily have for this process.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.52

Estimate the specific heat transfer from the area in the T-s diagram and compare it to the correct value for the states and process in Problem 6.51.

Solution:

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T$

Process: v = constant => ${}_1w_2 = 0$

State 1: (T, P) Table B.1.3 $u_1 = 2709.91$ kJ/kg, $v_1 = 0.23268$ m^3/kg,

$s_1 = 6.9246$ kJ/kg K

State 2: x = 1 and $v_2 = v_1$ so from Table B.1.1 we see $P_2 \cong 800$ kPa

$T_2 = 170 + 5 \times (0.23268 - 0.24283)/(0.2168 - 0.24283)$

$= 170 + 5 \times 0.38993 =$ **171.95°C**

$u_2 = 2576.46 + 0.38993 \times (2580.19 - 2576.46) = 2577.9$ kJ/kg

$s_2 = 6.6663 + 0.38993\ (6.6256 - 6.6663) = 6.6504$ kJ/kg K

From the energy equation

${}_1q_{2\ \text{actual}} = u_2 - u_1 = 2577.9 - 2709.91 =$ **–132 kJ/kg**

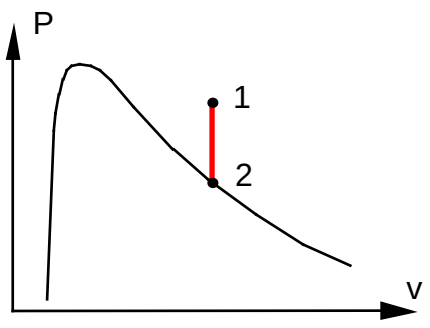
Assume a linear variation of T versus s.

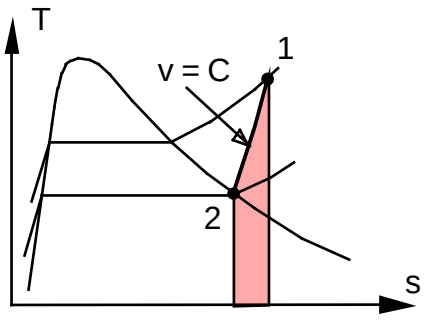
${}_1q_2 = \int T\,ds = \text{area} \cong \frac{1}{2}(T_1 + T_2)(s_2 - s_1)$

$= \frac{1}{2}(171.95 + (2 \times 273.15) + 250)$ K $(6.6504 - 6.9246)$ kJ/kg-K

= **-132.74 kJ/kg**

very close i.e. the v = C curve is close to a straight line in the T-s diagram. Look at the constant v curves in Fig. E.1. In the two-phase region they curve slightly and more so in the region above the critical point.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.53

A closed tank, $V = 10$ L, containing 5 kg of water initially at 25°C, is heated to 150°C by a heat pump that is receiving heat from the surroundings at 25°C. Assume that this process is reversible. Find the heat transfer to the water and the change in entropy.

Solution:

C.V.: Water from state 1 to state 2.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$

Process: constant volume (reversible isometric) so ${}_1W_2 = 0$

State 1: $v_1 = V/m = 0.002$ from Table B.1.1

$x_1 = (0.002 - 0.001003)/43.358 = 0.000023$

$u_1 = 104.86 + 0.000023 \times 2304.9 = 104.93$ kJ/kg

$s_1 = 0.3673 + 0.000023 \times 8.1905 = 0.36759$ kJ/kg K

Continuity eq. (same mass) and V = C fixes v_2

State 2: T_2, $v_2 = v_1$ so from Table B.1.1

$x_2 = (0.002 - 0.001090)/0.39169 = 0.0023233$

$u_2 = 631.66 + 0.0023233 \times 1927.87 = 636.14$ kJ/kg

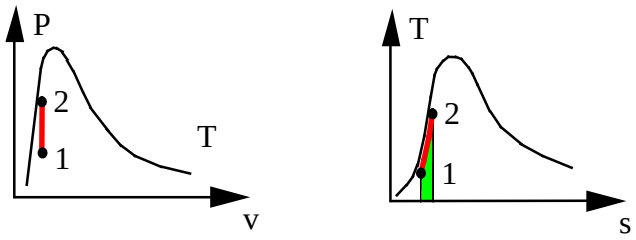
$s_2 = 1.8417 + 0.0023233 \times 4.9960 = 1.8533$ kJ/kg K

Energy eq. has W = 0, thus provides heat transfer as

${}_1Q_2 = m(u_2 - u_1) =$ **2656.05 k**J

The entropy change becomes

$m(s_2 - s_1) = 5(1.8533 - 0.36759) =$ **7.4286 kJ/K**



Notice we do not perform the integration $\int dQ/T$ to find change in s as the equation for the dQ as a function of T is not known.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.54

A piston/cylinder has 2 kg of R-410A at 60°C, 100 kPa which is compressed to 1000 kPa. The process happens so slowly that the temperature is constant. Find the heat transfer and work for the process assuming it to be reversible.

Solution:

CV : R-410A Control Mass

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$;

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$

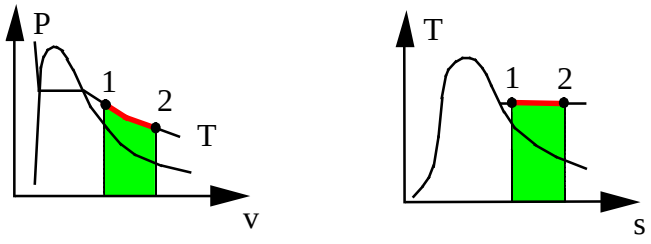
Process: T = constant and assume reversible process

1: (T,P), Table B.4.2: $v_1 = 0.37833\ m^3/kg$, $u_1 = 309.4\ kJ/kg$,

$s_1 = 1.4910\ kJ/kg\ K$

2: (T,P), Table B.4.2: $v_2 = 0.03470\ m^3/kg$, $u_2 = 301.04\ kJ/kg$,

$s_2 = 1.2019\ kJ/kg\ K$



From the entropy equation (2nd law)

$${}_1Q_2 = mT(s_2 - s_1) = 2\ kg \times 333.15\ K \times (1.2019 - 1.4910)\ kJ/kg\text{-}K$$

$$= -\mathbf{192.63\ kJ}$$

From the energy equation

$${}_1W_2 = {}_1Q_2 - m(u_2 - u_1) = -192.63\ kJ - 2\ kg \times (301.04 - 309.4)\ kJ/kg$$

$$= -\mathbf{175.9\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.55

A heavily insulated cylinder/piston contains ammonia at 1200 kPa, 60°C. The piston is moved, expanding the ammonia in a reversible process until the temperature is –20°C. During the process 200 kJ of work is given out by the ammonia. What was the initial volume of the cylinder?

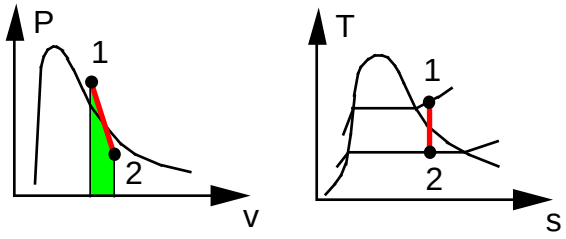
C.V. ammonia. Control mass with no heat transfer.

State 1: Table B.2.2 $v_1 = 0.1238\ m^3/kg$, $s_1 = 5.2357\ kJ/kg\ K$

$u_1 = 1404.8\ kJ/kg$

Entropy Eq.: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen}$

Process: reversible (${}_1S_{2\ gen} = 0$) and adiabatic ($dQ = 0$) => $s_2 = s_1$



State 2: T_2, s_2 $\Rightarrow$ $x_2 = (5.2357 - 0.3657)/5.2498 = 0.928$

$u_2 = 88.76 + 0.928 \times 1210.7 = 1211.95\ kJ/kg$

${}_1Q_2 = 0 = m(u_2 - u_1) + {}_1W_2 = m(1211.95 - 1404.8) + 200$

$\Rightarrow$ $m = 1.037\ kg$

$V_1 = mv_1 = 1.037 \times 0.1238 =$ **$0.1284\ m^3$**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.56

Water at 1000 kPa, 250°C is brought to saturated vapor in a piston/cylinder with an isothermal process. Find the specific work and heat transfer. Estimate the specific work from the area in the P-v diagram and compare it to the correct value.

Solution:

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$

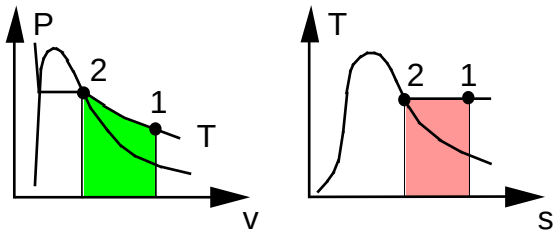
Process: T = constant, reversible

State 1: Table B.1.3:

$v_1 = 0.23268\ m^3/kg$; $u_1 = 2709.91$ kJ/kg; $s_1 = 6.9246$ kJ/kg K

State 2: (T, x) Table B.1.1 $P_2 = 3973$ kPa

$v_2 = 0.05013\ m^3/kg$, $u_2 = 2602.37$ kJ/kg, $s_2 = 6.0729$ kJ/kg K



From the entropy equation

${}_1q_2 = \int T\,ds = T(s_2 - s_1) = (250 + 273)\,(6.0729 - 6.9246) =$ **-445.6 kJ/kg**

From the energy equation

${}_1w_2 = {}_1q_2 + u_1 - u_2 = -445.6 + 2709.91 - 2602.37 =$ **-338 kJ/kg**

Estimation of the work term from the area in the P-v diagram

$${}_1w_{2\ area} \cong \frac{1}{2}(P_1+P_2)(v_2 - v_1) = \frac{1}{2}(1000 + 3973)(0.05013 - 0.23268)$$

$$= -454 \text{ kJ/kg}$$

Not extremely accurate estimate; P-v curve not linear more like Pv = constant as curve has positive curvature the linear variation over-estimates area.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.57

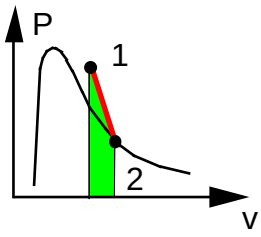
A rigid, insulated vessel contains superheated vapor steam at 3 MPa, 400°C. A valve on the vessel is opened, allowing steam to escape. The overall process is irreversible, but the steam remaining inside the vessel goes through a reversible adiabatic expansion. Determine the fraction of steam that has escaped, when the final state inside is saturated vapor.

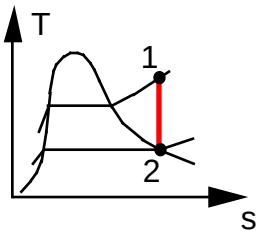
C.V.: steam remaining inside tank. Rev. & Adiabatic (inside only)

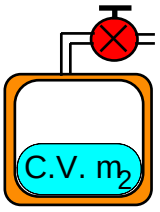
Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$







Rev $({}_1S_{2\,gen} = 0)$ Adiabatic $(Q = 0)$ => $s_2 = s_1 = 6.9212 = s_G$ at T_2

$\Rightarrow$ $T_2 = 141°C$, $v_2 = v_{g\ at\ T_2} = 0.4972\ m^3/kg$

$$\frac{m_e}{m_1} = \frac{m_1 - m_2}{m_1} = 1 - \frac{m_2}{m_1} = 1 - \frac{v_1}{v_2} = 1 - \frac{0.09936}{0.4972} = \mathbf{0.80}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.58

Water at 100 kPa, 25°C is brought to the boiling point in a piston/cylinder with an isobaric process. The heat is supplied by a heat pump with the cold side at the ambient temperature of 25°C. Assume that the whole process is reversible and find the work input to the heat pump per kg of water.

C.V. H_2O

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T + 0$

Process: $P = C \Rightarrow w = \int P\, dv = P(v_2 - v_1)$

State 1: B.1.1 $s_1 = 0.3673$ kJ/kg-K, $h_1 = 104.87$ kJ/kg

State 2: B.1.2 $s_2 = 1.3025$ kJ/kg K, $h_2 = 417.44$ kJ/kg

From the process equation and the energy equation

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = h_2 - h_1 = 417.44 - 104.87 = 312.57 \text{ kJ/kg}$$

CV Total

Energy Eq.3.5: $u_2 - u_1 = q_L - {}_1w_2 + w_{HP}$

Entropy Eq.6.3: $s_2 - s_1 = q_L/T_{amb} + 0$

$$q_L = T_{amb}(s_2 - s_1) = 298.15 \text{ K } (1.3025 - 0.3673) \text{ kJ/kgK}$$
$$= 278.83 \text{ kJ/kg}$$

Now the energy equation for the heat engine gives

$$w_{HP} = {}_1q_2 - q_L = 312.57 - 278.83 = \mathbf{33.74\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.59

Water at 1000 kPa, 200°C is brought to saturated vapor in a piston/cylinder with an isobaric process. Find the specific work and heat transfer. Estimate the specific heat transfer from the area in the T-s diagram and compare it to the correct value.

Solution:

C.V. H_2O

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T$

Process: $P = C$ => $w = \int P\, dv = P(v_2 - v_1)$

State 1: B.1.3 $v_1 = 0.20596\ m^3/kg$, $s_1 = 6.6939$ kJ/kg-K, $u_1 = 2621.90$ kJ/kg

State 2: B1.3 $v_2 = 0.19444\ m^3/kg$, $s_2 = 6.5864$ kJ/kg K, $u_2 = 2583.64$ kJ/kg

$T_2 = 179.91°C$

From the process equation

${}_1w_2 = P\,(v_2 - v_1) = 1000\ kPa\ (0.19444 - 0.20596)\ m^3/kg =$ **-11.52 kJ/kg**

From the energy equation

${}_1q_2 = u_2 - u_1 + {}_1w_2 = 2583.64 - 2621.90 - 11.52 =$ **-49.78 kJ/kg**

Now estimate the heat transfer from the T-s diagram.

${}_1q_2 = \int T\, ds = \text{AREA} \cong \frac{1}{2}(T_1 + T_2)(s_2 - s_1)$

$= \frac{1}{2}(200 + 179.91 + 2 \times 273.15)\ K \times (6.5864 - 6.6939)\ kJ/kg\text{-}K$

$= 463.105 \times (-0.1075) =$ **-49.78 kJ/kg**

very close approximation. The P = C curve in the T-s diagram is nearly a straight line. Look at the constant P curves on Fig.E.1. Up over the critical point they curve significantly.

Entropy of a liquid or a solid

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.60

Two 5 kg blocks of steel, one at 250°C the other at 25°C, come in thermal contact. Find the final temperature and the change in entropy of the steel?

C.V. Both blocks, no external heat transfer, C from Table A.3.

Energy Eq.: $U_2 - U_1 = m_A(u_2 - u_1)_A + m_B(u_2 - u_1)_B = 0 - 0$

$$= m_A C(T_2 - T_{A1}) + m_B C(T_2 - T_{B1})$$

$$T_2 = \frac{m_A T_{A1} + m_B T_{B1}}{m_A + m_B} = \frac{1}{2} T_{A1} + \frac{1}{2} T_{B1} = \mathbf{137.5^oC}$$

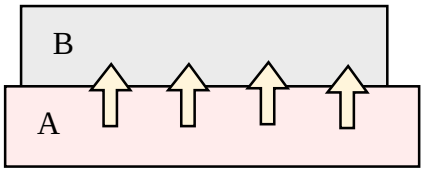
Entropy Eq.6.37: $S_2 - S_1 = m_A(s_2 - s_1)_A + m_B(s_2 - s_1)_B = {}_1S_{2\,\text{gen}}$

Entropy changes from Eq.6.11

$$S_2 - S_1 = m_A C \ln \frac{T_2}{T_{A1}} + m_B C \ln \frac{T_2}{T_{B1}}$$

$$= 5 \times 0.46 \ln \frac{137.5 + 273.15}{250 + 273.15} + 5 \times 0.46 \ln \frac{137.5 + 273.15}{298.15}$$

$$= -0.5569 + 0.7363 = \mathbf{0.1794\ kJ/K}$$



Heat transfer over a finite temperature difference is an irreversible process

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.61

A rigid tank of 1.2 kg steel contains 1.5 kg of R-134a at 40°C, 500 kPa. The tank is placed in a refrigerator that brings it to -20°C. Find the process heat transfer and the combined steel and R-134a change in entropy.

C.V. The steel tank and the R-134a.

The energy equation, Eq. 3.5 now becomes (summing over the mass)

$$m_{st}\,(u_2 - u_1)_{st} + m_{R134a}\,(u_2 - u_1)_{R134a} = {}_1Q_2 - 0$$

Process: No change in volume so no work as used above.

Use specific heat from Table A.3 for steel and Table B.5 for R-134a

R-134a: $v_1 = 0.04656\ m^3/kg$, $u_1 = 407.44\ kJ/kg$, $s_1 = 1.7971\ kJ/kgK$

State 2: $v_2 = v_1 < v_g \Rightarrow x_2 = (v_2 - v_f)/v_{fg} = \dfrac{0.04656 - 0.000738}{0.14576} = 0.314366$

$$u_2 = u_f + x_2\, u_{fg} = 173.65 + x_2 \times 192.85 = 234.275\ kJ/kg$$

$$s_2 = s_f + x_2\, s_{fg} = 0.9007 + x_2 \times 0.8388 = 1.16439\ kJ/kg\text{-}K$$

Now the heat transfer from the energy equation

$${}_1Q_2 = m_{R134a}(u_2 - u_1)_{R134a} + m_{st}\, C_{st}\,(T_2 - T_1)$$

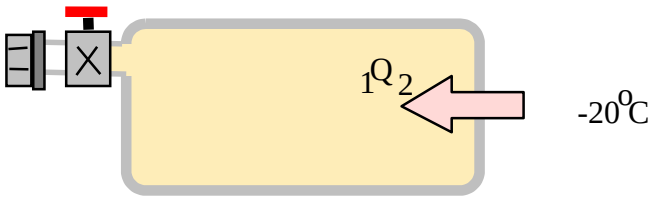
$$= 1.5 \times (234.275 - 407.44) + 1.2 \times 0.46\,(-20 - 40) = \mathbf{-292.87\ kJ}$$

Steel: $m_{st}(s_2 - s_1)_{st} = m_{st}C_{st} \ln (T_2/T_1) = 1.2 \times 0.46 \ln \dfrac{253.15}{313.15} = -0.11741\ kJ/K$

Entropy change for the total control volume steel and R-134a

$$S_2 - S_1 = m_{st}\,(s_2 - s_1)_{st} + m_{R134a}\,(s_2 - s_1)_{R134a}$$

$$= -0.11741 + 1.5(1.16439 - 1.7971) = -\,\mathbf{1.066\ kJ/K}$$



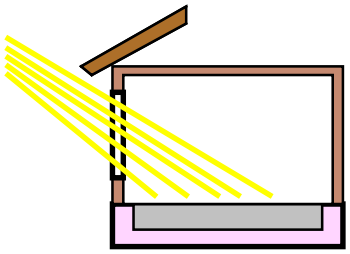
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.62

A large slab of concrete, 5 × 8 × 0.3 m, is used as a thermal storage mass in a solar-heated house. If the slab cools overnight from 23°C to 18°C in an 18°C house, what is the net entropy change associated with this process?

Solution:

C.V.: Control mass concrete.



$V = 5 \times 8 \times 0.3 = 12\ m^3$

$m = \rho V = 2200 \times 12 = 26\ 400\ kg$

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m(s_2 - s_1) = \dfrac{{}_1Q_2}{T_0} + {}_1S_{2\ gen}$

Process: V = constant so ${}_1W_2 = 0$

Use heat capacity (Table A.3) for change in u of the slab

${}_1Q_2 = mC\Delta T = 26400\ kg \times 0.88\ kJ/kg\text{-}K \times (-5)\ K = -116\ 160\ kJ$

We add all the storage changes as in Eq.6.39:

$$\Delta S_{slab} = m(s_2 - s_1) = m\ C \ln \frac{T_2}{T_1}$$

$$= 26400\ kg \times 0.88\ kJ/kg\text{-}K \times \ln \frac{291.2}{296.2} = \mathbf{-395.5\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.63

A foundry form box with 25 kg of 200°C hot sand is dumped into a bucket with 50 L water at 15°C. Assuming no heat transfer with the surroundings and no boiling away of liquid water, calculate the net entropy change for the mass.

Solution:

C.V. Sand and water, constant pressure process

$$m_{sand}(u_2 - u_1)_{sand} + m_{H_2O}(u_2 - u_1)_{H_2O} = -P(V_2 - V_1)$$

$$\Rightarrow \; m_{sand}\Delta h_{sand} + m_{H_2O}\Delta h_{H_2O} = 0$$

For this problem we could also have said that the work is nearly zero as the solid sand and the liquid water will not change volume to any measurable extent. Now we get changes in u's instead of h's. For these phases $C_V = C_P = C$ which is a consequence of the incompressibility. Now the energy equation becomes

$$m_{sand}C_{sand}\Delta T_{sand} + m_{H_2O}C_{H_2O}\Delta T_{H_2O} = 0$$

$$25 \text{ kg} \times 0.8 \text{ kJ/kg-K} \times (T_2 - 200) \text{ K}$$

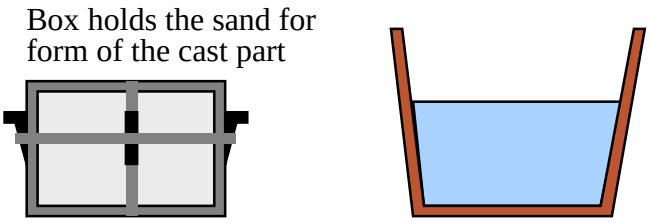
$$+ (50\times10^{-3} \text{ m}^3 / 0.001001 \text{ m}^3/\text{kg}) \times 4.184 \text{ kJ/kg-K} \times (T_2 - 15) \text{ K} = 0$$

$$T_2 = 31.2°C$$

$$S_2 - S_1 = m_{sand}(s_2 - s_1) + m_{H2O} (s_2 - s_1)$$

$$= m_{sand}\, C_{sand} \ln(T_2/T_1) + m_{H2O}\, C_{H2O} \ln(T_2/T_1)$$

$$= 25 \times 0.8 \ln\left(\frac{304.3}{473.15}\right) + 49.95 \times 4.184 \ln\left(\frac{304.3}{288.15}\right) = \mathbf{2.57 \text{ kJ/K}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.64

Heat transfer to a block of 1.5 kg ice at -10^{o}C melts it to liquid at 10^{o}C in a kitchen. Find the entropy change of the water.

Water changes state from nearly saturated solid to nearly saturated liquid. The pressure is 101 kPa but we approximate the state properties with saturated state at the same temperature.

State 1: Compressed (saturated) solid, B.1.5, $s_1 = -1.2995$ kJ/kg-K

State 2: Compressed (saturated) liquid B.1.1 $s_2 = 0.1510$ kJ/kg-K

The entropy change is

$$\Delta s = s_2 - s_1 = 0.151 - (-1.2995) = \mathbf{1.4505\ kJ/kg\text{-}K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.65

In a sink 5 liters of water at 70°C is combined with 1 kg aluminum pots, 1 kg of flatware (steel) and 1 kg of glass all put in at 20°C. What is the final uniform temperature and change in stored entropy neglecting any heat loss and work?

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2 = 0$

Entropy Eq.: $S_2 - S_1 = \int dQ/T + {}_1S_{2\ gen}$

For the water: $v_f = 0.001023\ m^3/kg$, $V = 5\ L = 0.005\ m^3$; $m = V/v = 4.8876\ kg$

For the liquid and the metal masses we will use the specific heats (Tbl A.3, A.4) so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i}\,(T_2 - T_1)_i = T_2 \sum m_i C_{v\,i} - \sum m_i C_{v\,i} T_{1\,i}$$

noticing that all masses have the same T_2 but not same initial T.

$$\sum m_i C_{v\,i} = 4.8876 \times 4.18 + 1 \times 0.9 + 1 \times 0.46 + 1 \times 0.8 = 22.59\ kJ/K$$

Energy Eq.: $22.59\ T_2 = 4.8876 \times 4.18 \times 70 + (1\times 0.9 + 1\times 0.46 + 1\times 0.8) \times 20$

$$= 1430.11 + 43.2$$

$$T_2 = \mathbf{65.2^oC}$$

$$S_2 - S_1 = \sum m_i(s_2 - s_1)_i = \sum m_i\, C_i \ln \frac{T_2}{T_{i1}}$$

$$= 4.8876 \times 4.18 \times \ln \frac{65.22 + 273.15}{70 + 273.15}$$

$$+ 1 \times (0.9 + 0.46 + 0.8) \ln \frac{65.22 + 273.15}{20 + 273.15}$$

$$= -0.28659 + 0.30986 = \mathbf{0.02327\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.66

A piston cylinder has constant pressure of 2000 kPa with water at 20°C. It is now heated up to 100°C. Find the heat transfer and the entropy change using the steam tables. Repeat the calculation using constant heat capacity and incompressibility.

Solution:

C.V. Water. Constant pressure heating.

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.37: $s_2 - s_1 = {}_1q_2 / T_{SOURCE} + {}_1s_{2\,gen}$

Process: $P = P_1 \Rightarrow {}_1w_2 = P(v_2 - v_1)$

The energy equation then gives the heat transfer as

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = h_2 - h_1$$

Steam Tables B.1.4: $h_1 = 85.82$ kJ/kg; $s_1 = 0.2962$ kJ/kg K

$h_2 = 420.45$ kJ/kg; $s_2 = 1.3053$ kJ/kg K

${}_1q_2 = h_2 - h_1 = -85.82 + 420.45 =$ **334.63 kJ/kg**

$s_2 - s_1 = 1.3053 - 0.2962 =$ **1.0091 kJ/kg K**

Now using values from Table A.4: Liquid water $C_p = 4.18$ kJ/kg K

$$h_2 - h_1 \cong C_p(T_2 - T_1) = 4.18 \times 80 = \textbf{334.4 kJ/kg}$$

$$s_2 - s_1 \cong C_p \ln(T_2/T_1) = 4.18 \ln \frac{373.15}{293.15} = \textbf{1.0086 kJ/kg K}$$

Approximations are very good

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.67

A 4 L jug of milk at 25°C is placed in your refrigerator where it is cooled down to the refrigerators inside constant temperature of 5°C. Assume the milk has the property of liquid water and find the entropy change of the milk.

Solution:

C.V. Jug of milk. Control mass at constant pressure.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

State 1: Table B.1.1: $v_1 \cong v_f = 0.001003\ m^3/kg$, $s_f = 0.3673$ kJ/kg K

$m = V/v = 0.004\ m^3 / 0.001003\ (m^3/kg) = 3.988$ kg

State 2: Table B.1.1: $s = s_f = 0.0761$ kJ/kg K

The change of entropy becomes

$S_2 - S_1 = m(s_2 - s_1) = 3.988$ kg $(0.0761 - 0.3673)$ kJ/kg-K

$= \mathbf{-\ 1.1613\ kJ/K}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.68

A constant pressure container of 1.2 kg steel contains 1.5 kg of R-134a at 40°C, 500 kPa. The container is placed in a refrigerator that brings it to -20°C. Find the process heat transfer and the combined steel and R-134a change in entropy.

C.V. The steel container and the R-134a.

The energy equation, Eq. 3.5 now becomes (summing over the mass)

$$m_{st}\,(u_2 - u_1)_{st} + m_{R134a}\,(u_2 - u_1)_{R134a} = {}_1Q_2 - {}_1W_2$$

Process: P = C so ${}_1W_2 = P\,(V_2 - V_1) = P\,m_{R134a}\,(v_2 - v_1)_{R134a}$

Substitute the work into the energy eqution and we combine the R-134a terms

$${}_1Q_2 = m_{R134a}(h_2 - h_1)_{R134a} + m_{st}\,C_{st}\,(T_2 - T_1)$$

Use specific heat from Table A.3 for steel and Table B.5 for R-134a

R-134a: $v_1 = 0.04656\ m^3/kg$, $h_1 = 430.72\ kJ/kg$, $s_1 = 1.7971\ kJ/kgK$

State 2: 500 kPa, -20°C compressed liquid.

$v_2 = 0.000738$, $s_2 = s_f = 0.9007\ kJ/kg\text{-}K$

$h_2 = h_f + \Delta Pv = 173.74 + (500\text{-}133.7) \times 0.000738 = 174.0\ kJ/kg$

notice how the correction for P higher than Psat is small

Now the heat transfer from the energy equation

$${}_1Q_2 = m_{R134a}(h_2 - h_1)_{R134a} + m_{st}\,C_{st}\,(T_2 - T_1)$$

$$= 1.5 \times (174.0 - 430.72) + 1.2 \times 0.46\,(-20 - 40) = \mathbf{-418.2\ kJ}$$

Steel: $m_{st}(s_2 - s_1)_{st} = m_{st}C_{st} \ln (T_2/T_1) = 1.2 \times 0.46 \ln \dfrac{253.15}{313.15} = -0.11741\ kJ/kgK$

Entropy change for the total control volume steel and R-134a

$$S_2 - S_1 = m_{st}\,(s_2 - s_1)_{st} + m_{R134a}\,(s_2 - s_1)_{R134a}$$

$$= -0.11741 + 1.5(0.9007 - 1.7971) = \mathbf{-\ 1.462\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.69

A 10-kg steel container is cured at 500°C. An amount of liquid water at 15°C, 100 kPa is added to the container so a final uniform temperature of the steel and the water becomes 50°C. Neglect any water that might evaporate during the process and any air in the container. How much water should be added and how much was the entropy changed?

CV. The steel and the water no external heat transfer nor any work.

Energy Eq.: $m_{H2O}(u_2 - u_1)_{H2O} + m_{st}(u_2 - u_1) = 0$

$m_{H2o}(209.3 - 62.98) + m_{st}C (T_2 - T_1) = 0$

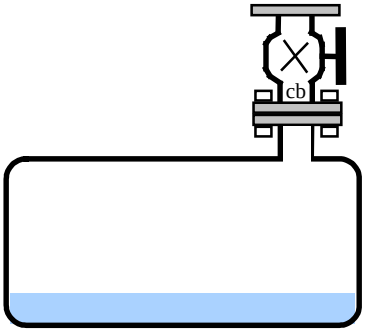
$m_{H2O} \times 146.32 \text{ kJ/kg} + 10 \times 0.46 \times (50 - 500) \text{ kJ} = 0$

$m_{H2O} = 2070/146.32 =$ **14.147 kg**

Entropy Eq. 6.37: $m_{H2O} (s_2 - s_1) + m_{st}(s_2 - s_1) = \varnothing + {}_1S_{2\ gen}$

$$S_2 - S_1 = 14.147 \text{ kg } (0.7037 - 0.2245) \text{ kJ/kg-K} + 10\text{kg} \times 0.46 \text{ kJ/kg-K} \times \ln \frac{50 + 273}{773}$$

$= 6.7792 - 4.0141 =$ **2.7651 kJ/K**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.70

A pan in an autoshop contains 5 L of engine oil at 20°C, 100 kPa. Now 3 L of hot 100°C oil is mixed into the pan. Neglect any work term and find the final temperature and the entropy change.

Solution:

Since we have no information about the oil density, we assume the same for both from Table A.4: $\rho = 885$ kg/m^3

Energy Eq.: $m_2u_2 - m_Au_A - m_Bu_B \cong 0 - 0$

$\Delta u \cong C_v\Delta T$ so same $C_v = 1.9$ kJ/kg K for all oil states.

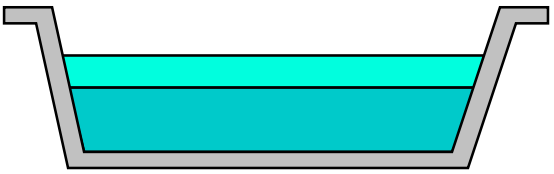
$$T_2 = \frac{m_A}{m_2} T_A + \frac{m_B}{m_2} T_B = \frac{5}{8} \times 20 + \frac{3}{8} \times 100 = 50.0^oC = \mathbf{323.15\ K}$$

$$S_2 - S_1 = m_2s_2 - m_As_A - m_Bs_B = m_A(s_2 - s_A) + m_B(s_2 - s_B)$$

$$= 0.005 \times 885 \times 1.9 \ln \frac{323.15}{293.15} + 0.003 \times 885 \times 1.9 \ln \frac{323.15}{373.15}$$

$$= 0.8192 - 0.7257 = \mathbf{+\ 0.0935\ kJ/K}$$

Entropy generation is the total change in S, recall Eq.6.39, no external Q



Oils shown before mixed to final uniform state.

6.71

A computer CPU chip consists of 50 g silicon, 20 g copper, 50 g polyvinyl chloride (plastic). It heats from 15°C to 75°C as the computer is turned on. How much did the entropy increase?

C.V. CPU chip. The process has electrical work input and no heat transfer.

Entropy Eq.: $S_2 - S_1 = \sum m_i(s_2 - s_1)_i = \int dQ/T + {}_1S_{2\,gen} = {}_1S_{2\,gen}$

For the solid masses we will use the specific heats, Table A.3, and they all have the same temperature so

$$\sum m_i(s_2 - s_1)_i = \sum m_i C_i \ln(T_2 / T_1)_i = \ln (T_2/T_1) \sum m_i C_i$$

$$\sum m_i C_i = 0.05 \times 0.7 + 0.02 \times 0.42 + 0.05 \times 0.96 = 0.0914 \text{ kJ/K}$$

$$S_2 - S_1 = 0.0914 \text{ kJ/K} \times \ln (348.15 / 288.15) = \mathbf{0.0173\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.72

A 5-kg aluminum radiator holds 2 kg of liquid R-134a at -10°C. The setup is brought indoors and heated with 220 kJ. Find the final temperature and the change in entropy of all the mass.

Solution:

C.V. The aluminum radiator and the R-134a.

Energy Eq.3.5: $m_2u_2 - m_1u_1 = {}_1Q_2 - 0$

Process: No change in volume so no work as used above.

The energy equation now becomes (summing over the mass)

$$m_{al}\,(u_2 - u_1)_{al} + m_{R134a}\,(u_2 - u_1)_{R134a} = {}_1Q_2$$

Use specific heat from Table A.3 and A.4

$$m_{al}C_{al}\,(T_2 - T_1) + m_{R134a}C_{R134a} \ln (T_2 - T_1) = {}_1Q_2$$

$$T_2 - T_1 = {}_1Q_2 / [m_{al}C_{al} + m_{R134a}C_{R134a}]$$

$$= 220 \text{ kJ}/ [5 \times 0.9 + 2 \times 1.43] \text{ kJ/K} = 29.89^{\circ}\text{C}$$

$$T_2 = -10 + 29.89 = 19.89^{\circ}\text{C}$$

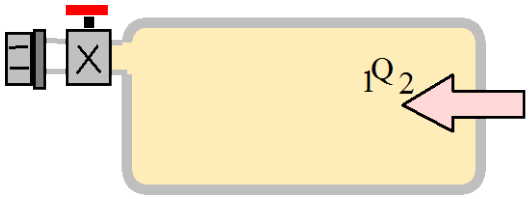
Entropy change for solid (A.3) and liquid (A.4) from Eq.6.11

$$S_2 - S_1 = m_{al}\,(s_2 - s_1)_{al} + m_{R134a}\,(s_2 - s_1)_{R134a}$$

$$= m_{al}C_{al} \ln (T_2/T_1) + m_{R134a}C_{R134a} \ln (T_2/T_1)$$

$$= (5 \times 0.9 + 2 \times 1.43) \text{ kJ/K} \ln \frac{(19.89 + 273.15)}{-10 + 273.15}$$

$$= \mathbf{0.792\ kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.73

A 12 kg steel container has 0.2 kg superheated water vapor at 1000 kPa, both at 200°C. The total mass is now cooled to ambient temperature 30°C. How much heat transfer was taken out and what is the steel-water entropy change?

Solution:

C.V.: Steel and the water, control mass of constant volume.

Energy Eq.3.5: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

Process: V = constant => ${}_1W_2 = 0$

State 1: H_20 Table B.1.3: $u_1 = 2621.9$ kJ/kg, $v_1 = 0.20596$ m^3/kg, $s_1 = 6.6939$ kJ/kg K

State 2: H_20: T_2 , $v_2 = v_1$ => from Table B.1.1

$$x_2 = \frac{v - v_f}{v_{fg}} = \frac{0.20596 - 0.001004}{32.8922} = 0.006231$$

$$u_2 = 125.77 + x_2 \times 2290.81 = 140.04 \text{ kJ/kg}$$

$$s_2 = 0.4369 + x_2 \times 8.0164 = 0.48685 \text{ kJ/kg K}$$

$${}_1Q_2 = m(u_2 - u_1) = m_{steel}C_{steel}\,(T_2 - T_1) + m_{H2O}\,(u_2 - u_1)_{H2O}$$

$$= 12 \text{ kg} \times 0.46 \text{ kJ/kg-K}\,(30 - 200) \text{ K} + 0.2 \text{ kg}(140.04 - 2621.9) \text{ kJ/kg}$$

$$= \mathbf{-1434.8\ kJ}$$

Entropy changes from Eq.6.11 and the water tables

$$S_2 - S_1 = m_2 s_2 - m_1 s_1 = m_{steel}C_{steel} \ln\left(\frac{T_2}{T_1}\right) + m_{H2O}\,(s_2 - s_1)_{H2O}$$

$$= 12 \times 0.46 \text{ kJ/K} \times \ln\left(\frac{303.15}{473.15}\right) + 0.2 \text{ kg}\,(0.48685 - 6.6939) \text{ kJ/kg-K}$$

$$= -2.4574 - 1.2414$$

$$= \mathbf{-3.699\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

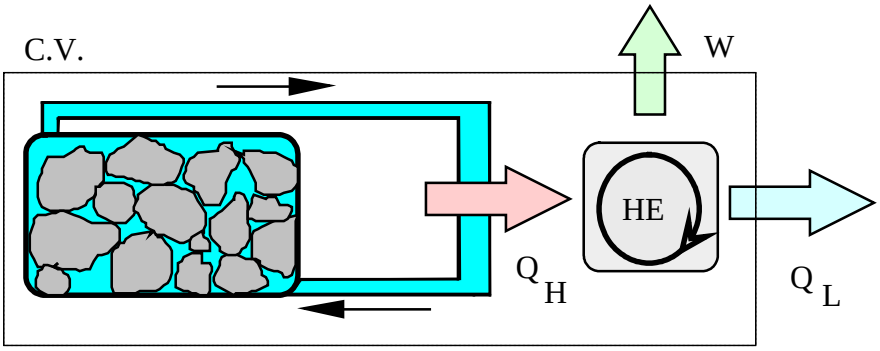
6.74

Find the total work the heat engine can give out as it receives energy from the rock bed as described in Problem 5.60 (see Fig.P 6.74). Hint: write the entropy balance equation for the control volume that is the combination of the rock bed and the heat engine.

Solution:

To get the work we must integrate over the process or do the 2nd law for a control volume around the whole setup out to T_0

C.V. Heat engine plus rock bed out to T_0. W and Q_L goes out.



Energy Eq.3.5: $(U_2 - U_1)_{rock} = - Q_L - W$

Entropy Eq.6.3, 11: $(S_2 - S_1)_{rock} = - \dfrac{Q_L}{T_0} = mC \ \ln \left(\dfrac{T_2}{T_1} \right)$

$$= 5500 \times 0.89 \ln \frac{290}{400} = -1574.15 \text{ kJ/K}$$

$$Q_L = -T_0 \, (S_2 - S_1)_{rock} = -290 \, (-1574.15) = 456\,504 \text{ kJ}$$

The energy drop of the rock $-(U_2 - U_1)_{rock}$ equals Q_H into heat engine

$$(U_2 - U_1)_{rock} = mC \, (T_2 - T_1) = 5500 \times 0.89 \, (290 - 400) = -538\,450 \text{ kJ}$$

$$W = -(U_2 - U_1)_{rock} - Q_L = 538450 - 456504 = \mathbf{81\,946 \text{ kJ}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.75

Consider problem 6.60 if the two blocks of steel exchange energy through a heat engine similar to the setup in Problem 6.74. Find the work output of the heat engine.

C.V. Both blocks, no external heat transfer, C from Table A.3.

Energy Eq.: $U_2 - U_1 = m_A(u_2 - u_1)_A + m_B(u_2 - u_1)_B = 0 - W$

$= m_A C(T_2 - T_{A1}) + m_B C(T_2 - T_{B1})$

Entropy Eq.6.37: $S_2 - S_1 = m_A(s_2 - s_1)_A + m_B(s_2 - s_1)_B = {}_1S_{2\ gen}$

Process: Assume reversible then ${}_1S_{2\ gen} = 0$

Entropy changes from Eq.6.11

$$S_2 - S_1 = m_A C \ln \frac{T_2}{T_{A1}} + m_B C \ln \frac{T_2}{T_{B1}} = 0$$

Now solve for T_2 by combining the "ln" terms as

$$0 = \ln \frac{T_2}{T_{A1}} + \ln \left(\frac{T_2}{T_{B1}} \right)^{m_B/m_A} = \ln \left[\frac{T_2}{T_{A1}} \left(\frac{T_2}{T_{B1}} \right)^{m_B/m_A} \right]$$

So the factors inside the ln function equal to one. The rewrite as

$$\frac{T_2}{T_{A1}} \left(\frac{T_2}{T_{B1}} \right)^{m_B/m_A} = 1 \quad \Rightarrow \quad T_2 = T_{A1}^{x_A}\ T_{B1}^{x_B}$$

$x_A = m_A/(m_A + m_B)$; $x_B = m_B/(m_A + m_B)$

In the actual case the two masses are the same so $x_A = x_B = ½$ and the result is

$$T_2 = \sqrt{T_{A1}\, T_{B1}} = \sqrt{523.15 \times 298.15} = 394.94 \text{ K} = 121.8^{\circ}\text{C}$$

The work output comes from the energy equation

$W = m_A C(T_{A1} - T_2) + m_B C(T_{B1} - T_2)$

$= 5 \text{ kg} \times 0.46 \text{ kJ/kg-K} \times [(250 - 121.8) + (25 - 121.8)] \text{ K}$

$= \mathbf{72.2\ kJ}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.76

Two kg of liquid lead initially at 400°C is poured into a form. It then cools at constant pressure down to room temperature of 20°C as heat is transferred to the room. The melting point of lead is 327°C and the enthalpy change between the phases, h_{if} , is 24.6 kJ/kg. The specific heats are in Tables A.3 and A.4. Calculate the net entropy change for the mass.

Solution:

C.V. Lead, constant pressure process

$$m_{Pb}(u_2 - u_1)_{Pb} = {}_1Q_2 - P(V_2 - V_1)$$

We need to find changes in enthalpy (u + Pv) for each phase separately and then add the enthalpy change for the phase change.

Consider the process in several steps:

Cooling liquid to the melting temperature

Solidification of the liquid to solid, recall $s_{if} = h_{if}/T$, see page 268

Cooling of the solid to the final temperature

$${}_1Q_2 = m_{Pb}(h_2 - h_1) = m_{Pb}(h_2 - h_{327,sol} - h_{if} + h_{327,f} - h_{400})$$

$$= 2 \text{ kg} \times [0.138 \times (20 - 327) - 24.6 + 0.155 \times (327 - 400)] \text{ kJ/kg}$$

$$= -84.732 - 49.2 - 22.63 = -156.56 \text{ kJ}$$

$$S_2 - S_1 = m_{Pb}[C_{p\,sol}\ln(T_2/600) - (h_{if}/600) + C_{P\,liq}\ln(600/T_1)]$$

$$= 2 \times \left[0.138 \ln \frac{293.15}{600} - \frac{24.6}{600} + 0.155 \ln \frac{600}{673.15}\right] = \mathbf{-0.315\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Entropy of ideal gases

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.77

Air inside a rigid tank is heated from 300 to 350 K. Find the entropy increase $s_2 - s_1$? What if it is from 1300 to 1350 K?

Process: V = C $\rightarrow {}_1W_2 = Ø$

Entropy change from Eq.6.17:

a) $s_2 - s_1 = C_{vo} \ln \left(\frac{T_2}{T_1}\right) = 0.717 \ln \left(\frac{350}{300}\right) =$ **0.1105 kJ/kgK**

b) $s_2 - s_1 = C_{vo} \ln \left(\frac{T_2}{T_1}\right) = 0.717 \ln \left(\frac{1350}{1300}\right) =$ **0.02706 kJ/kgK**

From A.7:

case a) $C_v \approx \Delta u / \Delta T = 36/50 = 0.72$ kJ/kg K , see A.5

case b) $C_v \approx \Delta u / \Delta T = 45.2/50 = 0.904$ kJ/kg K (25 % higher)
so result should have been 0.0341 kJ/kgK

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.78

A rigid tank contains 1 kg methane at 500 K, 1500 kPa. It is now cooled down to 300 K. Find the heat transfer and the change in entropy using ideal gas.

Ideal gas, constant volume so there is no work.

Energy Eq. 3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

Use specific heat from Table A.5

$$u_2 - u_1 = C_v (T_2 - T_1) = 1.736\ (300 - 500) = -347.2\ \text{kJ/kg}$$

$${}_1Q_2 = m(u_2 - u_1) = 1\ (-347.2) = \mathbf{-347.2\ kJ}$$

The change in s for an ideal gas, Eqs.6.16-17 and $v_2 = v_1$ gives

$$m(s_2 - s_1) = m \left[C_{vo} \ln \frac{T_2}{T_1} + R \ln \frac{v_2}{v_1} \right] = m\, C_{vo} \ln \frac{T_2}{T_1}$$

$$= 1\ \text{kg} \times 1.736\ \text{kJ/kg-K} \ln \frac{300}{500} = \mathbf{-\ 0.8868\ kJ/K}$$

6.79

Three kg of air is in a piston/cylinder keeping constant pressure at 27°C, 300 kPa. It is now heated to 500 K. Plot the process path in a T-s diagram and find the heat transfer in the process.

Solution:

CV Air, so this is a control mass.

Energy Eq.3.5: $U_2 - U_1 = m\,(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $P = C$ so ${}_1W_2 = \int PdV = P_1(V_2 - V_1) = m\,(Pv_2 - Pv_1)$

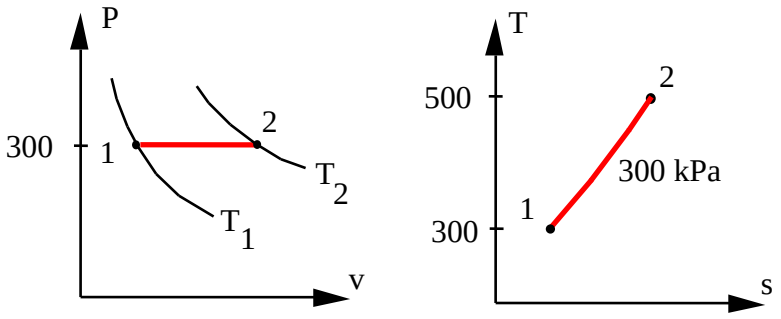
State 1: T_1, P_1 ideal gas so $P_1V_1 = mRT_1$

State 2: $T_2, P_2 = P_1$ and ideal gas so $P_2V_2 = mRT_2$

From the energy equation

$${}_1Q_2 = m\,(u_2 - u_1) + m\,(Pv_2 - Pv_1) = m\,(h_2 - h_1) = mC_{Po}\,(T_2 - T_1)$$

$$= 3\text{ kg} \times 1.004\text{ kJ/kg-K} \times (500 - 300)\text{ K} = \mathbf{602.4\ kJ}$$



If we were to find the change in entropy we get

$$s_2 - s_1 = C_{Po}\ln(T_2 / T_1) = 1.004\ln(500/300) = 0.5129\text{ kJ/kgK}$$

The process curve in the T-s diagram is: $T = T_1 \exp[(s - s_1)/C_{Po}]$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.80

A piston/cylinder setup contains air at 100 kPa, 400 K which is compressed to a final pressure of 1000 kPa. Consider two different processes (i) a reversible adiabatic process and (ii) a reversible isothermal process. Show both processes in P-v and a T-s diagram. Find the final temperature and the specific work for both processes.

Solution:
C.V. Air, control mass of unknown size and mass.

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T$

i) $dq = 0$ so ${}_1q_2 = 0$

ii) $T = C$ so $\int dq/T = {}_1q_2/T$

i) For this process the entropy equation reduces to:

$s_2 - s_1 = 0$ so we have constant s, an isentropic process.

The relation for an ideal gas, constant s and k becomes Eq.6.23

$$T_2 = T_1(P_2/P_1)^{\frac{k-1}{k}} = 400\left(\frac{1000}{100}\right)^{\frac{0.4}{1.4}} = 400 \times 10^{0.28575} = \mathbf{772\ K}$$

From the energy equation we get the work term

${}_1w_2 = u_1 - u_2 = C_v(T_1 - T_2) = 0.717(400 - 772) = \mathbf{-266.7\ kJ/kg}$

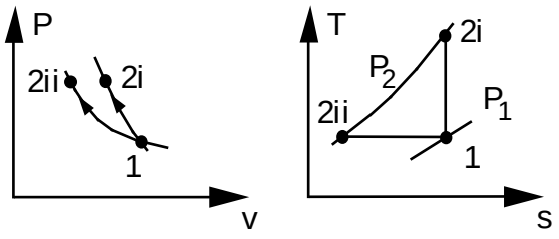
ii) For this process $T_2 = T_1$ so since ideal gas we get

$u_2 = u_1$ also $s^o_{T2} = s^o_{T1}$ => Energy Eq.: ${}_1w_2 = {}_1q_2$

Now from the entropy equation we solve for ${}_1q_2$

$${}_1w_2 = {}_1q_2 = T(s_2 - s_1) = T[s^\circ_{T2} - s^\circ_{T1} - R\ln\frac{P_2}{P_1}] = -RT\ln\frac{P_2}{P_1}$$

$= -0.287 \times 400 \ln 10 = \mathbf{-264\ kJ/kg}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.81

Prove that the two relations for changes in s, Eqs.6.16 and 6.17 are equivalent once we assume constant specific heat. Hint: recall the relation for specific heat in Eq. 3.42.

From Eq. 3.42: $C_{po} = C_{vo} + R$

Start with Eq.6.16: $s_2 - s_1 = C_{po} \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1}$

Now substitute Eq.3.42 to get:

$$s_2 - s_1 = (C_{vo} + R) \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1}$$

$$= C_{vo} \ln \frac{T_2}{T_1} - R \left[\ln \frac{P_2}{P_1} - \ln \frac{T_2}{T_1} \right]$$

$$= C_{vo} \ln \frac{T_2}{T_1} - R \ln \left(\frac{P_2}{P_1} \frac{T_1}{T_2} \right)$$

Use the ideal gas law $Pv = RT$ for both states to get the ratio

$$\frac{P_2 v_2}{RT_2} = \frac{P_1 v_1}{RT_1} \quad \Rightarrow \quad \frac{P_2}{P_1} \frac{T_1}{T_2} = \frac{v_1}{v_2}$$

so then we get to Eq. 6.17 as

$$s_2 - s_1 = C_{vo} \ln \frac{T_2}{T_1} - R \ln \frac{v_1}{v_2}$$

$$= C_{vo} \ln \frac{T_2}{T_1} + R \ln \frac{v_2}{v_1}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.82

A closed rigid container is filled with 1.5 kg water at 100 kPa, 55°C, 1 kg of stainless steel and 0.5 kg of PVC (polyvinyl chloride) both at 20°C and 0.1 kg of hot air at 400 K, 100 kPa. It is now left alone, with no external heat transfer and no water vaporizes. Find the final temperature and the change in entropy of the masses.

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2 = 0$

Process: ${}_1Q_2 = 0$; ${}_1W_2 = 0$

For the liquid and the metal masses we will use the specific heats (Tbl A.3, A.4) so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i} (T_2 - T_1)_i = T_2 \sum m_i C_{v\,i} - \sum m_i C_{v\,i} T_{1\,i}$$

noticing that all masses have the same T_2 but not same initial T.

$$\sum m_i C_{v\,i} = 1.5 \times 4.18 + 1 \times 0.46 + 0.5 \times 0.96 + 0.1 \times 0.717 = 7.282 \text{ kJ/K}$$

Energy Eq.: $7.282\, T_2 = 1.5 \times 4.18 \times 55 + (1 \times 0.46 + 0.5 \times 0.96) \times 20$

$$+ 0.1 \times 0.717 \times (400 - 273.15) = 372.745 \text{ kJ}$$

$$T_2 = \mathbf{51.2^oC} = 324.3 \text{ K}$$

The change in entropy for the solids and liquid follow Eq.6.11 and that for the ideal gas is from Eq.6.16 or 6.17 or 6.19, we use here 6.17 since $v_2 = v_1$

$$S_2 - S_1 = \sum m_i (s_2 - s_1)_i = \sum C_{v\,i}\, m_i [\, \ln(T_2 / T_1)_i \,]$$

$$= 1.5 \times 4.18 \ln \frac{324.3}{328.15} + 1 \times 0.46 \ln \frac{324.3}{293.15}$$

$$+ 0.5 \times 0.96 \ln \frac{324.3}{293.15} + 0.1 \times 0.717 \ln \frac{324.3}{400}$$

$$= \mathbf{0.00588 \text{ kJ/K}}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.83

Water at 150°C, 400 kPa, is brought to 1200°C in a constant pressure process. Find the change in the specific entropy, using a) the steam tables, b) the ideal gas water Table A.8, and c) the specific heat from A.5.

Solution:

a)

State 1: Table B.1.3 Superheated vapor $s_1 = 6.9299$ kJ/kgK

State 2: Table B.1.3 $s_2 = 9.7059$ kJ/kgK

$$s_2 - s_1 = 9.7059 - 6.9299 = \mathbf{2.776\ kJ/kgK}$$

b)

Table A.8 at 423.15 K: $s^o_{T1} = 11.13891$ kJ/kgK

Table A.8 at 1473.15 K: $s^o_{T2} = 13.86383$ kJ/kgK

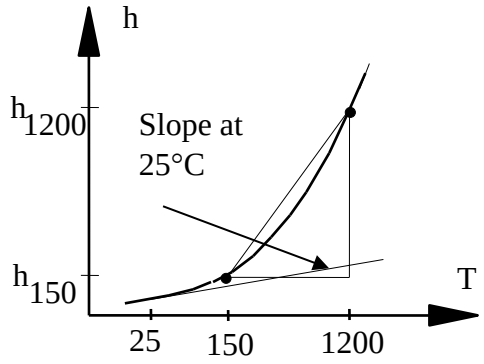
$$s_2 - s_1 = s^o_{T2} - s^o_{T1} - R \ln \frac{P_2}{P_1} = s^o_{T2} - s^o_{T1}$$

$$s^o_{T2} - s^o_{T1} = 13.86383 - 11.13891 = \mathbf{2.72492\ kJ/kgK}$$

c) Table A.5: $C_{po} = 1.872$ kJ/kgK

$$s_2 - s_1 \approx C_{po} \ln \left(\frac{T_2}{T_1} \right) = 1.872 \ln \left(\frac{1473.15}{423.15} \right) = \mathbf{2.3352\ kJ/kgK}$$

Notice how the average slope from 150°C to 1200°C is higher than the one at 25°C (= C_{po})



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.84

R-410A at 400 kPa is brought from 20°C to 120°C in a constant pressure process. Evaluate the change in specific entropy using Table B.4 and using ideal gas with C_p = 0.81 kJ/kgK.

Table B.4.2 $s_1 = 1.2108$ kJ/kg-K, $s_2 = 1.4788$ kJ/kg-K

$s_2 - s_1 = 1.4788 - 1.2108 =$ **0.268 kJ/kg-K**

Eq. 6.16: $s_2 - s_1 \approx C_{po} \ln \frac{T_2}{T_1} = 0.81 \ln \frac{393.15}{293.15} =$ **0.238 kJ/kg-K**

Two explanations for the difference are as the average temperature is higher than 25°C we could expect a higher value of the specific heat and secondly it is not an ideal gas (if you calculate Z = Pv/RT = 0.94).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.85

R-410A at 300 kPa, 20°C is brought to 200°C in a constant volume process. Evaluate the change in specific entropy using Table B.4 and using ideal gas with C_v = 0.695 kJ/kgK.

Table B.4.2 $s_1 = 1.2485$ kJ/kg-K, $v_1 = 0.10720$ m^3/kg

$s_2 = 1.6413$ kJ/kg-K, $v_2 = 0.10714$ m^3/kg at 500 kPa

(very close, we could have interpolated between 400 and 500 kPa)

$s_2 - s_1 = 1.6413 - 1.2485 =$ **0.3928 kJ/kg-K**

Eq. 6.17: $s_2 - s_1 \approx C_{vo} \ln \frac{T_2}{T_1} = 0.695 \ln \frac{473.15}{293.15} =$ **0.333 kJ/kg-K**

Two explanations for the difference are as the average temperature is higher than 25°C we could expect a higher value of the specific heat and secondly it is not an ideal gas (if you calculate Z = Pv/RT = 0.96).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.86

Consider a small air pistol with a cylinder volume of 1 cm^3 at 250 kPa, 27°C. The bullet acts as a piston initially held by a trigger. The bullet is released so the air expands in an adiabatic process. If the pressure should be 120 kPa as the bullet leaves the cylinder find the final volume and the work done by the air.

Solution:

C.V. Air. Assume a reversible, adiabatic process.

Energy Eq.3.5: $u_2 - u_1 = 0 - {}_1w_2$;

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\,gen} = \emptyset$

State 1: (T_1, P_1) State 2: $(P_2, ?)$

So we realize that one piece of information is needed to get state 2.

Process: Adiabatic ${}_1q_2 = 0$ Reversible ${}_1s_{2\,gen} = 0$

With these two terms zero we have a zero for the entropy change. So this is a constant s (isentropic) expansion process giving $s_2 = s_1$. From Eq.6.23

$$T_2 = T_1(P_2/P_1)^{\frac{k-1}{k}} = 300\left(\frac{120}{250}\right)^{\frac{0.4}{1.4}} = 300 \times 0.48^{0.28575} = 243.24 \text{ K}$$

The ideal gas law PV = mRT at both states leads to

$$V_2 = V_1 P_1 T_2/P_2 T_1 = 1 \times 250 \times 243.24/120 \times 300 = \mathbf{1.689\ cm^3}$$

The work term is from Eq.6.29 or Eq.4.4 with polytropic exponent n = k

$${}_1W_2 = \frac{1}{1-k}(P_2V_2 - P_1V_1) = \frac{1}{1-1.4}(120 \times 1.689 - 250 \times 1) \times 10^{-6} \text{ kPa m}^3$$

$$= \mathbf{0.118\ J}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.87

Oxygen gas in a piston cylinder at 300 K, 100 kPa with volume 0.1 m^3 is compressed in a reversible adiabatic process to a final temperature of 700 K. Find the final pressure and volume using Table A.5 and repeat the process with Table A.8.

Solution:

C.V. Air. Assume a reversible, adiabatic process.

Energy Eq.3.5: $u_2 - u_1 = 0 - {}_1w_2$;

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\,gen} = 0$

Process: Adiabatic ${}_1q_2 = 0$ Reversible ${}_1s_{2\,gen} = 0$

Properties: Table A.5: k = 1.393

With these two terms zero we have a zero for the entropy change. So this is a constant s (isentropic) expansion process. From Eq.6.23

$$P_2 = P_1(T_2 / T_1)^{\frac{k}{k-1}} = 100 \left(\frac{700}{300}\right)^{\frac{1.393}{1-1.393}} = \mathbf{2015\ kPa}$$

Using the ideal gas law to eliminate P from this equation leads to Eq.6.24

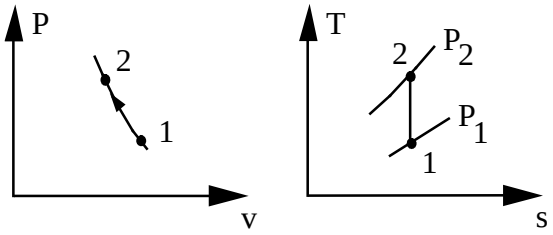
$$V_2 = V_1(T_2 / T_1)^{\frac{1}{1-k}} = 0.1 \times \left(\frac{700}{300}\right)^{\frac{1}{1-1.393}} = \mathbf{0.0116\ m^3}$$

Using the ideal gas tables A.8 we get

$$s_2 - s_1 = s^o_{T2} - s^o_{T1} - R \ln(P_2/P_1) = 0 \quad \text{or} \quad P_2 = P_1 \exp[(s^o_{T2} - s^o_{T1})/R]$$

$$P_2 = 100 \exp[(7.2336 - 6.4168)/0.2598] = \mathbf{2319.5\ kPa}$$

$$V_2 = V_1 (T_2 / T_1)(P_1/P_2) = 0.1\ m^3 \times \frac{700}{300} \times \frac{100}{2319.5} = \mathbf{0.010\ m^3}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.88

Air in a rigid tank is at 100 kPa, 300 K with a volume of 0.75 m^3. The tank is heated to 400 K, state 2. Now one side of the tank acts as a piston, letting the air expand slowly at constant temperature to state 3 with a volume of 1.5 m^3. Find the entropy at states 1, 2 and 3.

Solution:

State 1: (P_1, T_1) $\quad m = P_1V_1 / RT_1 = \dfrac{100 \times 0.75}{0.287 \times 300} \dfrac{\text{kPa m}^3}{\text{kJ/kg}} = 0.871$ kg

Process 1 to 2: Constant volume heating, $dV = 0 \Rightarrow {}_1W_2 = 0$

State 2: T_2, $P_2 = P_1 T_2 / T_1 = 100 \times 400 / 300 = 133.3$ kPa

Process 2 to 3: Isothermal expansion, $dT = 0 \Rightarrow u_3 = u_2$ and

State 3: T_3, $P_3 = P_2 V_2 / V_3 = 133.3 \times 0.75 / 1.5 = 66.67$ kPa

The entropy is generally used as a relative value with different reference states in different tables. We can use here the reference as in Table A.7 so

$$s = s^o_T - R \ln(P/P_0)$$

where s^o_T is absolute entropy from A.7 at T and P_0 = 100 kPa

$s_1 = 6.86926$ kJ/kgK which is at 300 K, 100 kPa

$s_2 = 7.15926 - 0.287 \ln(133.3/100) = 7.07677$ kJ/kgK

$s_3 = 7.15926 - 0.287 \ln(66.67/100) = 7.27561$ kJ/kgK

To get total entropy for the given mass multiply with m = 0.871 kg, which will give (**5.9831, 6.1639, 6.3371**) all in kJ/K.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.89

An insulated piston/cylinder setup contains carbon dioxide gas at 800 kPa, 300 K which is then compressed to 6 MPa in a reversible adiabatic process. Calculate the final temperature and the specific work using a) ideal gas tables A.8 and b) using constant specific heats A.5.

Solution:

C.V. CO_2, a control mass undergoing a reversible, adiabatic process.

Energy Eq.3.5: $u_2 - u_1 = 0 - {}_1w_2$;

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\,gen} = \emptyset$

Process: Adiabatic ${}_1q_2 = 0$ Reversible ${}_1s_{2\,gen} = 0$

State 1: (300 K, 800 kPa) State 2: (6000 kPa, ?)

With two terms zero in the entropy equation we have a zero for the entropy change. So this is a constant s (isentropic) expansion process, $s_2 = s_1$.

a) Table A.8 for CO_2 and Eq.6.19

$$s_2 - s_1 = 0 = s^o_{T2} - s^o_{T1} - R \ln(P_2/P_1)$$

$$s^o_{T2} = s^o_{T1} + R \ln \frac{P_2}{P_1} = 4.8631 + 0.1889 \ln \frac{6000}{800} = 5.2437 \text{ kJ/kg-K}$$

Now interpolate in A.8 to find T_2

$$T_2 = 450 + 50\,(5.2437 - 5.2325)/(5.3375 - 5.2325) = \mathbf{455.3\ K}$$

$${}_1w_2 = -(u_2 - u_1) = -(271 - 157.7) = \mathbf{-113.3\ kJ/kg}$$

b) Table A.5: $k = 1.289$, $C_{Vo} = 0.653$ kJ/kg K and now Eq.6.23

$$T_2 = T_1 \left(\frac{P_2}{P_1}\right)^{\frac{k-1}{k}} = 300 \left(\frac{6000}{800}\right)^{0.224} = \mathbf{471.1\ K}$$

$${}_1w_2 = -C_{Vo}(T_2 - T_1) = -0.653 \text{ kJ/kg-K } (471.1 - 300)\text{K} = \mathbf{-111.7\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.90

Extend the previous problem to solve using Table B.3.

C.V. CO_2, a control mass undergoing a reversible, adiabatic process.

Energy Eq.3.5: $u_2 - u_1 = 0 - {}_1w_2$;

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\,gen} = 0$

Process: Adiabatic ${}_1q_2 = 0$ Reversible ${}_1s_{2\,gen} = 0$

State 1: (300 K, 800 kPa) State 2: (6000 kPa, ?)

With two terms zero in the entropy equation we have a zero for the entropy change. So this is a constant s (isentropic) expansion process, $s_2 = s_1$.

From Table B.3.2: $s_1 = 1.8240$ kJ/kg-K, $u_1 = 333.5$ kJ/kg

$T_2 = 260.7^{o}C =$ **533.9 K**, $u_2 = 502.9$ kJ/kg

$${}_1w_2 = -(u_2 - u_1) = -(502.9 - 333.5) = \mathbf{-169.4\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.91

A handheld pump for a bicycle has a volume of 25 cm^3 when fully extended. You now press the plunger (piston) in while holding your thumb over the exit hole so that an air pressure of 300 kPa is obtained. The outside atmosphere is at P_0, T_0. Consider two cases: (1) it is done quickly (~1 s), and (2) it is done very slowly (~1 h).

a. State assumptions about the process for each case.

b. Find the final volume and temperature for both cases.

Solution:

C.V. Air in pump. Assume that both cases result in a reversible process.

State 1: P_0, T_0 State 2: 300 kPa, ?

One piece of information must resolve the ? for a state 2 property.

Case I) Quickly means no time for heat transfer

$Q = 0$, so a reversible adiabatic compression.

$$u_2 - u_1 = -{}_1w_2 \; ; \quad s_2 - s_1 = \int dq/T + {}_1s_{2\,gen} = \emptyset$$

With constant s and constant heat capacity we use Eq.6.23

$$T_2 = T_1(P_2 / P_1)^{\frac{k-1}{k}} = 298 \left(\frac{300}{101.325}\right)^{\frac{0.4}{1.4}} = \mathbf{405.3\ K}$$

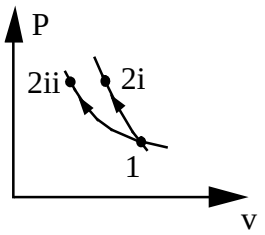
Use ideal gas law $PV = mRT$ at both states so ratio gives

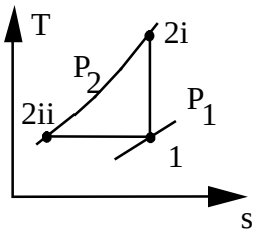
$$\Rightarrow \quad V_2 = P_1V_1T_2/T_1P_2 = \mathbf{11.48\ cm^3}$$

Case II) Slowly, time for heat transfer so T = constant = T_0.

The process is then a reversible isothermal compression.

$$T_2 = T_0 = \mathbf{298\ K} \quad \Rightarrow \quad V_2 = V_1P_1/P_2 = \mathbf{8.44\ cm^3}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.92

A piston/cylinder, shown in Fig. P6.92, contains air at 1380 K, 15 MPa, with V_1 = 10 cm^3, A_{cyl} = 5 cm^2. The piston is released, and just before the piston exits the end of the cylinder the pressure inside is 200 kPa. If the cylinder is insulated, what is its length? How much work is done by the air inside?

Solution:

C.V. Air, Cylinder is insulated so adiabatic, Q = 0.

Continuity Eq.: $m_2 = m_1 = m$,

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = 0 + {}_1S_{2\ gen}$

State 1: (T_1, P_1) State 2: $(P_2, ?)$

So one piece of information is needed for the ?, assume reversible process.

${}_1S_{2\ gen} = 0 \quad \Rightarrow \quad s_2 - s_1 = 0$ (which is also Eq.6.3)

State 1: Table A.7: $u_1 = 1095.2$ kJ/kg, $s^o_{T1} = 8.5115$ kJ/kg K

$$m = P_1V_1/RT_1 = \frac{15000 \times 10{\times}10^{-6}}{0.287 \times 1380} = 0.000379 \text{ kg}$$

State 2: P_2 and from Entropy eq.: $s_2 = s_1$ so from Eq.6.19

$$s^\circ_{T2} = s^\circ_{T1} + R \ln \frac{P_2}{P_1} = 8.5115 + 0.287 \ln(\frac{200}{15000}) = 7.2724 \text{ kJ/kg K}$$

Now interpolate in Table A.7 to get T_2

$T_2 = 440 + 20\ (7.2724 - 7.25607)/(7.30142 - 7.25607) = 447.2$ K

$u_2 = 315.64 + (330.31 - 315.64)\ 0.36 = 320.92$ kJ/kg

$$V_2 = V_1 \frac{T_2\ P_1}{T_1 P_2} = \frac{10 \times 447.2 \times 15000}{1380 \times 200} = 243 \text{ cm}^3$$

$\Rightarrow \quad L_2 = V_2 / A_{cyl} = 243/5 =$ **48.6 cm**

${}_1w_2 = u_1 - u_2 = 774.3$ kJ/kg, ${}_1W_2 = m_1w_2 =$ **0.2935 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.93

Argon in a light bulb is at 90 kPa and 20°C when it is turned on and electric input now heats it to 60°C. Find the entropy increase of the argon gas.

Solution:

C.V. Argon gas. Neglect any heat transfer.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1W_{2\ \text{electrical in}}$

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\ \text{gen}} = {}_1s_{2\ \text{gen}}$

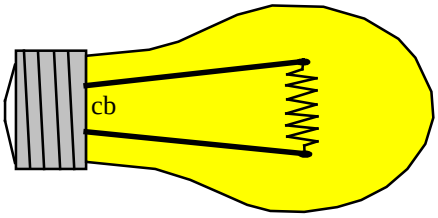
Process: v = constant and ideal gas => $P_2/P_1 = T_2/T_1$

Evaluate changes in s from Eq.6.16 or 8.17

$$s_2 - s_1 = C_p \ln (T_2/T_1) - R \ln (P_2/P_1) \qquad \text{Eq.6.16}$$

$$= C_p \ln (T_2/T_1) - R \ln (T_2/T_1) = C_v \ln(T_2/T_1) \qquad \text{Eq.6.17}$$

$$= 0.312\ \text{kJ/kg-K} \times \ln \left[\frac{60 + 273}{20 + 273} \right] = \mathbf{0.04\ kJ/kg\ K}$$



Since there was no heat transfer but work input all the change in s is generated by the process (irreversible conversion of W to internal energy)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

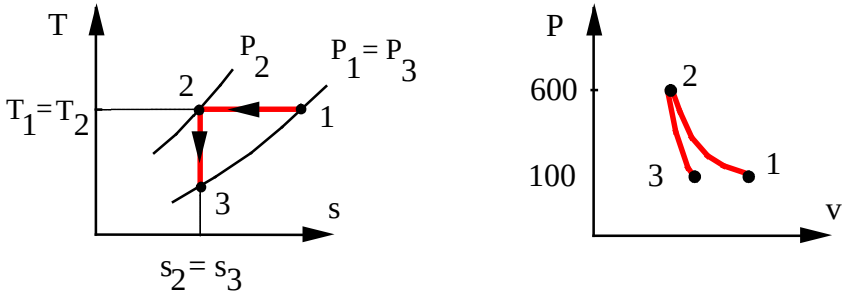
6.94

We wish to obtain a supply of cold helium gas by applying the following technique. Helium contained in a cylinder at ambient conditions, 100 kPa, 20°C, is compressed in a reversible isothermal process to 600 kPa, after which the gas is expanded back to 100 kPa in a reversible adiabatic process.

a. Show the process on a *T–s* diagram.
b. Calculate the final temperature and the net work per kilogram of helium.

Solution:

a)



b) The adiabatic reversible expansion gives constant s from the entropy equation Eq.6.37. With ideal gas and constant specific heat this gives relation in Eq.6.23

$$T_3 = T_2(P_3/P_2)^{\frac{k-1}{k}} = 293.15\ (100/600)^{0.4} = \mathbf{143.15\ K}$$

The net work is summed up over the two processes. The isothermal process has work as Eq.6.31

$$_1w_2 = -RT_1 \ln(P_2/P_1) = -2.0771\ \text{kJ/kg-K} \times 293.15\ \text{K} \times \ln(600/100)$$

$$= -1091.0\ \text{kJ/kg}$$

The adiabatic process has a work term from energy equation with no q

$$_2w_3 = C_{Vo}(T_2-T_3) = 3.116\ \text{kJ/kg-K}\ (293.15 - 143.15)\ \text{K} = +467.4\ \text{kJ/kg}$$

The net work is the sum

$$w_{NET} = -1091.0 + 467.4 = \mathbf{-623.6\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.95

A 1-m^3 insulated, rigid tank contains air at 800 kPa, 25°C. A valve on the tank is opened, and the pressure inside quickly drops to 150 kPa, at which point the valve is closed. Assuming that the air remaining inside has undergone a reversible adiabatic expansion, calculate the mass withdrawn during the process.

Solution:

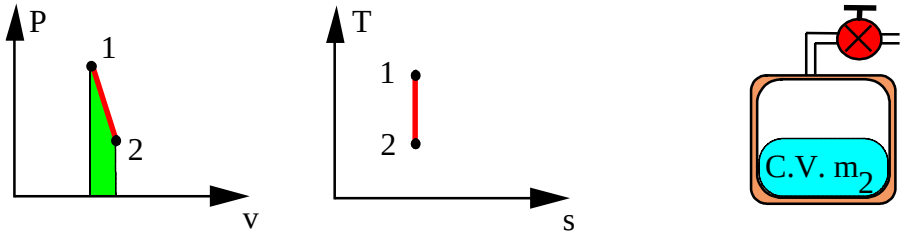
C.V.: Air remaining inside tank, m_2.

Cont.Eq.: $m_2 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

Process: adiabatic ${}_1Q_2 = 0$ and reversible ${}_1S_{2\,gen} = 0$



Entropy eq. then gives $s_2 = s_1$ and ideal gas gives the relation in Eq.6.23

$$T_2 = T_1(P_2/P_1)^{\frac{k-1}{k}} = 298.2\ \text{K}\ (150/800)^{0.286} = \mathbf{184.8\ K}$$

$m_1 = P_1V/RT_1 = (800\ \text{kPa} \times 1\ \text{m}^3)/(0.287\ \text{kJ/kgK} \times 298.2\ \text{K}) = 9.35\ \text{kg}$

$m_2 = P_2V/RT_2 = (150\ \text{kPa} \times 1\ \text{m}^3)/(0.287\ \text{kJ/kgK} \times 184.8\ \text{K}) = 2.83\ \text{kg}$

$m_e = m_1 - m_2 = \mathbf{6.52\ kg}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.96

Two rigid, insulated tanks are connected with a pipe and valve. One tank has 0.5 kg air at 200 kPa, 300 K and the other has 0.75 kg air at 100 kPa, 400 K. The valve is opened and the air comes to a single uniform state without any heat transfer. Find the final temperature and the change in entropy of the air.

Solution:

C.V. Total tank. Control mass of constant volume.

Mass and volume: $m_2 = m_A + m_B$; $V = V_A + V_B$

Energy Eq.: $U_2 - U_1 = m_2 u_2 - m_A u_{A1} - m_B u_{B1} = {}_1Q_2 - {}_1W_2 = 0$

Process Eq.: V = constant $\Rightarrow {}_1W_2 = 0$; Insulated $\Rightarrow {}_1Q_2 = 0$

Ideal gas at A1: $V_A = m_A RT_{A1}/P_{A1} = 0.5 \times 0.287 \times 300 / 200 = 0.2153\ m^3$

Ideal gas at B1: $V_B = m_B RT_{B1}/ P_{B1} = 0.75 \times 0.287 \times 400 / 100 = 0.861\ m^3$

State 2: $m_2 = m_A + m_B = 1.25$ kg; $V_2 = V_A + V_B = 1.0763\ m^3$

Energy Eq.: $u_2 = \dfrac{m_A u_{A1} + m_B u_{B1}}{m_2}$ and use constant specific heat

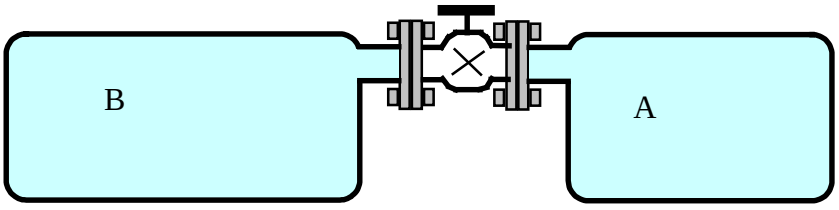
$$T_2 = \frac{m_A}{m_2} T_{A1} + \frac{m_B}{m_2} T_{B1} = \frac{0.5}{1.25} 300 + \frac{0.75}{1.25} 400 = \mathbf{360\ K}$$

$$P_2 = m_2 RT_2/V = 1.25 \text{ kg} \times 0.287 \text{ kJ/kgK} \times 360 \text{ K} / 1.0763\ m^3 = 120 \text{ kPa}$$

$$S_2 - S_1 = m_A[C_P \ln T_2/T_{A1} - R\ln(P_2/P_{A1})] + m_B[C_P \ln T_2/T_{B1} - R\ln(P_2/P_{B1})]$$

$$= 0.5[\ 1.004 \ln\frac{360}{300} - 0.287 \ln\frac{120}{200}\ ] + 0.75[1.004 \ln\frac{360}{400} - 0.287 \ln\frac{120}{100}]$$

$$= 0.5 \times 1.3514 + 0.75 \times (-0.1581) = \mathbf{0.5571\ kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.97

Two rigid tanks, shown in Fig. P6.97, each contain 10 kg N_2 gas at 1000 K, 500 kPa. They are now thermally connected to a reversible heat pump, which heats one and cools the other with no heat transfer to the surroundings. When one tank is heated to 1500 K the process stops. Find the final (P, T) in both tanks and the work input to the heat pump, assuming constant heat capacities.

Solution:

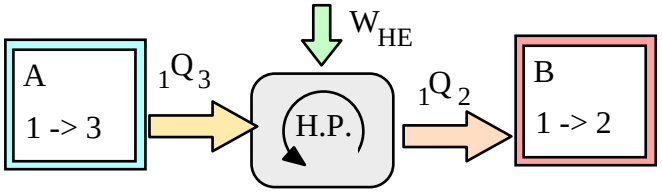
Control volume of hot tank B,

Process = constant volume & mass so no work

Energy equation Eq.3.5 and specific heat in Eq.5.20 gives

$$U_2 - U_1 \cong mC_v(T_2 - T_1) = {}_1Q_2 = 10 \text{ kg} \times 0.7448 \text{ kJ/kg-K} \times 500 \text{ K} = 3724 \text{ kJ}$$

$$P_2 = P_1T_2/T_1 = 1.5(P_1) = \mathbf{750\ kPa}$$



State: 1 = initial,
2 = final hot
3 = final cold

To fix temperature in cold tank, C.V.: total

For this CV only W_{HP} cross the control surface no heat transfer. The entropy equation Eq.6.37 for a reversible process becomes

$$(S_2 - S_1)_{tot} = 0 = m_{hot}\,(s_2 - s_1) + m_{cold}\,(s_3 - s_1)$$

Use specific heats to evaluate the changes in s from Eq.6.16 and division by m

$$C_{p,hot} \ln(T_2 / T_1) - R \ln(P_2 / P_1) + C_{p,cold} \ln(T_3 / T_1) - R \ln(P_3 / P_1) = \emptyset$$

$$P_3 = P_1T_3/T_1 \quad \text{and} \quad P_2 = P_1T_2/T_1$$

Now everything is in terms of T and $C_p = C_v + R$, so

$$C_{v,hot} \ln(T_2/T_1) + C_{v,cold} \ln(T_3/T_1) = 0$$

same C_v: $T_3 = T_1(T_1/T_2) = \mathbf{667\ K}$, $P_3 = \mathbf{333\ kPa}$

$$Q_{cold} = -\,{}_1Q_3 = m\,C_v\,(T_3 - T_1) = -2480 \text{ kJ},$$

$$W_{HP} = {}_1Q_2 + Q_{cold} = {}_1Q_2 - {}_1Q_3 = \mathbf{1244\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.98

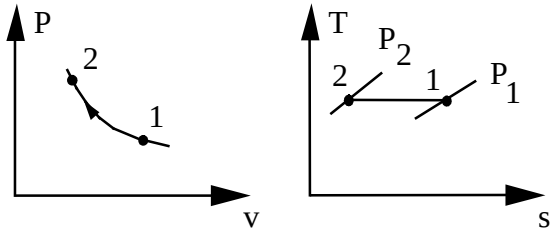
A hydrogen gas in a piston/cylinder assembly at 300 K, 100 kPa with a volume of 0.1 m^3 is now slowly compressed to a volume of 0.01 m^3 while cooling it in a reversible isothermal process. What is the final pressure, the heat transfer and the change in entropy?

Solution:

C.V. Hydrogen, control mass.

Energy Eq. 3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: T = constant so with ideal gas => $u_2 = u_1$



From the process equation ($T_2 = T_1$) and ideal gas law we get

$$P_2 = P_1 (V_1/V_2) = 10\ P_1 = \mathbf{1000\ kPa}$$

we can calculate the work term as in Eq.3.22

$${}_1Q_2 = {}_1W_2 = \int PdV = P_1V_1 \ln (V_2/V_1)$$

$$= 100\ \text{kPa} \times 0.1\ \text{m}^3 \times \ln (1/10) = \mathbf{-23.0\ kJ}$$

The change of entropy from the entropy equation Eq.6.3 is

$$m(s_2 - s_1) = {}_1Q_2/T_1 = \frac{-23}{300}\frac{\text{kJ}}{\text{K}} = \mathbf{-0.07667\ kJ/K}$$

If instead we use Eq.6.17 we would get

$$\Delta S = m(s_2 - s_1) = m(C_{vo} \ln \frac{T_2}{T_1} + R \ln \frac{v_2}{v_1}) = m\ R \ln \frac{v_2}{v_1}$$

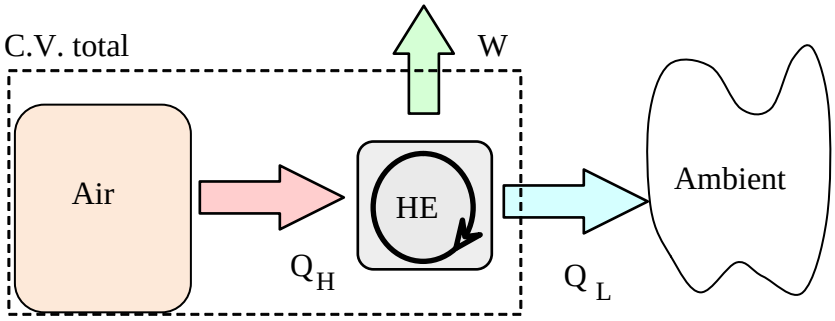
$$= (P_1V_1/T_1) \ln (\frac{v_2}{v_1}) = {}_1Q_2/T_1$$

consistent with the above result.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.99

A rigid tank contains 4 kg air at 300°C, 4 MPa which acts as the hot energy reservoir for a heat engine with its cold side at 20°C shown in Fig. P.6.99. Heat transfer to the heat engine cools the air down in a reversible process to a final 20°C and then stops. Find the final air pressure and the work output of the heat engine.



Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$ (T not constant)

Process: v = constant $\Rightarrow$ ${}_1W_2 = 0$

State 2: T_2 and $v_2 = v_1$,

$P_2 = P_1T_2/T_1 = 4000 \times 293.15/573.15 =$ **2045.9 kPa**

From the energy equation

$Q_H = -{}_1Q_2 = -m(u_2 - u_1) = -m\, C_{vo}\, (T_2 - T_1)$

$= -4$ kg $\times$ 0.717 kJ/kg-K (293.15 – 573.15) K = **803.0 kJ**

Take now CV total as the air plus heat engine out to ambient

Entropy Eq.6.3: $m(s_2 - s_1) = -\dfrac{Q_L}{T_{amb}}$ $\Rightarrow$

$$Q_L = -mT_{amb}\,(s_2 - s_1) = -mT_{amb}\, C_{vo} \ln \frac{T_2}{T_1}$$

$= -4$ kg $\times$ 293.15 K $\times$ 0.717 kJ/kg-K ln(293.15/573.15) = 563.7 kJ

Now the CV heat engine can give the engine work from the energy equation

Energy H.E.: $W_{HE} = Q_H - Q_L = 803.0 - 563.7 =$ **239.3 kJ**

Notice to get ${}_1q_2 = \int T\, ds$ we must know the function T(s) which we do not readily have for this process.

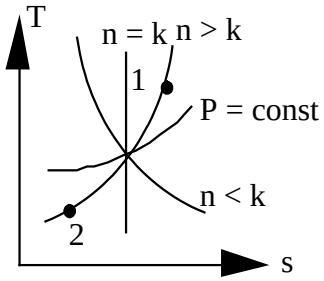
Polytropic processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.100

An ideal gas having a constant specific heat undergoes a reversible polytropic expansion with exponent, $n = 1.4$. If the gas is carbon dioxide will the heat transfer for this process be positive, negative, or zero?

Solution:



CO_2: Table A.5 $k = 1.289 < n$

Since $n > k$ and $P_2 < P_1$

it follows that $s_2 < s_1$ and thus Q flows out.

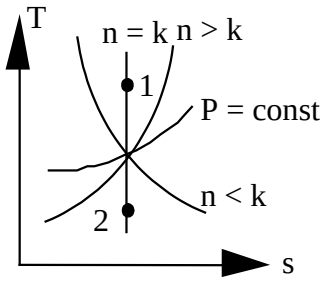
$$_1Q_2 < 0$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.101

Repeat the previous problem for the gas carbon monoxide, CO.

Solution:



CO: Table A.5 $k = 1.399 = n$

Since $n \approx k$ and $P_2 < P_1$

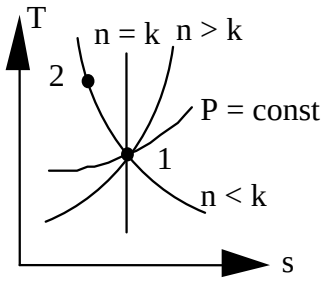
it follows that $s_2 \approx s_1$ and thus adiabatic.

$$\mathbf{{}_1Q_2 \approx 0}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.102

A nitrogen gas goes through a polytropic process with n = 1.3 in a piston/cylinder arrangement. It starts out at 600 K, 600 kPa and ends at 800 K. Is the heat transfer positive, negative or zero?



N_2: Table A.5 $k = 1.40$ and $n = 1.3 < k$

Since $n < k$ and $T_2 > T_1$

process goes up on the n < k curve

$s_2 < s_1$ and thus q must go out.

q is negative

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.103

A cylinder/piston contains 1 kg methane gas at 100 kPa, 300 K. The gas is compressed reversibly to a pressure of 800 kPa. Calculate the work required if the process is adiabatic.

Solution:

C.V. Methane gas of constant mass $m_2 = m_1 = m$ and reversible process.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3 (37): $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = \int dQ/T$

Process: ${}_1Q_2 = 0 \quad => \quad s_2 = s_1$

thus isentropic process s = constant and ideal gas gives the relation in Eq.6.23 with k = 1.299 from Table A.5

$$T_2 = T_1 (P_2/P_1)^{\frac{k-1}{k}} = 300 \text{ K} \left(\frac{800}{100}\right)^{0.230} = 483.99 \text{ K}$$

$${}_1W_2 = -mC_{V0}(T_2 - T_1) = -1 \text{ kg} \times 1.736 \text{ kJ/kg-K } (483.99 - 293.15) \text{ K}$$

$$= \mathbf{-331.3\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.104

Do the previous problem but assume the process is isothermal.

Solution:

C.V. Methane gas of constant mass $m_2 = m_1 = m$ and reversible process.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = \int dQ/T$

Process: T = constant. For ideal gas then $u_2 = u_1$ and $s^\circ_{T2} = s^\circ_{T1}$

Energy eq. gives ${}_1W_2 = {}_1Q_2$ and $\int dQ/T = {}_1Q_2/T$

with the entropy change found from Eq.6.16

$$\Rightarrow \quad {}_1W_2 = {}_1Q_2 = mT(s_2 - s_1) = -mRT \ln(P_2/P_1)$$

$$= -0.5183 \text{ kJ/K} \times 300 \text{ K} \ln\left(\frac{800}{100}\right) = \mathbf{-323.3\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.105

A piston/cylinder contains air at 300 K, 100 kPa. It is now compressed in a reversible adiabatic process to a volume 7 times as small. Use constant heat capacity and find the final pressure and temperature, the specific work and specific heat transfer for the process.

Solution:

Expansion ratio: $v_2/ v_1 = 1/7$

Process eq.: Rev. adiabatic and ideal gas gives $Pv^n = C$, with n = k

$$P_2 /P_1 = (v_2/v_1)^{-k} = 7^{1.4} = 15.245$$

$$P_2 = P_1 (7^{1.4}) = 100 \times 15.245 = \mathbf{1524.5\ kPa}$$

$$T_2 = T_1 (v_1/v_2)^{k-1} = 300 \times 7^{0.4} = \mathbf{653.4\ K}$$

$$_1q_2 = \mathbf{0\ kJ/kg}$$

Polytropic process work term from Eq.6.29

$$_1w_2 = \frac{R}{1 - k} (T_2 - T_1) = \frac{0.287}{-0.4} \text{ kJ/kg-K } (653.4 - 300) \text{ K} = \mathbf{-253.6\ kJ/kg}$$

Notice: $C_v = R/(k-1)$ so the work term is also the change in u consistent with the energy equation.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.106

A piston/cylinder contains pure oxygen at 500 K, 600 kPa. The piston is moved to a volume such that the final temperature is 700 K in a polytropic process with exponent n = 1.25. Use ideal gas approximation and constant heat capacity to find the final pressure, the specific work, and the heat transfer.

Take CV as the oxygen. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $Pv^n = \text{Constant}$ (polytropic)

From the ideal gas law and the process equation we can get:

State 2: $P_2 = P_1 \left(v_2 / v_1\right)^{-n}$ and $Pv = RT \Rightarrow T_2/T_1 = (v_2 / v_1)^{1-n}$

$$P_2 = P_1 \left(T_2 / T_1\right)^{n/(n-1)} = 600 \left(\frac{700}{500}\right)^{1.25/0.25} = \mathbf{3226.9\ kPa}$$

From process eq.:

$${}_1w_2 = \int P\, dv = \text{area} = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$$

$$= \frac{0.2598}{1-1.25}(700 - 500) = \mathbf{-207.8\ kJ/kg}$$

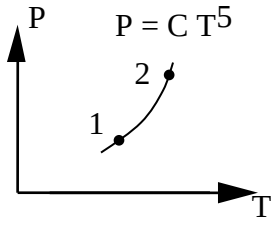
From the energy equation and Table A.8

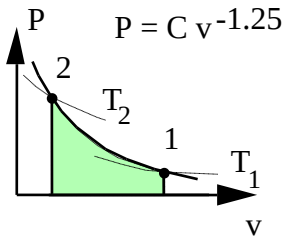
${}_1q_2 = u_2 - u_1 + {}_1w_2 = (480.18 - 331.72 - 207.8)$ kJ/kg = **-59.34 kJ/kg**

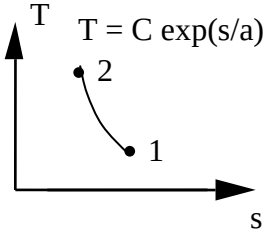
From the energy equation and constant specific heat from Table A.5

${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v (T_2 - T_1) + {}_1w_2$

$= 0.662$ kJ/kg-K $(700 - 500)$ K $- 207.8$ kJ/kg $= -75.4$ kJ/kg







The function T(s) can be done with constant C_P: $a = C_P - nR/(n-1) = -0.377$

6.107

Do Problem 6.103 and assume the process is polytropic with n = 1.15

Process: Pv^n = constant with n = 1.15 ;

The T-P relation is given in Eq.6.28

$$T_2 = T_1 (P_2/P_1)^{\frac{n-1}{n}} = 300 \left(\frac{800}{100}\right)^{0.130} = 393.1 \text{ K}$$

and the work term is given by Eq.6.29

$$_1W_2 = \int mP\, dv = m(P_2v_2 - P_1v_1)/(1 - n) = mR\,(T_2 - T_1)/(1 - n)$$

$$= 1 \text{ kg} \times 0.5183 \frac{\text{kJ}}{\text{kg-K}} \times \frac{393.1 - 293.15}{1 - 1.15} \text{ K} = \mathbf{-345.4\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.108

Hot combustion air at 2000 K expands in a polytropic process to a volume 6 times as large with n = 1.3. Find the specific boundary work and the specific heat transfer.

Energy Eq.: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Reversible work Eq. 6.29: ${}_1w_2 = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$

Process Eq: $Pv^n = C$; $T_2 = T_1 (v_1/v_2)^{n-1} = 2000 \left(\frac{1}{6}\right)^{0.3} = 1168.4$ K

Properties from Table A.7.1: $u_1 = 1677.52$ kJ/kg, $u_2 = 905.46$ kJ/kg

$${}_1w_2 = \frac{0.287}{1 - 1.3} \text{ kJ/kg-K } (1168.4 - 2000) \text{ K} = \mathbf{795.6\ kJ/kg}$$

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = 905.46 - 1677.52 + 795.6 = \mathbf{23.5\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.109

Air in a piston/cylinder is at 1800 K, 7 MPa and expands in a polytropic process with n = 1.5 to a volume eight times larger. Find the specific work and specific heat transfer in the process using Table A.7 and draw the T-s diagram.

C.V. Air of constant mass $m_2 = m_1 = m$.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $Pv^{1.50} = \text{constant}, \quad v_2/v_1 = 8$

State 1: $P_1 = 7$ MPa, $T_1 = 1800$ K

State 2: ($v_2 = 8v_1$, ?) Must be on process curve so

$$P_2 = P_1 (v_1/v_2)^n = 7000\ (1/8)^{1.50} = 309.36 \text{ kPa}$$

$$T_2 = T_1 \frac{P_2 v_2}{P_1 v_1} = T_1 (v_1/v_2)^{n-1} = 1800\ (1/8)^{0.5} = 636.4 \text{ K}$$

Table A.7: $u_1 = 1486.33$ kJ/kg and interpolate $u_2 = 463.06$ kJ/kg

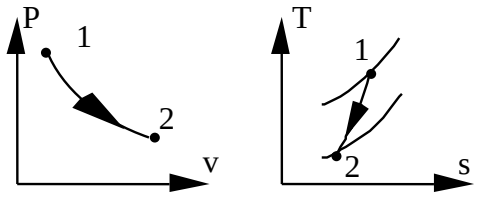
Work from the process expressed in Eq.3.21, 6.29

$${}_1w_2 = \int P dv = \frac{P_2 v_2 - P_1 v_1}{1 - n} = \frac{R}{1 - n}(T_2 - T_1) = \frac{0.287\ (636.4 - 1800)}{1 - 1.5}$$

$$= \mathbf{667.9\ kJ/kg}$$

Heat transfer from the energy equation

$${}_1q_2 = (u_2 - u_1) + {}_1w_2 = (463.06 - 1486.33) + 667.9 = \mathbf{-355.4\ kJ/kg}$$



Notice:
n = 1.5, k = 1.4

n > k

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.110

Helium in a piston/cylinder at 20°C, 100 kPa is brought to 400 K in a reversible polytropic process with exponent n = 1.25. You may assume helium is an ideal gas with constant specific heat. Find the final pressure and both the specific heat transfer and specific work.

Solution:

C.V. Helium

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process: $Pv^n = C$ & $Pv = RT$ => $Tv^{n-1} = C$

Table A.5: $C_v = 3.116$ kJ/kg K, $R = 2.0771$ kJ/kg K

From the process equation and $T_1 = 293.15$, $T_2 = 400$ K

$$T_1 v^{n-1} = T_2 v^{n-1} \quad => \quad v_2 / v_1 = (T_1 / T_2)^{1/n-1} = 0.2885$$

$$P_2 / P_1 = (v_1 / v_2)^n = 4.73 \quad => P_2 = \mathbf{473\ kPa}$$

The work is from Eq.6.29 per unit mass

$${}_1w_2 = \int P\, dv = \int C\, v^{-n}\, dv = [\, C / (1-n)\,] \times (\, v_2^{1-n} - v_1^{1-n}\,)$$

$$= \frac{1}{1-n}(P_2 v_2 - P_1 v_1) = \frac{R}{1-n}(T_2 - T_1)$$

$$= \frac{2.0771}{1 - 1.25}\ \text{kJ/kg-K} \times (400 - 293.15)\ \text{K} = \mathbf{-887.7\ kJ/kg}$$

The heat transfer follows from the energy equation

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v (T_2 - T_1) + (-887.7) = \mathbf{-554.8\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.111

The power stroke in an internal combustion engine can be approximated with a polytropic expansion. Consider air in a cylinder volume of 0.2 L at 7 MPa, 1800 K, shown in Fig. P6.111. It now expands in a reversible polytropic process with exponent, *n* = 1.5, through a volume ratio of 10:1. Show this process on *P–v* and *T–s* diagrams, and calculate the work and heat transfer for the process.

Solution:

C.V. Air of constant mass $m_2 = m_1 = m$.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3 (37): $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = \int dQ/T$

Process: $PV^{1.50} = \text{constant}, \quad V_2/V_1 = 10$

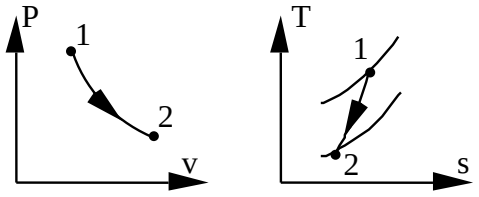
State 1: $P_1 = 7$ MPa, $T_1 = 1800$ K, $V_1 = 0.2$ L

$$m_1 = \frac{P_1V_1}{RT_1} = \frac{7000 \times 0.2 \times 10^{-3}}{0.287 \times 1800} = 2.71\times10^{-3} \text{ kg}$$

State 2: ($v = V_2/m$, ?) Must be on process curve so Eq.6.24 gives

$$T_2 = T_1 (V_1/V_2)^{n-1} = 1800\ (1/10)^{0.5} = 569.2 \text{ K}$$

Table A.7: $u_1 = 1486.33$ kJ/kg and interpolate $u_2 = 411.707$ kJ/kg



Notice:
n = 1.5, k = 1.4

n > k

Work from the process expressed in Eq.6.29

$${}_1W_2 = \int PdV = mR(T_2 - T_1)/(1 - n)$$

$$= \frac{2.71\times10^{-3} \times 0.287(569.2 - 1800)}{1 - 1.5} = \mathbf{1.91\ kJ}$$

Heat transfer from the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$$

$$= 2.71\times10^{-3} \text{ kg} \times (411.707 - 1486.33) \text{ kJ/kg} + 1.91 \text{ kJ} = \mathbf{-1.00\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.112

A cylinder/piston contains saturated vapor R-410A at 10°C; the volume is 10 L. The R-410A is compressed to 2 MPa, 60°C in a reversible (internally) polytropic process. Find the polytropic exponent n and calculate the work and heat transfer.

Solution:

C.V. R-410A of constant mass $m_2 = m_1 = m$ out to ambient.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{amb} + {}_1S_{2\,gen}$

Process: $P_1v_1^n = P_2v_2^n$ Eq.6.36

State 1: (T_1, x_1) Table B.4.1 $P_1 = 1085.7$ kPa, $v_1 = 0.02383$ m^3/kg

$m = V_1/v_1 = 0.01/0.02383 = 0.4196$ kg

State 2: (T_2, P_2) Table B.4.2 $v_2 = 0.01536$ m^3/kg

From process eq. $P_2/P_1 = \dfrac{2000}{1085.7} = \left(\dfrac{0.02383}{0.01536}\right)^n$ => **n = 1.39106**

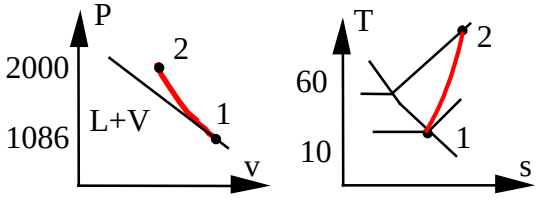
The work is from Eq.6.29

$$ {}_1W_2 = \int PdV = m\frac{P_2v_2 - P_1v_1}{1-n} = 0.4196\,\frac{2000 \times 0.01536 - 1085.7 \times 0.02383}{1 - 1.39106} $$

$$ = \mathbf{-5.20\ kJ} $$

Heat transfer from energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.4196\,(289.9 - 255.9) - 5.20 = \mathbf{9.07\ kJ}$$



Notice:
n = 1.39, k = 1.17

n > k

The two curves are shown below from the CATT3 process plot function.

6.113

Air goes through a polytropic process with n = 1.3 in a piston/cylinder setup. It starts at 200 kPa, 300 K and ends with a pressure of 2200 kPa. Find the expansion ratio v_2/v_1, the specific work, and the specific heat transfer.

Take CV as the air. $m_2 = m_1 = m$;

Energy Eq.3.5 $\quad m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Process Eq.: $\quad Pv^n = \text{Constant}$ (polytropic)

From the ideal gas law and the process equation we can get:

State 2: $(v_2/v_1) = (P_2/P_1)^{-1/n}$ and $Pv = RT \Rightarrow T_2/T_1 = (v_2 / v_1)^{1 - n}$

$$(v_2/v_1) = (P_2/P_1)^{-1/n} = (2200 / 200)^{-1/1.3} = \mathbf{0.1581}$$

$$T_2 = T_1 (P_2/P_1)^{(n-1)/n} = 300 \left(\frac{2200}{200}\right)^{0.3/1.3} = \mathbf{521.7\ K}$$

From process eq.:

$${}_1w_2 = \int P\, dv = \text{area} = \frac{1}{1-n}(P_2v_2 - P_1v_1) = \frac{R}{1-n}(T_2 - T_1)$$

$$= \frac{0.287}{1-1.3}(521.7 - 300) = \mathbf{-212.09\ kJ/kg}$$

From the energy equation and constant specific heat from Table A.5

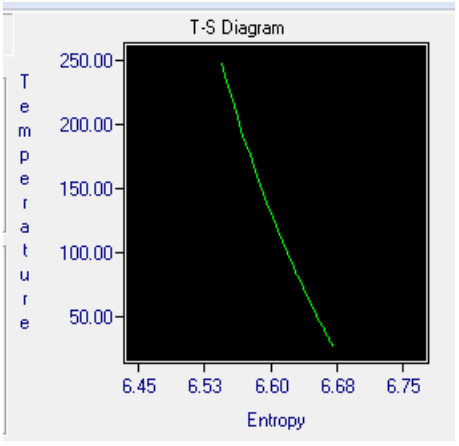
${}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v (T_2 - T_1) + {}_1w_2$

$= 0.717$ kJ/kg-K (521.7 – 300) K – 212.09 kJ/kg = **-53.13 kJ/kg**

From the energy equation and Table A.7

${}_1q_2 = u_2 - u_1 + {}_1w_2$

$= 376.0 – 214.36 – 212.09 =$ **-50.45 kJ/kg**



process plotted from CATT3

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

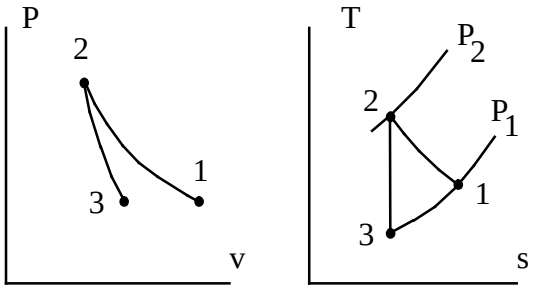
6.114

A cylinder/piston contains air at ambient conditions, 100 kPa and 20°C with a volume of 0.3 m^3. The air is compressed to 800 kPa in a reversible polytropic process with exponent, $n = 1.2$, after which it is expanded back to 100 kPa in a reversible adiabatic process.

a. Show the two processes in *P–v* and *T–s* diagrams.
b. Determine the final temperature and the net work.

Solution:

a)



$$m = P_1V_1/RT_1 = \frac{100 \times 0.3}{0.287 \times 293.2} = 0.3565 \text{ kg}$$

b) The process equation is expressed in Eq.6.28

$$T_2 = T_1(P_2/P_1)^{\frac{n-1}{n}} = 293.2 \left(\frac{800}{100}\right)^{0.167} = 414.9 \text{ K}$$

The work is from Eq.6.29

$$_1w_2 = \int_1^2 Pdv = \frac{P_2v_2 - P_1v_1}{1-n} = \frac{R(T_2-T_1)}{1-n} = \frac{0.287(414.9-293.2)}{1-1.20} = -174.6 \text{ kJ/kg}$$

Isentropic relation is from Eq.6.23

$$T_3 = T_2 (P_3/P_2)^{\frac{k-1}{k}} = 414.9 \left(\frac{100}{800}\right)^{0.286} = \mathbf{228.9\ K}$$

With zero heat transfer the energy equation gives the work

$$_2w_3 = C_{V0}(T_2 - T_3) = 0.717(414.9 - 228.9) = +133.3 \text{ kJ/kg}$$

$$w_{NET} = 0.3565(-174.6 + 133.3) = \mathbf{-14.7\ kJ}$$

Entropy generation

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.115

Consider a heat transfer of 100 kJ from 1500 K hot gases to a steel container at 750 K that has a heat transfer of the 100 kJ out to some air at 375 K. Determine the entropy generation in each of the control volumes indicated in Fig. P6.115.

There is no change in energy or entropy in the indicated control volumes, so no storage effect. There is a transfer of energy in and out of each CV and an associated transfer of entropy.

Take CV1
Energy Eq.:

$0 = Q - Q$

Entropy Eq.:

$$0 = \frac{Q}{T_H} - \frac{Q}{T_M} + S_{gen\ CV1}$$

$$S_{gen\ CV1} = \frac{Q}{T_M} - \frac{Q}{T_H}$$

$$= \frac{100}{750} - \frac{100}{1500} = \mathbf{0.0667\ kJ/K}$$

Take CV2
Energy Eq.:

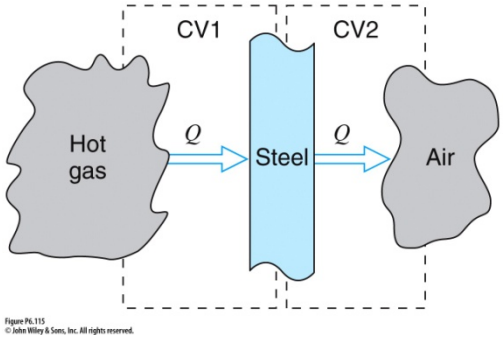
$0 = Q - Q$

Entropy Eq.:

$$0 = \frac{Q}{T_M} - \frac{Q}{T_L} + S_{gen\ CV2}$$

$$S_{gen\ CV2} = \frac{Q}{T_L} - \frac{Q}{T_M}$$

$$= \frac{100}{375} - \frac{100}{750} = \mathbf{0.133\ kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.116

A rigid tank has 0.1 kg saturated vapor R-410A at 0°C that is cooled to -20°C by a -20°C heat sink. Show the process in a T-s diagram; find the change in entropy of the R-410A, the heat sink, and the total entropy generation.

Solution:

C.V.: R-410A in tank + out to the sink. $m_2 = m_1$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq. 6.37: $m(s_2 - s_1) = {}_1Q_2 / T_{sink} + {}_1S_{2\ gen}$

Process: V = constant, $v_2 = v_1 = V/m$ => ${}_1W_2 = 0$

Table B.4.1: State 1: $u_1 = 253.02$ kJ/kg, $s_1 = 1.0368$ kJ/kgK

State 2: -20°C, $v_2 = v_1 = V/m$, look in Table B.4.1 at -20°C

$$x_2 = \frac{v_2 - v_{f2}}{v_{fg2}} = \frac{0.03267 - 0.000803}{0.06400} = 0.4979$$

$u_2 = u_{f2} + x_2\, u_{fg2} = 27.92 + x_2 \times 218.07 = 136.5$ kJ/kg

$s_2 = s_{f2} + x_2\, s_{fg2} = 0.1154 + x_2 \times 0.9625 = 0.5946$ kJ/kgK

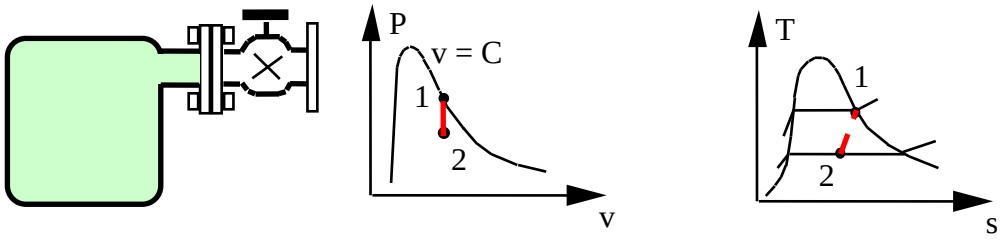
From the energy equation

${}_1Q_2 = m(u_2 - u_1) = 0.1$ kg (136.5 – 253.0) kJ/kg = -11.65 kJ

$(S_2 - S_1)_{R\text{-}410a} = m(s_2 - s_1) = 0.1\ (0.5946 - 1.0368) =$ **–0.0442 kJ/K**

$(S_2 - S_1)_{sink} = -{}_1Q_2 / T_{sink} = 11.65$ kJ/253.15 K = **0.046 kJ/K**

${}_1S_{2\ gen} = m(s_2 - s_1) - {}_1Q_2 / T_{sink} = -0.0442 + 0.046 =$ **0.0018 kJ**/K



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.117

One kg water at 500°C and 1 kg saturated water vapor both at 200 kPa are mixed in a constant pressure and adiabatic process. Find the final temperature and the entropy generation for the process.

Solution:

Continuity Eq.: $m_2 - m_A - m_B = 0$

Energy Eq.3.5: $m_2u_2 - m_Au_A - m_Bu_B = -{}_1W_2$

Entropy Eq.6.37: $m_2s_2 - m_As_A - m_Bs_B = \int dQ/T + {}_1S_{2\ gen}$

Process: $P = \text{Constant} \Rightarrow {}_1W_2 = \int PdV = P(V_2 - V_1)$

$Q = 0$

Substitute the work term into the energy equation and rearrange to get

$$m_2u_2 + P_2V_2 = m_2h_2 = m_Au_A + m_Bu_B + PV_1 = m_Ah_A + m_Bh_B$$

where the last rewrite used $PV_1 = PV_A + PV_B$.

State A1: Table B.1.3 $h_A = 3487.03$ kJ/kg, $s_A = 8.5132$ kJ/kg K

State B1: Table B.1.2 $h_B = 2706.63$ kJ/kg, $s_B = 7.1271$ kJ/kg K

Energy equation gives:

$$h_2 = \frac{m_A}{m_2} h_A + \frac{m_B}{m_2} h_B = \tfrac{1}{2}\, 3487.03 + \tfrac{1}{2}\, 2706.63 = 3096.83 \text{ kJ/kg}$$

State 2: P_2, $h_2 = 3096.83$ kJ/kg $\Rightarrow$ $s_2 = 7.9328$ kJ/kg K; $T_2 =$ **312.2°C**

With the zero heat transfer we have

$${}_1S_{2\ gen} = m_2s_2 - m_As_A - m_Bs_B$$

$$= 2 \times 7.9328 - 1 \times 8.5132 - 1 \times 7.1271 = \mathbf{0.225\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.118

A car uses an average power of 25 hp for a one hour round trip. With a thermal efficiency of 35% how much fuel energy was used? What happened to all the energy? What change in entropy took place if we assume ambient at 20^{o}C?

Since it is a round trip, there are no changes in storage of energy for the car after it has cooled down again. All the energy is given out to the ambient in the form of exhaust flow (hot air) and heat transfer from the radiator and underhood air flow.

$$W = \int \dot{W}\, dt = 25 \text{ hp} \times 0.7457 \text{ (kW/hp)} \times 3600 \text{ s} = 67\,113 \text{ kJ} = \eta\, Q$$

Fuel energy used to deliver the W

$$Q = E / \eta = 67\,113 \text{ kJ} / 0.35 = \mathbf{191\,751\ kJ}$$

$$\Delta S = Q / T = 191\,751 \text{ kJ} / 293.15 \text{ K} = \mathbf{654.1\ kJ/K}$$

All the energy (Q) ends up in the ambient at the ambient temperature.

6.119

A computer chip dissipates 2 kJ of electric work over time and rejects that as heat transfer from its 50°C surface to 25°C air. How much entropy is generated in the chip? How much if any is generated outside the chip?

C.V.1 Chip with surface at 50°C, we assume chip state is constant.

Energy: $U_2 - U_1 = 0 = {}_1Q_2 - {}_1W_2 = W_{electrical\ in} - Q_{out\ 1}$

Entropy: $S_2 - S_1 = 0 = -\dfrac{Q_{out\ 1}}{T_{surf}} + {}_1S_{2\ gen1}$

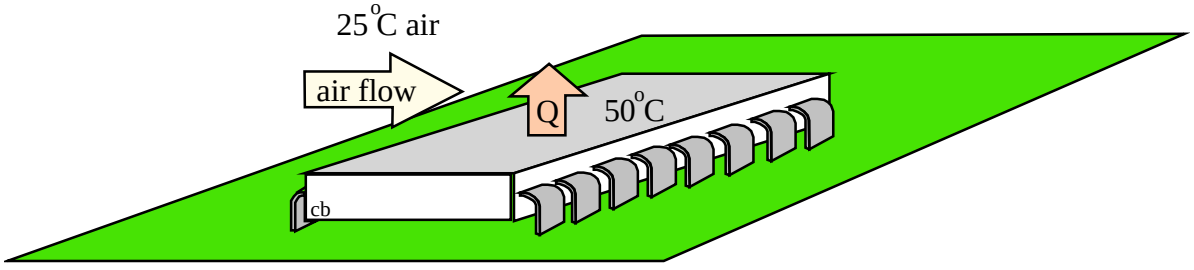
$${}_1S_{2\ gen1} = \frac{Q_{out\ 1}}{T_{surf}} = \frac{W_{electrical\ in}}{T_{surf}} = \frac{2\ kJ}{323.15\ K} = \mathbf{6.19\ J/K}$$

C.V.2 From chip surface at 50°C to air at 25°C, assume constant state.

Energy: $U_2 - U_1 = 0 = {}_1Q_2 - {}_1W_2 = Q_{out\ 1} - Q_{out\ 2}$

Entropy: $S_2 - S_1 = 0 = \dfrac{Q_{out1}}{T_{surf}} - \dfrac{Q_{out2}}{T_{air}} + {}_1S_{2\ gen2}$

$${}_1S_{2\ gen2} = \frac{Q_{out2}}{T_{air}} - \frac{Q_{out1}}{T_{surf}} = \frac{2\ kJ}{298.15\ K} - \frac{2\ kJ}{323.15\ K} = \mathbf{0.519\ J/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.120

An insulated cylinder/piston contains R-134a at 1 MPa, 50°C, with a volume of 100 L. The R-134a expands, moving the piston until the pressure in the cylinder has dropped to 100 kPa. It is claimed that the R-134a does 190 kJ of work against the piston during the process. Is that possible?

Solution:

C.V. R-134a in cylinder. Insulated so assume Q = 0.

State 1: Table B.5.2, $v_1 = 0.02185\ m^3/kg$, $u_1 = 409.39$ kJ/kg,

$s_1 = 1.7494$ kJ/kg K, $m = V_1/v_1 = 0.1/0.02185 = 4.577$ kg

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = 0 - 190 \Rightarrow$

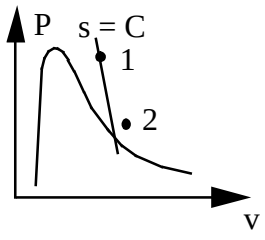
$u_2 = u_1 - {}_1W_2/m = 367.89$ kJ/kg

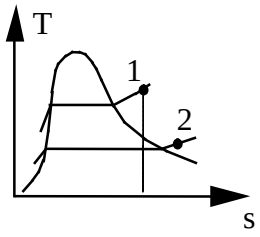
State 2: P_2 , $u_2 \Rightarrow$ Table B.5.2: $T_2 = -19.25°C$; $s_2 = 1.7689$ kJ/kg K

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2,gen} = {}_1S_{2,gen}$

${}_1S_{2,gen} = m(s_2 - s_1) = 0.0893$ kJ/K

This is possible since ${}_1S_{2,gen} > 0$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.121

A rigid tank holds 0.75 kg ammonia at 70°C as saturated vapor. The tank is now cooled to 20°C by heat transfer to the ambient at 20°C. Determine the amount of entropy generation during the process.

C.V. The ammonia out to 20°C, this is a control mass.

Process: Rigid tank V = C => v = constant & $_1W_2 = \int_1^2 PdV = \mathbf{0}$

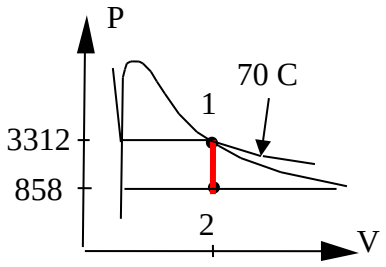
Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = {}_1Q_2$,

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2,gen} = {}_1Q_2/T_0 + {}_1S_{2,gen}$

State 1: $v_1 = 0.03787\ m^3/kg$,

$u_1 = 1338.9$ kJ/kg, $s_1 = 4.3533$ kJ/kgK

State 2: **T, v** => two-phase (straight down in P-v diagram from state 1)



$x_2 = (v - v_f)/v_{fg} = (0.03787 - 0.001638)/0.14758 = 0.2455$

$u_2 = u_f + x_2\, u_{fg} = 272.89 + 0.2455 \times 1059.3 = 532.95$ kJ/kg

$s_2 = s_f + x_2\, s_{fg} = 1.0408 + 0.2455 \times 4.0452 = 2.0339$ kJ/kgK

${}_1Q_2 = m(u_2 - u_1) = 0.75$ kg (532.95 – 1338.9) kJ/kg = -604.5 kJ

${}_1S_{2,gen} = m(s_2 - s_1) - {}_1Q_2/T_0 = 0.75(2.0339 - 4.3533) + 604.5/293.15$

= **0.322 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.122

The unrestrained expansion of the reactor water in Problem 3.101 has a final state in the two-phase region. Find the entropy generated in the process.

A water-filled reactor with volume of 1 m^3 is at 20 MPa, 360°C and placed inside a containment room as shown in Fig. P3.101. The room is well insulated and initially evacuated. Due to a failure, the reactor ruptures and the water fills the containment room. Find the minimum room volume so the final pressure does not exceed 200 kPa.

Solution:

C.V.: Containment room and reactor.

Mass: $m_2 = m_1 = V_{reactor}/v_1 = 1/0.001823 = 548.5$ kg

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = 0 - 0 = 0$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

State 1: (T, P) Table B.1.4 $u_1 = 1702.8$ kJ/kg, $s_1 = 3.877$

Energy equation implies $u_2 = u_1 = 1702.8$ kJ/kg

State 2: $P_2 = 200$ kPa, $u_2 < u_g$ => Two-phase Table B.1.2

$x_2 = (u_2 - u_f)/ u_{fg} = (1702.8 - 504.47)/2025.02 = 0.59176$

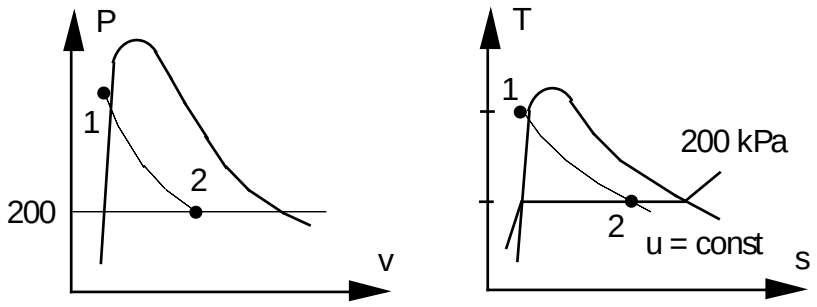
$v_2 = 0.001061 + 0.59176 \times 0.88467 = 0.52457\ m^3/kg$

$s_2 = s_f + x_2 s_{fg} = 1.53 + 0.59176 \times 5.597 = 4.8421$ kJ/kg K

$V_2 = m_2 v_2 = 548.5 \times 0.52457 =$ **287.7 m^3**

From the entropy equation the generation is

${}_1S_{2\,gen} = m(s_2 - s_1) = 548.5\ (4.8421 - 3.877) =$ **529.4 kJ/K**



Entropy is generated due to the unrestrained expansion. No work was taken out as the volume goes up.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.123

Heat transfer from a 20^{o}C kitchen to a block of 1.5 kg ice at -10^{o}C melts it to liquid at 10^{o}C. How much entropy is generated?

Water changes state from nearly saturated solid to nearly saturated liquid. The pressure is 101 kPa but we approximate the state properties with saturated state at the same temperature.

CV Ice out to the 20^{o}C kitchen air

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = {}_1Q_2/T_0 + {}_1S_{2\ gen}$

State 1: Compressed (saturated) solid, B.1.5,

$u_1 = -354.09$ kJ/kg, $s_1 = -1.2995$ kJ/kg-K

State 2: Compressed (saturated) liquid B.1.1

$u_2 = 41.99$ kJ/kg, $s_2 = 0.1510$ kJ/kg-K

Heat transfer from the energy Eq.

${}_1Q_2 = m(u_2 - u_1) = 1.5\ [41.99 - (-354.09)] = 594.12$ kJ

From the entropy Eq.

${}_1S_{2\ gen} = m(s_2 - s_1) - {}_1Q_2/T_0$

$= 1.5\ [0.151 - (-1.2995)] - 594.12/293.15 =$ **0.149 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.124

Ammonia is contained in a rigid sealed tank unknown quality at 0^oC. When heated in boiling water to 100^oC its pressure reaches 1200 kPa. Find the initial quality, the heat transfer to the ammonia and the total entropy generation.

Solution:

C.V. Ammonia, which is a control mass of constant volume.

Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\,gen}$

State 2: 1200 kPa, 100^oC => Table B.2.2

$s_2 = 5.5325$ kJ/kg K, $v_2 = 0.14347$ m^3/kg, $u_2 = 1485.8$ kJ/kg

State 1: $v_1 = v_2$ => Table B.2.1

$x_1 = (0.14347 - 0.001566)/0.28763 = 0.49336$

$u_1 = 741.28$ kJ/kg, $s_1 = 0.7114 + x_1 \times 4.6195 = 2.9905$ kJ/kg K

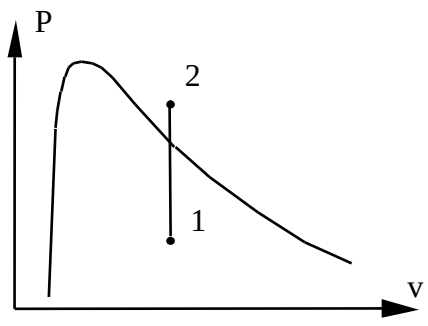
Process: V = constant => ${}_1w_2 = 0$

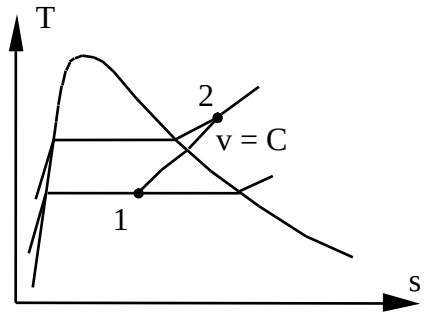
${}_1q_2 = (u_2 - u_1) = 1485.8 - 741.28 = 744.52$ kJ/kg

To get the total entropy generation take the C.V out to the water at 100^oC.

${}_1s_{2\,gen} = s_2 - s_1 - {}_1q_2/T = 5.5325 - 2.9905 - 744.52/373.15$

= **0.547 kJ/kg K**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.125

Water in a piston/cylinder is at 101 kPa, 25°C, and mass 0.5 kg. The piston rests on some stops, and the pressure should be 1000 kPa to float the piston. We now heat the water from a 200°C reservoir, so the volume becomes 5 times the initial volume. Find the total heat transfer and the entropy generation.

Solution:

Take CV as the water out to the reservoir.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{res} + {}_1S_{2\,gen}$

Process: v = constant, then $P = C = P_{float}$.

Volume does go up so we get $v_2 = 5\ v_1$

State 1: $v_1 = 0.001003\ m^3/kg$, $u_1 = 104.86$ kJ/kg, $s_1 = 0.3673$ kJ/kgK

State 2: $P_2 = P_{float}$, $v_2 = 5 \times 0.001003 = 0.005015\ m^3/kg$; $T_2 = 179.91°C$

$x_2 = (v_2 - v_f)/v_{fg} = (0.005015 - 0.001127)/0.19332 = 0.02011$,

$u_2 = 761.67 + x_2 \times 1821.97 = 798.31$ kJ/kg

$s_2 = 2.1386 + x_2 \times 4.4478 = 2.2280$ kJ/kgK

From the process equation (see P-V diagram) we get the work as

${}_1w_2 = P_{float}(v_2 - v_1) = 1000$ kPa $(0.005015 - 0.001003)\ m^3/kg = 4.012$ kJ/kg

From the energy equation we solve for the heat transfer

${}_1Q_2 = m[u_2 - u_1 + {}_1w_2] = 0.5 \times [798.31 - 104.86 + 4.012] =$ **348.7 kJ**

${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T_{res} = 0.5(2.2280 - 0.3673) - 348.7/473.15$

= **0.1934 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.126

Do Problem 6.125 assuming the piston/cylinder is 1.5 kg of steel and has the the same temperature as the water at any time.

Solution:

Take CV as the water and steel out to the reservoir.

Continuity Eq.: $m_2 = m_1 = m_{H2O} + m_{steel}$

Energy Eq.: $m_{H2O}\,(u_2 - u_1)_{H2O} + m_{steel}\,(u_2 - u_1)_{steel} = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m_{H2O}(s_2 - s_1)_{H2O} + m_{steel}(s_2 - s_1)_{steel} = {}_1Q_2/T_{res} + {}_1S_{2\,gen}$

Process: v = constant, then $P = C = P_{float}$.

Volume does go up so we get $v_2 = 5\ v_1$

State 1: $v_1 = 0.001003\ m^3/kg,\ u_1 = 104.86\ kJ/kg,\ s_1 = 0.3673\ kJ/kgK$

State 2: $P_2 = P_{float},\ v_2 = 5 \times 0.001003 = 0.005015\ m^3/kg;\ T_2 = 179.91°C$

$x_2 = (v_2 - v_f)\,/v_{fg} = (0.005015 - 0.001127)/0.19332 = 0.02011,$

$u_2 = 761.67 + x_2 \times 1821.97 = 798.31\ kJ/kg$

$s_2 = 2.1386 + x_2 \times 4.4478 = 2.2280\ kJ/kgK$

There is only work when piston moves and then $P = P_{float}$ so the work is

${}_1W_2 = P_{float}(V_2 - V_1) = 1000\ kPa \times 0.5\ (0.005015 - 0.001003)\ m^3 = 2.006\ kJ$

From the energy equation we solve for the heat transfer

$${}_1Q_2 = U_2 - U_1 + {}_1W_2$$
$$= 0.5\times[798.31 - 104.86] + 1.5 \times 0.46 \times (179.91 - 25) + 2.006$$
$$= \mathbf{455.6\ kJ}$$

For the entropy change we use B.1.1 for water and A.5 and Eq.6.11 for steel

$${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_{res}$$
$$= 0.5(2.2280 - 0.3673) + 1.5 \times 0.46 \times \ln\frac{453.06}{298.15} - \frac{455.6}{473.15}$$
$$= \mathbf{0.256\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.127

A cylinder fitted with a movable piston contains water at 3 MPa, 50% quality, at which point the volume is 20 L. The water now expands to 1.2 MPa as a result of receiving 600 kJ of heat from a large source at 300°C. It is claimed that the water does 124 kJ of work during this process. Is this possible?

Solution:

C.V.: H_2O in Cylinder

Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$;

Entropy Eq.6.37: $m(s_2 - s_1) = \dfrac{{}_1Q_2}{T_{source}} + {}_1S_{2,gen}$; $T_{source} = 300^oC$,

Process: ${}_1Q_2 = 600$ kJ, ${}_1W_2 = 124$ kJ ?

State 1: 3 MPa, $x_1 = 0.5$, Table B.1.2: $T_1 = 233.9^oC$

$v_1 = v_f + x_1 v_{fg} = 0.001216 + 0.5 \times 0.06546 = 0.033948$ m^3/kg

$u_1 = u_f + x_1 u_{fg} = 1804.5$ kJ/kg, $s_1 = s_f + x_1 s_{fg} = 4.4162$ kJ/kg-K

$m_1 = V_1/v_1 = 0.02$ m^3/ [0.033948 m^3/kg] = 0.589 kg

Now solve for u_2 from the energy equation

$$u_2 = u_1 + ({}_1Q_2 - {}_1W_2)/m_1$$

$$= 1804.5 + (600 - 124)/0.589 = 2612.6 \text{ kJ/kg}$$

State 2: $P_2 = 1.2$ MPa : $u_2 = 2612.6$ kJ/kg Table B.1.3

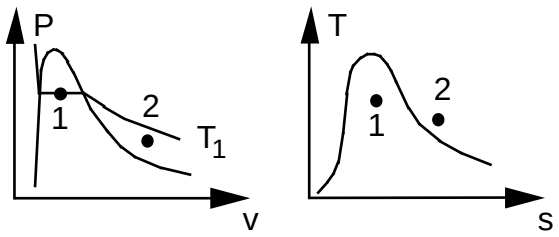
$$T_2 \cong 200^oC, \quad s_2 = 6.5898 \text{ kJ/kgK}$$

From the entropy equation

$${}_1S_{2,gen} = m(s_2 - s_1) - \frac{{}_1Q_2}{T_{source}}$$

$$= 0.589 \text{ kg } (6.5898 - 4.4162) \text{ kJ/kg-K} - \frac{600}{300 + 273} \text{ kJ/K}$$

$$= 0.2335 \text{ kJ/K} \geq 0; \quad \textbf{Process is possible}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.128

A piston/cylinder device keeping a constant pressure has 1 kg water at 20°C and 1 kg of water at 100°C both at 500 kPa separated by a thin membrane. The membrane is broken and the water comes to a uniform state with no external heat transfer. Find the final temperature and the entropy generation for the process.

Solution:

Continuity Eq.: $m_2 - m_A - m_B = 0$

Energy Eq.3.5: $m_2u_2 - m_Au_A - m_Bu_B = -{}_1W_2$

Entropy Eq.6.37: $m_2s_2 - m_As_A - m_Bs_B = \int dQ/T + {}_1S_{2\ gen}$

Process: $P = \text{Constant} \Rightarrow {}_1W_2 = \int PdV = P(V_2 - V_1)$

$Q = 0$

Substitute the work term into the energy equation and rearrange to get

$$m_2u_2 + P_2V_2 = m_2h_2 = m_Au_A + m_Bu_B + PV_1 = m_Ah_A + m_Bh_B$$

where the last rewrite used $PV_1 = PV_A + PV_B$.

State A1: Table B.1.4 $h_A = 84.41$ kJ/kg $s_A = 0.2965$ kJ/kg K

State B1: Table B.1.4 $h_B = 419.32$ kJ/kg $s_B = 1.3065$ kJ/kg K

Energy equation gives:

$$h_2 = \frac{m_A}{m_2} h_A + \frac{m_B}{m_2} h_B = \tfrac{1}{2}\, 84.41 + \tfrac{1}{2}\, 419.32 = 251.865 \text{ kJ/kg}$$

State 2: $h_2 = 251.865$ kJ/kg & $P_2 = 500$ kPa from Table B.1.4

$T_2 = 60.085°C$, $s_2 = 0.83184$ kJ/kg K

With the zero heat transfer we have

$${}_1S_{2\ gen} = m_2s_2 - m_As_A - m_Bs_B$$

$$= 2 \times 0.83184 - 1 \times 0.2965 - 1 \times 1.3065 = \mathbf{0.0607\ kJ/K}$$

6.131

A closed rigid container is filled with 1.5 kg water at 100 kPa, 55°C, 1 kg of stainless steel and 0.5 kg of PVC (polyvinyl chloride) both at 20°C and 0.1 kg of air at 400 K, 100 kPa. It is now left alone with no external heat transfer and no water vaporizes. Find the final temperature and the entropy generation for the process.

CV. Container.

Process: V = constant => $_1W_2 = 0$ and also given $_1Q_2 = 0$

Energy Eq.: $U_2 - U_1 = \sum m_i(u_2 - u_1)_i = {}_1Q_2 - {}_1W_2 = 0$

Entropy Eq.6.37: $S_2 - S_1 = \sum m_i(s_2 - s_1)_i = 0 + {}_1S_{2,gen}$

For the liquid and the metal mass we will use the specific heat (Tbl A.3, A.4) so

$$\sum m_i(u_2 - u_1)_i = \sum m_i C_{v\,i}\,(T_2 - T_1)_i = T_2 \sum m_i C_{v\,i} - \sum m_i C_{v\,i} T_{1\,i}$$

$$\sum m_i(s_2 - s_1)_i = \sum m_i C_{v\,i} \ln(T_2/T_1)_i$$

noticing that all masses have the same T_2 but not same initial T.

$$\sum m_i C_{v\,i} = 1.5 \times 4.18 + 1 \times 0.46 + 0.5 \times 0.96 + 0.1 \times 0.717 = 7.282 \text{ kJ/K}$$

Energy Eq.: $7.282\ T_2 = 1.5 \times 4.18 \times 55 + (1 \times 0.46 + 0.5 \times 0.96) \times 20$

$$+ 0.1 \times 0.717 \times (400\text{-}273.15) = 372.745 \text{ kJ}$$

$$T_2 = \mathbf{51.2^oC}$$

The volume of the air is constant so entropy change from Eq.6.17 is the same expression as for the solids and liquids given above.

$$_1S_{2,gen} = S_2 - S_1 = \sum m_i(s_2 - s_1)_i = 1.5 \times 4.18 \times \ln(324.35/328.15)$$

$$+ (1 \times 0.46 + 0.5 \times 0.96) \times \ln\left(\frac{324.35}{293.15}\right) + 0.1 \times 0.717 \times \ln\left(\frac{324.35}{400}\right)$$

$$= -0.07304 \text{ kJ/K} + 0.09507 \text{ kJ/K} - 0.01503 \text{ kJ/K} = \mathbf{0.007\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.132

A cylinder/piston contains water at 200 kPa, 200°C with a volume of 20 L. The piston is moved slowly, compressing the water to a pressure of 800 kPa. The loading on the piston is such that the product *PV* is a constant. Assuming that the room temperature is 20°C, show that this process does not violate the second law.

Solution:

C.V.: Water + cylinder out to room at 20°C

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = {}_1Q_2 / T_{room} + {}_1S_{2\,gen}$

Process: $PV = \text{constant} = Pmv \Rightarrow v_2 = P_1v_1/P_2$

$${}_1w_2 = \int P dv = P_1v_1 \ln(v_2/v_1)$$

State 1: Table B.1.3, $v_1 = 1.0803\ m^3/kg$, $u_1 = 2654.4$ kJ/kg,

$s_1 = 7.5066$ kJ/kg K

State 2: P_2 , $v_2 = P_1v_1/P_2 = 200 \times 1.0803/800 = 0.2701\ m^3/kg$

Table B.1.3: $u_2 = 2655.0$ kJ/kg , $s_2 = 6.8822$ kJ/kg K

$${}_1w_2 = 200 \times 1.0803 \ln\left(\frac{0.2701}{1.0803}\right) = -299.5 \text{ kJ/kg}$$

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = 2655.0 - 2654.4 - 299.5 = -298.9 \text{ kJ/kg}$$

$${}_1s_{2,gen} = s_2 - s_1 - \frac{{}_1q_2}{T_{room}} = 6.8822 - 7.5066 + \frac{298.9}{293.15}$$

$$= 0.395 \text{ kJ/kg K} > 0 \quad \textbf{satisfies entropy eq.}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.133

A rigid steel tank of mass 2.5 kg contains 0.5 kg R-410A at 0°C with specific volume 0.01m/kg. The whole system heats up to the room temperature, 25°C. Find the process heat transfer and the entropy generation.

C.V. R-410A and steel tank out to room T. Control mass.

Continuity Eq.: $m_2 - m_{R410a} - m_{st} = 0$

Energy Eq.: $m_{R410a}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m_{R410a}(s_2 - s_1) + m_{st}(s_2 - s_1) = {}_1Q_2/T_{room} + {}_1S_{2,gen}$

Process: $V = C$ so ${}_1W_2 = 0$

State 1: $T_1 = 0°C$, $v_1 = 0.01\ m^3/kg$,

$V = mv_1 = 0.005\ m^3$

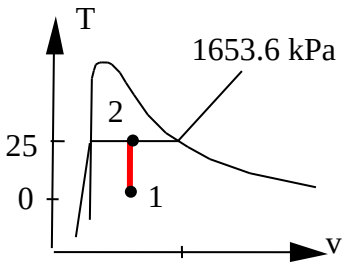
$x_1 = (v - v_f)/v_{fg} = (0.01 - 0.000855)/0.03182$

$= 0.28758$

$u_1 = u_f + x_1\, u_{fg} = 57.07 + x_1\ 195.95$

$= 113.42$ kJ/kg

$s_1 = 0.2264 + x_1\ 0.8104 = 0.45945$ kJ/kgK



State 2: **(T, v)** => sup-vapor (straight up in T-v diagram from state 1)

B.4.1 at 25°C, $v_f = 0.000944\ m^3/kg$, $v_g = 0.01514\ m^3/kg$, $v_f < v < v_g$: saturated.

$$P = 1653.6\ \text{kPa}, \qquad x = \frac{v - v_f}{v_{fg}} = \frac{0.01 - 0.000944}{0.01420} = 0.63775,$$

$u_2 = u_f + x_2\, u_{fg} = 96.03 + x_2\ 162.95 = 199.95$ kJ/kg

$s_2 = s_f + x_2\, s_{fg} = 0.3631 + x_2\ 0.6253 = 0.7619$ kJ/kgK

From the energy Eq.:

${}_1Q_2 = m_{R410a}(u_2 - u_1) + m_{st}\, C_{st}(T_2 - T_1)$

$= 0.5$ kg $\times$ (199.95 – 113.42) kJ/kg + 2.5 kg $\times$ 0.46 kJ/kgK $\times$ (25–0) K

$=$ **72.0 kJ**

${}_1S_{2,gen} = m_{R410a}(s_2 - s_1) + m_{st}\, C_{st} \ln(T_2/T_1) - {}_1Q_2/T_{room}$

$$= 0.5\ \text{kg} \times (0.7619 - 0.45945)\ \frac{\text{kJ}}{\text{kgK}} + 2.5\ \text{kg} \times 0.46\ \frac{\text{kJ}}{\text{kgK}} \times \ln\frac{298.15}{273.15}$$

$$- (72/298.15)\ \text{kJ/K}$$

$= 0.1512$ kJ/K + 0.1007 kJ/K – 0.2415 kJ/K = **0.0104 kJ/K**

6.135

One kilogram of ammonia (NH_3) is contained in a spring-loaded piston/cylinder, Fig. P6.135, as saturated liquid at –20°C. Heat is added from a reservoir at 100°C until a final condition of 800 kPa, 70°C is reached. Find the work, heat transfer, and entropy generation, assuming the process is internally reversible.

Solution:

C.V. = NH_3 out to the reservoir.

Continuity Eq.: $m_2 = m_1 = m$

Energy Eq.3.5: $E_2 - E_1 = m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $S_2 - S_1 = \int dQ/T + {}_1S_{2,gen} = {}_1Q_2/T_{res} + {}_1S_{2,gen}$

Process: $P = A + BV$ linear in V =>

$${}_1W_2 = \int PdV = \tfrac{1}{2}(P_1 + P_2)(V_2 - V_1) = \tfrac{1}{2}(P_1 + P_2)m(v_2 - v_1)$$

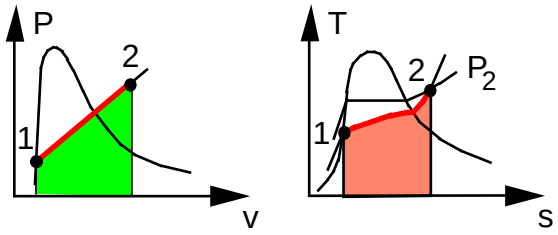
State 1: Table B.2.1

$P_1 = 190.08$ kPa,

$v_1 = 0.001504$ m^3/kg

$u_1 = 88.76$ kJ/kg,

$s_1 = 0.3657$ kJ/kg K



State 2: Table B.2.2 sup. vapor

$v_2 = 0.199$ m^3/kg, $u_2 = 1438.3$ kJ/kg, $s_2 = 5.5513$ kJ/kg K

${}_1W_2 = \frac{1}{2}(190.08 + 800)$ kPa $\times 1$ kg $(0.1990 - 0.001504)$ m^3/kg = **97.768 kJ**

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1(1438.3 - 88.76) + 97.768$ = **1447.3 kJ**

${}_1S_{2,gen} = m(s_2 - s_1) - {}_1Q_2/T_{res} = 1(5.5513 - 0.3657) - \dfrac{1447.3}{373.15}$ = **1.307 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.136

A 5 kg aluminum radiator holds 2 kg of liquid R-134a both at –10°C. The setup is brought indoors and heated with 220 kJ from a heat source at 100°C. Find the total entropy generation for the process assuming the R-134a remains a liquid.

Solution:

C.V. The aluminum radiator and the R-134a.

Energy Eq.3.5: $m_2u_2 - m_1u_1 = {}_1Q_2 - 0$

Process: No change in volume so no work as used above.

The energy equation now becomes (summing over the mass)

$$m_{al}\,(u_2 - u_1)_{al} + m_{R134a}\,(u_2 - u_1)_{R134a} = {}_1Q_2$$

Use specific heat from Table A.3 and A.4

$$m_{al}C_{al}\,(T_2 - T_1) + m_{R134a}C_{R134a}\ln\,(T_2 - T_1) = {}_1Q_2$$

$$T_2 - T_1 = {}_1Q_2 / [m_{al}C_{al} + m_{R134a}C_{R134a}]$$

$$= 220 / [5 \times 0.9 + 2 \times 1.43] = 29.89^{o}C$$

$$T_2 = -10 + 29.89 = 19.89^{o}C$$

Entropy generation from Eq.6.37

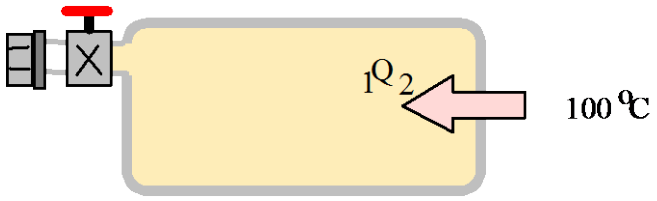
$${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T$$

$$= m_{al}C_{al}\ln\,(T_2/T_1) + m_{R134a}C_{R134a}\ln\,(T_2/T_1) - \frac{{}_1Q_2}{T_{amb}}$$

$$= (5 \times 0.9 + 2 \times 1.43)\ln\frac{(19.89 + 273.15)}{-10 + 273.15} - \frac{220}{373.15}$$

$$= 0.7918 - 0.5896$$

$$= \mathbf{0.202\ kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.137

A piston/cylinder of total 1 kg steel contains 0.5 kg ammonia at 1600 kPa both masses at 120°C. Some stops are placed so a minimum volume is 0.02 m^3, shown in Fig. P6.137. Now the whole system is cooled down to 30°C by heat transfer to the ambient at 20°C, and during the process the steel keeps same temperature as the ammonia. Find the work, the heat transfer and the total entropy generation in the process.

Energy Eq.3.5: $m(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) + m_{st}(s_2 - s_1) = {}_1Q_2/T_{amb} + {}_1S_{2\ gen}$

State 1 : $v_1 = 0.11265\ m^3/kg$, $u_1 = 1516.6\ kJ/kg$, $s_1 = 5.5018\ kJ/kg\ K$

$V_1 = mv_1 = 0.05634\ m^3$

Stop 1a: $v_{stop} = V/m = 0.02/0.5 = 0.04\ m^3/kg$, $P_{stop} = P_1 \Rightarrow T \sim 42^oC$

State 2 : $30^oC < T_{stop}$ so $v_2 = v_{stop} = 0.04\ m^3/kg$

$$x_2 = \left(\frac{v_2 - v_f}{v_{fg}}\right) = \frac{0.04 - 0.00168}{0.10881} = 0.35217$$

$u_2 = 320.46 + x_2 \times 1016.9 = 678.58\ kJ/kg$

$s_2 = 1.2005 + x_2 \times 3.7734 = 2.5294\ kJ/kg\ K$

${}_1W_2 = \int P\ dV = P_1 m\ (v_2 - v_1) = 1600 \times 0.5\ (0.004 - 0.11268) = -58.14\ kJ$

${}_1Q_2 = m\ (u_2 - u_1) + m_{st}(u_2 - u_1) + {}_1W_2$

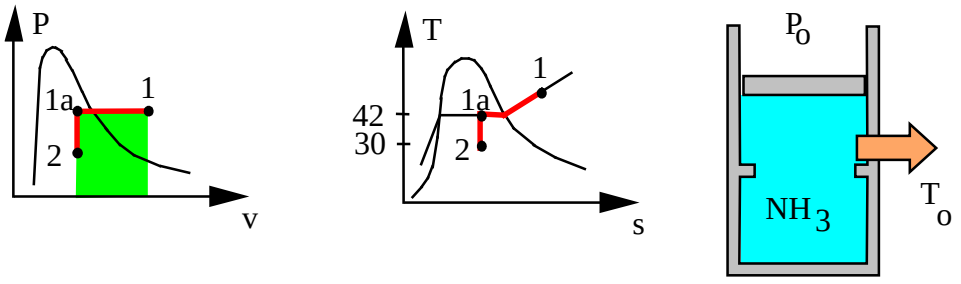
$= 0.5(\ 678.58 - 1516.6\ ) + 1 \times 0.46(30 - 120) - 58.14$

$= -419.01 - 41.4 - 58.14 = \mathbf{-518.55\ kJ}$

${}_1S_{2\ gen} = m(s_2 - s_1) + m_{st}\ (s_2 - s_1) - {}_1Q_2/T_{amb}$

$$= 0.5\ (2.5294 - 5.5018) + 1 \times 0.46 \ln \frac{273+30}{273+120} - \frac{-518.5}{293.15}$$

$= -1.4862 - 0.1196 + 1.6277 = \mathbf{0.02186\ kJ/K}$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.138

A piston/cylinder contains 0.1 kg water at 500°C, 1000 kPa. The piston has a stop at half the original volume, similar to Fig. 6.137. The water now cools to room temperature 25°C. Find the heat transfer and the entropy generation.

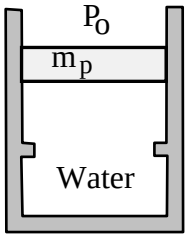
Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m(s_2 - s_1) = {}_1Q_2/T_{room} + {}_1S_{2,gen}$

Process Eq: $P = C$ if $v > v_{stop}$; $V = C$ if $P < P_{float}$

State 1: $v_1 = 0.35411\ m^3/kg$, $u_1 = 3124.34\ kJ/kg$

$s_1 = 7.7621\ kJ/kgK$



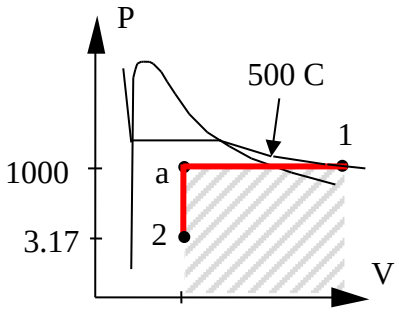
State a: $v_a = v_1/2 = 0.177055\ m^3/kg < v_{g\ 1000\ kPa}$ so $T_a = T_{sat\ 1000\ kPa} = 179.9°C$

The possible state 2 (P,V) combinations are shown. State "a" is (1000 kPa, v_a) so it is two-phase with $T_a = 180°C > T_2$

$P_2 = P_{sat\ 25\ C} = 3.169\ kPa$ and $v_2 = v_a$

$x_2 = (v_2 - v_f)/v_{fg} = (0.177 - 0.001003)/43.358$

$= 0.0040604$



$u_2 = u_f + x_2\, u_{fg} = 104.86 + x_2\ 2304.9 = 114.219\ kJ/kg$

$s_2 = s_f + x_2\, s_{fg} = 0.3673 + x_2\ 8.1905 = 0.40056\ kJ/kgK$

${}_1W_2 = m \int P\, dv = m\, P_1\, (v_2 - v_1)$ [see area below process curve in figure]

$= 0.1\ kg \times 1000\ kPa \times (0.177055 - 0.35411)\ m^3/kg = -17.706\ kJ$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.1\ kg\ (114.219 - 3124.34)\ kJ/kg - 17.706\ kJ$

$= \mathbf{-318.72\ kJ}$

${}_1S_{2,gen} = m\,(s_2 - s_1) - {}_1Q_2/T_{room}$

$= 0.1\ kg(0.40056 - 7.7621)\ kJ/kgK + 318.72\ kJ/298.15\ K$

$= -0.73615\ kJ/K + 1.06899\ kJ/K = \mathbf{0.333\ kJ/K}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.139

A hollow steel sphere with a 0.5-m inside diameter and a 2-mm thick wall contains water at 2 MPa, 250°C. The system (steel plus water) cools to the ambient temperature, 30°C. Calculate the net entropy change of the system and surroundings for this process.

C.V.: Steel + water out to ambient T_0. This is a control mass.

Energy Eq.: $U_2 - U_1 = m_{H_2O}(u_2 - u_1) + m_{steel}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $S_2 - S_1 = \int dQ/T + {}_1S_{2\ gen} = {}_1Q_2/T_0 + {}_1S_{2\ gen}$

Process: V = constant => ${}_1W_2 = 0$

$m_{steel} = (\rho V)_{steel} = 8050 \times (\pi/6)\left[(0.504)^3 - (0.5)^3\right] = 12.746$ kg

$V_{H2O} = (\pi/6)(0.5)^3$, $m_{H_2O} = V/v = 6.545\times10^{-2}/0.11144 = 0.587$ kg

$v_2 = v_1 = 0.11144 = 0.001004 + x_2 \times 32.889$ => $x_2 = 3.358\times10^{-3}$

$u_2 = 125.78 + 3.358\times10^{-3} \times 2290.8 = 133.5$ kJ/kg

$s_2 = 0.4639 + 3.358\times10^{-3} \times 8.0164 = 0.4638$ kJ/kg K

${}_1Q_2 = m_{H_2O}(u_2 - u_1) + m_{steel}(u_2 - u_1)$

$= 0.587(133.5 - 2679.6) + 12.746 \times 0.48(30 - 250)$

$= -1494.6 + (-1346) = -2840.6$ kJ

$S_2 - S_1 = m_{H_2O}(s_2 - s_1) + m_{steel}(s_2 - s_1) = 0.587(0.4638 - 6.545)$

$+ 12.746 \times 0.48 \ln (303.15 / 523.15) =$ **-6.908 kJ/K**

$\Delta S_{SURR} = -{}_1Q_2/T_0 = +2840.6/303.2 =$ **+9.370 kJ/K**

${}_1S_{2\ gen} = S_2 - S_1 - {}_1Q_2/T_0 = -6.908 + 9.370 =$ **+2.462 kJ/K**

6.140

A cylinder/piston arrangement contains 10 g ammonia at 20°C with a volume of 1 L. There are some stops so if the piston is at the stops the volume is 1.4 L. The ammonia is now heated to 200°C by a 240°C source. The piston and cylinder is made of 0.5 kg aluminum, and assume that the mass has the same temperature as the ammonia at any time. Find the total heat transfer and the total entropy generation

C.V. NH3. Control mass, goes out to source

Energy Eq.: $U_3 - U_1 = m_{NH3}(u_3 - u_1) + m_{Alu}(u_3 - u_1) = {}_1Q_3 - {}_1W_3$

Entropy Eq.: $m_{NH3}(s_3 - s_1) + m_{Alu}(s_3 - s_1) = {}_1Q_3/T_{source} + {}_1S_{3,gen}$

State 1: B.2.1 $v_1 = V/m = 0.001 / 0.01 = 0.1\ m^3/kg < v$ so 2-phase P = 857.5 kPa

$x_1 = (v - v_f)/ v_{fg} = (0.1 - 0.001638)/ 0.14758 = 0.6665$

$u_1 = u_f + x_1\, u_{fg} = 272.89 + x_1 \times 1059.3 = 978.91\ kJ/kg$

$s_1 = s_f + x_1\, s_{fg} = 1.0408 + x_1 \times 4.0452 = 3.73693\ kJ/kgK$

State 2: $v_2 = 1.4 \times v_1 = 0.14\ m^3/kg$ & P = 857.5 kPa still 2-phase so $T_2 = 20^oC$

State 3: 200^oC & $v_3 = v_2$, => P = 1600 kPa, $u_3 = 1676.5$ kJ/kg, $s_3 = 5.9734$ kJ/kgK

We get the work from the process equation (see P-V diagram)

$${}_1W_3 = {}_1W_2 = P_1 m(v_2 - v_1) = 857.5\ kPa \times 0.01\ (0.14 - 0.1)\ m^3 = 0.343\ kJ$$

The energy equation and the entropy equation give heat transfer and entropy generation

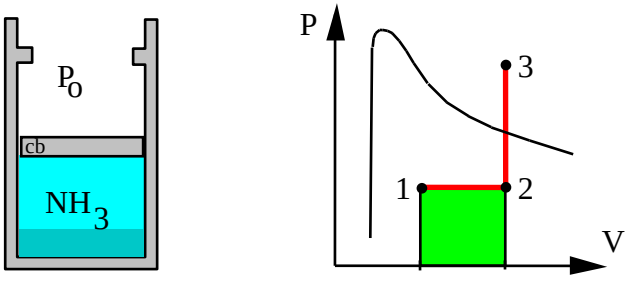
$${}_1Q_3 = m_{NH3}(u_3 - u_1) + m_{Alu}(u_3 - u_1) + {}_1W_3$$

$$= 0.01\ (1676.5 - 978.91) + 0.5 \times 0.9\ (200 - 20) + 0.343 = \mathbf{88.32\ kJ}$$

$${}_1S_{3,gen} = m_{NH3}(s_3 - s_1) + m_{Alu}(s_3 - s_1) - {}_1Q_3/T_{source}$$

$$= 0.01\ (5.9734 - 3.73693) + 0.5 \times 0.9 \ln\left(\frac{473.15}{293.15}\right) - \frac{88.32}{513.15}$$

$$= 0.02236 + 0.21543 - 0.1721 = \mathbf{0.0657\ kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.141

A cylinder/piston arrangement contains 0.1 kg R-410A of quality x = 0.2534 and at –20°C. Stops are mounted so $V_{stop} = 3V_1$, similar to Fig. P6.140. The system is now heated to the final temperature of 20°C by a 50°C source. Find the total entropy generation.

C.V. The R-410A mass out to source.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $S_2 - S_1 = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{source} + {}_1S_{2\,gen}$

Process: $P = \text{Constant}$ if $V < V_{stop}$; $V = V_{stop}$ if $P > P_1$

State 1: $u_1 = 27.92 + x_1\, 218.07 = 83.18$ kJ/kg, $P_1 = P_{sat} = 399.6$ kPa

$v_1 = 0.000803 + x_1\, 0.064 = 0.01702$ m^3/kg

$s_1 = 0.1154 + x_1\, 0.9625 = 0.2439$ kJ/kgK

State 1a: $v_{stop} = 3\, v_1 = 0.05106$ m^3/kg $< v_g$ at P_1

State 2: at 20°C > T_1 : $v_{stop} > v_g = 0.01758$ m^3/kg so superheated vapor.

Table B.4.2: $P_2 = 600$ kPa, $u_2 = 273.56$ kJ/kg, $s_2 = 1.1543$ kJ/kgK

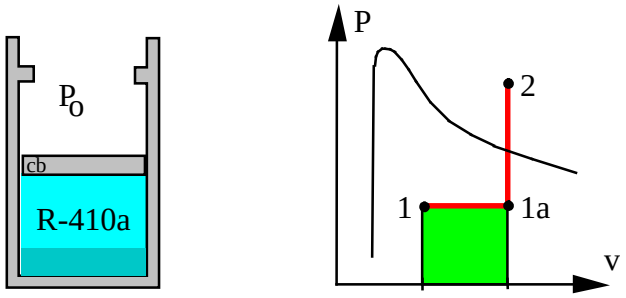
${}_1W_2 = \int PdV = P_1\, m(v_2 - v_1) = 399.6 \times 0.1\, (0.051 - 0.017) = 1.36$ kJ

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.1(273.56 - 83.18) + 1.36 = 20.398$ kJ

${}_1S_{2,gen} = m\,(s_2 - s_1) - {}_1Q_2/T_{source}$

$= 0.1\,(1.1543 - 0.2439) - \dfrac{20.398}{323.15} = \mathbf{0.0279\ kJ/K}$

See the work term from the process in the P-v diagram

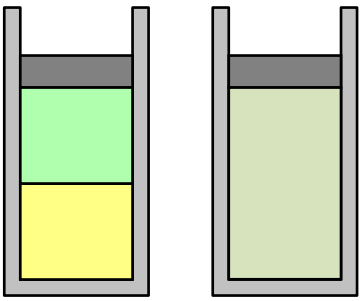


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.142

One kg of air at 300 K is mixed with 2 kg air at 400 K in a process at a constant 100 kPa and Q = 0. Find the final T and the entropy generation in the process.

C.V. All the air.



Energy Eq.: $U_2 - U_1 = 0 - W$

Entropy Eq.: $S_2 - S_1 = 0 + {}_1S_{2\ gen}$

Process Eq.: $P = C; \quad W = P(V_2 - V_1)$

Substitute W into energy Eq.

$$U_2 - U_1 + W = U_2 - U_1 + P(V_2 - V_1) = H_2 - H_1 = 0$$

Due to the low T let us use constant specific heat

$$H_2 - H_1 = m_A(h_2 - h_1)_A + m_B(h_2 - h_1)_B$$
$$= m_A C_p(T_2 - T_{A1}) + m_B C_p(T_2 - T_{B1}) = 0$$

$$T_2 = \frac{m_A T_{A1} + m_B T_{B1}}{m_A + m_B} = \frac{1}{3} T_{A1} + \frac{2}{3} T_{B1} = \mathbf{366.67\ K}$$

Entropy change is from Eq. 6.16 with no change in P

$${}_1S_{2\ gen} = S_2 - S_1 = m_A C_p \ln \frac{T_2}{T_{A1}} + m_B C_p \ln \frac{T_2}{T_{B1}}$$
$$= 1 \times 1.004 \ln \frac{366.67}{300} + 2 \times 1.004 \ln \frac{366.67}{400}$$
$$= 0.20148 - 0.17470 = \mathbf{0.0268\ kJ/K}$$

Remark: If you check, the volume does not change and there is no work.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.143

Air in a rigid tank is at 900 K, 500 kPa and it now cools to the ambient temperature of 300 K by heat loss to the ambient. Find the entropy generation.

C.V. Air out to ambient. No size given so do it per unit mass.

Energy Eq.3.5: $u_2 - u_1 = C_v (T_2 - T_1) = {}_1q_2 - {}_1w_2$

Entropy Eq.6.37: $s_2 - s_1 = {}_1q_2/T_{amb} + {}_1s_{2\ gen\ tot}$

Process: V = constant => $v_2 = v_1$ also ${}_1W_2 = 0$

Ideal gas: $P_2 = P_1\ T_2 / T_1 = 500 \times 300/900 = 166.67$ kPa

From Table A.7: $u_1 = 674.82$ kJ/kg; $s_{T1} = 8.01581$ kJ/kg-K;

$u_2 = 214.36$ kJ/kg; $s_{T2} = 6.86926$ kJ/kg-K

${}_1q_2 = u_2 - u_1 = 214.36 - 674.82 = -460.46$ kJ/kg

$${}_1s_{2\ gen\ tot} = s_2 - s_1 - \frac{{}_1q_2}{T_{amb}} = s_{T2} - s_{T1} - R \ln\left(\frac{P_2}{P_1}\right) - \frac{{}_1q_2}{T_{amb}}$$

$$= 6.86926 - 8.01581 - 0.287 \ln\left(\frac{166.67}{500}\right) - \frac{-460.46}{300}$$

$$= \mathbf{0.661\ kJ/kg\text{-}K}$$

We could also have used constant specific heat being slightly less accurate.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.144

Two rigid insulated tanks are connected with a pipe and valve. One tank has 0.5 kg air at 200 kPa, 300 K and the other has 0.75 kg air at 100 kPa, 400 K. The valve is opened and the air comes to a single uniform state without external heat transfer. Find the final *T* and *P* and the entropy generation.

Solution:

C.V. Total tank. Control mass of constant volume.

Mass and volume: $m_2 = m_A + m_B$; $V = V_A + V_B$

Energy Eq.: $U_2 - U_1 = m_2 u_2 - m_A u_{A1} - m_B u_{B1} = {}_1Q_2 - {}_1W_2 = 0$

Entropy Eq.: $S_2 - S_1 = m_2 s_2 - m_A s_{A1} - m_B s_{B1} = {}_1Q_2/T + {}_1S_{2\,gen}$

Process Eq.: V = constant $\Rightarrow {}_1W_2 = 0$; Insulated $\Rightarrow {}_1Q_2 = 0$

Ideal gas at A1: $V_A = m_A RT_{A1}/P_{A1} = 0.5 \times 0.287 \times 300 / 200 = 0.2153\ m^3$

Ideal gas at B1: $V_B = m_B RT_{B1}/ P_{B1} = 0.75 \times 0.287 \times 400 / 100 = 0.861\ m^3$

State 2: $m_2 = m_A + m_B = 1.25$ kg; $V_2 = V_A + V_B = 1.0763\ m^3$

Energy Eq.: $u_2 = \dfrac{m_A u_{A1} + m_B u_{B1}}{m_2}$ and use constant specific heat

$$T_2 = \frac{m_A}{m_2} T_{A1} + \frac{m_B}{m_2} T_{B1} = \frac{0.5}{1.25} 300 + \frac{0.75}{1.25} 400 = \mathbf{360\ K}$$

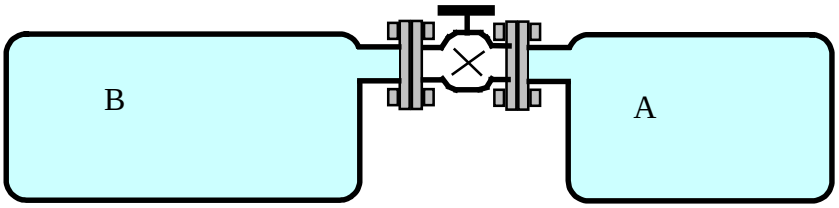
$$P_2 = m_2 RT_2/V = 1.25\ \text{kg} \times 0.287\ \text{kJ/kgK} \times 360\ \text{K} / 1.0763\ m^3 = \mathbf{120\ kPa}$$

$$S_2 - S_1 = m_A[C_P \ln T_2/T_{A1} - R\ln(P_2/P_{A1})] + m_B[C_P \ln T_2/T_{B1} - R\ln(P_2/P_{B1})]$$

$$= 0.5[\ 1.004 \ln\frac{360}{300} - 0.287 \ln\frac{120}{200}\ ] + 0.75[1.004 \ln\frac{360}{400} - 0.287 \ln\frac{120}{100}]$$

$$= 0.5 \times 1.3514 + 0.75 \times (-0.1581) = 0.5571\ \text{kJ/K}$$

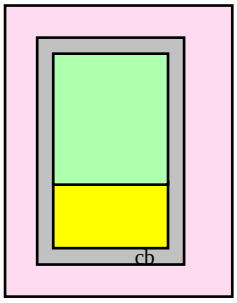
$${}_1S_{2\,gen} = S_2 - S_1 = \mathbf{0.5571\ kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.145

One kg of air at 100 kPa is mixed with 2 kg air at 200 kPa, both at 300 K, in a rigid insulated tank. Find the final state (P, T) and the entropy generation in the process.



C.V. All the air.

Energy Eq.: $U_2 - U_1 = Q - W$

Entropy Eq.: $S_2 - S_1 = Q/T + {}_1S_{2\ gen}$

Process Eqs.: $V = C$; $W = 0$, $Q = 0$

States A1, B1: $u_{A1} = u_{B1}$

$V_A = m_A RT_1/P_{A1}$; $V_B = m_B RT_1/P_{B1}$

$U_2 - U_1 = m_2u_2 - m_Au_{A1} - m_Bu_{B1} = 0 \Rightarrow u_2 = (u_{A1} + 2u_{B1})/3 = u_{A1}$

State 2: $\mathbf{T_2 = T_1 = 300\ K}$ (from u_2); $m_2 = m_A + m_B = 3$ kg;

$V_2 = m_2RT_1/P_2 = V_A + V_B = m_ART_1/P_{A1} + m_BRT_1/P_{B1}$

Divide with m_ART_1 and get

$$3/P_2 = 1/P_{A1} + 2/P_{B1} = \frac{1}{100} + \frac{2}{200} = 0.02\ \text{kPa}^{-1} \quad \Rightarrow \quad P_2 = \mathbf{150\ kPa}$$

Entropy change from Eq. 6.16 with the same T, so only P changes

$${}_1S_{2\ gen} = S_2 - S_1 = -m_AR \ln \frac{P_2}{P_{A1}} - m_BR \ln \frac{P_2}{P_{B1}}$$

$$= -0.287\ [1 \times \ln \frac{150}{100} + 2 \times \ln \frac{150}{200}\ ]$$

$$= -0.287\ (0.4055 - 0.5754) = \mathbf{0.049\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.146

A rigid storage tank of 1.5 m^3 contains 1 kg argon at 30°C. Heat is then transferred to the argon from a furnace operating at 1300°C until the specific entropy of the argon has increased by 0.343 kJ/kg K. Find the total heat transfer and the entropy generated in the process.

Solution:

C.V. Argon out to 1300°C. Control mass. , m = 1 kg

Argon is an ideal gas with constant heat capacity.

Energy Eq.3.5: $m (u_2 - u_1) = m C_v (T_2 - T_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = {}_1Q_2/T_{res} + {}_1S_{2\ gen\ tot}$

Process: V = constant => $v_2 = v_1$ also ${}_1W_2 = 0$

Properties: Table A.5 R = 0.20813, C_v = 0.312 kJ/kg K

State 1: (T_1, v_1= V/m) $P_1 = mRT_1/V$ = 42.063 kPa

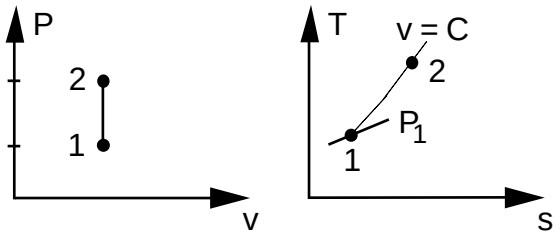
State 2: $s_2 = s_1 + 0.343$, and change in s from Eq.6.16 or Eq.6.17

$$s_2 - s_1 = C_p \ln (T_2 / T_1) - R \ln (T_2 / T_1) = C_v \ln (T_2 / T_1)$$

$$T_2 / T_1 = \exp[\frac{s_2 - s_1}{C_v}] = \exp[\frac{0.343}{0.312}] = \exp(1.09936) = 3.0$$

$$Pv = RT \quad => \quad (P_2 / P_1)(v_2 / v_1) = T_2 / T_1 = P_2 / P_1$$

$$T_2 = 3.0 \times T_1 = 909.45\ K, \quad P_2 = 3.0 \times P_1 = 126.189\ kPa$$



Heat transfer from energy equation

${}_1Q_2 = 1 \times 0.312\ (909.45 - 303.15) =$ **189.2 kJ**

Entropy generation from entropy equation

${}_1S_{2\ gen\ tot} = m(s_2 - s_1) - {}_1Q_2/T_{res}$

$= 1 \times 0.343 - 189.2 / (1300 + 273) =$ **0.223 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.147

Argon in a light bulb is at 110 kPa, 90^{o}C. The light is turned off so the argon cools to the ambient 20^{o}C. Disregard the glass and any other mass and find the specific entropy generation.

Solution:

C.V. Argon gas. Neglect any heat transfer.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2$

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\ gen} = {}_1q_2/T_{room} + {}_1s_{2\ gen}$

Process: v = constant and ideal gas => $P_2/P_1 = T_2/T_1$

${}_1q_2 = u_2 - u_1 = C_v\,(T_2 - T_1) = 0.312\ (20 - 90) = -21.84$ kJ/kg

Evaluate changes in s from Eq.6.16 or 8.17

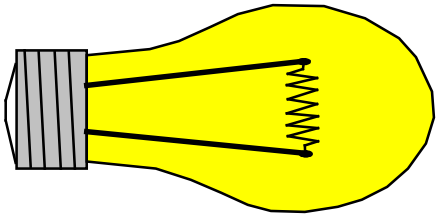
$s_2 - s_1 = C_p \ln (T_2/T_1) - R \ln (P_2/P_1)$ Eq.6.16

$= C_p \ln (T_2/T_1) - R \ln (T_2/T_1) = C_v \ln(T_2/T_1)$ Eq.6.17

$= 0.312 \ln [\ (20 + 273)/(90 + 273)\ ] = -0.06684$ kJ/kg K

${}_1s_{2\ gen} = s_2 - s_1 - {}_1q_2/T_{room} = -0.06684 + 21.84 / 293.15$

= **0.00766 kJ/kgK**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.148

A rigid tank contains 2 kg of air at 200 kPa and ambient temperature, 20°C. An electric current now passes through a resistor inside the tank. After a total of 100 kJ of electrical work has crossed the boundary, the air temperature inside is 80°C. Is this possible?

Solution:

C.V.: Air in tank out to ambient;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$, ${}_1W_2 = -100$ kJ

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{amb} + {}_1S_{2\,gen}$

Process: Constant volume and mass so $v_2 = v_1$

State 1: $T_1 = 20^oC$, $P_1 = 200$ kPa, $m_1 = 2$ kg

State 2: $T_2 = 80^oC$, $v_2 = v_1$

Ideal gas, Table A.5: $R = 0.287$ kJ/kg-K, $C_v = 0.717$ kJ/kg-K

Assume constant specific heat then energy equation gives

$${}_1Q_2 = mC_v(T_2 - T_1) + {}_1W_2 = 2 \times 0.717(80 - 20) - 100 = -14.0 \text{ kJ}$$

Change in s from Eq.6.17 (since second term drops out)

$$s_2 - s_1 = C_v \ln (T_2/T_1) + R\ln \frac{v_2}{v_1} \; ; \quad v_2 = v_1, \quad \ln \frac{v_2}{v_1} = 0$$

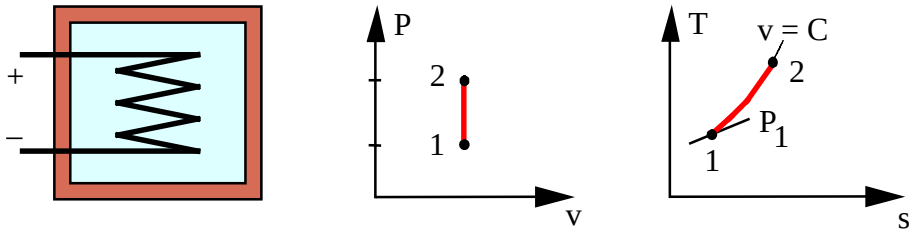
$$s_2 - s_1 = C_v \ln (T_2/T_1) = 0.1336 \text{ kJ/kg-K}$$

Now Eq.6.37

$${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T_{amb} = 2 \times 0.1336 + \frac{14}{293} = 0.315 \text{ kJ/K} \geq 0,$$

Process is Possible

Note: $P_2 = P_1 \dfrac{T_2}{T_1}$ in Eq.6.16 $s_2 - s_1 = C_p \ln \dfrac{T_2}{T_1} - R \ln \dfrac{P_2}{P_1}$, results in the same answer as Eq.6.17.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.149

A piston/cylinder system contains 50 L of air at 300°C, 100 kPa, with the piston initially on a set of stops. A total external constant force acts on the piston so a balancing pressure inside should be 200 kPa. The cylinder is made of 2 kg of steel initially at 1300°C. The system is insulated so that heat transfer occurs only between the steel cylinder and the air. The system comes to equilibrium. Find the final temperature, and the entropy generation.

C.V.: Steel + water out to ambient T_0. This is a control mass.

Energy Eq.: $U_2 - U_1 = m_{air}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $S_2 - S_1 = m_{air}(s_2 - s_1) + m_{st}(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = {}_1S_{2\ gen}$

Process: ${}_1Q_2 = 0$ and must be on P-V diagram shown

$$m_{air} = P_1V_1 / RT_1 = 100 \times 0.05 /(0.287 \times 573.15) = 0.0304 \text{ kg}$$

Since $V_{1a} = V_1$ then $T_{1a} = T_1(P_{float}/P_1) = 573.15 \times 200/100 = 1146.3$ K

Use constant C_v for air at 900 K: $C_v = \Delta u/\Delta T = 0.833$ kJ/kgK (from A.7)

To reach state 1a: $\Delta U_{air} = mC_v\Delta T = 0.0304 \times 0.833 \times (1146 - 573) = 14.5$ kJ

$$\Delta U_{st} = mC_v\Delta T = 2 \times 0.46 \times (1146 - 1573) = -392.8 \text{ kJ}$$

Conclusion from this is: T_2 is higher than $T_{1a} = 1146$ K, piston lifts, $P_2 = P_{float}$

Write the work as ${}_1W_2 = P_2 (V_2 - V_1)$ and use constant C_v in the energy Eq. as

$$m_{air}\, C_v\, (T_2 - T_1) + m_{st}\, C_{st}\, (T_2 - T_1) = - P_2 m_{air} v_2 + P_2\, V_1$$

now $P_2\, v_2 = RT_2$ for the air, so isolate T_2 terms as

$$[m_{air}\, (C_v + R) + mC_{st}\,]\, T_2 = m_{air}\, C_v T_{1\ air} + mC_{st}\, T_{1\ st} + P_2V_1$$

$$[0.0304 \times 1.12 + 2 \times 0.46]\, T_2 = 0.0304 \times 0.833 \times 573.15 + 2 \times 0.46 \times 1573.15 + 200 \times 0.05$$

Solution gives: $T_2 =$ **1542.7 K**

$${}_1S_{2\ gen} = S_2 - S_1 = m_{air}(s_2 - s_1) + m_{st}(s_2 - s_1)$$

$$= m_{air}\, [C_P \ln(T_2/T_{1\ air}) - R \ln(P_2/P_1)] + m_{st}\, C_{st} \ln(T_2/T_{1\ st})$$

$$= 0.0304[1.12 \ln \frac{1542.7}{573.15} - 0.287 \ln \frac{200}{100}\,] + 2 \times 0.46 \ln (\frac{1542.7}{1573.15})$$

$$= 0.027665 - 0.017982 = \textbf{0.0097 kJ/K}$$

6.150

A spring loaded piston cylinder contains 1.5 kg air at 27°C and 160 kPa. It is now heated in a process where pressure is linear in volume, P = A + BV, to twice the initial volume where it reaches 900 K. Find the work, the heat transfer and the total entropy generation assuming a source at 900 K.

Solution:

C.V. Air out to the 900 K source. Since air T is lower than the source temperature we know that this is an irreversible process.

Continuity Eq.: $m_2 = m_1 = m$,

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{source} + {}_1S_{2\,gen}$

Process: $P = A + BV$

State 1: (T_1, P_1) Table A.7 $u_1 = 214.36$ kJ/kg

$V_1 = mRT_1/P_1 = (1.5 \times 0.287 \times 300)$ kJ / 160 kPa = 0.8072 m^3

State 2: $(T_2, v_2 = 2\,v_1)$ Table A.7 $u_2 = 674.824$ kJ/kg

$P_2 = RT_2/v_2 = RT_2/2v_1 = T_2\,P_1/2T_1 = P_1\,T_2/2\,T_1$

$= 160$ kPa $\times$ 900 K/ (2 $\times$ 300 K) = 240 kPa

From the process equation we can express the work as

${}_1W_2 = \int PdV = 0.5 \times (P_1 + P_2)(V_2 - V_1) = 0.5 \times (P_1 + P_2)\,V_1$

$= 0.5 \times (160 + 240)$ kPa $\times$ 0.8072 m^3 = **161.4 kJ**

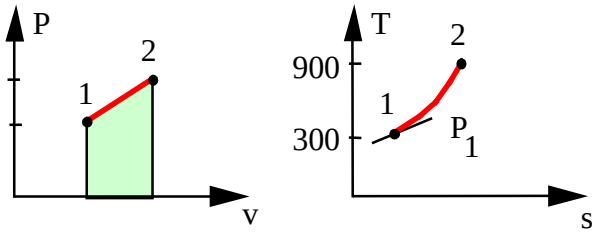
${}_1Q_2 = 1.5 \times (674.824 - 214.36) + 161.4 =$ **852.1 kJ**

Change in s from Eq.6.19 and Table A.7 values

$${}_1S_{2\,gen} = m(s^o_{T2} - s^o_{T1} - R \ln \frac{P_2}{P_1}) - {}_1Q_2/T_{SOURCE}$$

$$= 1.5 \times [8.0158 - 6.8693 - 0.287 \ln (\frac{240}{160})] - (\frac{852.1}{900})$$

$$= 1.545 - 0.947 = \textbf{0.598 kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.151

A rigid container with volume 200 L is divided into two equal volumes by a partition, shown in Fig. P6.151. Both sides contain nitrogen, one side is at 2 MPa, 200°C, and the other at 200 kPa, 100°C. The partition ruptures, and the nitrogen comes to a uniform state at 70°C. Assume the temperature of the surroundings is 20°C, determine the work done and the net entropy change for the process.

Solution:

C.V. : A + B no change in volume. $\quad {}_1\mathbf{W_2} = \mathbf{0}$

$m_{A1} = P_{A1}V_{A1}/RT_{A1} = (2000 \times 0.1)/(0.2968 \times 473.2) = 1.424$ kg

$m_{B1} = P_{B1}V_{B1}/RT_{B1} = (200 \times 0.1)/(0.2968 \times 373.2) = 0.1806$ kg

$P_2 = m_{TOT}RT_2/V_{TOT} = (1.6046 \times 0.2968 \times 343.2)/0.2 = 817$ kPa

From Eq.6.16

$$S_2 - S_1 = m_{A1}\,(s_2 - s_1)_{A1} + m_{B1}\,(s_2 - s_1)_{B1}$$

$$= 1.424 \text{ kg} \left[1.042 \ln\frac{343.2}{473.2} - 0.2968 \ln\frac{817}{2000}\right] \text{kJ/kgK}$$

$$+ 0.1806 \text{ kg} \left[1.042 \ln\frac{343.2}{373.2} - 0.2968 \ln\frac{817}{200}\right] \text{kJ/kgK} = -0.1894 \text{ kJ/K}$$

$${}_1Q_2 = U_2 - U_1 = 1.424 \times 0.745(70 - 200) + 0.1806 \times 0.745(70 - 100)$$

$$= -141.95 \text{ kJ}$$

From Eq.6.37

$${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_0 = -0.1894 \text{ kJ/K} + 141.95 \text{ kJ} /293.2 \text{ K}$$

$$= -0.1894 + 0.4841 = \mathbf{+0.2947\ kJ/K}$$

6.152

A constant pressure piston/cylinder contains 0.5 kg air at 300 K, 400 kPa. Assume the piston/cylinder has a total mass of 1 kg steel and is at the same temperature as the air at any time. The system is now heated to 1600 K by heat transfer from a 1700 K source. Find the entropy generation using constant specific heat for air.

C.V. Air and Steel.

Energy Eq.: $U_2 - U_1 = m_{air}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m_{air}\,(s_2 - s_1) + m_{st}(s_2 - s_1) = {}_1Q_2/T_{source} + {}_1S_{2\,gen}$

Process: $P = C \Rightarrow {}_1W_2 = \int_1^2 PdV = P\,(V_2 - V_1) = P\,m_{air}\,(v_2 - v_1)$

${}_1Q_2 = m_{air}(u_2 - u_1)_{air} + m_{st}(u_2 - u_1)_{st} + {}_1W_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$

Use A.3: $(u_2 - u_1)_{st} = C\,(T_2 - T) = 0.46\ \text{kJ/kgK} \times (1600 - 300)\ \text{K} = 598\ \text{kJ/kg}$

Use A.5: $(h_2 - h_1)_{air} = C_p(T_2 - T_1) = 1.004\ \text{kJ/kgK} \times (1600 - 300)\ \text{K} = 1305.2\ \text{kJ/kg}$

$${}_1Q_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$$
$$= 0.5\ \text{kg} \times 1305\ \text{kJ/kg} + 1\ \text{kg} \times 598\ \text{kJ/kg} = 1250.6\ \text{kJ}$$

$$S_2 - S_1 = m_{air}\,(s_2 - s_1) + m_{st}(s_2 - s_1)$$
$$= 0.5\ \text{kg} \times 1.004\ \text{kJ/kgK} \times \ln\frac{1600}{300} + 1\ \text{kg} \times 0.46\ \text{kJ/kgK} \times \ln\frac{1600}{300}$$
$$= 1.6104\ \text{kJ/K}$$
$${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_{source} = 1.6104 - 1250.6/1700 = \mathbf{0.875\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.153

Do Problem 6.152 using Table A.7.

C.V. Air and Steel.

Energy Eq.: $U_2 - U_1 = m_{air}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m_{air}\,(s_2 - s_1) + m_{st}(s_2 - s_1) = {}_1Q_2/T_{source} + {}_1S_{2\,gen}$

Process: $P = C \Rightarrow {}_1W_2 = \int_1^2 PdV = P\,(V_2 - V_1) = P\,m_{air}\,(v_2 - v_1)$

${}_1Q_2 = m_{air}(u_2 - u_1)_{air} + m_{st}(u_2 - u_1)_{st} + {}_1W_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$

Use air tables A.7: $(h_2 - h_1)_{air} = 1757.33 - 300.47 = 1456.86$ kJ/kg

$(s_2 - s_1)_{air} = 8.69051 - 6.86926 + 0 = 1.82125$ kJ/kgK

No pressure correction as $P_2 = P_1$

Use A.3: $(u_2 - u_1)_{st} = C(T_2 - T_1) = 0.46$ kJ/kgK $\times (1600 - 300)$ K $= 598$ kJ/kg

${}_1Q_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$

$= 0.5$ kg $\times$ 1456.86 kJ/kg + 1 kg $\times$ 598 kJ/kg = **1326.43 kJ**

$S_2 - S_1 = m_{air}\,(s_2 - s_1) + m_{st}(s_2 - s_1)$

$= 1.82125 + 1$ kg $\times$ 0.46 kJ/kgK $\times \ln \dfrac{1600}{300} = 2.59128$ kJ/K

${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_{source} = 2.59128 - 1326.43/1700 =$ **1.811 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.154

Nitrogen at 200°C, 300 kPa is in a piston cylinder, volume 5 L, with the piston locked with a pin. The forces on the piston require a pressure inside of 200 kPa to balance it without the pin. The pin is removed and the piston quickly comes to its equilibrium position without any heat transfer. Find the final P, T and V and the entropy generation due to this partly unrestrained expansion.

Solution:

C.V. Nitrogen gas.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = -\int P_{eq}\, dV = -P_2 (V_2 - V_1)$

Entropy Eq.6.37: $m(s_2 - s_1) = 0 + {}_1S_{2\,gen}$

Process: ${}_1Q_2 = 0$ (already used), $P = P_{eq}$ after pin is out.

State 1: 200 °C, 300 kPa State 2: $P_2 = P_{eq} =$ **200 kPa**

$$m = P_1V_1/RT_1 = 300 \times 0.005 / 0.2968 \times 473.15 = 0.01068 \text{ kg}$$

The energy equation becomes

$$mu_2 + P_2V_2 = mu_1 + P_2V_1 = mh_2 \Rightarrow$$

$$h_2 = u_1 + P_2V_1/m = u_1 + P_2V_1\, RT_1 /P_1V_1 = u_1 + (P_2/P_1)\, RT_1$$

Solve using constant C_p, C_v

$$C_p\, T_2 = C_v\, T_1 + (P_2/P_1)\, RT_1$$

$$T_2 = T_1\, [C_v + (P_2/P_1)\, R] / C_p$$

$$= 473.15\, [0.745 + (200 / 300) \times 0.2368] / 1.042$$

$$= \mathbf{428.13\ K}$$

$$V_2 = V_1(T_2 / T_1) \times (P_1/P_2) = 0.005 \times \frac{428.13}{473.15} \times \frac{300}{200}$$

$$= 0.00679\ m^3$$

${}_1S_{2\,gen} = m(s_2 - s_1) \cong m[C_p \ln (T_2/T_1) - R \ln (P_2/ P_1)]$

$$= P_1V_1 /RT_1\, [C_p \ln (T_2/T_1) - R \ln (P_2/ P_1)]$$

$$= 0.01068\, [1.042 \times \ln (428.13/473.15) - 0.2968 \times \ln (200 / 300)]$$

$$= \mathbf{0.000173\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.155

The air in the tank of Problem 6.88 receives the heat transfer from a reservoir at 450 K. Find the entropy generation due to the process from 1 to 3.

C.V. Air out to reservoir.

Energy eq.: $m(u_3 - u_1) = {}_1Q_3 - {}_1W_3$

Entropy eq.: $m(s_3 - s_1) = {}_1Q_3 / T_{res} + {}_1S_{3\,gen}$

State 1: $m = P_1V_1 / RT_1 = \dfrac{100 \times 0.75}{0.287 \times 300} \dfrac{\text{kPa m}^3}{\text{kJ/kg}} = 0.871$ kg

Process 1 to 2: Constant volume heating, $dV = 0 \Rightarrow {}_1W_2 = 0$

$P_2 = P_1 T_2 / T_1 = 100 \times 400 / 300 = 133.3$ kPa

Process 2 to 3: Isothermal expansion, $dT = 0 \Rightarrow u_3 = u_2$ and

$P_3 = P_2 V_2 / V_3 = 133.3 \times 0.75 / 1.5 = 66.67$ kPa

$${}_2W_3 = \int_2^3 P\, dV = P_2V_2 \ln\left(\frac{V_3}{V_2}\right) = 133.3 \times 0.75 \ln(2) = 69.3 \text{ kJ}$$

The overall process:

${}_1W_3 = {}_1W_2 + {}_2W_3 = {}_2W_3 = 69.3$ kJ

From the energy equation

$${}_1Q_3 = m(u_3 - u_1) + {}_1W_3 = m\, C_v\, (T_3 - T_1) + {}_1W_3$$
$$= 0.871 \times 0.717\, (400 - 300) + 69.3 = 131.8 \text{ kJ}$$

$${}_1S_{3\,gen} = m(s_3 - s_1) - {}_1Q_3 / T_{res}$$
$$= m\left(C_P \ln\frac{T_3}{T_1} - R \ln\frac{P_3}{P_1}\right) - {}_1Q_3 / T_{res}$$
$$= 0.871\left[\, 1.004 \ln\frac{400}{300} - 0.287 \ln\frac{66.67}{100}\,\right] - \frac{131.8}{450}$$
$$= \mathbf{0.060\ kJ/K}$$

6.159

A cylinder/piston contains carbon dioxide at 1 MPa, 300°C with a volume of 200 L. The total external force acting on the piston is proportional to V^3. This system is allowed to cool to room temperature, 20°C. What is the total entropy generation for the process?

Solution:

C.V. Carbon dioxide gas of constant mass $m_2 = m_1 = m$ out to ambient.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = {}_1Q_2/T_{amb} + {}_1S_{2\ gen}$

Process: $P = CV^3$ or $PV^{-3} = \text{constant}$, which is polytropic with $n = -3$

State 1: (T, P) => $m = P_1V_1/RT_1 = \dfrac{1000 \times 0.2}{0.18892 \times 573.2} = 1.847$ kg

State 2: (T, ?) state must be on process curve and ideal gas leads to Eq.6.28

$$\Rightarrow \quad P_2 = P_1(T_2/T_1)^{\frac{n}{n-1}} = 1000(293.2/573.2)^{3/4} = 604.8 \text{ kPa}$$

$$V_2 = V_1(T_1/T_2)^{\frac{1}{n-1}} = 0.16914 \text{ m}^3$$

$${}_1W_2 = \int PdV = (P_2V_2 - P_1V_1)/(1-n)$$

$$= [604.8 \times 0.16914 - 1000 \times 0.2] / [1 - (-3)] = -24.4 \text{ kJ}$$

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2$$

$$= 1.847 \times 0.653\ (20 - 300) - 24.4 = -362.1 \text{ kJ}$$

From Eq.6.16

$$m(s_2 - s_1) = 1.847\left[0.842 \ln\frac{293.2}{573.2} - 0.18892 \ln\frac{604.8}{1000}\right]$$

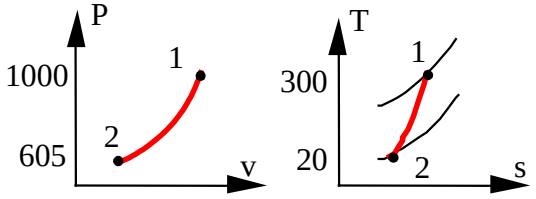
$$= 1.847[-0.4694] = -0.87 \text{ kJ/K}$$

$$\Delta S_{SURR} = -{}_1Q_2/T_{amb} = +362.1 / 293.2 = +1.235 \text{ kJ/K}$$

From Eq.6.37 or 8.39

$${}_1S_{2\ gen} = m(s_2 - s_1) - {}_1Q_2/T_{amb} = \Delta S_{NET} = \Delta S_{CO2} + \Delta S_{SURR}$$

$$= -0.87 + 1.235 = \mathbf{+0.365\ kJ/K}$$



Notice:
$n = -3$, $k = 1.3$

$n < k$

6.160

The air in the engine cylinder of Problem 3.156 looses the heat to the engine coolant at 100°C. Find the entropy generation (external to the air) using constant specific heat.

Take CV as the air. $m_2 = m_1 = m$;

Energy Eq.3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{amb} + {}_1S_{2\,gen}$

Process Eq.: $Pv^n = \text{Constant}$ (polytropic)

From the ideal gas law and the process equation we can get:

State 2: $P_2 = P_1 \left(v_2 / v_1\right)^{-n} = 4000 \times 10^{-1.5} = 126.5$ kPa

$$T_2 = T_1 \ (P_2v_2 / P_1v_1) = (1527 + 273)\frac{126.5 \times 10}{4000} = 569.3 \text{ K}$$

From process eq.: ${}_1W_2 = \int P\,dV = \frac{m}{1-n}(P_2v_2 - P_1v_1) = \frac{mR}{1-n}(T_2 - T_1)$

$$= \frac{0.1 \times 0.287}{1 - 1.5}(569.3 - 1800) = 70.64 \text{ kJ}$$

From energy eq.: ${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = mC_v(T_2 - T_1) + {}_1W_2$

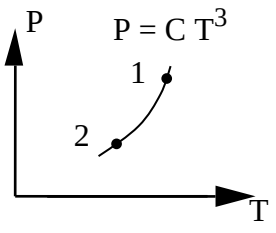
$$= 0.1 \times 0.717(569.3 - 1800) + 70.64 = -17.6 \text{ kJ}$$

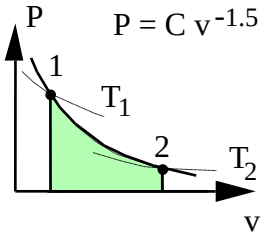
$m(s_2 - s_1) = m\,[C_P \ln(T_2/T_1) - R \ln(P_2/P_1)]$

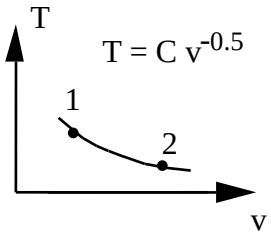
$$= 0.1\,[\,1.004 \ln\frac{569.3}{1800} - 0.287 \ln\frac{126.5}{4000}\,] = -0.01645 \text{ kJ/K}$$

${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T_{amb}$

$= -0.011645 + 17.6/373.15 =$ **0.0307 kJ/K**







Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.161

A cylinder/piston contains 100 L of air at 110 kPa, 25°C. The air is compressed in a reversible polytropic process to a final state of 800 kPa, 500 K. Assume the heat transfer is with the ambient at 25°C and determine the polytropic exponent *n* and the final volume of the air. Find the work done by the air, the heat transfer and the total entropy generation for the process.

Solution:

C.V. Air of constant mass $m_2 = m_1 = m$ out to ambient.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_0 + {}_1S_{2\,gen}$

Process: $Pv_1^{\,n} = P_2v_2^{\,n}$ Eq.6.27

State 1: (T_1, P_1) State 2: (T_2, P_2)

Thus the unknown is the exponent n.

$$m = P_1V_1/(RT_1) = 110 \times 0.1/(0.287 \times 298.15) = 0.1286 \text{ kg}$$

The relation from the process and ideal gas is in Eq.6.28

$$T_2/T_1 = (P_2/P_1)^{\frac{n-1}{n}} \quad \Rightarrow \quad \frac{500}{298.15} = \left(\frac{800}{110}\right)^{\frac{n-1}{n}} \quad \Rightarrow \quad \frac{n-1}{n} = 0.260573$$

$$\mathbf{n = 1.3524,} \quad V_2 = V_1(P_1/P_2)^{\frac{1}{n}} = 0.1\left(\frac{110}{800}\right)^{0.73943} = \mathbf{0.02306\ m^3}$$

The work is from Eq.6.29

$${}_1W_2 = \int PdV = \frac{P_2V_2 - P_1V_1}{1 - n} = \frac{800 \times 0.02306 - 110 \times 0.1}{1 - 1.3524} = \mathbf{-21.135\ kJ}$$

Heat transfer from the energy equation

$${}_1Q_2 = mC_v(T_2 - T_1) + {}_1W_2$$

$$= 0.1286 \times 0.717 \times (500 - 298.15) - 21.135 = \mathbf{-2.523\ kJ}$$

Entropy change from Eq.6.16

$$s_2 - s_1 = C_{p0}\ln(T_2/T_1) - R\ln(P_2/P_1)$$

$$= 1.004 \ln\left(\frac{500}{298.15}\right) - 0.287 \ln\left(\frac{800}{110}\right) = -0.0504 \frac{\text{kJ}}{\text{kg K}}$$

From the entropy equation (also Eq.6.37)

$${}_1S_{2,gen} = m(s_2 - s_1) - {}_1Q_2/T_0$$

$$= 0.1286 \times (-0.0504) + (2.523/298.15) = \mathbf{0.00198\ kJ/K}$$

Rates or fluxes of entropy

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.162

A room at 22^{o}C is heated electrically with 1500 W to keep steady temperature. The outside ambient is at 5^{o}C. Find the flux of S (= $\dot{Q}/T$) into the room air, into the ambient and the rate of entropy generation.

CV. The room and walls out to the ambient T, we assume steady state

Energy Eq.: $0 = \dot{W}_{el\ in} - \dot{Q}_{out}$ => $\dot{Q}_{out} = \dot{W}_{el\ in} = 1500$ W

Entropy Eq.: $0 = -\dot{Q}_{out}/T + \dot{S}_{gen\ tot}$

Flux of S into room air at 22^{o}C: $\dot{Q}/T = 1500 / 295.15 = 5.08$ W/K

Flux of S into ambient air at 5^{o}C: $\dot{Q}/T = 1500 / 278.15 = 5.393$ W/K

Entropy generation: $\dot{S}_{gen\ tot} = \dot{Q}_{out}/T = 1500 / 278.15 =$ **5.393 W/K**

Comment: The flux of S into the outside air is what leaves the control volume and since the control volume did not receive any S it was all made in the process. Notice most of the generation is done in the heater, the room heat loss process generates very little S (5.393 – 5.08 = 0.313 W/K)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.163

A mass of 3 kg nitrogen gas at 2000 K, V = C, cools with 500 W. What is dS/dt?

Assume that we do not generate any s in the nitrogen then

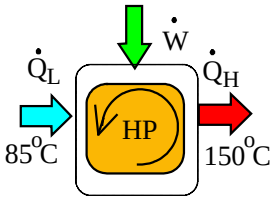
Entropy Eq. 6.42: $\dot{S}_{cv} = \frac{\dot{Q}}{T} = -\frac{500}{2000}\frac{W}{K} =$ **–0.25 W/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.164

A heat pump, see problem 5.49, should upgrade 5 MW of heat at 85°C to heat delivered at 150°C. For a reversible heat pump what are the fluxes of entropy in and out of the heat pump?

C.V.TOT. Assume reversible Carnot cycle.



Energy Eq.: $\dot{Q}_L + \dot{W} = \dot{Q}_H$

Entropy Eq.: $0 = \dfrac{\dot{Q}_L}{T_L} - \dfrac{\dot{Q}_H}{T_H} \quad \Rightarrow \quad \dfrac{\dot{Q}_L}{T_L} = \dfrac{\dot{Q}_H}{T_H}$

The fluxes of entropy become the same as

$$\frac{\dot{Q}_H}{T_H} = \frac{\dot{Q}_L}{T_L} = \frac{5}{273.15 + 85}\frac{\text{MW}}{\text{K}} = \mathbf{0.01396\ MW/K}$$

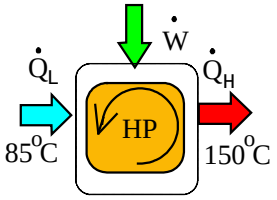
This is what constitutes a reversible process (flux of S in = flux out, no generation).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.165

Reconsider the heat pump in the previous problem and assume it has a COP of 2.5. What are the fluxes of entropy in and out of the heat pump and the rate of entropy generation inside it?

C.V. TOT.



Energy Eq.: $\dot{Q}_L + \dot{W} = \dot{Q}_H$

Entropy Eq.: $0 = \dfrac{\dot{Q}_L}{T_L} - \dfrac{\dot{Q}_H}{T_H} + \dot{S}_{gen\ tot}$

Definition of COP: $\beta_{HP} = \dfrac{\dot{Q}_H}{\dot{W}_{in}} = 2.5$; $\beta_{REF} = \beta_{HP} - 1 = \dfrac{\dot{Q}_L}{\dot{W}_{in}} = 1.50$

$$\dot{W}_{in} = \dot{Q}_L/\beta_{REF} = 5/1.50 = 3.333 \text{ MW}$$

$$\dot{Q}_H = \dot{Q}_L + \dot{W} = 5 \text{ MW} + 3.333 \text{ MW} = 8.333 \text{ MW}$$

$$\frac{\dot{Q}_L}{T_L} = \frac{5}{273.15 + 85}\frac{\text{MW}}{\text{K}} = \mathbf{0.01396\ MW/K}$$

$$\frac{\dot{Q}_H}{T_H} = \frac{8.333}{273.15 + 85}\frac{\text{MW}}{\text{K}} = \mathbf{0.01969\ MW/K}$$

From the entropy equation

$$\dot{S}_{gen\ tot} = \frac{\dot{Q}_H}{T_H} - \frac{\dot{Q}_L}{T_L} = (0.01969 - 0.01396)\frac{\text{MW}}{\text{K}} = \mathbf{5.73\ kW/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.166

A radiant heating lamp powered by electricity has a surface temperature of 1000 K emitting 500 W. The radiation is absorbed by surfaces at the ambient 18°C. Find the total entropy generation and specify where it is made, including how much.

CV1 Radiant element.

Energy Eq.: $0 = \dot{W}_{el\ in} - \dot{Q}_{out}$ Entropy Eq.: $0 = -\dot{Q}_{out}/T_{surf} + \dot{S}_{gen\ CV1}$

$$\dot{Q}_{out} = \dot{W}_{el\ in} = 500\ W; \qquad \dot{S}_{gen\ CV1} = \dot{Q}_{out}/T_{surf} = \frac{500}{1000} = \mathbf{0.5\ W/K}$$

CV2 Space between radiant element and 18°C surfaces (this is the room air).

Energy Eq.: $0 = \dot{Q}_{in} - \dot{Q}_{out}$ Entropy Eq.: $0 = \frac{\dot{Q}_{in}}{T_{in}} - \frac{\dot{Q}_{out}}{T_{amb}} + \dot{S}_{gen\ CV2}$

$$\dot{Q}_{in} = \dot{Q}_{out} = 500\ W; \qquad \dot{S}_{gen\ CV2} = \frac{\dot{Q}_{out}}{T_{amb}} - \frac{\dot{Q}_{in}}{T_{in}} = \frac{500}{291.15} - \frac{500}{1000}$$

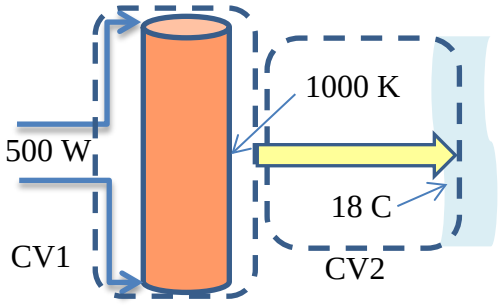
$$= \mathbf{1.217\ W/K}$$

The total entropy generation is the sum of the two contributions above, which also matches with a total control volume that is the element and the room air.

CV Radiant element and space out to ambient 18°C.

Energy Eq.: $0 = \dot{W}_{el\ in} - \dot{Q}_{out}$ Entropy Eq.: $0 = -\dot{Q}_{out}/T_{amb} + \dot{S}_{gen\ CV\ tot}$

$$\dot{Q}_{out} = \dot{W}_{el\ in} = 500\ W; \qquad \dot{S}_{gen\ CV\ tot} = \frac{\dot{Q}_{out}}{T_{amb}} = \frac{500}{291.15} = \mathbf{1.717\ W/K}$$



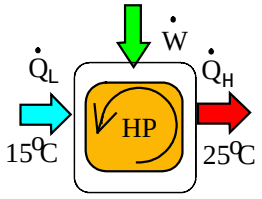
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.167

A heat pump with COP = 4 uses 1 kW of power input to heat a 25°C room, drawing energy from the outside at 15°C. Assume the high/low temperatures in the heat pump are 45°C /0°C. Find the total rates of entropy into and out of the heat pump, the rate from the outside at 15°C, and the rate to the room at 25°C?

Solution:

C.V.TOT.



Energy Eq.: $\dot{Q}_L + \dot{W} = \dot{Q}_H$

Entropy Eq.: $0 = \dfrac{\dot{Q}_L}{T_L} - \dfrac{\dot{Q}_H}{T_H} + \dot{S}_{gen\ CV\ tot}$

From definition of COP: $\dot{Q}_H = COP\ \dot{W} = 4 \times 1\ kW = 4\ kW$

From energy equation: $\dot{Q}_L = \dot{Q}_H - \dot{W} = (4 - 1)\ kW = 3\ kW$

Flux into heat pump at 0°C: $\dfrac{\dot{Q}_L}{T_{L\text{-}HP}} = \dfrac{3}{273.15}\dfrac{kW}{K} = \mathbf{0.0110\ kW/K}$

Flux out of heat pump at 45°C: $\dfrac{\dot{Q}_H}{T_{H\text{-}HP}} = \dfrac{4}{318.15}\dfrac{kW}{K} = \mathbf{0.0126\ kW/K}$

Flux out into room at T_H = 25°C: $\dfrac{\dot{Q}_H}{T_H} = \dfrac{4}{298.15}\dfrac{kW}{K} = \mathbf{0.0134\ kW/K}$

Flux from outside at 15°C: $\dfrac{\dot{Q}_L}{T_L} = \dfrac{3}{288.15}\dfrac{kW}{K} = \mathbf{0.0104\ kW/K}$

Comment: Following the flow of energy notice how the flux from the outside at 15°C grows a little when it arrives at 0°C this is due to entropy generation in the low T heat exchanger. The flux out of the heat pump at 45°C is larger than the flux in which is due to entropy generation in the heat pump cycle (COP is smaller than Carnot COP) and finally this flux increases due to entropy generated in the high T heat exchanger as the energy arrives at room T.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.168

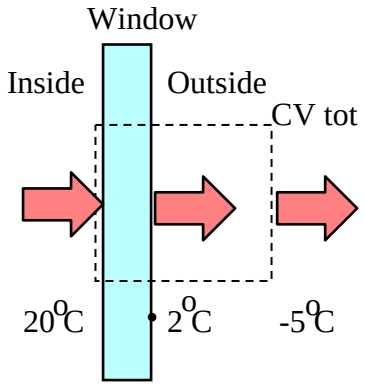
A window receives 500 W of heat transfer at the inside surface of 20°C and transmits the 500 W from its outside surface at 2°C continuing to ambient air at –5°C. Find the flux of entropy at all three surfaces and the window's rate of entropy generation.

Flux of entropy: $\dot{S} = \dfrac{\dot{Q}}{T}$

$$\dot{S}_{inside} = \frac{500}{293.15}\frac{W}{K} = 1.7056 \text{ W/K}$$

$$\dot{S}_{win} = \frac{500}{275.15}\frac{W}{K} = 1.8172 \text{ W/K}$$

$$\dot{S}_{amb} = \frac{500}{268.15}\frac{W}{K} = 1.8646 \text{ W/K}$$



Window only: $\dot{S}_{gen\ win} = \dot{S}_{win} - \dot{S}_{inside} = 1.8172 - 1.7056 =$ **0.112 W/K**

If you want to include the generation in the outside air boundary layer where T changes from 2°C to the ambient –5°C then chose the control volume as CV tot and it becomes

$$\dot{S}_{gen\ tot} = \dot{S}_{amb} - \dot{S}_{inside} = 1.8646 - 1.7056 = 0.159 \text{ W/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

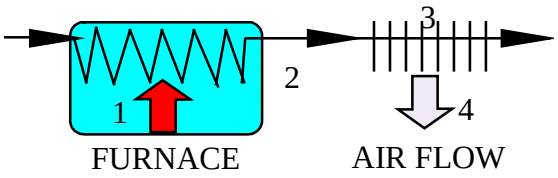
6.169

An amount of power, say 1000 kW, comes from a furnace at 800°C going into water vapor at 400°C. From the water the power goes to a solid metal at 200°C and then into some air at 70°C. For each location calculate the flux of *s* through a surface as ($\dot{Q}$/T). What makes the flux larger and larger?

Solution:

T_1 => T_2 => T_3 => T_4

furnace vapor metal air



Flux of s: $F_s = \dot{Q}/T$ with T as absolute temperature.

F_{s1} = 1000/1073.15 = 0.932 kW/K, F_{s2} = 1000/673.15 = 1.486 kW/K

F_{s3} = 1000/473.15 = 2.11 kW/K, F_{s4} = 1000/343.15 = 2.91 kW/K

T	800	400	200	70	(°C)
T_{amb}	1073	673	476	646	K
Q/T	0.932	1.486	2.114	2.915	kW/K

$_1S_{2\ gen}$ for every change in T

Q over ΔT is an irreversible process

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.170

Room air at 23°C is heated by a 2000 W space heater with a surface filament temperature of 700 K, shown in Fig. P6.170. The room at steady state looses the power to the outside which is at 7°C. Find the rate(s) of entropy generation and specify where it is made.

Solution:

For any C.V at steady state the entropy equation as a rate form is Eq.6.43

$$\frac{dS_{c.v.}}{dt} = 0 = \int d\dot{Q}/T + \dot{S}_{gen}$$

C.V. Heater Element

$$\dot{S}_{gen} = -\int d\dot{Q}/T = -(-2000/700) = \mathbf{2.857\ W/K}$$

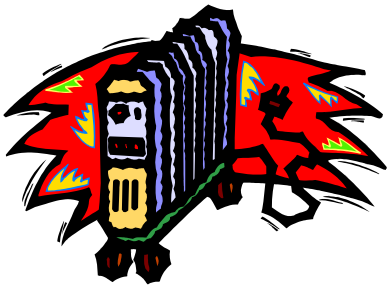
C.V. Space between heater 700 K and room 23°C

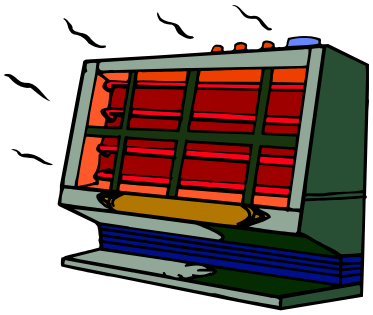
$$\dot{S}_{gen} = -\int d\dot{Q}/T = (-2000 / 700) - [-2000 / (23+273)] = \mathbf{3.9\ W/K}$$

C.V. Wall between 23°C inside and 7°C outside

$$\dot{S}_{gen} = -\int d\dot{Q}/T = [-2000 / (23+273)] - [2000 / (7 + 273)] = \mathbf{0.389\ W/K}$$

Notice biggest $\dot{S}_{gen}$ is for the largest change in 1/T.





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.171

A car engine block receives 2 kW at its surface of 450 K from hot combustion gases at 1500 K. Near the cooling channel the engine block transmits 2 kW out at its 400 K surface to the coolant flowing at 370 K. Finally, in the radiator the coolant at 350 K delivers the 2 kW to air which is at 25 C. Find the rate of entropy generation inside the engine block, inside the coolant and in the radiator/air combination.

For a C.V at steady state we have the entropy equation as a rate form as Eq.6.43

$$\frac{dS_{c.v.}}{dt} = 0 = \int d\dot{Q}/T + \dot{S}_{gen}$$

CV1. Engine block receives 2 kW at 450 K and it leaves at 400 K

$$\dot{S}_{gen1} = -\int d\dot{Q}/T = \frac{-2000}{450} - [\frac{-2000}{400}] = \mathbf{0.555\ W/K}$$

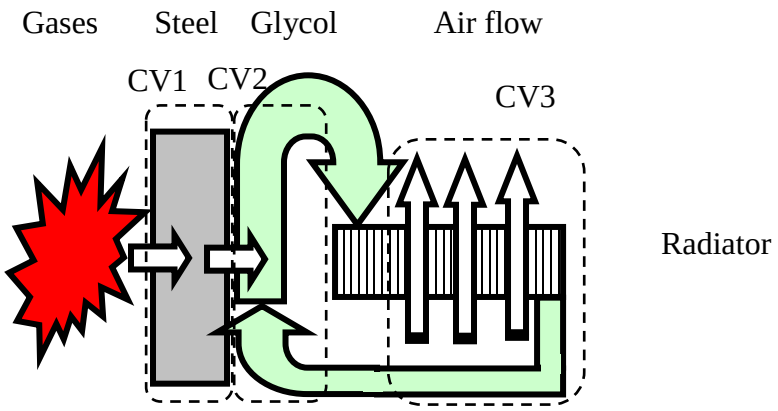
CV2. The coolant receives 2 kW at 370 K andf gives it out at 350 K

$$\dot{S}_{gen2} = -\int d\dot{Q}/T = [\frac{-2000}{370}] - [\frac{-2000}{350}] = \mathbf{0.309\ W/K}$$

CV3 Radiator to air heat transfer.

$$\dot{S}_{gen3} = -\int d\dot{Q}/T = [\frac{-2000}{350}] - [\frac{-2000}{298.15}] = \mathbf{0.994\ W/K}$$

Notice the biggest $\dot{S}_{gen}$ is for the largest change $\Delta[1/T]$



Remark: The flux of S is $\dot{Q}/T$ flowing across a surface. Notice how this flux increases as the heat transfer flows towards lower and lower T.

T [K]	1500	450	370	298.15
$\dot{Q}/T$ [W/K]	1.33	4.44	5.40	6.71

6.172

A farmer runs a heat pump using 2 kW of power input. It keeps a chicken hatchery at a constant 30°C while the room loses 10 kW to the colder outside ambient at 10°C. Find the COP of the heat pump, the rate of entropy generated in the heat pump and its heat exchangers, and the rate of entropy generated in the heat loss process?

Solution:

C.V. Hatchery, steady state.

To have steady state at 30°C for the hatchery

Energy Eq.: $0 = \dot{Q}_H - \dot{Q}_{Loss} \quad \Rightarrow \quad \dot{Q}_H = \dot{Q}_{Loss} = 10$ kW

COP: $COP = \dot{Q}_H / \dot{W} = 10 / 2 = \mathbf{5}$

C.V. Heat pump, steady state

Energy eq.: $0 = \dot{Q}_L + \dot{W} - \dot{Q}_H \quad \Rightarrow \quad \dot{Q}_L = \dot{Q}_H - \dot{W} = 8$ kW

Entropy Eq.: $0 = \dfrac{\dot{Q}_L}{T_L} - \dfrac{\dot{Q}_H}{T_H} + \dot{S}_{gen\ HP}$

$$\dot{S}_{gen\ HP} = \frac{\dot{Q}_H}{T_H} - \frac{\dot{Q}_L}{T_L} = \frac{10}{273 + 30} - \frac{8}{273 + 10} = \mathbf{0.00473\ kW/K}$$

C.V. From hatchery at 30°C to the ambient 10°C. This is typically the walls and the outer thin boundary layer of air. Through this goes $\dot{Q}_{Loss}$.

Entropy Eq.: $0 = \dfrac{\dot{Q}_{Loss}}{T_H} - \dfrac{\dot{Q}_{Loss}}{T_{amb}} + \dot{S}_{gen\ walls}$

$$\dot{S}_{gen\ walls} = \frac{\dot{Q}_{Loss}}{T_{amb}} - \frac{\dot{Q}_{Loss}}{T_H} = \frac{10}{283} - \frac{10}{303} = \mathbf{0.00233\ kW/K}$$

6.173

An insulated cylinder/piston has an initial volume of 0.15 m^3 and contains steam at 400 kPa, 200°C. The steam is expanded adiabaticly, and the work output is measured very carefully to be 30 kJ. It is claimed that the final state of the water is in the two-phase (liquid and vapor) region. What is your evaluation of the claim?

Solution:

C.V. Water.

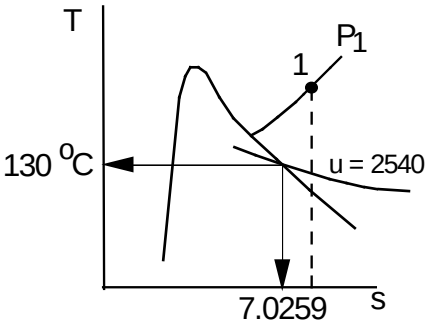
Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$

Process: ${}_1Q_2 = 0$ and reversible

State 1: (T, P) Table B.1.3

$v_1 = 0.5342,\ u_1 = 2646.8,\ s_1 = 7.1706$ kJ/kg K



$$m = \frac{V_1}{v_1} = \frac{0.15}{0.5342} = 0.2808 \text{ kg}$$

With the assumed reversible process we have from entropy equation

$$s_2 = s_1 = 7.1706 \text{ kJ/kg K}$$

and from the energy equation

$$u_2 = u_1 - {}_1W_2/m = 2646.8 - \frac{30}{0.2808} = 2540.0 \text{ kJ/kg}$$

State 2 given by (u, s) check Table B.1.1: s_G (at $u_G = 2540$) $= 7.0259 < s_1$

$\Rightarrow$ **State 2 must be in superheated vapor region.**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.174

A piston cylinder has a water volume separated in $V_A = 0.2\ m^3$ and $V_B = 0.3\ m^3$ by a stiff membrane. The initial state in A is 1000 kPa, x = 0.75 and in B it is 1600 kPa and 250°C. Now the membrane ruptures and the water comes to a uniform state at 200°C with heat transfer from a 250°C source. Find the work, the heat transfer, and the total entropy generation in the process.

Take the water in A and B as CV.

Continuity: $m_2 - m_{1A} - m_{1B} = 0$

Energy: $m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m_2 s_2 - m_A s_{A1} - m_B s_{B1} = {}_1Q_2/T_{res} + {}_1S_{2\ gen}$

Process: $P_2 = P_{eq} = \text{constant} = P_{1A}$ as piston floats and m_p, P_o are constant

State 1A: Two phase. Table B.1.2

$v_{1A} = 0.001127 + 0.75 \times 0.19332 = 0.146117\ m^3/kg,$

$u_{1A} = 761.67 + 0.75 \times 1821.97 = 2128.15\ kJ/kg$

$s_{1A} = 2.1386 + 0.75 \times 4.4478 = 5.47445\ kJ/kg\text{-}K$

State 1B: $v_{1B} = 0.14184\ m^3/kg$, $u_{1B} = 2692.26\ kJ/kg$, $s_{1B} = 6.6732\ kJ/kg\text{-}K$

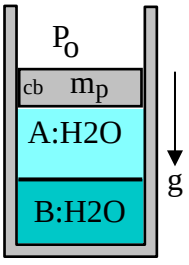
$\Rightarrow \quad m_{1A} = V_{1A}/v_{1A} = 1.3688\ kg, \quad m_{1B} = V_{1B}/v_{1B} = 2.115\ kg$

State 2: 1000 kPa, 200°C sup. vapor $\Rightarrow$

$v_2 = 0.20596\ m^3/kg$, $u_2 = 2621.9\ kJ/kg$, $s_2 = 6.6939\ kJ/kgK$

$m_2 = m_{1A} + m_{1B} = 3.4838\ kg \quad \Rightarrow \quad V_2 = m_2v_2 = 3.4838 \times 0.20596 = 0.7175\ m^3$

So now



$${}_1W_2 = \int P\,dV = P_{eq}(V_2 - V_1) = 1000\ (0.7175 - 0.5)$$
$$= \mathbf{217.5\ kJ}$$
$${}_1Q_2 = m_2u_2 - m_{1A}u_{1A} - m_{1B}u_{1B} + {}_1W_2$$
$$= 3.4838 \times 2621.9 - 1.3688 \times 2128.15$$
$$- 2.115 \times 2692.26 + 217.5 = \mathbf{744\ kJ}$$

$${}_1S_{2\ gen} = m_2s_2 - m_As_{A1} - m_Bs_{B1} - {}_1Q_2/T_{res}$$
$$= 3.4838 \times 6.6939 - 1.3688 \times 5.47445 - 2.115 \times 6.6732 - \frac{744}{523.15}$$
$$= \mathbf{0.2908\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.175

The water in the two tanks of Problem 3.214 receives the heat transfer from a reservoir at 300°C. Find the total entropy generation due to this process.

Two rigid tanks are filled with water. Tank A is 0.2 m^3 at 100 kPa, 150°C and tank B is 0.3 m^3 at saturated vapor 300 kPa. The tanks are connected by a pipe with a closed valve. We open the valve and let all the water come to a single uniform state while we transfer enough heat to have a final pressure of 300 kPa. Give the two property values that determine the final state and heat transfer.

Take CV total A + B out to reservoir (neglect kinetic and potential energy)

Energy Eq.: $m_2 u_2 - m_A u_{A1} - m_B u_{B1} = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

Entropy Eq.: $m_2 s_2 - m_A s_{A1} - m_B s_{B1} = {}_1Q_2/T_{res} + {}_1S_{2\,gen}$

State A1: u = 2582.75 kJ/kg, v = 1.93636 m^3/kg, s = 7.6133 kJ/kg-K

=> $m_{A1} = V/v = 0.2/1.93636 = 0.1033$ kg

State B1: u = 2543.55 kJ/kg, v = 0.60582 m^3/kg, s = 6.9918 kJ/kg-K

=> $m_{B1} = V/v = 0.3 / 0.60582 = 0.4952$ kg

The total volume (and mass) is the sum of volumes (mass) for tanks A and B.

$m_2 = m_{A1} + m_{B1} = 0.1033 + 0.4952 = 0.5985$ kg,

$V_2 = V_{A1} + V_{B1} = 0.2 + 0.3 = 0.5\ m^3$

=> $v_2 = V_2/m_2 = 0.5 / 0.5985 = 0.8354\ m^3$/kg

State 2: $[P_2, v_2] = [300\ kPa, 0.8354\ m^3/kg]$

=> $T_2 = 274.76°C$ and $u_2 = 2767.32$ kJ/kg, s = 7.60835 kJ/kgK

From energy eq.

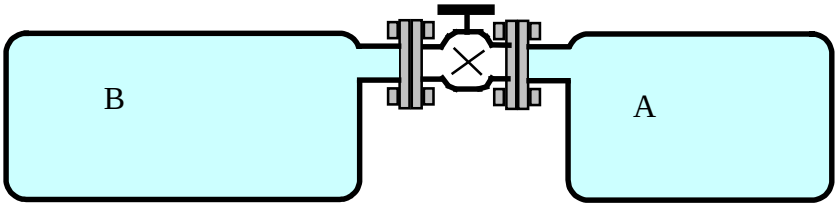
${}_1Q_2 = 0.5985 \times 2767.32 - 0.1033 \times 2582.75 - 0.4952 \times 2543.55 = 129.9$ kJ

From entropy equation

${}_1S_{2\,gen} = m_2 s_2 - m_A s_{A1} - m_B s_{B1} - {}_1Q_2/T_{res}$

$= 0.5985 \times 7.60835 - 0.1033 \times 7.6133 - 0.4952 \times 6.9918$

$- 129.9 / (273.15 + 300) =$ **0.0782 kJ/K**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.176

A steel piston/cylinder of 1 kg contains 2.5 kg ammonia at 50 kPa, -20°C. Now it is heated to 50°C at constant pressure through the bottom of the cylinder from external hot gas at 200°C, and we assume the steel has the same temperature as the ammonia. Find the heat transfer from the hot gas and the total entropy generation.

Solution:

C.V. Ammonia plus space out to the hot gas.

Energy Eq.3.5: $m_{NH3}(u_2 - u_1) + m_{steel}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $S_2 - S_1 = \int dQ/T + {}_1S_{2,gen} = {}_1Q_2/ T_{gas} + {}_1S_{2\ gen}$

$S_2 - S_1 = m_{NH3}(s_2 - s_1) + m_{steel}(s_2 - s_1)$

Process: $P = C \quad => \quad {}_1W_2 = Pm_{NH3}(v_2 - v_1)_{NH3}$

State 1: (B.2.2) $v_1 = 2.4463\ m^3/kg,\ h_1 = 1434.6\ kJ/kg,\ s_1 = 6.3187\ kJ/kg\ K$

State 2: (B.2.2) $v_2 = 3.1435\ m^3/kg,\ h_2 = 1583.5\ kJ/kg,\ s_2 = 6.8379\ kJ/kg\ K$

Substitute the work into the energy equation and solve for the heat transfer

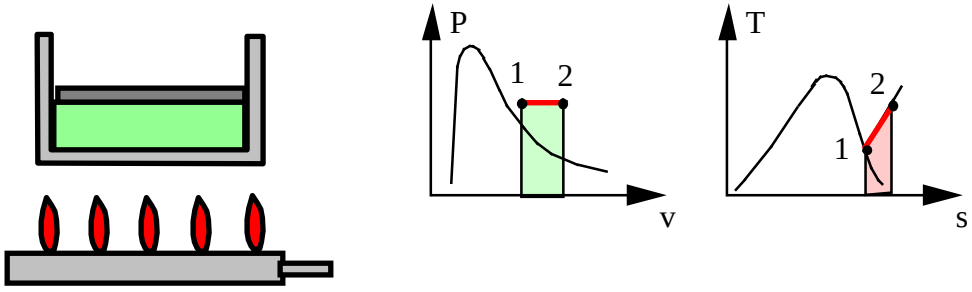
$${}_1Q_2 = m_{NH3}(h_2 - h_1) + m_{steel}(u_2 - u_1)$$

$$= 2.5\ (1583.5 - 1434.6) + 1 \times 0.46\ [50 - (-20)] = \mathbf{404.45\ kJ}$$

$${}_1S_{2\ gen} = m_{NH3}(s_2 - s_1) + m_{steel}(s_2 - s_1) - {}_1Q_2/T_{gas}$$

$$= 2.5\ (6.8379 - 6.3187) + 1 \times 0.46\ \ln\left(\frac{323.15}{253.15}\right) - \frac{404.45}{473.15}$$

$$= \mathbf{0.555\ kJ/K}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

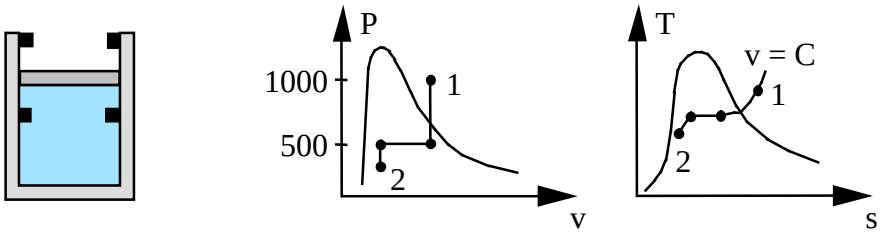
6.177

Water in a piston/cylinder is at 1 MPa, 500°C. There are two stops, a lower one at which $V_{min} = 1$ m^3 and an upper one at $V_{max} = 3$ m^3. The piston is loaded with a mass and outside atmosphere such that it floats when the pressure is 500 kPa. This setup is now cooled to 100°C by rejecting heat to the surroundings at 20°C. Find the total entropy generated in the process.

C.V. Water.

Initial state: Table B.1.3: $v_1 = 0.35411$ m^3/kg, $u_1 = 3124.3$, $s_1 = 7.7621$

$m = V/v_1 = 3/0.35411 = 8.472$ kg



Final state: 100°C and on line in P-V diagram.

Notice the following: $v_g(500\text{ kPa}) = 0.3749 > v_1$, $v_1 = v_g(154°C)$

$T_{sat}(500\text{ kPa}) = 152°C > T_2$, so now piston hits bottom stops.

State 2: $v_2 = v_{bot} = V_{bot}/m = 0.118$ m^3/kg,

$x_2 = (0.118 - 0.001044)/1.67185 = 0.0699$,

$u_2 = 418.91 + 0.0699 \times 2087.58 = 564.98$ kJ/kg,

$s_2 = 1.3068 + 0.0699 \times 6.048 = 1.73$ kJ/kg K

Now we can do the work and then the heat transfer from the energy equation

$${}_1W_2 = \int PdV = 500(V_2 - V_1) = -1000 \text{ kJ} \quad ({}_1w_2 = -118 \text{ kJ/kg})$$

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = -22683.4 \text{ kJ} \quad ({}_1q_2 = -2677.5 \text{ kJ/kg})$$

Take C.V. total out to where we have 20°C:

$$m(s_2 - s_1) = {}_1Q_2/T_0 + S_{gen} \Rightarrow$$

$$S_{gen} = m(s_2 - s_1) - {}_1Q_2/T_0 = 8.472\,(1.73 - 7.7621) + 22683 / 293.15$$

$$= \mathbf{26.27\ kJ/K} \quad (= \Delta S_{water} + \Delta S_{sur})$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.178

A piston/cylinder contains air at 300 K, 100 kPa. A reversible polytropic process with n = 1.3 brings the air to 500 K. Any heat transfer if it comes in is from a 325°C reservoir and if it goes out it is to the ambient at 300 K. Sketch the process in a P-v and a T-s diagram. Find the specific work and specific heat transfer in the process. Find the specific entropy generation (external to the air) in the process.

Solution:

Process : $Pv^n = C$

$$P_2/P_1 = (T_2/T_1)^{n/(n-1)} = (500/300)^{1.3/0.3} = 9.148$$

$$_1w_2 = \int P\, dv = \left(\frac{P_2v_2 - P_1v_1}{1-n}\right) = \frac{R}{1-n}(T_2 - T_1)$$

$$= \frac{0.287}{1 - 1.3}(500 - 300) = \mathbf{-191.3\ kJ/kg}$$

Energy equation

$$_1q_2 = u_2 - u_1 + {}_1w_2 = C_v(T_2 - T_1) + {}_1w_2$$

$$= 0.717\,(500 - 300) - 191.3 = \mathbf{-47.93\ kJ/kg}$$

The $_1q_2$ is negative and thus goes out. Entropy is generated between the air and ambient.

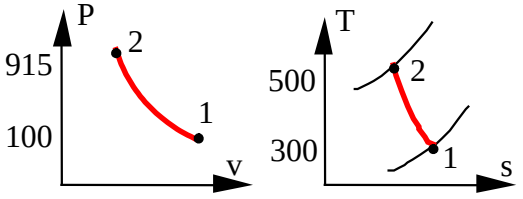
$$s_2 - s_1 = {}_1q_2/T_{amb} + {}_1s_{2\,gen}$$

$$_1s_{2\,gen} = s_2 - s_1 - {}_1q_2/T_{amb} = C_p \ln(T_2/T_1) - R \ln(P_2/P_1) - {}_1q_2/T_{amb}$$

$$_1s_{2\,gen} = 1.004 \ln\left(\frac{500}{300}\right) - 0.287 \ln 9.148 - \left(\frac{-47.93}{300}\right)$$

$$= 0.51287 - 0.635285 + 0.15977$$

$$= \mathbf{0.03736\ kJ/kg\ K}$$



Notice:
n = 1.3, k = 1.4

n < k

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.179

Assume the heat transfer in problem 3.213 came from a 200°C reservoir. What is the total entropy generation in the process?

C.V. Water in A and B. Control mass goes through process: 1 -> 2

Continuity Eq.: $m_2 - m_{A1} - m_{B1} = 0 \quad \Rightarrow m_2 = m_{A1} + m_{B1} = 0.5 + 0.5 = 1$ kg

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m_2 s_2 - m_A s_{A1} - m_B s_{B1} = {}_1Q_2/T_{res} + {}_1S_{2\,gen}$

State A1: $v_{A1} = 0.001067 + x_{A1} \times 0.71765 = 0.072832$; $V_{A1} = mv = 0.036416$ m^3

$u_{A1} = 535.08 + 0.1 \times 2002.14 = 735.22$ kJ/kg;

$s_{A1} = 1.6072 + 0.1 \times 5.4455 = 2.15175$ kJ/kgK

State B1: $v_{B1} = 1.5493$ m^3/kg; $u_{B1} = 2966.69$ kJ/kg; $s_{B1} = 8.2217$ kJ/kg-K

$V_{B1} = (mv)_{B1} = 0.77465$ m^3

State 2: If $V_2 > V_{A1}$ then $P_2 = 200$ kPa that is the piston floats.

For $(T_2, P_2) = (150°C, 200$ kPa) => superheated vapor

$u_2 = 2576.87$ kJ/kg; $v_2 = 0.95964$ m^3/kg, $s_2 = 7.2795$ kJ/kgK

$V_2 = m_2 v_2 = 0.95964$ m^3 $> V_{A1}$ checks OK.

Process: ${}_1W_2 = P_2 (V_2 - V_1) = 200\ (0.95964 - 0.77465 - 0.036416) = 29.715$ kJ

From the energy and entropy equations:

$${}_1Q_2 = m_2 u_2 - m_{A1} u_{A1} - m_{B1} u_{B1} + {}_1W_2$$

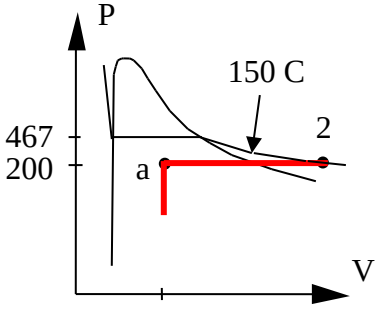
$$= 1 \times 2576.87 - 0.5 \times 735.222 - 0.5 \times 2966.69 + 29.715 = 755.63 \text{ kJ}$$

$${}_1S_{2\,gen} = m_2 s_2 - m_A s_{A1} - m_B s_{B1} - {}_1Q_2/T_{res}$$

$$= 1 \times 7.2795 - 0.5 \times 2.15175 - 0.5 \times 8.2217 - 755.63/473.15$$

$$= \mathbf{0.496\ kJ/K}$$

The possible state 2 (P,V) combinations are shown. State a is 200 kPa, $v_a = V_{A1}/m_2 = 0.036$ and thus two-phase $T_a = 120°C$ less than T_2



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.180

A closed tank, $V = 10$ L, containing 5 kg of water initially at 25°C, is heated to 150°C by a heat pump that is receiving heat from the surroundings at 25°C. Assume that this process is reversible. Find the heat transfer to the water and the work input to the heat pump.

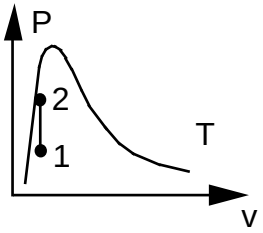
C.V.: Water from state 1 to state 2.

Process: constant volume (reversible isometric)

State 1: $v_1 = V/m = 0.002 \Rightarrow x_1 = (0.002 - 0.001003)/43.358 = 0.000023$

$u_1 = 104.86 + 0.000023 \times 2304.9 = 104.93$ kJ/kg

$s_1 = 0.3673 + 0.000023 \times 8.1905 = 0.36759$ kJ/kg K



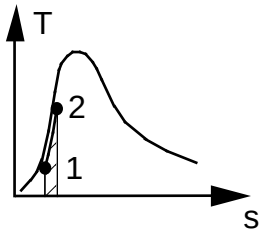
Continuity eq. (same mass) and V = C fixes v_2

2: T_2, $v_2 = v_1 \Rightarrow$

$x_2 = (0.002 - 0.001090)/0.39169 = 0.0023233$

$u_2 = 631.66 + 0.0023233 \times 1927.87 = 636.14$ kJ/kg

$s_2 = 1.8417 + 0.0023233 \times 4.9960 = 1.8533$ kJ/kg K



Energy eq. has W = 0, thus provides heat transfer as

$${}_1Q_2 = m(u_2 - u_1) = \mathbf{2656\ kJ}$$

Entropy equation for the total (tank plus heat pump) control volume gives for a reversible process:

$$m(s_2 - s_1) = Q_L/T_0 \Rightarrow$$

$$Q_L = mT_0(s_2 - s_1) = 5 \times 298.15 \times (1.8533 - 0.36759) = 2214.8 \text{ kJ}$$

and then the energy equation for the heat pump gives

$$W_{HP} = {}_1Q_2 - Q_L = 2656 - 2214.8 = \mathbf{441.2\ kJ}$$

6.181

A resistor in a heating element is a total of 0.5 kg with specific heat of 0.8 kJ/kgK. It is now receiving 500 W of electric power so it heats from 20°C to 180°C. Neglect external heat loss and find the time the process took and the entropy generation.

C.V. Heating element.

Energy Eq.: $m(u_2 - u_1) = {}_1W_{2\,in} = \dot{W}_{electrical\ in}\,\Delta t$

Entropy Eq.: $m(s_2 - s_1) = 0 + {}_1S_{2\,gen}$ (no heat transfer)

$$\Delta t = m(u_2 - u_1) / \dot{W}_{electrical\ in} = m\,C\,(T_2 - T_1) / \dot{W}_{electrical\ in}$$

$$= 0.5\ kg \times 800\ J/kg\text{-}K \times (180 - 20)\ K / 500\ (J/s) = \mathbf{128\ s}$$

$${}_1S_{2\,gen} = m(s_2 - s_1) = m\,C \ln \frac{T_2}{T_1} = 0.5\ kg \times 0.8\ kJ/kg\text{-}K \ln \left(\frac{180 + 273}{20 + 273}\right)$$

$$= \mathbf{0.174\ kJ/K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.182

Two tanks contain steam, and they are both connected to a piston/cylinder as shown in Fig. P6.182. Initially the piston is at the bottom and the mass of the piston is such that a pressure of 1.4 MPa below it will be able to lift it. Steam in A is 4 kg at 7 MPa, 700°C and B has 2 kg at 3 MPa, 350°C. The two valves are opened, and the water comes to a uniform state. Find the final temperature and the total entropy generation, assuming no heat transfer.

Solution:

Control mass: All water $m_A + m_B$.

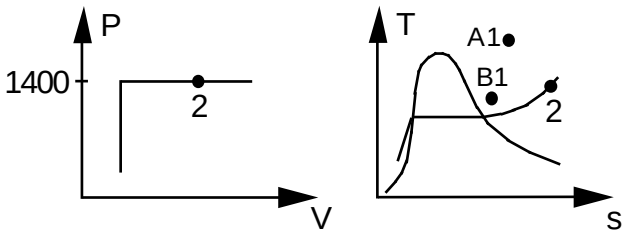
Continuity Eq.: $m_2 = m_A + m_B = 6$ kg

Energy Eq.3.5: $m_2u_2 - m_Au_{A1} - m_Bu_{B1} = {}_1Q_2 - {}_1W_2 = - {}_1W_2$

Entropy Eq.6.37: $m_2s_2 - m_As_{A1} - m_Bs_{B1} = {}_1S_{2\,gen}$

B.1.3: $v_{A1} = 0.06283$, $u_{A1} = 3448.5$, $s_{A1} = 7.3476$, $V_A = 0.2513$ m^3

B.1.3: $v_{B1} = 0.09053$, $u_{B1} = 2843.7$, $s_{B1} = 6.7428$, $V_B = 0.1811$ m^3



The only possible P, V combinations for state 2 are on the two lines.

Assume $V_2 > V_A + V_B \Rightarrow P_2 = P_{lift}$, ${}_1W_2 = P_2(V_2 - V_A - V_B)$

Substitute into energy equation:

$m_2h_2 = m_Au_{A1} + m_Bu_{B1} + P_2(V_A + V_B)$

$= 4 \times 3448.5 + 2 \times 2843.7 + 1400 \times 0.4324 = 20\,086.8$ kJ

State 2: $h_2 = m_2h_2/m_2 = 20\,086.8$ kJ /6 kg = 3347.8 kJ/kg, $P_2 = 1400$ kPa,

$v_2 = 0.2323$ m^3/kg, $s_2 = 7.433$ kJ/kg-K, **$T_2 = 441.9$ °C**,

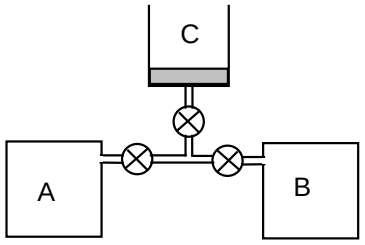
Check assumption: $V_2 = m_2v_2 = 1.394$ m^3 $> V_A + V_B$ **OK.**

${}_1S_{2\,gen} = 6 \times 7.433 - 4 \times 7.3476 - 2 \times 6.7428 =$ **1.722 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.183

Assume the heat source in Problem 3.217 is at 300°C in a setup similar to Fig. P6.182. Find the heat transfer and the entropy generation.



C.V.: A + B + C.

Only work in C, total mass constant.

$m_2 - m_1 = 0 \quad => \quad m_2 = m_{A1} + m_{B1}$

$U_2 - U_1 = {}_1Q_2 - {}_1W_2$;

$S_2 - S_1 = {}_1Q_2/T_{res} + {}_1S_{2\,gen}$

${}_1W_2 = \int P dV = P_{lift}\,(V_2 - V_1)$

1A: $v = 0.6/3 = 0.2\ m^3/kg \quad => \quad x_{A1} = (0.2 - 0.00106)/0.8908 = 0.223327$

$u = 503.48 + x \times 2025.76 = 955.89$ kJ/kg, $s = 1.5275 + x \times 5.602 = 2.7786$ kJ/kgK

1B: $v = 0.35202\ m^3/kg \quad => \quad ; \quad u = 2638.91$ kJ/kg, $s = 6.9665$ kJ/kgK

$m_{B1} = 0.4/0.35202 = 1.1363$ kg and $m_2 = 3 + 1.1363 = 4.1363$ kg

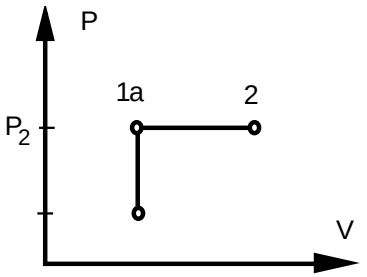
$V_2 = V_A + V_B + V_C = 1\ m^3 + V_C$

Locate state 2: Must be on P-V lines shown

State 1a: 800 kPa,

$$v_{1a} = \frac{V_A + V_B}{m} = 0.24176\ m^3/kg$$

800 kPa, $v_{1a} \quad => \quad T = 173°C$ too low.



Assume 800 kPa: 250°C => $v = 0.29314\ m^3/kg > v_{1a}$ OK

$V_2 = m_2 v_2 = 4.1363\ kg \times 0.29314\ m^3/kg =$ **1.2125 m³**

Final state is : **800 kPa**; 250°C => $u_2 = 2715.46$ kJ/kg, $s_2 = 7.0384$ kJ/kgK

${}_1W_2 = P_{lift}\,(V_2 - V_1) = 800\ kPa \times (1.2125 - 1)\ m^3 =$ **170 kJ**

${}_1Q_2 = m_2u_2 - m_1u_1 + {}_1W_2 = m_2u_2 - m_{A1}u_{A1} - m_{B1}u_{B1} + {}_1W_2$

$= 4.1363 \times 2715.46 - 3 \times 955.89 - 1.1363 \times 2638.91 + 170$

$= 11\,232 - 2867.7 - 2998.6 + 170 =$ **5536 kJ**

${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_{res} = m_2s_2 - m_{A1}s_{A1} - m_{B1}s_{B1} - {}_1Q_2/T_{res}$

$= 4.1363 \times 7.0384 - 3 \times 2.7786 - 1.1363 \times 6.9665 - 5536/573.15$

$=$ **3.202 kJ/K**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.184

A cylinder fitted with a piston contains 0.5 kg of R-134a at 60°C, with a quality of 50 percent. The R-134a now expands in an internally reversible polytropic process to ambient temperature, 20°C at which point the quality is 100 percent. Any heat transfer is with a constant-temperature source, which is at 60°C. Find the polytropic exponent n and show that this process satisfies the second law of thermodynamics.

Solution:

C.V.: R-134a, Internally Reversible, Polytropic Expansion: $PV^n = \text{Const.}$

Cont.Eq.: $m_2 = m_1 = m$; Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

State 1: $T_1 = 60^oC$, $x_1 = 0.5$, Table B.5.1: $P_1 = P_g = 1681.8$ kPa,

$v_1 = v_f + x_1 v_{fg} = 0.000951 + 0.5 \times 0.010511 = 0.006207$ m^3/kg

$s_1 = s_f + x_1 s_{fg} = 1.2857 + 0.5 \times 0.4182 = 1.4948$ kJ/kg K,

$u_1 = u_f + x_1 u_{fg} = 286.19 + 0.5 \times 121.66 = 347.1$ kJ/kg

State 2: $T_2 = 20^oC$, $x_2 = 1.0$, $P_2 = P_g = 572.8$ kPa, Table B.5.1

$v_2 = v_g = 0.03606$ m^3/kg, $s_2 = s_g = 1.7183$ kJ/kg-K

$u_2 = u_g = 389.19$ kJ/kg

Process: $PV^n = \text{Const.} \Rightarrow \dfrac{P_1}{P_2} = \left(\dfrac{v_2}{v_1}\right)^n \Rightarrow n = \ln \dfrac{P_1}{P_2} \Big/ \ln \dfrac{v_2}{v_1} =$ **0.6122**

${}_1W_2 = \int PdV = \dfrac{P_2V_2 - P_1V_1}{1-n}$

$= 0.5(572.8 \times 0.03606 - 1681.8 \times 0.006207)/(1 - 0.6122) = 13.2$ kJ

2nd Law for C.V.: R-134a plus wall out to source:

${}_1S_{2\,gen} = m(s_2 - s_1) - \dfrac{Q_H}{T_H}$; Check $\Delta S_{net} \geq 0$

$Q_H = {}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 34.2$ kJ

${}_1S_{2\,gen} = 0.5(1.7183 - 1.4948) - 34.2/333.15 = 0.0092$ kJ/K,

${}_1S_{2\,gen} > 0$ Process Satisfies 2nd Law

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.185

A device brings 2 kg of ammonia from 150 kPa, -20°C to 400 kPa, 80°C in a polytropic process. Find the polytropic exponent, n, the work and the heat transfer. Find the total entropy generated assuming a source at 100°C.

Solution:

C.V. Ammonia of constant mass $m_2 = m_1 = m$ out to source.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = {}_1Q_2/T + {}_1S_{2\ gen}$

Process: $P_1v_1^n = P_2v_2^n$ Eq. (8.27)

State 1: Table B.2.2

$v_1 = 0.79774\ m^3/kg$, $s_1 = 5.7465\ kJ/kg\ K$, $u_1 = 1303.3\ kJ/kg$

State 2: Table B.2.2

$v_2 = 0.4216\ m^3/kg$, $s_2 = 5.9907\ kJ/kg\ K$, $u_2 = 1468.0\ kJ/kg$

$$\ln (P_2/P_1) = \ln (v_1/v_2)^n = n \times \ln (v_1/v_2)$$

$$\ln \left(\frac{400}{150}\right) = n \times \ln \left(\frac{0.79774}{0.4216}\right) = 0.98083 = n \times 0.63773$$

$\Rightarrow$ $n = \mathbf{1.538}$

The work term is integration of PdV as done in text leading to Eq.6.29

$${}_1W_2 = \frac{m}{1-n}(P_2v_2 - P_1v_1)$$

$$= \frac{2}{1-1.538} \times (400 \times 0.4216 - 150 \times 0.79774) = \mathbf{-182.08\ kJ}$$

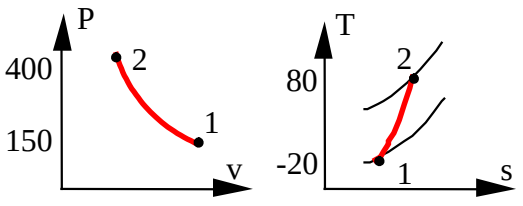
Notice we did not use Pv = RT as we used the ammonia tables.

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 2\ (1468 - 1303.3) - 182.08 = \mathbf{147.3\ kJ}$

From Eq.6.37

$${}_1S_{2\ gen} = m(s_2 - s_1) - {}_1Q_2/T = 2\ (5.9907 - 5.7465) - \frac{147.3}{373.15}$$

$$= \mathbf{0.0936\ kJ/K}$$



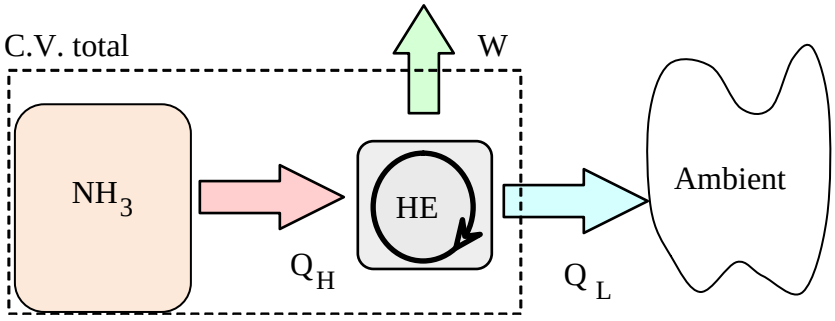
Notice:
n = 1.54, k = 1.3

n > k

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.186

A rigid tank with 0.5 kg ammonia at 1600 kPa, 160°C is cooled in a reversible process by giving heat to a reversible heat engine that has its cold side at ambient 20°C, shown in Fig. P6.186. The ammonia eventually reaches 20°C and the process stops. Find the heat transfer from the ammonia to the heat engine and the work output of the heat engine.



C.V. Ammonia

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$ (T not constant)

Process: v = constant $\Rightarrow$ ${}_1W_2 = 0$

State 1: (T, P) Table B.2.2: $u_1 = 1596.1$ kJ/kg, $v_1 = 0.12662$ m^3/kg,

$s_1 = 5.7485$ kJ/kgK

State 2: T_2 and $v_2 = v_1$ Table B.2.1 as $v_2 < v_g$

$\Rightarrow$ 2-phase, $P_2 = P_{sat} = 857.5$ kPa

$x_2 = (v_2 - v_f)/v_{fg} = (0.12662 - 0.001638)/0.14758 = 0.846876$

$u_2 = u_f + x_2\, u_{fg} = 272.89 + 0.846876 \times 1059.3 = 1170$ kJ/kg

$s_2 = s_f + x_2\, s_{fg} = 1.0408 + 0.846876 \times 4.0452 = 4.4666$ kJ/kgK

From the energy equation

$Q_H = -{}_1Q_2 = -m(u_2 - u_1) = -0.5(1170 - 1596.1) =$ **213.05 kJ**

Take now CV total ammonia plus heat engine out to ambient

Entropy Eq.6.3: $m(s_2 - s_1) = -\dfrac{Q_L}{T_{amb}}$ $\Rightarrow$

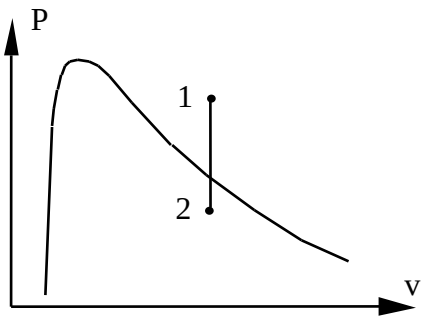
$Q_L = -mT_{amb}\,(s_2 - s_1) = -0.5 \times 293.15\,(4.4666 - 5.7485)$

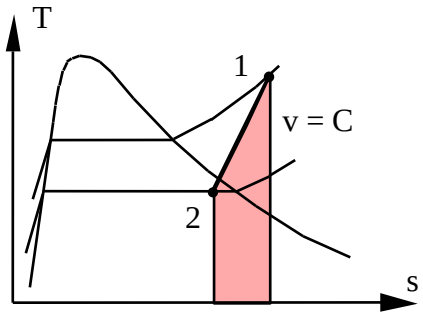
$= 187.89$ kJ

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Now the CV heat engine can give the engine work from the energy equation

Energy H.E.: $W_{HE} = Q_H - Q_L = 213.05 - 187.89 =$ **25.2 kJ**





Notice to get ${}_1q_2 = \int T\, ds$ we must know the function T(s) which we do not readily have for this process.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.187

A piston/cylinder with constant loading of piston contains 1 L water at 400 kPa, quality 15%. It has some stops mounted so the maximum possible volume is 11 L. A reversible heat pump extracting heat from the ambient at 300 K, 100 kPa heats the water to 300°C. Find the total work and heat transfer for the water and the work input to the heat pump.

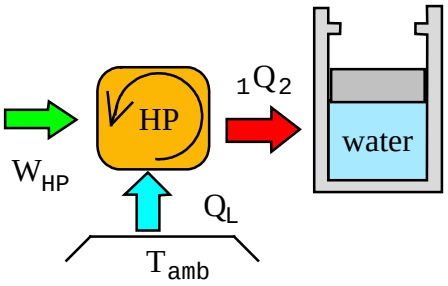
Solution: Take CV around the water and check possible P-V combinations.

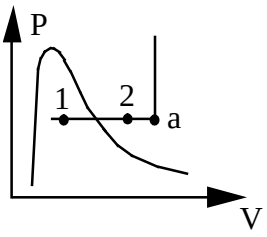
State 1: $v_1 = 0.001084 + 0.15 \times 0.46138 = 0.07029\ m^3/kg$

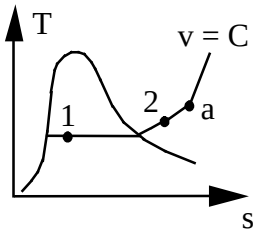
$u_1 = 604.29 + 0.15 \times 1949.26 = 896.68\ kJ/kg$

$s_1 = 1.7766 + 0.15 \times 5.1193 = 2.5445\ kJ/kg\ K$

$m_1 = V_1/v_1 = 0.001/0.07029 = 0.0142\ kg$







State a: $v = 11\ v_1 = 0.77319\ m^3/kg$, 400 kPa

=> Sup. vapor $T_a = 400^oC > T_2$

State 2: Since $T_2 < T_a$ then piston is not at stops but floating so $P_2 = 400$ kPa.

(T, P) => $v_2 = 0.65484\ m^3/kg$ => $V_2 = (v_2/v_1) \times V_1 = 9.316$ L

$_1W_2 = \int P\ dV = P(V_2 - V_1) = 400\ kPa\ (9.316 - 1) \times 0.001\ m^3 =$ **3.33 kJ**

$_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 0.0142\ (2804.8 - 896.68) + 3.33 =$ **30.43 kJ**

Take CV as water plus the heat pump out to the ambient.

$m(s_2 - s_1) = Q_L/T_o$ =>

$Q_L = mT_o\ (s_2 - s_1) = 0.0142\ kg \times 300\ K \times (7.5661 - 2.5445)\ kJ/kg\text{-}K$

$= 21.39\ kJ$

$W_{HP} = {}_1Q_2 - Q_L = 30.43 - 21.39 =$ **9.04 kJ**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.188

An un-insulated cylinder fitted with a piston contains air at 500 kPa, 200°C, at which point the volume is 10 L. The external force on the piston is now varied in such a manner that the air expands to 150 kPa, 25 L volume. It is claimed that in this process the air produces 70% of the work that would have resulted from a reversible, adiabatic expansion from the same initial pressure and temperature to the same final pressure. Room temperature is 20°C.

a) What is the amount of work claimed?

b) Is this claim possible?

Solution:

C.V.: Air; R = 0.287 kJ/kg-K, C_p = 1.004 kJ/kg K, C_v = 0.717 kJ/kg K

State 1: $T_1 = 200^oC$, P_1 = 500 kPa, V_1 = 10 L = 0.01 m^3;

$$m_1 = V_1/v_1 = P_1V_1/RT_1 = 0.0368 \text{ kg}$$

State 2: P_2 = 150 kPa, V_2 = 25 L = 0.025 m^3

η_s = 70%; Actual Work is 70% of Isentropic Work

a) Assume Reversible and Adiabatic Process; $s_1 = s_{2s}$

$$T_{2s} = T_1\left(\frac{P_2}{P_1}\right)^{\frac{k-1}{k}} = 473.15\ (150 / 500) = 335.4 \text{ K}$$

Energy Eq.: $\quad {}_1Q_{2s} = m(u_{2s} - u_1) + {}_1W_{2s}; \quad {}_1Q_{2s} = 0$

Assume constant specific heat

${}_1W_{2\,s} = mC_v(T_1 - T_{2s}) = 3.63$ kJ

${}_1W_{2\,ac} = 0.7 \times {}_1W_{2\,s} =$ **2.54 kJ**

b) Use Ideal Gas Law; $T_{2\,ac} = T_1P_2V_2 / P_1V_1 = 354.9$ K

Energy Eq.: $\quad {}_1Q_{2\,ac} = mC_v(T_{2\,ac} - T_1) + {}_1W_{2\,ac} = -0.58$ kJ

2^{nd} Law: ${}_1S_{2\,gen} = m(s_2 - s_1) - \dfrac{Q_{CV}}{T_o}$; $\quad Q_{CV} = {}_1Q_{2\,ac}$, $T_o = 20^oC$

$$s_2 - s_1 = Cp \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1} = 0.0569 \text{ kJ/kg-K}$$

${}_1S_{2\,gen} = 0.00406$ kJ/K $\geq$ 0 ; $\quad$ **Process is Possible**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.189

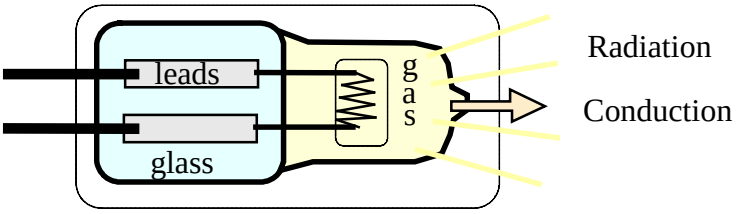
A small halogen light bulb receives an electrical power of 50 W. The small filament is at 1000 K and gives out 20% of the power as light and the rest as heat transfer to the gas, which is at 500 K; the glass is at 400 K. All the power is absorbed by the room walls at 25°C. Find the rate of generation of entropy in the filament, in the total bulb including glass and the total room including bulb.

Solution:

$\dot{W}_{el}$ = 50 W

$\dot{Q}_{RAD}$ = 10 W

$\dot{Q}_{COND}$ = 40 W



We will assume steady state and no storage in the bulb, air or room walls.

C.V. Filament steady-state

Energy Eq.3.31: $dE_{c.v.}/dt = 0 = \dot{W}_{el} - \dot{Q}_{RAD} - \dot{Q}_{COND}$

Entropy Eq.6.42: $dS_{c.v.}/dt = 0 = -\dfrac{\dot{Q}_{RAD}}{T_{FILA}} - \dfrac{\dot{Q}_{COND}}{T_{FILA}} + \dot{S}_{gen}$

$\dot{S}_{gen} = (\dot{Q}_{RAD} + \dot{Q}_{COND})/T_{FILA} = \dot{W}_{el}/T_{FILA} = \dfrac{50}{1000}$ = **0.05 W/K**

C.V. Bulb including glass

$\dot{Q}_{RAD}$ leaves at 1000 K $\dot{Q}_{COND}$ leaves at 400 K

$\dot{S}_{gen} = \int d\dot{Q}/T$ = -(-10/1000) – (-40/400) = **0.11 W/K**

C.V. Total room. All energy leaves at 25°C

Eq.5.31: $dE_{c.v.}/dt = 0 = \dot{W}_{el} - \dot{Q}_{RAD} - \dot{Q}_{COND}$

Eq.6.42: $dS_{c.v.}/dt = 0 = -\dfrac{\dot{Q}_{TOT}}{T_{WALL}} + \dot{S}_{gen}$

$$\dot{S}_{gen} = \frac{\dot{Q}_{TOT}}{T_{WALL}} = 50/(25+273) = \textbf{0.168 W/K}$$

Solutions using the Pr and vr functions in Table A.7.2

If you would like to see more of these please let me know (claus@umich.edu) and I can prepare more of the problem solutions using these functions.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.92 uses P_r function

A piston/cylinder, shown in Fig. P6.92, contains air at 1380 K, 15 MPa, with V_1 = 10 cm^3, A_{cyl} = 5 cm^2. The piston is released, and just before the piston exits the end of the cylinder the pressure inside is 200 kPa. If the cylinder is insulated, what is its length? How much work is done by the air inside?

Solution:

C.V. Air, Cylinder is insulated so adiabatic, Q = 0.

Continuity Eq.: $m_2 = m_1 = m$,

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = 0 + {}_1S_{2\ gen}$

State 1: (T_1, P_1) State 2: $(P_2, ?)$

So one piece of information is needed for the ?, assume reversible process.

$${}_1S_{2\ gen} = 0 \quad \Rightarrow \quad s_2 - s_1 = 0$$

State 1: Table A.7.1: $u_1 = 1095.2$ kJ/kg,

Table A.7.2: $P_{r1} = 340.53$, $v_{r1} = 2.7024$

$$m = P_1V_1/RT_1 = \frac{15000 \times 10 \times 10^{-6}}{0.287 \times 1380} = 0.000379 \text{ kg}$$

State 2: P_2 and from Entropy eq.: $s_2 = s_1$

$$\Rightarrow \quad P_{r2} = P_{r1}P_2/P_1 = 340.53 \times 200/15000 = 4.5404$$

Interpolate in A.7.2 to match the P_{r2} value

$T_2 = 447$ K, $u_2 = 320.85$ kJ/kg, $v_{r2} = 65.67$

$$\Rightarrow \quad V_2 = V_1 v_{r2}/v_{r1} = 10 \times 65.67 / 2.7024 = \mathbf{243\ cm^3}$$

$$\Rightarrow \quad L_2 = V_2 / A_{cyl} = 243/5 = \mathbf{48.6\ cm}$$

$$\Rightarrow \quad {}_1w_2 = u_1 - u_2 = 774.4 \text{ kJ/kg}, \qquad {}_1W_2 = m\,{}_1w_2 = \mathbf{0.2935\ kJ}$$

We could also have done $V_2 = V_1 (T_2P_1/T_1P_2)$ from ideal gas law and thus did not need the vr function for this problem

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.105 uses v_r function

A piston/cylinder contains air at 300 K, 100 kPa. It is now compressed in a reversible adiabatic process to a volume 7 times as small. Use constant heat capacity and find the final pressure and temperature, the specific work and specific heat transfer for the process.

Solution: Here we use the v_r function from Table A.7.2

Expansion ratio: $v_2/ v_1 = 1/7$

Process eq.: Rev. adiabatic and ideal gas gives $Pv^n = C$, with n = k

Since we know the v ratio and s is constant we use the v_r function

$v_{r1} = 179.49 \quad \Rightarrow \quad v_{r2} = v_{r1}\, v_2/ v_1 = 179.49/7 = 25.641$

Table A.7.2: Interpolate $T_2 =$ **640.7 K**

$P_2 = P_1 \times (T_2 / T_1) \times (v_1/v_2) = 100 \times (640.7/300) \times 7 =$ **1495 kPa**

Adiabatic: ${}_1q_2 =$ **0 kJ/kg**

Polytropic process work term from the energy equation

${}_1w_2 = -(u_2 - u_1) = -(466.37 - 214.36) =$ **-252.0 kJ/kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6. additional problem uses P_r function

A mass of 1 kg of air contained in a cylinder at 1.5 MPa, 1000 K, expands in a reversible adiabatic process to 100 kPa. Calculate the final temperature and the work done during the process, using

a. Constant specific heat, value from Table A.5
b. The ideal gas tables, Table A.7

Solution:

C.V. Air.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

Process: ${}_1Q_2 = 0$, ${}_1S_{2\,gen} = 0$ => $s_2 = s_1$

a) Using constant Cp from Table A.5 gives the power relation Eq.6.23.

$$T_2 = T_1(P_2/P_1)^{\frac{k-1}{k}} = 1000\left(\frac{0.1}{1.5}\right)^{0.286} = \mathbf{460.9\ K}$$

${}_1W_2 = -(U_2 - U_1) = mC_{Vo}(T_1 - T_2)$

$= 1\ \text{kg} \times 0.717\ \text{kj/kg-K}\ (1000 - 460.9)\ \text{K} = \mathbf{386.5\ kJ}$

b) Use the tabulated **reduced pressure function** that includes variable heat capacity from A.7.2 so since $s_2 = s_1$ we have

$$P_{r2} = P_{r1} \times P_2/P_1 = 91.65 \times \frac{0.1}{1.5} = 6.11$$

Interpolation gives $T_2 = \mathbf{486\ K}$ and $u_2 = 349.4$ kJ/kg

${}_1W_2 = m(u_1 - u_2) = 1\ \text{kg}\ (759.2 - 349.4)\ \text{kJ/kg} = \mathbf{409.8\ kJ}$

Concept Problems

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.190E

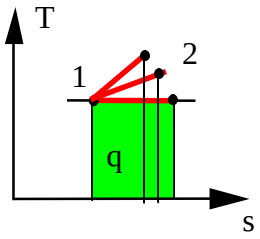
Water at 20 psia, 240 F receives 40 Btu/lbm in a reversible process by heat transfer. Which process changes s the most: constant T, constant v or constant P?

$$ds = \frac{dq}{T}$$

Look at the constant property lines in a T-s diagram, Fig. 6.5. The constant v line has a higher slope than the constant P line also at positive slope. Thus both the constant P and v processes have an increase in T. As T goes up the change in s is smaller for the same area (heat transfer) under the process curve in the T-s diagram as compared with the constant T process.

The constant T (isothermal) process therefore changes s the most.

In a reversible process the area below the process curve in the T-s diagram is the heat transfer.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.191E

Saturated water vapor at 20 psia is compressed to 60 psia in a reversible adiabatic process. Find the change in v and T.

Process adiabatic: $dq = 0$
Process reversible: $ds_{gen} = 0$
Change in s: $ds = dq/T + ds_{gen} = 0 + 0 = 0$ thus s is constant

Table F.7.2: $T_1 = 227.96$ F, $v_1 = 20.091$ ft^3/lbm, $s_1 = 1.732$ Btu/lbm R
Table F.7.2 at 60 psia and $s = s_1 = 1.732$ Btu/lbm R

$$T = 400 + 40 \frac{1.732 - 1.7134}{1.736 - 1.7134} = 400 + 40 \times 0.823 = \mathbf{432.9\ F}$$

$$v = 8.353 + (8.775 - 8.353) \times 0.823 = \mathbf{8.700\ ft^3/lbm}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Entropy, Clausius

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.192E

Consider the steam power plant in Problem 5.133E and show that this cycle satisfies the inequality of Clausius.

Solution:

Show Clausius: $\int \frac{dQ}{T} \leq 0$

For this problem we have two heat transfer terms:

Boiler: 1000 Btu/s at 1200 F = 1660 R

Condenser: 580 Btu/s at 100 F = 560 R

$$\int \frac{dQ}{T} = \frac{Q_H}{T_H} - \frac{Q_L}{T_L} = \frac{1000}{1660} - \frac{580}{560}$$

$$= 0.6024 - 1.0357 = \mathbf{-0.433\ Btu/s\ R < 0} \qquad \mathbf{OK}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.193E

Find the missing properties of P, v, s and x for ammonia, NH_3.

a. T = 190 F, P = 100 psia
b. T = 80 F, h = 650 Btu/lbm
c. T = 120 F, v = 1.6117 ft^3/lbm

a) Table F.8.1, $P < P_g$ = 708 psia, superheated vapor so x = undefined,

$v = (3.8804 + 4.0188)/2 = 3.9496$ ft^3/lbm

s = (1.3658 + 1.3834)/2 = 1.3746 Btu/lbm R

b) Table F.8.2 $h > h_g$ = 629.62 Btu/lbm so superheated vapor

x = undefined, found between 50 and 60 psia

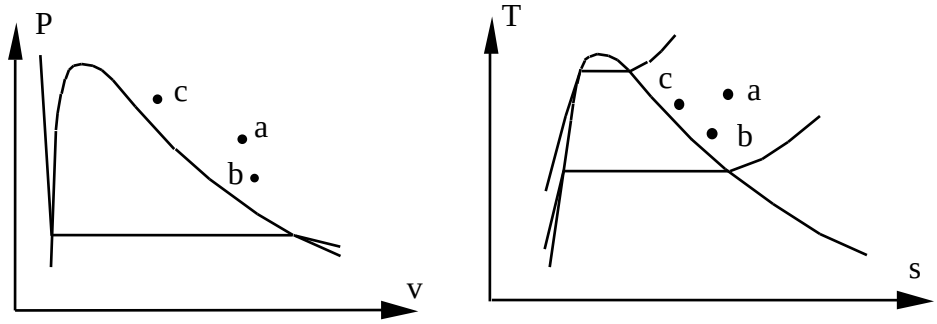
P = 50 + 10 (650 – 651.49)/(649.57 – 651.49) = 57.76 psia

$v = 6.5573 + 0.77604\ (5.4217 - 6.5573) = 5.676$ ft^3/lbm

s = 1.3588 + 0.77604 (1.3348 – 1.3588) = 1.3402 Btu/lbm R

c) Table F.8.1: $v > v_g = 1.0456$ ft^3/lbm so superheated vapor

Table F.8.2: x = undefined, P = 200 psia, s = 1.2052 Btu/lbm R



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.194E

Find the missing properties and give the phase of the substance

a. H_2O $s = 1.75$ Btu/lbm R, $T = 150$ F $h = ?$ $P = ?$ $x = ?$

b. H_2O $u = 1350$ Btu/lbm, $P = 1500$ lbf/in.^{2} $T = ?$ $x = ?$ $s = ?$

a) Table F.7.1: $s < s_g = 1.8683$ Btu/lbm-R, so 2 phase

$$P = P_{sat}(T) = 3.722 \text{ lbf/in.}^2$$

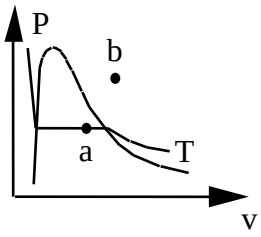
$$x = (s - s_f)/s_{fg} = (1.75 - 0.215)/1.6533 = 0.92845$$

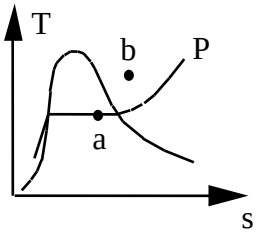
$$h = 117.95 + 0.92845 \times 1008.1 = 1053.9 \text{ Btu/lbm}$$

b) Table F.7.2, found between 1000 F and 1100 F, x = undefined,

T = 1000 + 100 (1350-1340.43)/(1387.16 – 1340.43) =1020.5 F,

s = 1.6001 + 0.2048 (1.6398 – 1.6001) =1.6083 Btu/lbm R





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.195E

Determine the missing property among P, T, s, and x for R-410A at:

a. T = -20 F, v = 3.1214 ft^3/lbm

b. T = 60 F, v = 0.3121 ft^3/lbm

c. P = 30 psia, s = 0.3425 Btu/lbm-R

a) F.9.1: $v > v_g = 1.4522$ ft^3/lbm =>

F.9.2 superheated vapor so x is undefined

very close to 20 psia, s = 0.2862 Btu/lbm-R

b) F.9.1: $0.01451 = v_f < v < v_g = 0.3221$ ft^3/lbm => Two-phase

$P = P_{sat} = 184.98$ psia

$$x = (v - v_f)/v_{fg} = \frac{0.3121 - 0.01451}{0.3076} = 0.96746$$

$s = s_f + x\, s_{fg} = 0.0744 + 0.96746 \times 0.1662 = 0.2352$ Btu/lbm-R

c) Table F.9.2 at 30 psia, $s > s_g$ so superheated vapor,

x is undefined, and we find the state at T = 160 F.

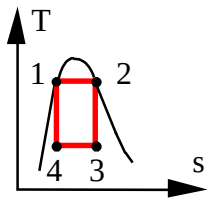
Reversible Processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.196E

In a Carnot engine with water as the working fluid, the high temperature is 500 F and as Q_L is received, the water changes from saturated liquid to saturated vapor. The water pressure at the low temperature is 14.7 lbf/in.^{2}. Find T_L, cycle thermal efficiency, heat added per pound-mass, and entropy, *s*, at the beginning of the heat rejection process.



Constant T $\Rightarrow$ constant P from 1 to 2 Table F.7.1

$q_H = \int T ds = T\,(s_2 - s_1) = T\, s_{fg}$

$= h_2 - h_1 = h_{fg} =$ **714.76 Btu/lbm**

States 3 & 4 are two-phase Table F.7.1

$\Rightarrow T_L = T_3 = T_4 =$ **212 F**

$$\eta_{cycle} = 1 - T_L/T_H = 1 - \frac{212 + 459.67}{500 + 459.67} = \mathbf{0.300}$$

Table F.8.1: $s_3 = s_2 = s_g(T_H) =$ **1.4335 Btu/lbm R**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.197E

Consider a Carnot-cycle heat pump with R-410A as the working fluid. Heat is rejected from the R-410A at 110 F, during which process the R-410A changes from saturated vapor to saturated liquid. The heat is transferred to the R-410A at 30 F.

a. Show the cycle on a *T–s* diagram.

b. Find the quality of the R-410A at the beginning and end of the isothermal heat addition process at 30 F.

c. Determine the coefficient of performance for the cycle.

a)

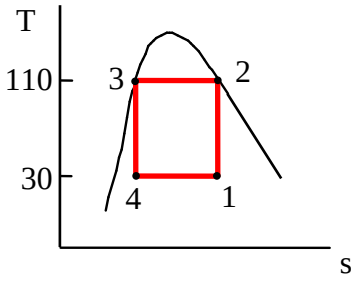


Table F.9.1

b) State 3 is saturated liquid

$s_4 = s_3 = 0.1115$ Btu/lbm R

$= 0.0526 + x_4(0.1955)$

$x_4 =$ **0.30128**

State 2 is saturated vapor

$s_1 = s_2 = 0.2261$ Btu/lbm R

$= 0.0526 + x_1(0.1955)$

$x_1 =$ **0.8875**

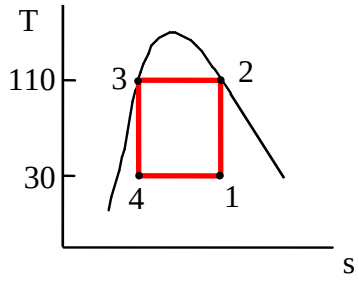
c) $\beta' = \dfrac{q_H}{w_{IN}} = \dfrac{T_H}{T_H - T_L} = \dfrac{569.67}{110 - 30} =$ **7.121** (depends only on the temperatures)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.198E

Do Problem 6.197E using refrigerant R-134a instead of R-410A.

a)



b) Table F.10.1

State 3 is saturated liquid

$s_4 = s_3 = 0.2882$ Btu/lbm R

$= 0.2375 + x_4(0.1749)$

$x_4 =$ **0.2899**

State 2 is saturated vapor

$s_1 = s_2 = 0.4087$ Btu/lbm R

$= 0.2375 + x_1(0.1749)$

$x_1 =$ **0.9788**

c) $$\beta' = \frac{q_H}{w_{IN}} = \frac{T_H}{T_H - T_L} = \frac{569.67}{110 - 30} =$$ **7.121**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.199E

R-410A at 150 psia and 140 F is expanded in a piston cylinder to 75 psia, 80 F in a reversible process. Find the sign for both the work and the heat transfer for this process.

Solution:

$_1w_2 = \int P\, dv$ so sign dv

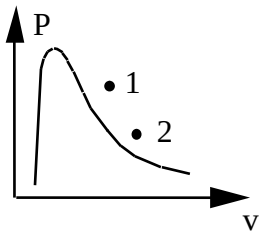
$_1q_2 = \int T\, ds$ so sign ds

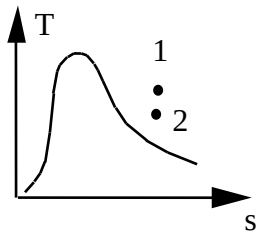
F.9.2 $v_1 = 0.5356$ ft^3/lbm $s_1 = 0.2859$ Btu/lbm-R

F.9.2 $v_2 = 0.9911$ ft^3/lbm $s_2 = 0.2857$ Btu/lbm-R

$dv > 0$ => **w is positive**

$ds < 0$ (≈ 0) => **q is negative (nearly zero)**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.200E

A piston/cylinder receives R-410A at 75 psia and compresses it in a reversible adiabatic process to 300 psia, 160 F. Find the initial temperature.

CV R-410A, this is a control mass

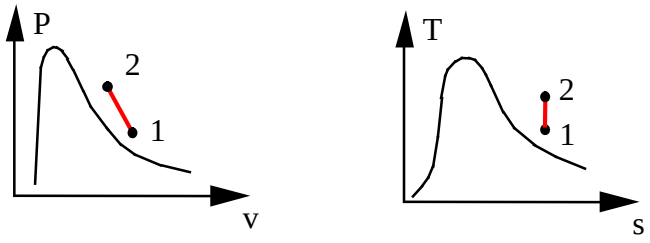
Energy Eq.3.5: $u_2 - u_1 = {}_1q_2 - {}_1w_2$

Entropy Eq.6.3: $s_2 - s_1 = \int dq/T = {}_1q_2 /T$

Process: Adiabatic and reversible $\Rightarrow$ ${}_1q_2 = 0$ so then $s_2 = s_1$

State 1: P_1, $s_1 = s_2 = 0.2673$ Btu/lbm-R =>

$$T_1 = 20 + (40 - 20) \times \frac{0.2673 - 0.2595}{0.2688 - 0.2595} = \mathbf{36.77\ F}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.201E

A piston/cylinder contains 1 lbm of water at 40 psia, 600 F and it now cools to 280 F in an isobaric process. The heat goes into a heat engine which rejects heat to the ambient at 77 F shown in Fig. P6.46 and the whole process is assumed reversible. Find the heat transfer out of the water and the work given out by the heat engine.

C.V. H_2O

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T + 0$

Process: $P = C \Rightarrow W = \int P\, dV = P(V_2 - V_1) = m\, P\, (v_2 - v_1)$

State 1: F.7.2 $s_1 = 1.8621$ Btu/lbm-R, $h_1 = 1333.43$ Btu/lbm

State 2: F.7.3 $s_2 = 1.6857$ Btu/lbm-R, $h_2 = 1176.59$ Btu/lbm

From the process equation and the energy equation

$${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = m(h_2 - h_1) = 1 \text{ lbm } (1176.59 - 1333.43) \text{ Btu/lbm}$$

$$= -\mathbf{156.84\ Btu}$$

CV Total

Energy Eq.3.5: $m(u_2 - u_1) = -Q_L - {}_1W_2 - W_{HE}$

Entropy Eq.6.3: $m(s_2 - s_1) = -Q_L/T_{amb} + 0$

$$Q_L = mT_{amb}(s_1 - s_2) = 1 \text{ lbm} \times 536.7 \text{ R} \times (1.8621 - 1.6857) \text{ Btu/lbmR}$$

$$= 94.67 \text{ Btu}$$

Now the energy equation for the heat engine gives

$$W_{HE} = -{}_1Q_2 - Q_L = 156.84 - 94.67 = \mathbf{62.17\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.202E

A cylinder fitted with a piston contains ammonia at 120 F, 20% quality with a volume of 60 in.^{3}. The ammonia expands slowly, and during this process heat is transferred to maintain a constant temperature. The process continues until all the liquid is gone. Determine the work and heat transfer for this process.

C.V. Ammonia in the cylinder.

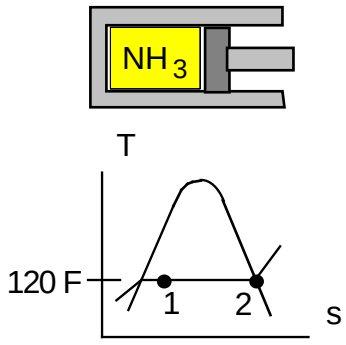
Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T + 0$

Process: T = constant to $x_2 = 1.0$, Table F.8.1: $P = 286.5$ lbf/in^2

$\Rightarrow W = \int P\, dV = P(V_2 - V_1) = m P (v_2 - v_1)$

$\Rightarrow \int dQ/T = {}_1Q_2 / T$



$T_1 = 120$ F, $x_1 = 0.20$, $V_1 = 60$ in^3

$v_1 = 0.02836 + 0.2 \times 1.0171 = 0.2318$ ft^3/lbm

$s_1 = 0.3571 + 0.2 \times 0.7829 = 0.5137$ Btu/lbm R,

$$m = V/v = \frac{60}{1728 \times 0.2318} = 0.15 \text{ lbm}$$

State 2: Saturated vapor,

$v_2 = 1.045$ ft^3/lbm, $s_2 = 1.140$ Btu/lbm R

$${}_1W_2 = \frac{286.5 \times 144}{778} \times 0.15 \times (1.045 - 0.2318) = \mathbf{6.47\ Btu}$$

From the entropy equation

$${}_1Q_2 = T\, m\, (s_2 - s_1)$$

$$= 579.7 \text{ R} \times 0.15 \text{ lbm} \times (1.1400 - 0.5137) \text{ Btu/lbm-R}$$

$$= \mathbf{54.46\ Btu}$$

- or - $h_1 = 178.79 + 0.2 \times 453.84 = 269.56$ Btu/lbm; $h_2 = 632.63$ Btu/lbm

$${}_1Q_2 = m(h_2 - h_1) = 0.15(632.63 - 269.56) = \mathbf{54.46\ Btu}$$

6.203E

One pound-mass of water at 600 F expands against a piston in a cylinder until it reaches ambient pressure, 14.7 lbf/in.^{2}, at which point the water has a quality of 90%. It may be assumed that the expansion is reversible and adiabatic.

a. What was the initial pressure in the cylinder?

b. How much work is done by the water?

Solution:

C.V. Water. Process: Rev., Q = 0

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = - {}_1W_2$

Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T$

Process: Adiabatic Q = 0 and reversible => $s_2 = s_1$

State 2: $P_2 = 14.7$ lbf/in^2, $x_2 = 0.90$ from Table F.7.1

$s_2 = 0.3121 + 0.9 \times 1.4446 = 1.6123$ Btu/lbm R

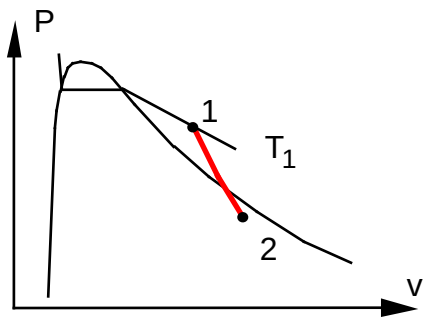
$u_2 = 180.1 + 0.9 \times 897.5 = 987.9$ Btu/lbm

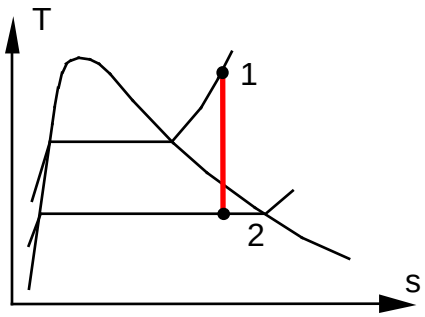
State 1 Table F.7.2: at $T_1 = 600$ F, $s_1 = s_2$

$\Rightarrow P_1 =$ **335 lbf/in^2** $u_1 = 1201.2$ Btu/lbm

From the energy equation

${}_1W_2 = m(u_1 - u_2) = 1$ lbm(1201.2 – 987.9) Btu/lbm = **213.3 Btu**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.204E

A closed tank, $V = 0.35$ ft^3, containing 10 lbm of water initially at 77 F is heated to 350 F by a heat pump that is receiving heat from the surroundings at 77 F. Assume that this process is reversible. Find the heat transfer to the water and the work input to the heat pump.

C.V.: Water from state 1 to state 2.

Process: constant volume (reversible isometric)

1: $v_1 = V/m = 0.35/10 = 0.035$ ft^3/lbm $\Rightarrow$ $x_1 = 2.692\times10^{-5}$

$u_1 = 45.11$ Btu/lbm, $s_1 = 0.08779$ Btu/lbm R

Continuity eq. (same mass) and constant volume fixes v_2

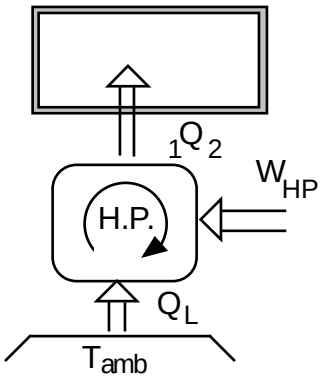
State 2: T_2, $v_2 = v_1 \Rightarrow x_2 = (0.035 - 0.01799) / 3.3279 = 0.00511$

$u_2 = 321.35 + 0.00511\times788.45 = 325.38$ Btu/lbm

$s_2 = 0.5033 + 0.00511\times1.076 = 0.5088$ Btu/lbm R

Energy eq. has zero work, thus provides heat transfer as

$$_1Q_2 = m(u_2 - u_1) = 10(325.38 - 45.11) = \mathbf{2802.7\ Btu}$$



Entropy equation for the total control volume gives for a reversible process:

$$m(s_2 - s_1) = Q_L/T_0$$

$\Rightarrow$

$$Q_L = mT_0(s_2 - s_1)$$

= 10 lbm (77 + 459.67)R (0.5088 - 0.08779) Btu/lbm-R

= 2259.4 Btu

and the energy equation for the heat pump gives

$$W_{HP} = {}_1Q_2 - Q_L = 2802.7 - 2259.4 = \mathbf{543.3\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.205E

A cylinder containing R-134a at 60 F, 30 lbf/in.^{2}, has an initial volume of 1 ft^3. A piston compresses the R-134a in a reversible, isothermal process until it reaches the saturated vapor state. Calculate the required work and heat transfer to accomplish this process.

Solution:

C.V. R-134a.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.:3.5 $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

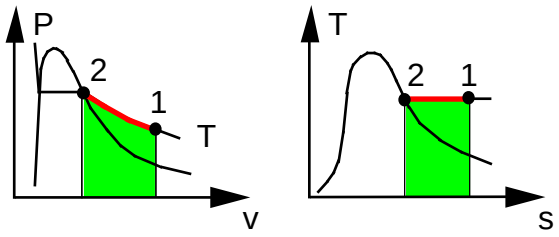
Entropy Eq.6.3: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

Process: T = constant, reversible so ${}_1S_{2\,gen} = 0$

State 1: (T, P) Table F.10.2 $u_1 = 168.41$ Btu/lbm, $s_1 = 0.4321$ Btu/lbm R

$m = V/v_1 = 1/1.7367 = 0.5758$ lbm

State 2: (60 F sat. vapor)
Table F.10.1
$u_2 = 166.28$ Btu/lbm,
$s_2 = 0.4108$ Btu/lbm R



As T is constant we can find Q by integration as

${}_1Q_2 = \int T ds = mT(s_2 - s_1) = 0.5758$ lbm $\times$ 519.7 R $\times$(0.4108 - 0.4321) Btu/lbm-R

= **-6.374 Btu**

The work is then from the energy equation

${}_1W_2 = m(u_1 - u_2) + {}_1Q_2 = 0.5758$ lbm $\times$ (168.41 – 166.28) Btu/lbm - 6.374 Btu

= **-5.15 Btu**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

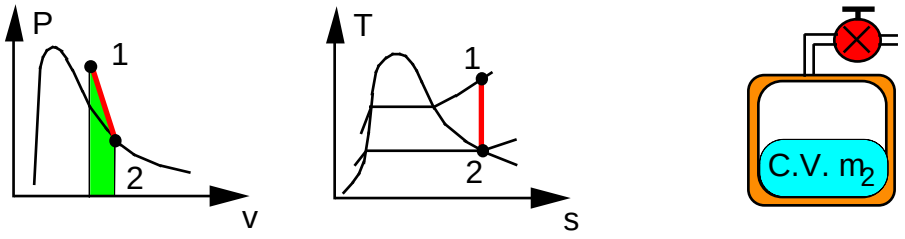
6.206E

A rigid, insulated vessel contains superheated vapor steam at 400 lbf/in.^{2}, 700 F. A valve on the vessel is opened, allowing steam to escape. It may be assumed that the steam remaining inside the vessel goes through a reversible adiabatic expansion. Determine the fraction of steam that has escaped, when the final state inside is saturated vapor.

C.V.: steam remaining inside tank. Rev. & Adiabatic (inside only)

Cont.Eq.: $m_2 = m_1 = m$; Energy Eq.: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = 0 + 0$



State 1: Table F.7.2 $v_1 = 1.6503$ ft^3/lbm, $s_1 = 1.6396$ Btu/lbm R

State 2: Table F.7.1 $s_2 = s_1 = 1.6396$ Btu/lbm R $= s_g$ at P_2

$\Rightarrow$ Interpolate in F.7.1 $P_2 = 63.861$ lbf/in^2, $v_2 = v_g = 6.800$ ft^3/lbm

$$\frac{m_e}{m_1} = \frac{m_1 - m_2}{m_1} = 1 - \frac{m_2}{m_1} = 1 - \frac{v_1}{v_2} = 1 - \frac{1.6503}{6.800} = \mathbf{0.757}$$

Entropy of a Liquid or Solid

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.207E

Two 5 lbm blocks of steel, one at 500 F the other at 80 F, come in thermal contact. Find the final temperature and the change in the entropy of the steel.

C.V. Both blocks, no external heat transfer, C = 0.11 Btu/lbm-R from Table F.2.

Energy Eq.: $U_2 - U_1 = m_A(u_2 - u_1)_A + m_B(u_2 - u_1)_B = 0 - 0$

$$= m_A C(T_2 - T_{A1}) + m_B C(T_2 - T_{B1})$$

$$T_2 = \frac{m_A T_{A1} + m_B T_{B1}}{m_A + m_B} = \frac{1}{2} T_{A1} + \frac{1}{2} T_{B1} = \mathbf{290\ F}$$

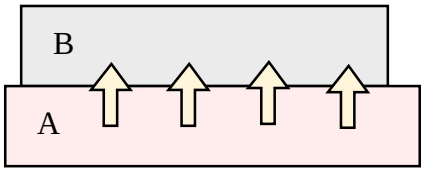
Entropy Eq.6.37: $S_2 - S_1 = m_A(s_2 - s_1)_A + m_B(s_2 - s_1)_B = {}_1S_{2\ \text{gen}}$

Entropy changes from Eq.6.11

$$S_2 - S_1 = m_A C \ln \frac{T_2}{T_{A1}} + m_B C \ln \frac{T_2}{T_{B1}}$$

$$= 5 \times 0.11 \ln \frac{290 + 459.67}{500 + 459.67} + 5 \times 0.11 \ln \frac{290 + 459.67}{80 + 459.67}$$

$$= -0.13583 + 0.18077 = \mathbf{0.0449\ Btu/R}$$



Heat transfer over a finite temperature difference is an irreversible process

6.208E

A foundry form box with 50 lbm of 400 F hot sand is dumped into a bucket with 2 ft^3 water at 60 F. Assuming no heat transfer with the surroundings and no boiling away of liquid water, calculate the net entropy change for the masses.

C.V. Sand and water, P = const.

Energy Eq.: $m_{sand}(u_2 - u_1)_{sand} + m_{H_2O}(u_2 - u_1)_{H_2O} = -P(V_2 - V_1)$

$$\Rightarrow m_{sand}\Delta h_{sand} + m_{H_2O}\Delta h_{H_2O} = 0, \qquad m_{H_2O} = \frac{2}{0.016035} = 124.73 \text{ lbm}$$

$$50 \text{ lbm} \times 0.19 \text{ Btu/lbm-R} \times (T_2 - 400 \text{ F})$$

$$+ \ 124.73 \text{ lbm} \times 1.0 \text{ Btu/lbm-R} \times (T_2 - 60 \text{ F}) = 0,$$

$$T_2 = 84 \text{ F}$$

$$S_2 - S_1 = m_{sand}(s_2 - s_1) + m_{H2O} (s_2 - s_1)$$

$$= m_{sand}\, C_{sand} \ln(T_2/T_1) + m_{H2O}\, C_{H2O} \ln(T_2/T_1)$$

$$= 50 \times 0.19 \times \ln\left(\frac{544}{860}\right) + 124.73 \times 1.0 \times \ln\left(\frac{544}{520}\right)$$

$$= \mathbf{1.293 \text{ Btu/R}}$$

Box holds the sand for form of the cast part

6.209E

Heat transfer to a block of 3 lbm ice at 15 F melts it to liquid at 50 F in a kitchen. Find the entropy change of the water.

Water changes state from nearly saturated solid to nearly saturated liquid. The pressure is 1 atm, but we approximate the state properties with saturated state at the same temperature.

State 1: Compressed (saturated) solid, F.7.4, $s_1 = -0.3093$ Btu/lbm-R

State 2: Compressed (saturated) liquid F.7.1 $s_2 = 0.0361$ Btu/lbm-R

The entropy change is

$$\Delta S = m(s_2 - s_1) = 3 \text{ lbm } [0.0361 - (-0.3093)] \text{ Btu/lbm-R}$$
$$= \mathbf{1.0362} \text{ Btu/R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.210E

A rigid tank of 1.2 lbm steel contains 1.5 lbm of R-134a at 100 F, 80 psia. The tank is placed in a refrigerator that brings it to 0 F. Find the process heat transfer and the combined steel and R-134a change in entropy.

C.V. The steel tank and the R-134a.

The energy equation, Eq. 3.5 now becomes (summing over the mass)

$$m_{st}\,(u_2 - u_1)_{st} + m_{R134a}\,(u_2 - u_1)_{R134a} = {}_1Q_2 - 0$$

Process: No change in volume so no work as used above.

Use specific heat from Table F.2 for steel and Table F.10 for R-134a

R-134a: $v_1 = 0.6617$ ft^3/lbm, $u_1 = 174.06$ Btu/lbm, $s_1 = 0.4252$ Btu/lbmR

State 2: $v_2 = v_1 < v_g \Rightarrow x_2 = (v_2 - v_f)/v_{fg} = \dfrac{0.6617 - 0.01187}{2.1340} = 0.304513$

$$u_2 = u_f + x_2\, u_{fg} = 75.88 + x_2 \times 82.24 = 100.923 \text{ Btu/lbm}$$

$$s_2 = s_f + x_2\, s_{fg} = 0.2178 + x_2 \times 0.1972 = 0.27785 \text{ Btu/lbmR}$$

Now the heat transfer from the energy equation

$${}_1Q_2 = m_{R134a}(u_2 - u_1)_{R134a} + m_{st}\, C_{st}\, (T_2 - T_1)$$

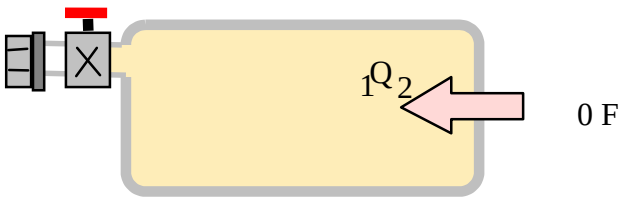
$$= 1.5 \times (100.923 - 174.06) + 1.2 \times 0.11\, (0 - 100) = \mathbf{-122.91\ Btu}$$

Steel: $m_{st}(s_2 - s_1)_{st} = m_{st} C_{st} \ln(T_2/T_1) = 1.2 \times 0.11 \ln \dfrac{459.7}{559.7} = -0.02598$ Btu/lbmR

Entropy change for the total control volume steel and R-134a

$$S_2 - S_1 = m_{st}\,(s_2 - s_1)_{st} + m_{R134a}\,(s_2 - s_1)_{R134a}$$

$$= -0.02598 + 1.5(0.27785 - 0.4252) = \mathbf{-0.247\ Btu/R}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.211E

A 5-lbm aluminum radiator holds 2 lbm of liquid R-134a at 10 F. The setup is brought indoors and heated with 220 Btu. Find the final temperature and the change in entropy of all the mass.

Solution:

C.V. The aluminum radiator and the R-134a.

Energy Eq.3.5: $m_2u_2 - m_1u_1 = {}_1Q_2 - 0$

Process: No change in volume so no work as used above.

The energy equation now becomes (summing over the mass)

$$m_{al}\,(u_2 - u_1)_{al} + m_{R134a}\,(u_2 - u_1)_{R134a} = {}_1Q_2$$

Use specific heat from Table F.2 and F.3

$$m_{al}C_{al}\,(T_2 - T_1) + m_{R134a}C_{R134a}\ln(T_2 - T_1) = {}_1Q_2$$

$$T_2 - T_1 = {}_1Q_2 / [m_{al}C_{al} + m_{R134a}C_{R134a}]$$

$$= 220 / [5 \times 0.215 + 2 \times 0.34] = 125 \text{ F}$$

$$T_2 = 10 + 125 = 135 \text{ F}$$

Entropy change for solid (F.2) and liquid (F.3) from Eq.6.11

$$S_2 - S_1 = m_{al}\,(s_2 - s_1)_{al} + m_{R134a}\,(s_2 - s_1)_{R134a}$$

$$= m_{al}C_{al}\ln(T_2/T_1) + m_{R134a}C_{R134a}\ln(T_2/T_1)$$

$$= (5 \times 0.215 + 2 \times 0.34)\ln\frac{(135 + 459.67)}{10 + 459.67}$$

$$= \mathbf{0.414\ Btu/R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.212E

Four pounds of liquid lead at 750 F are poured into a form. It then cools at constant pressure down to room temperature at 68 F as heat is transferred to the room. The melting point of lead is 620 F and the enthalpy change between the phases h_{if} is 10.6 Btu/lbm. The specific heats are in Table F.2 and F.3. Calculate the net entropy change for the lead.

Solution:

C.V. Lead, constant pressure process

$$m_{Pb}(u_2 - u_1)_{Pb} = {}_1Q_2 - P(V_2 - V_1)$$

We need to find changes in enthalpy (u + Pv) for each phase separately and then add the enthalpy change for the phase change.

$$C_{liq} = 0.038 \text{ Btu/lbm R}, \quad C_{sol} = 0.031 \text{ Btu/lbm R}$$

Consider the process in several steps:

Cooling liquid to the melting temperature

Solidification of the liquid to solid

Cooling of the solid to the final temperature

$${}_1Q_2 = m_{Pb}(h_2 - h_1) = m_{Pb}(h_2 - h_{620,sol} - h_{if} + h_{620,f} - h_{750})$$

$$= 4 \times [0.031 \times (68 - 620) - 10.6 + 0.038 \times (620 - 750)]$$

$$= -68.45 - 42.4 - 19.76 = -130.61 \text{ Btu}$$

$$S_2 - S_1 = m_{Pb}[C_{p\,sol}\ln(T_2/1079.7) - (h_{if}/1079.7) + C_{P\,liq}\ln(1079.7/T_1)]$$

$$= 4 \times \left[0.031 \ln \frac{527.7}{1079.7} - \frac{10.6}{1079.7} + 0.038 \ln \frac{1079.6}{1209.7}\right] = \mathbf{-0.145\ Btu/R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Entropy of Ideal Gases

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.213E

Air inside a rigid tank is heated from 550 to 600 R. Find the entropy increase $s_2 - s_1$? What if it is from 2300 to 2350 R?

Process: V = C $\rightarrow {}_1W_2 = Ø$

Entropy change from Eq.6.17:

a) $s_2 - s_1 = C_{vo} \ln \left(\frac{T_2}{T_1}\right) = 0.171 \ln \left(\frac{600}{550}\right) =$ **0.015 Btu/lbm-R**

b) $s_2 - s_1 = C_{vo} \ln \left(\frac{T_2}{T_1}\right) = 0.171 \ln \left(\frac{2350}{2300}\right) =$ **0.00368 Btu/lbm-R**

From F.5:

case a) $C_v \approx \Delta u / \Delta T = 6.868/40 = 0.1717$ Btu/lbm-R, see F.4 (0.171)

case b) $C_v \approx \Delta u / \Delta T = 21.53/100 = 0.215$ Btu/lbm-R (25 % higher)
so result should have been 0.00463 Btu/lbm-R

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.214E

R-410A at 60 psia is brought from 60 F to 240 F in a constant pressure process. Evaluate the change in specific entropy using Table F.9 and using ideal gas with C_p = 0.1935 Btu/lbmR.

Table F.9.2 s_1 = 0.2849 Btu/lbm-R, s_2 = 0.3496 Btu/lbm-R

$s_2 - s_1 = 0.3496 - 0.2849 =$ **0.0647 Btu/lbm-R**

Eq. 6.16: $s_2 - s_1 \approx C_{po} \ln \frac{T_2}{T_1} = 0.1935 \ln \frac{240 + 460}{60 + 460} =$ **0.0575 Btu/lbm-R**

Two explanations for the difference are as the average temperature is higher than 77 F we could expect a higher value of the specific heat and secondly it is not an ideal gas (if you calculate Z = Pv/RT = 0.94).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.215E

Oxygen gas in a piston/cylinder at 500 R and 1 atm with a volume of 1 ft^3 is compressed in a reversible adiabatic process to a final temperature of 1000 R. Find the final pressure and volume using constant heat capacity from Table F.4 and repeat with Table F.6.

Solution:

C.V. Air. Assume a reversible, adiabatic process.

Energy Eq.3.5: $u_2 - u_1 = 0 - {}_1w_2$;

Entropy Eq.6.37: $s_2 - s_1 = \int dq/T + {}_1s_{2\ gen} = 0$

Process: Adiabatic ${}_1q_2 = 0$ Reversible ${}_1s_{2\ gen} = 0$

Properties: Table F.4: k = 1.393

With these two terms zero we have a zero for the entropy change. So this is a constant s (isentropic) expansion process. From Eq.6.23

$$P_2 = P_1(T_2 / T_1)^{\frac{k}{k-1}} = 14.7\ (1000/500)^{3.5445} = \mathbf{171.5\ psia}$$

Using the ideal gas law to eliminate P from this equation leads to Eq.6.24

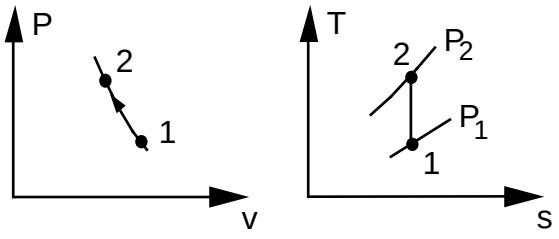
$$V_2 = V_1(T_2 / T_1)^{\frac{1}{1-k}} = 1 \times \left(\frac{1000}{500}\right)^{\frac{1}{1-1.393}} = \mathbf{0.171\ ft^3}$$

Using the ideal gas tables F.6 we get

$$s_2 - s_1 = s^o_{T2} - s^o_{T1} - R \ln(P_2/P_1) \quad \text{or} \quad P_2 = P_1 \exp[(s^o_{T2} - s^o_{T1})/R]$$

$$P_2 = 14.7\ \text{psia} \times \exp[(53.475 - 48.4185)/1.98589] = \mathbf{187.55\ psia}$$

$$V_2 = V_1\ (T_2 / T_1)(P_1/P_2) = 1\ ft^3 \times \frac{1000}{500} \times \frac{14.7}{187.55} = \mathbf{0.157\ ft^3}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.216E

A handheld pump for a bicycle has a volume of 2 in.^{3} when fully extended. You now press the plunger (piston) in while holding your thumb over the exit hole so an air pressure of 45 lbf/in.^{2} is obtained. The outside atmosphere is at P_o, T_o. Consider two cases: (1) it is done quickly (~1 s), and (2) it is done slowly (~1 h).

a. State assumptions about the process for each case.

b. Find the final volume and temperature for both cases.

Solution:

C.V. Air in pump. Assume that both cases result in a reversible process.

State 1: P_0, T_0 State 2: 45 lbf/in.^{2}, ?

One piece of information must resolve the ? for a state 2 property.

Case I) Quickly means no time for heat transfer

$Q = 0$, so a reversible adiabatic compression.

$$u_2 - u_1 = -{}_1w_2 \ ; \quad s_2 - s_1 = \int dq/T + {}_1s_{2\ gen} = \emptyset$$

With constant s and constant heat capacity we use Eq.6.23

$$T_2 = T_1(P_2 / P_1)^{\frac{k-1}{k}} = 536.7 \left(\frac{45}{14.696}\right)^{\frac{0.4}{1.4}} = \mathbf{738.9\ R}$$

Use ideal gas law $PV = mRT$ at both states so ratio gives

$$\Rightarrow \quad V_2 = P_1V_1T_2/T_1P_2 = \mathbf{0.899\ in^3}$$

Case II) Slowly, time for heat transfer so T = constant = T_0.

The process is then a reversible isothermal compression.

$$T_2 = T_0 = \mathbf{536.7\ R} \quad \Rightarrow \quad V_2 = V_1P_1/P_2 = \mathbf{0.653\ in^3}$$

6.217E

A piston/cylinder contains air at 2500 R, 2200 lbf/in.^{2}, with V_1 = 1 in.^{3}, A_{cyl} = 1 in.^{2} as shown in Fig. P6.92. The piston is released and just before the piston exits the end of the cylinder the pressure inside is 30 lbf/in.^{2}. If the cylinder is insulated, what is its length? How much work is done by the air inside?

Solution:

C.V. Air, Cylinder is insulated so adiabatic, Q = 0.

Continuity Eq.: $m_2 = m_1 = m$,

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = - {}_1W_2$

Entropy Eq.6.14: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = 0 + {}_1S_{2\,gen}$

State 1: (T_1, P_1) State 2: $(P_2, ?)$

So one piece of information is needed for the ?, assume reversible process.

$${}_1S_{2\,gen} = 0 \quad \Rightarrow \quad s_2 - s_1 = 0$$

State 1: Table F.5: u_1 = 474.33 Btu/lbm, s°_{T1} = 2.03391 Btu/lbm R

$$m = P_1V_1/RT_1 = \frac{2200 \times 1.0}{53.34 \times 2500 \times 12} = 1.375 \times 10^{-3} \text{ lbm}$$

State 2: P_2 and from Entropy eq.: $s_2 = s_1$ so from Eq.6.19

$$s^\circ_{T2} = s^\circ_{T1} + R \ln \frac{P_2}{P_1} = 2.03391 + \frac{53.34}{778} \ln(\frac{30}{2200}) = 1.73944 \text{ Btu/lbm R}$$

Now interpolate in Table F.5 to get T_2

$$T_2 = 840 + 40\ (1.73944 - 1.73463)/(1.74653 - 1.73463) = 816.2 \text{ R}$$

$$u_2 = 137.099 + (144.114 - 137.099)\ 0.404 = 139.93 \text{ Btu/lbm}$$

$$V_2 = V_1 \frac{T_2\, P_1}{T_1 P_2} = \frac{1 \times 816.2 \times 2200}{2500 \times 30} = \mathbf{23.94\ in^3}$$

$$\Rightarrow \quad L_2 = V_2 / A_{cyl} = 23.94/1 = \mathbf{23.94\ in}$$

$${}_1W_2 = m(u_1 - u_2) = 1.375 \times 10^{-3}(474.33 - 139.93) = \mathbf{0.46\ Btu}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.218E

A 25-ft^3 insulated, rigid tank contains air at 110 lbf/in.^{2}, 75 F. A valve on the tank is opened, and the pressure inside quickly drops to 15 lbf/in.^{2}, at which point the valve is closed. Assuming that the air remaining inside has undergone a reversible adiabatic expansion, calculate the mass withdrawn during the process.

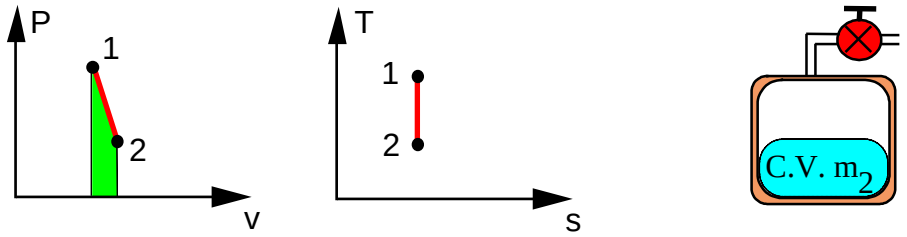
C.V.: Air remaining inside tank, m_2.

Cont.Eq.: $m_2 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen}$

Process: adiabatic ${}_1Q_2 = 0$ and reversible ${}_1S_{2\ gen} = 0$



Entropy eq. then gives $s_2 = s_1$ and ideal gas gives the relation in Eq.6.23

$$T_2 = T_1(P_2/P_1)^{\frac{k-1}{k}} = 535\ R\ (15/110)^{0.286} = 302.6\ R$$

$$m_1 = P_1V/RT_1 = 110\ psia \times 144\ \frac{in^2}{ft^2} \times 25\ ft^3/(53.34\ \frac{ft\text{-}lbf}{lbm\text{-}R} \times 535\ R)$$

$$= 13.88\ lbm$$

$$m_2 = P_2V/RT_2 = 15\ psia \times 144\ \frac{in^2}{ft^2} \times 25\ ft^3/(53.34\ \frac{ft\text{-}lbf}{lbm\text{-}R} \times 302.6\ R)$$

$$= 3.35\ lbm$$

$m_e = m_1 - m_2 =$ **10.53 lbm**

Polytropic Processes

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.219E

A cylinder/piston contains 0.1 lbm methane gas at 15 psia, 70 F. The gas is compressed reversibly to a pressure of 120 psia. Calculate the work required if the process is adiabatic.

Solution:

C.V. Methane gas of constant mass $m_2 = m_1 = m$ and reversible process.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.3 (37): $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\ gen} = \int dQ/T$

Process: ${}_1Q_2 = 0 \quad => \quad s_2 = s_1$

thus isentropic process s = const and ideal gas gives relation in Eq.6.23

$$T_2 = T_1 (P_2/P_1)^{\frac{k-1}{k}} = 529.7\ R \left(\frac{120}{15}\right)^{0.230} = 854.6\ R$$

${}_1W_2 = -mC_{V0}(T_2 - T_1) = -0.1\ lbm \times 0.415\ Btu/lbm\text{-}R\ (854.6 - 529.7)\ R$

$= \mathbf{-13.48\ Btu}$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.220E

Helium in a piston/cylinder at 70 F, 20 psia is brought to 720 R in a reversible polytropic process with exponent n = 1.25. You may assume helium is an ideal gas with constant specific heat. Find the final pressure and both the specific heat transfer and specific work.

Solution:

C.V. Helium, control mass. C_v = 0.744 Btu/lbm R, R = 386 ft lbf/ lbm R

Process $Pv^n = C$ & $Pv = RT$ => $Tv^{n-1} = C$

From the process equation and T_1 = 70 + 460 = 530 R, T_2 = 720 R

$T_1 v^{n-1} = T_2 v^{n-1}$ => $v_2 / v_1 = (T_1 / T_2)^{1/n-1} = 0.2936$

$P_2 / P_1 = (v_1 / v_2)^n = 4.63$ => P_2 = **69.4 lbf/in.^{2}**

The work is from Eq.6.29 per unit mass

$$ {}_1w_2 = \int P\, dv = \int C\, v^{-n}\, dv = \frac{1}{1-n}(P_2 v_2 - P_1 v_1) = \frac{R}{1-n}(T_2 - T_1) $$

$$ = \frac{386}{778 \times (-0.25)} \text{ Btu/lbm-R } (720 - 530) \text{ R} = \mathbf{-377\ Btu/lbm} $$

The heat transfer follows from the energy equation

$$ {}_1q_2 = u_2 - u_1 + {}_1w_2 = C_v (T_2 - T_1) + {}_1w_2 $$

$$ = 0.744(720 - 530) + (-377) = \mathbf{-235.6\ Btu/lbm} $$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

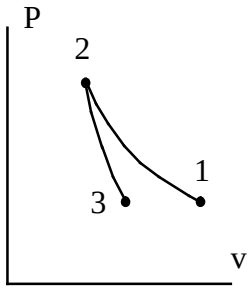
6.221E

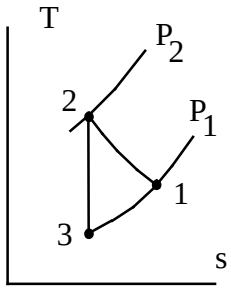
A cylinder/piston contains air at ambient conditions, 14.7 lbf/in.^{2} and 70 F with a volume of 10 ft^3. The air is compressed to 100 lbf/in.^{2} in a reversible polytropic process with exponent, $n = 1.2$, after which it is expanded back to 14.7 lbf/in.^{2} in a reversible adiabatic process.

a. Show the two processes in *P–v* and *T–s* diagrams.

b. Determine the final temperature and the net work.

a)





$$m = P_1V_1/RT_1 = \frac{14.7 \times 144 \times 10}{53.34 \times 529.7} = 0.7492 \text{ lbm}$$

b) The process equation is expressed in Eq.6.28

$$T_2 = T_1(P_2/P_1)^{\frac{n-1}{n}} = 529.7\left(\frac{100}{14.7}\right)^{0.167} = 729.6 \text{ R}$$

The work is from Eq.6.29

$$_1w_2 = \int_1^2 Pdv = \frac{P_2v_2 - P_1v_1}{1 - n} = \frac{R(T_2 - T_1)}{1 - n} = \frac{53.34(729.6 - 529.7)}{778(1 - 1.20)}$$

$$= -68.5 \text{ Btu/lbm}$$

Isentropic relation is from Eq.6.23

$$T_3 = T_2(P_3/P_2)^{\frac{k-1}{k}} = 729.7 \text{ R}\left(\frac{14.7}{100}\right)^{0.286} = \mathbf{421.6\ R}$$

With zero heat transfer the energy equation gives the work

$$_2w_3 = C_{V0}(T_2 - T_3) = 0.171(729.6 - 421.6) = +52.7 \text{ Btu/lbm}$$

$$w_{NET} = 0.7492(-68.5 + 52.7) = \mathbf{-11.8\ Btu}$$

Entropy Generation

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.222E

Consider a heat transfer of 100 Btu from 2400 R hot gases to a steel container at 1200 R which has a heat transfer of the 100 Btu out to some air at 600 R. Determine the entropy generation in each of the control volumes indicated in Fig. P6.115.

There is no change in energy or entropy in the indicated control volumes, so no storage effect. There is a transfer of energy in and out of each CV and an associated transfer of entropy.

Take CV1
Energy Eq.:

$0 = Q - Q$

Entropy Eq.:

$$0 = \frac{Q}{T_H} - \frac{Q}{T_M} + S_{gen\ CV1}$$

$$S_{gen\ CV1} = \frac{Q}{T_M} - \frac{Q}{T_H}$$

$$= \frac{100}{1200} - \frac{100}{2400} = \mathbf{0.0417\ Btu/R}$$

Take CV2
Energy Eq.:

$0 = Q - Q$

Entropy Eq.:

$$0 = \frac{Q}{T_M} - \frac{Q}{T_L} + S_{gen\ CV2}$$

$$S_{gen\ CV2} = \frac{Q}{T_L} - \frac{Q}{T_M}$$

$$= \frac{100}{600} - \frac{100}{1200} = \mathbf{0.083\ Btu/R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.223E

A computer chip dissipates 2 Btu of electric work over time and rejects that as heat transfer from its 125 F surface to 70 F air. How much entropy is generated in the chip? How much if any is generated outside the chip?

C.V.1 Chip with surface at 125 F, we assume chip state is constant.

Energy: $U_2 - U_1 = 0 = {}_1Q_2 - {}_1W_2 = W_{electrical\ in} - Q_{out\ 1}$

Entropy: $S_2 - S_1 = 0 = -\dfrac{Q_{out\ 1}}{T_{surf}} + {}_1S_{2\ gen1}$

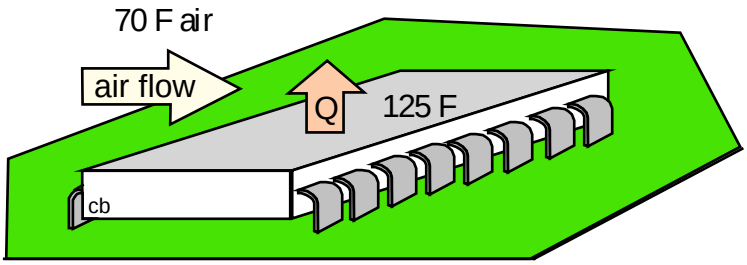
$${}_1S_{2\ gen1} = \frac{Q_{out\ 1}}{T_{surf}} = \frac{W_{electrical\ in}}{T_{surf}} = \frac{2\ Btu}{(125 + 459.7)\ R} = \mathbf{0.0034\ Btu/R}$$

C.V.2 From chip surface at 125 F to air at 70 F, assume constant state.

Energy: $U_2 - U_1 = 0 = {}_1Q_2 - {}_1W_2 = Q_{out\ 1} - Q_{out\ 2}$

Entropy: $S_2 - S_1 = 0 = \dfrac{Q_{out1}}{T_{surf}} - \dfrac{Q_{out2}}{T_{air}} + {}_1S_{2\ gen2}$

$${}_1S_{2\ gen2} = \frac{Q_{out2}}{T_{air}} - \frac{Q_{out1}}{T_{surf}} = \frac{2\ Btu}{529.7\ R} - \frac{2\ Btu}{584.7\ R} = \mathbf{0.000\ 36\ Btu/R}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.224E

An insulated cylinder/piston contains R-134a at 150 lbf/in.^{2}, 120 F, with a volume of 3.5 ft^3. The R-134a expands, moving the piston until the pressure in the cylinder has dropped to 15 lbf/in.^{2}. It is claimed that the R-134a does 180 Btu of work against the piston during the process. Is that possible?

Solution:

C.V. R-134a in cylinder. Insulated so assume Q = 0.

State 1: Table F.10.2, $v_1 = 0.3332$ ft^3/lbm, $u_1 = 175.33$ Btu/lbm,

$s_1 = 0.41586$ Btu/lbm R, $m = V_1/v_1 = 3.5/0.3332 = 10.504$ lbm

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = \emptyset - 180 \Rightarrow$

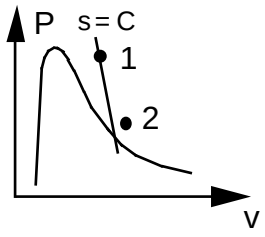
$u_2 = u_1 - {}_1W_2/m = 158.194$ Btu/lbm

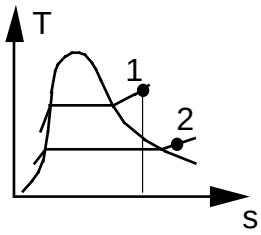
State 2: P_2 , $u_2 \Rightarrow$ Table F.10.2: $T_2 = -2$ F ; $s_2 = 0.422$ Btu/lbm R

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2,gen} = {}_1S_{2,gen}$

${}_1S_{2,gen} = m(s_2 - s_1) = 10.504\ (0.422 - 0.41586) =$ **0.0645 Btu/R**

This is **possible since** ${}_1S_{2\ gen} > \emptyset$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.225E

Heat transfer from a 70 F kitchen to a block of 3 lbm ice at 15 F melts it to liquid at 50 F. Find the entropy generation.

Water changes state from nearly saturated solid to nearly saturated liquid. The pressure is 1 atm, but we approximate the state properties with saturated state at the same temperature.

CV Ice out to the 20°C kitchen air

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2 = {}_1Q_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_0 + {}_1S_{2\,gen}$

State 1: Compressed (saturated) solid, F.7.4,

$u_1 = -151.75$ Btu/lbm, $s_1 = -0.3093$ Btu/lbm-R

State 2: Compressed (saturated) liquid F.7.1

$u_2 = 38.09$ Btu/lbm, $s_2 = 0.0746$ Btu/lbm-R

Heat transfer from the energy Eq.

${}_1Q_2 = m(u_2 - u_1) = 3\,[38.09 - (-151.75)] = 569.52$ Btu

From the entropy Eq.

${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T_0$

$= 3\,[0.0746 - (-0.3093)] - 569.52/529.7 =$ **0.0765 Btu/R**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.226E

A mass and atmosphere loaded piston/cylinder contains 4 lbm of water at 500 lbf/in.^{2}, 200 F. Heat is added from a reservoir at 1200 F to the water until it reaches 1200 F. Find the work, heat transfer, and total entropy production for the system and surroundings.

Solution:

C.V. Water out to surroundings at 1200 F. This is a control mass.

Energy Eq.3.5: $U_2 - U_1 = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{res} + {}_1S_{2\,gen}$

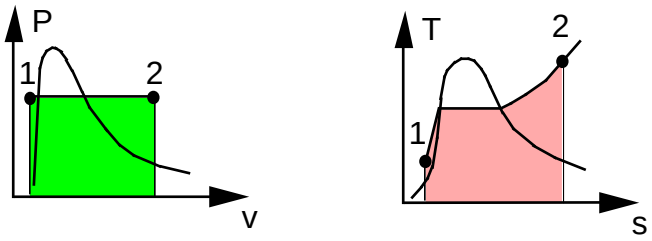
Process: P = constant so ${}_1W_2 = P(V_2 - V_1) = mP(v_2 - v_1)$

State 1: Table F.7.3, $v_1 = 0.01661$ ft^3/lbm

$h_1 = 169.18$ Btu/lbm, $s_1 = 0.2934$ Btu/lbm R

State 2: Table F.7.2, $v_2 = 1.9518$ ft^3/lbm, $h_2 = 1629.8$ Btu/lbm,

$s_2 = 1.8071$ Btu/lbm R



Work is found from the process (area in P-V diagram)

$${}_1W_2 = mP(v_2 - v_1) = 4 \times 500(1.9518 - 0.01661)\frac{144}{778} = \mathbf{716.37\ Btu}$$

The heat transfer from the energy equation is

$${}_1Q_2 = U_2 - U_1 + {}_1W_2 = m(u_2 - u_1) + mP(v_2 - v_1) = m(h_2 - h_1)$$

$${}_1Q_2 = 4(1629.8 - 169.18) = \mathbf{5842.48\ Btu}$$

Entropy generation from entropy equation (Eq.6.37)

$${}_1S_{2\,gen} = m(s_2 - s_1) - \frac{{}_1Q_2}{T_{res}} = 4(1.8071 - 0.2934) - \frac{5842.48}{1659.67} = \mathbf{2.535\ Btu/R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.227E

A 1 gallon jug of milk at 75 F is placed in your refrigerator where it is cooled down to the refrigerators inside temperature of 40 F. Assume the milk has the properties of liquid water and find the entropy generated in the cooling process.

Solution:

C.V. Jug of milk. Control mass at constant pressure.

Continuity Eq.: $m_2 = m_1 = m$;

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

State 1: Table F.7.1: $v_1 \cong v_f = 0.01606$ ft^3/lbm, $h_1 = h_f = 43.085$ Btu/lbm;

$s_f = 0.08395$ Btu/lbm R

State 2: Table F.7.1: $h_2 = h_f = 8.01$ Btu/lbm, $s_2 = s_f = 0.0162$ Btu/lbm R

Process: P = constant = 14.7 psia => ${}_1W_2 = mP(v_2 - v_1)$

$V_1 = 1$ Gal = 231 in^3 => $m = 231 / 0.01606 \times 12^3 = 8.324$ lbm

Substitute the work into the energy equation and solve for the heat transfer

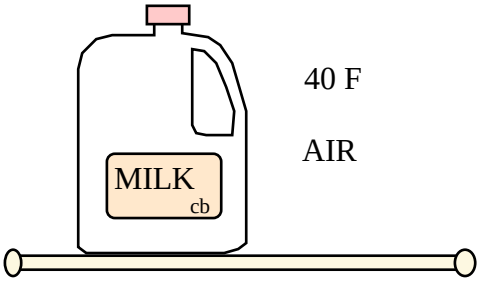
${}_1Q_2 = m(h_2 - h_1) = 8.324$ lbm (8.01 - 43.085) Btu/lbm = -292 Btu

The entropy equation gives the generation as

${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T_{refrig}$

$= 8.324\,(0.0162 - 0.08395) - (-292 / 500)$

$= -0.564 + 0.584 =$ **0.02 Btu/R**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.228E

A cylinder/piston contains water at 30 lbf/in.^{2}, 400 F with a volume of 1 ft^3. The piston is moved slowly, compressing the water to a pressure of 120 lbf/in.^{2}. The loading on the piston is such that the product *PV* is a constant. Assuming that the room temperature is 70 F, show that this process does not violate the second law.

Solution:

C.V.: Water + cylinder out to room at 70 F

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = {}_1Q_2 / T_{room} + {}_1S_{2\ gen}$

Process: $PV = \text{constant} = Pmv \Rightarrow v_2 = P_1v_1/P_2$

$${}_1w_2 = \int Pdv = P_1v_1 \ln(v_2/v_1)$$

State 1: Table B.1.3, $v_1 = 16.891$ ft^3/lbm, $u_1 = 1144$ Btu/lbm,

$s_1 = 1.7936$ Btu/lbm R

State 2: P_2 , $v_2 = P_1v_1/P_2 = 30 \times 16.891/120 = 4.223$ ft^3/lbm

Table F.7.3: $T_2 = 425.4$ F, $u_2 = 1144.4$ Btu/lbm, $s_2 = 1.6445$ Btu/lbmR

$${}_1w_2 = 30 \times 16.891 \times \frac{144}{778} \ln\left(\frac{4.223}{16.891}\right) = -130.0 \text{ Btu}$$

$${}_1q_2 = u_2 - u_1 + {}_1w_2 = 1144.4 - 1144 - 130 = -129.6 \text{ Btu/lbm}$$

$${}_1s_{2,gen} = s_2 - s_1 - \frac{{}_1q_2}{T_{room}} = 1.6445 - 1.7936 + \frac{129.6}{529.67}$$

$= 0.0956$ Btu/lbm R > 0 **satisfies entropy equation.**

6.229E

One pound mass of ammonia (NH_3) is contained in a linear spring-loaded piston/cylinder as saturated liquid at 0 F. Heat is added from a reservoir at 225 F until a final condition of 200 lbf/in.^{2}, 160 F is reached. Find the work, heat transfer, and entropy generation, assuming the process is internally reversible.

Solution:

C.V. = NH_3 out to the reservoir.

Continuity Eq.: $m_2 = m_1 = m$

Energy Eq.3.5: $E_2 - E_1 = m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $S_2 - S_1 = \int dQ/T + {}_1S_{2,gen} = {}_1Q_2/T_{res} + {}_1S_{2,gen}$

Process: $P = A + BV$ linear in V =>

$${}_1W_2 = \int P\, dV = \frac{1}{2}(P_1 + P_2)(V_2 - V_1) = \frac{1}{2}(P_1 + P_2)m(v_2 - v_1)$$

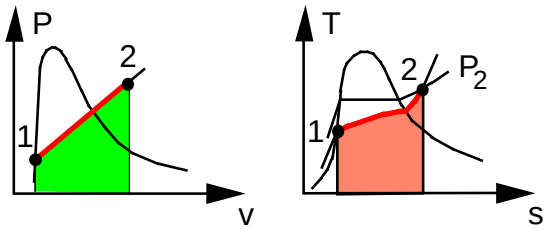
State 1: Table F.8.1

$P_1 = 30.4$ psia,

$v_1 = 0.0242$ ft^3/lbm

$u_1 = 42.46$ Btu/lbm,

$s_1 = 0.0967$ Btu/lbm R



State 2: Table F.8.2 sup. vap.

$v_2 = 1.7807$ ft^3/lbm, $u_2 = 677.36$ Btu/lbm,

$s_2 = 1.2514$ Btu/lbm R

${}_1W_2 = \frac{1}{2}(30.4 + 200)1(1.7807 - 0.0242)\times 144/778 =$ **37.45 Btu**

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 1(677.36 - 42.46) + 37.45 =$ **672.35 Btu**

$$S_{gen} = m(s_2 - s_1) - {}_1Q_2/T_{res} = 1(1.2514 - 0.0967) - \frac{672.35}{684.7} = \textbf{0.173 Btu/R}$$

6.230E

A hollow steel sphere with a 2-ft inside diameter and a 0.1-in. thick wall contains water at 300 lbf/in.^{2}, 500 F. The system (steel plus water) cools to the ambient temperature, 90 F. Calculate the net entropy change of the system and surroundings for this process.

C.V.: Steel + water out to ambient T_0. This is a control mass.

Energy Eq.: $U_2 - U_1 = {}_1Q_2 - {}_1W_2 = m_{H_2O}(u_2 - u_1) + m_{steel}(u_2 - u_1)$

Entropy Eq.: $S_2 - S_1 = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_0 + {}_1S_{2\,gen}$

Process: V = constant $\Rightarrow$ ${}_1W_2 = 0$

$$V_{steel} = \frac{\pi}{6}\left[2.0083^3 - 2^3\right] = 0.0526 \text{ ft}^3$$

$$m_{steel} = (\rho V)_{steel} = 490 \times 0.0526 = 25.763 \text{ lbm}$$

$V_{H_2O} = \pi/6 \times 2^3 = 4.189 \text{ ft}^3$, $m_{H_2O} = V/v = 2.372$ lbm

$v_2 = v_1 = 1.7662 = 0.016099 + x_2 \times 467.7 \quad \Rightarrow \quad x_2 = 3.74\times10^{-3}$

$u_2 = 61.745$ Btu/lbm, $s_2 = 0.1187$ Btu/lbm R

${}_1Q_2 = \Delta U_{steel} + \Delta U_{H_2O} = (mC)_{steel}(T_2 - T_1) + m_{H_2O}(u_2 - u_1)$

$= 25.763 \times 0.107(90-500) + 2.372(61.74 - 1159.5)$

$= -1130 - 2603.9 = -3734$ Btu

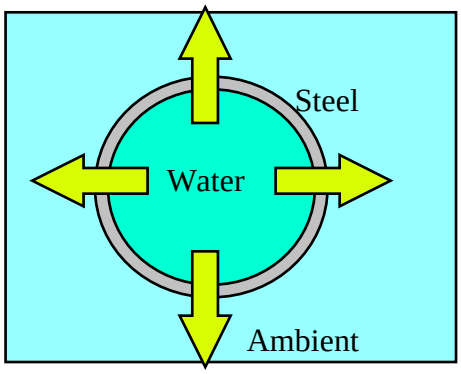
$S_2 - S_1 = m_{steel}(s_2 - s_1) + m_{H_2O}(s_2 - s_1) = 25.763 \times 0.107 \times \ln(550/960)$

$+ 2.372(0.1187 - 1.5701) = -4.979$ Btu/R

$\Delta S_{SUR} = -Q_{12}/T_0 = 3734/549.67 = 6.793$ Btu/R

${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_0 = \Delta S_{SYS} + \Delta S_{SUR}$

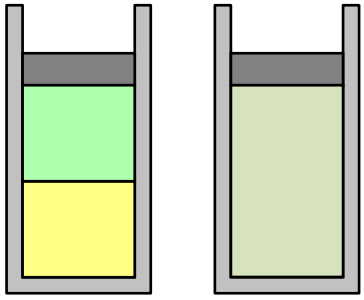
$= -4.979 + 6.793 =$ **1.814 Btu/R**



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.231E

One lbm of air at 540 R is mixed with two lbm air at 720 R in a process at a constant 15 psia and Q = 0. Find the final T and the entropy generation in the process.



C.V. All the air.

Energy Eq.: $U_2 - U_1 = 0 - W$

Entropy Eq.: $S_2 - S_1 = 0 + {}_1S_{2\ gen}$

Process Eq.: $P = C; \quad W = P(V_2 - V_1)$

Substitute W into energy Eq.

$$U_2 - U_1 + W = U_2 - U_1 + P(V_2 - V_1) = H_2 - H_1 = 0$$

Due to the low T let us use constant specific heat

$$H_2 - H_1 = m_A(h_2 - h_1)_A + m_B(h_2 - h_1)_B$$
$$= m_A C_p(T_2 - T_{A1}) + m_B C_p(T_2 - T_{B1}) = 0$$

$$T_2 = \frac{m_A T_{A1} + m_B T_{B1}}{m_A + m_B} = \frac{1}{3} T_{A1} + \frac{2}{3} T_{B1} = \mathbf{660\ R}$$

Entropy change is from Eq. 6.16 with no change in P and Table F.4 for C_p

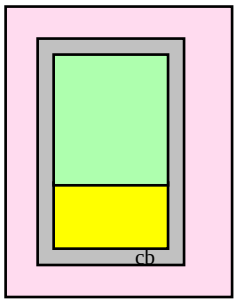
$${}_1S_{2\ gen} = S_2 - S_1 = m_A C_p \ln \frac{T_2}{T_{A1}} + m_B C_p \ln \frac{T_2}{T_{B1}}$$
$$= 1 \times 0.24 \ln \frac{660}{540} + 2 \times 0.24 \ln \frac{660}{720}$$
$$= 0.0482 - 0.0418 = \mathbf{0.0064\ Btu/R}$$

Remark: If you check the volume does not change and there is no work.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.232E

One lbm of air at 15 psia is mixed with two lbm air at 30 psia, both at 540 R, in a rigid insulated tank. Find the final state (P, T) and the entropy generation in the process.



C.V. All the air.

Energy Eq.: $U_2 - U_1 = 0 - 0$

Entropy Eq.: $S_2 - S_1 = 0 + {}_1S_{2\,gen}$

Process Eqs.: $V = C$; $W = 0$, $Q = 0$

States A1, B1: $u_{A1} = u_{B1}$

$V_A = m_A RT_1/P_{A1}$; $V_B = m_B RT_1/P_{B1}$

$U_2 - U_1 = m_2u_2 - m_Au_{A1} - m_Bu_{B1} = 0 \Rightarrow u_2 = (u_{A1} + 2u_{B1})/3 = u_{A1}$

State 2: $\mathbf{T_2 = T_1 = 540\ R}$ (from u_2); $m_2 = m_A + m_B = 3$ kg;

$V_2 = m_2RT_1/P_2 = V_A + V_B = m_ART_1/P_{A1} + m_BRT_1/P_{B1}$

Divide with m_ART_1 and get

$$3/P_2 = 1/P_{A1} + 2/P_{B1} = \frac{1}{15} + \frac{2}{30} = 0.133\ \text{psia}^{-1} \Rightarrow P_2 = \mathbf{22.5\ psia}$$

Entropy change from Eq. 6.16 with the same T, so only P changes

$${}_1S_{2\,gen} = S_2 - S_1 = -m_AR \ln \frac{P_2}{P_{A1}} - m_BR \ln \frac{P_2}{P_{B1}}$$

$$= -1 \times 53.34 \left[\ln \frac{22.5}{15} + 2 \ln \frac{22.5}{30} \right]$$

$$= -53.34\ (0.4055 - 0.5754) = \mathbf{9.06\ lbf\text{-}ft/R = 0.0116\ Btu/R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.233E

A rigid container with volume 7 ft^3 is divided into two equal volumes by a partition. Both sides contain nitrogen, one side is at 300 $lbf/in.^2$, 400 F, and the other at 30 $lbf/in.^2$, 200 F. The partition ruptures, and the nitrogen comes to a uniform state at 160 F. Assume the temperature of the surroundings is 68 F, determine the work done and the net entropy change for the process.

Solution:

C.V.: A + B Control mass no change in volume => $\mathbf{{}_1W_2 = 0}$

$m_{A1} = P_{A1}V_{A1}/RT_{A1} = 300\times144\times 3.5 /(55.15 \times 859.7) = 3.189$ lbm

$m_{B1} = P_{B1}V_{B1}/RT_{B1} = 30\times144\times 3.5 / (55.15\times 659.7) = 0.416$ lbm

$P_2 = m_{TOT}RT_2/V_{TOT} = 3.605 \times 55.15 \times 619.7/(144 \times 7) = 122.2$ lbf/in^2

From Eq.6.16

$$S_2 - S_1 = m_{A1}\,(s_2 - s_1)_{A1} + m_{B1}\,(s_2 - s_1)_{B1}$$

$$= 3.189\,[0.249 \ln\frac{619.7}{859.7} - \frac{55.15}{778}\ln\frac{122.2}{300}]$$

$$+ 0.416\,[0.249 \ln\frac{619.7}{659.7} - \frac{55.15}{778}\ln\frac{122.2}{30}]$$

$$= -0.0569 - 0.0479 = -0.1048 \text{ Btu/R}$$

$${}_1Q_2 = m_{A1}(u_2 - u_1) + m_{B1}(u_2 - u_1)$$

$$= 3.189 \times 0.178(160 - 400) + 0.416 \times 0.178(160 - 200) = -139.2 \text{ Btu}$$

From Eq.6.37

$${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_0 = -0.1048 \text{ Btu/R} + 139.2 \text{ Btu}/ 527.7 \text{ R}$$

$$= +\mathbf{0.159\ Btu/R}$$

6.235E

Do Problem 6.234E using Table F.5.

C.V. Air and Steel.

Energy Eq.: $U_2 - U_1 = m_{air}(u_2 - u_1) + m_{st}(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m_{air}\,(s_2 - s_1) + m_{st}(s_2 - s_1) = {}_1Q_2/T_{source} + {}_1S_{2\,gen}$

Process: $P = C \Rightarrow {}_1W_2 = \int_1^2 PdV = P\,(V_2 - V_1) = P\,m_{air}\,(v_2 - v_1)$

${}_1Q_2 = m_{air}(u_2 - u_1)_{air} + m_{st}(u_2 - u_1)_{st} + {}_1W_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$

Use air tables F.5: $(h_2 - h_1)_{air} = 674.421 - 129.18 = 545.24$ Btu/lbm

$(s_2 - s_1)_{air} = 2.04517 - 1.63979 + 0 = 0.40538$ Btu/lbmR

No pressure correction as $P_2 = P_1$

Use F.2: $(u_2 - u_1)_{st} = C(T_2 - T_1) = 0.11$ Btu/lbm-R $\times$ (2600 – 540) R

$= 226.6$ Btu/lbm

${}_1Q_2 = m_{air}(h_2 - h_1)_{air} + m_{st}(u_2 - u_1)_{st}$

$= 1$ lbm $\times$ 545.24 Btu/lbm + 2 lbm $\times$ 226.6 Btu/lbm = **998.44 Btu**

$S_2 - S_1 = m_{air}\,(s_2 - s_1) + m_{st}(s_2 - s_1)$

$= 0.40538 + 2$ lbm $\times$ 0.11 kJ/kgK $\times \ln \dfrac{2600}{540} = 0.75115$ Btu/lbm

${}_1S_{2\,gen} = S_2 - S_1 - {}_1Q_2/T_{source} = 0.75115 - 998.44/2800 =$ **0.395 Btu/R**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.236E

Nitrogen at 90 lbf/in.^{2}, 260 F is in a 20 ft^3 insulated tank connected to a pipe with a valve to a second insulated initially empty tank of volume 10 ft^3. The valve is opened and the nitrogen fills both tanks. Find the final pressure and temperature and the entropy generation this process causes. Why is the process irreversible?

CV Both tanks + pipe + valve Insulated : Q = 0 Rigid: W = 0

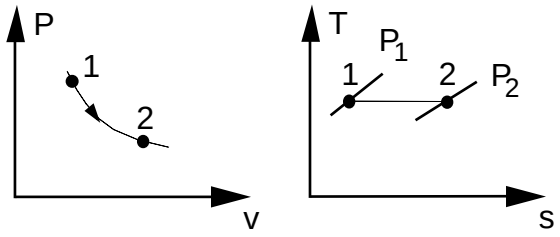
Energy Eq.3.5: $m(u_2 - u_1) = 0 - 0 \quad \Rightarrow \quad u_2 = u_1 = u_{a1}$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1S_{2\,gen} \quad (dQ = 0)$

State 1: P_1 , T_1 , V_a => Ideal gas

$m = PV/RT = (90 \times 20 \times 144)/ (55.15 \times 720) = 6.528$ lbm

State 2: $V_2 = V_a + V_b$; uniform final state $v_2 = V_2 / m$; $u_2 = u_{a1}$



Ideal gas u (T) => $u_2 = u_{a1}$ => $T_2 = T_{a1}$ = **720 R**

$P_2 = mR\ T_2 / V_2 = (V_1 / V_2)\ P_1 = (2/3) \times 90 =$ **60 lbf/in.^{2}**

From entropy equation and Eq.6.19 for entropy change

$S_{gen} = m(s_2 - s_1) = m\ (s_{T2}^o - s_{T1}^o - R \ln (P_2 / P_1)$

$= m\ (0 - R \ln (P_2 / P_1) = -6.528 \times 55.15 \times (1/778) \ln 2/3$

= **0.187 Btu/R**

Irreversible due to unrestrained expansion in valve P ↓ but no work out.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

If not a uniform final state then flow until $P_{2b} = P_{2a}$ and valve is closed.

Assume no Q between A and B

$m_{a2} + m_{b2} = m_{a1}$; $m_{a2} v_{a2} + m_{b2} v_{b2} = m_{a1} v_{a1}$

$m_{a2} s_{a2} + m_{b2} s_{b2} - m_{a1} s_{a1} = 0 + {}_1S_{2\,gen}$

Now we must assume m_{a2} went through rev adiabatic expansion

1) $V_2 = m_{a2} v_{a2} + m_{b2} v_{b2}$; 2) $P_{b2} = P_{a2}$;

3) $s_{a2} = s_{a1}$; 4) Energy eqs.

4 Eqs 4 unknowns : P_2 , T_{a2} , T_{b2} , $x = m_{a2} / m_{a1}$

$V_2 / m_{a1} = x\, v_{a2} + (1 - x)\, v_{b2} = x \times (R\, T_{a2} / P_2) + (1 - x)\, (R\, T_{b2} / P_2)$

Energy Eq.: $m_{a2} (u_{a2} - u_{a1}) + m_{b2} (u_{b2} - u_{a1}) = 0$

$x\, C_v (T_{a2} - T_{a1}) + (1 - x)\, C_v (T_{b2} - T_{a1}) = 0$

$x\, T_{a2} + (1 - x) T_{b2} = T_{a1}$

Vol constraint: $P_2 V_2 / m_{a1} R = x\, T_{a2} + (1 - x)\, T_{b2} = T_{a1}$

$P_2 = m_{a1} R\, T_{a1} / V_2 = m_{a1} R\, T_{a1} / (1.5 V_{a1}) = 2/3\, P_{a1}$ = **60 lbf/in.^{2}**

$s_{a2} = s_{a1}$ => $T_{a2} = T_{a1} (P_2 / P_{a1})^{k-1 / k} = 720 \times (2/3)^{0.2857}$ = **641.24 R**

Now we have final state in A

$v_{a2} = R\, T_{a2} / P_2 = 4.0931$ ft/lbm; $m_{a2} = V_a / v_{a2} = 4.886$ lbm

$x = m_{a2} / m_{a1} = 0.7485$ $m_{b2} = m_{a1} - m_{a2} = 1.642$ lbm

Substitute into energy equation

$T_{b2} = (T_{a1} - x\, T_{a2}) / (1 - x) = 954.4$ R

${}_1S_{2\,gen} = m_{b2} (s_{b2} - s_{a1}) = m_{b2} [C_p \ln (T_{b2} / T_{a1}) - R \ln (P_2 / P_{a1})]$

$= 1.642 [0.249 \ln (954.4/720) - (55.15/778) \ln (2/3)]$

= **0.1624 Btu/R**

Comment: This shows less entropy generation as the mixing part is out compared with the previous solution.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.237E

A cylinder/piston contains carbon dioxide at 150 lbf/in.^{2}, 600 F with a volume of 7 ft^3. The total external force acting on the piston is proportional to V^3. This system is allowed to cool to room temperature, 70 F. What is the total entropy generation for the process?

C.V. Carbon dioxide gas of constant mass $m_2 = m_1 = m$ out to ambient.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_{amb} + {}_1S_{2\,gen}$

Process: $P = CV^3$ or PV^{-3} = constant, which is polytropic with n = -3

State 1: $P_1 = 150$ lbf/in^2, $T_1 = 600$ F = 1060 R, $V_1 = 7$ ft^3 Ideal gas

$$m = \frac{P_1V_1}{RT_1} = \frac{150 \times 144 \times 7}{35.10 \times 1060} = 4.064 \text{ lbm}$$

Process: $P = CV^3$ or PV^{-3} = const. polytropic with n = -3.

$$P_2 = P_1(T_2/T_1)^{\frac{n}{n-1}} = 150\left(\frac{530}{1060}\right)^{0.75} = 89.2 \text{ lbf/in}^2$$

$$\& \; V_2 = V_1(T_1/T_2)^{\frac{1}{n-1}} = V_1 \times \frac{P_1}{P_2} \times \frac{T_2}{T_1} = 7 \times \frac{150}{89.2} \times \frac{530}{1060} = 5.886$$

$${}_1W_2 = \int PdV = \frac{P_2V_2 - P_1V_1}{1 - n} = \frac{(89.2 \times 5.886 - 150 \times 7)}{1 + 3} \times \frac{144}{778} = -24.3 \text{ Btu}$$

$${}_1Q_2 = 4.064 \times 0.158 \times (530 - 1060) - 24.3 = -346.6 \text{ Btu}$$

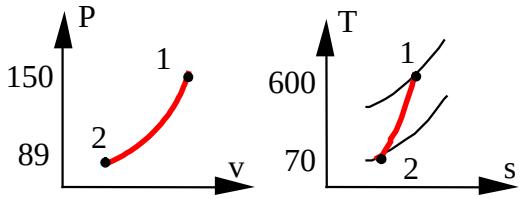
$$m(s_2 - s_1) = 4.064 \times \left[0.203 \times \ln\left(\frac{530}{1060}\right) - \frac{35.10}{778}\ln\left(\frac{89.2}{150}\right)\right] = -0.4765 \text{ Btu/R}$$

$$\Delta S_{SURR} = -{}_1Q_2/T_{amb} = 364.6 / 530 = +0.6879 \text{ Btu/R}$$

From Eq.6.37 or 6.39

$${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T_{amb} = \Delta S_{NET} = \Delta S_{CO2} + \Delta S_{SURR}$$

$$= -0.4765 \text{ Btu/R} + 0.6879 \text{ Btu/R} = \mathbf{+0.2114 \; Btu/R}$$



Notice:
n = -3, k = 1.3

n < k

6.238E

A cylinder/piston contains 4 ft^3 of air at 16 lbf/in.^{2}, 77 F. The air is compressed in a reversible polytropic process to a final state of 120 lbf/in.^{2}, 400 F. Assume the heat transfer is with the ambient at 77 F and determine the polytropic exponent *n* and the final volume of the air. Find the work done by the air, the heat transfer and the total entropy generation for the process.

Solution:

C.V. Air of constant mass $m_2 = m_1 = m$ out to ambient.

Energy Eq.3.5: $m(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.37: $m(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = {}_1Q_2/T_0 + {}_1S_{2\,gen}$

Process: $Pv_1^{\,n} = P_2v_2^{\,n}$ Eq.6.27

State 1: (T_1, P_1) State 2: (T_2, P_2)

Thus the unknown is the exponent n.

$m = (P_1V_1)/(RT_1) = (16 \times 4 \times 144)/(53.34 \times 537) = 0.322$ lbm

The relation from the process and ideal gas is in Eq.6.28

$$T_2/T_1 = (P_2/P_1)^{\frac{n-1}{n}} \quad \Rightarrow \quad \frac{n-1}{n} = \ln(T_2 / T_1) / \ln(P_2 / P_1) = 0.2337$$

n = 1.305, $V_2 = V_1(P_1/P_2)^{1/n} = 4 \times (16/20)1/1.305 =$ **0.854 ft^3**

$${}_1W_2 = \int PdV = \frac{P_2V_2 - P_1V_1}{1 - n}$$

$= [(120 \times 0.854 - 16 \times 4)\,(144 / 778)\,] / (1 - 1.305) =$ **-23.35 Btu / lbm**

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = mC_v(T_2 - T_1) + {}_1W_2$

$= 0.322 \times 0.171 \times (400 - 77) - 23.35 =$ **-5.56 Btu / lbm**

$s_2 - s_1 = C_p \ln(T_2 / T_1) - R \ln(P_2 / P_1)$

$= 0.24 \ln (860/537) - (53.34/778) \ln (120/16) = -0.0251$ Btu/lbm R

${}_1S_{2\,gen} = m(s_2 - s_1) - {}_1Q_2/T_0$

$= 0.322 \times (-0.0251) + (5.56/537) =$ **0.00226 Btu/R**

6.239E

A room at 72 F is heated electrically with 1500 W to keep steady temperature. The outside ambient is at 40 F. Find the flux of S (= $\dot{Q}/T$) into the room air, into the ambient and the rate of entropy generation.

CV. The room and walls out to the ambient T, we assume steady state

Energy Eq.: $0 = \dot{W}_{el\ in} - \dot{Q}_{out}$ => $\dot{Q}_{out} = \dot{W}_{el\ in} = 1500$ W

Entropy Eq.: $0 = -\dot{Q}_{out}/T + \dot{S}_{gen\ tot}$

Flux of S into room air at 22°C: $\dot{Q}/T = 1500 / 531.7 = 2.82$ W/R

Flux of S into ambient air at 5°C: $\dot{Q}/T = 1500 / 499.7 = 3.0$ W/R

Entropy generation: $\dot{S}_{gen\ tot} = \dot{Q}_{out}/T = 1500 / 499.7 =$ **3.0 W/R**

Comment: The flux of S into the outside air is what leaves the control volume and since the control volume did not receive any S it was all made in the process. Notice most of the generation is done in the heater, the room heat loss process generates very little S (3.0 – 2.82 = 0.18 W/R)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.240E

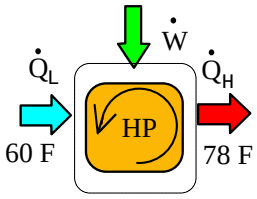
A heat pump with COP = 4 uses 1 kW of power input to heat a 78 F room, drawing energy from the outside at 60 F. Assume the high/low temperatures in the HP are 120 F/32 F. Find the total rates of entropy in and out of the heat pump, the rate from the outside at 60 F and to the room at 78 F.

Solution:

C.V.TOT.

Energy Eq.: $\dot{Q}_L + \dot{W} = \dot{Q}_H$

Entropy Eq.: $0 = \dfrac{\dot{Q}_L}{T_L} - \dfrac{\dot{Q}_H}{T_H} + \dot{S}_{gen\ CV\ tot}$



From definition of COP: $\dot{Q}_H = COP\ \dot{W} = 4 \times 1\ kW = 4\ kW$

From energy equation: $\dot{Q}_L = \dot{Q}_H - \dot{W} = (4 - 1)\ kW = 3\ kW$

Flux into heat pump at 32 F: $\dfrac{\dot{Q}_L}{T_{L\text{-}HP}} = \dfrac{3}{491.7}\dfrac{kW}{R} =$ **0.0061 kW/R**

Flux out of heat pump at 120 F: $\dfrac{\dot{Q}_H}{T_{H\text{-}HP}} = \dfrac{4}{579.7}\dfrac{kW}{R} =$ **0.0069 kW/R**

Flux out into room at T_H = 78 F: $\dfrac{\dot{Q}_H}{T_H} = \dfrac{4}{537.7}\dfrac{kW}{R} =$ **0.00744 kW/R**

Flux from outside at 60 F: $\dfrac{\dot{Q}_L}{T_L} = \dfrac{3}{519.7}\dfrac{kW}{R} =$ **0.00577 kW/R**

Comment: Following the flow of energy notice how the flux from the outside at 60 F grows a little when it arrives at 32 F this is due to entropy generation in the low T heat exchanger. The flux out of the heat pump at 120 F is larger than the flux in which is due to entropy generation in the heat pump cycle (COP is smaller than Carnot COP) and finally this flux increases due to entropy generated in the high T heat exchanger as the energy arrives at room T.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.241E

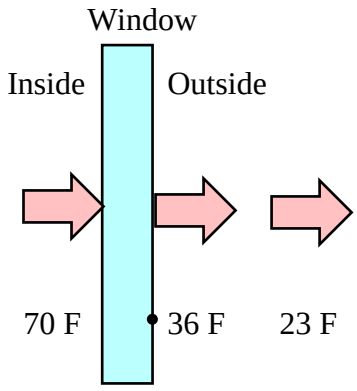
A window receives 800 Btu/h of heat transfer at the inside surface of 70 F and transmits the 800 Btu/h from its outside surface at 36 F continuing to ambient air at 23 F. Find the flux of entropy at all three surfaces and the window's rate of entropy generation.

Flux of entropy: $\dot{S} = \dfrac{\dot{Q}}{T}$

$$\dot{S}_{inside} = \frac{800}{529.7}\frac{Btu}{h\text{-}R} = 1.51 \text{ Btu/h-R}$$

$$\dot{S}_{win} = \frac{800}{495.7}\frac{Btu}{h\text{-}R} = 1.614 \text{ Btu/h-R}$$

$$\dot{S}_{amb} = \frac{800}{482.7}\frac{Btu}{h\text{-}R} = 1.657 \text{ Btu/h-R}$$



Window only: $\dot{S}_{gen\ win} = \dot{S}_{win} - \dot{S}_{inside} = 1.614 - 1.51 =$ **0.104 Btu/h-R**

If you want to include the generation in the outside air boundary layer where T changes from 36 F to the ambient 23 F then it is

$$\dot{S}_{gen\ tot} = \dot{S}_{amb} - \dot{S}_{inside} = 1.657 - 1.51 = 0.147 \text{ Btu/h-R}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.242E

A farmer runs a heat pump using 2.5 hp of power input. It keeps a chicken hatchery at a constant 86 F while the room loses 20 Btu/s to the colder outside ambient at 50 F. What is the rate of entropy generated in the heat pump? What is the rate of entropy generated in the heat loss process?

Solution:

C.V. Hatchery, steady state.

Power: $\dot{W}$ = 2.5 hp = 2.5 2544.4 / 3600 = 1.767 Btu/s

To have steady state at 86 F for the hatchery

Energy Eq.: $0 = \dot{Q}_H - \dot{Q}_{Loss} \quad \Rightarrow \quad \dot{Q}_H = \dot{Q}_{Loss} = 20$ Btu/s

C.V. Heat pump, steady state

Energy eq.: $0 = \dot{Q}_L + \dot{W} - \dot{Q}_H \quad \Rightarrow \quad \dot{Q}_L = \dot{Q}_H - \dot{W} = 18.233$ Btu/s

Entropy Eq.: $0 = \dfrac{\dot{Q}_L}{T_L} - \dfrac{\dot{Q}_H}{T_H} + \dot{S}_{gen\ HP}$

$$\dot{S}_{gen\ HP} = \frac{\dot{Q}_H}{T_H} - \frac{\dot{Q}_L}{T_L} = \frac{20}{545.7} - \frac{18.233}{509.7} = \mathbf{0.000\ 878\ \frac{Btu}{s\ R}}$$

C.V. From hatchery at 86 F to the ambient 50 F. This is typically the walls and the outer thin boundary layer of air. Through this goes $\dot{Q}_{Loss}$.

Entropy Eq.: $0 = \dfrac{\dot{Q}_{Loss}}{T_H} - \dfrac{\dot{Q}_{Loss}}{T_{amb}} + \dot{S}_{gen\ walls}$

$$\dot{S}_{gen\ walls} = \frac{\dot{Q}_{Loss}}{T_{amb}} - \frac{\dot{Q}_{Loss}}{T_H} = \frac{20}{509.7} - \frac{20}{545.7} = \mathbf{0.00259\ \frac{Btu}{s\ R}}$$

6.243E

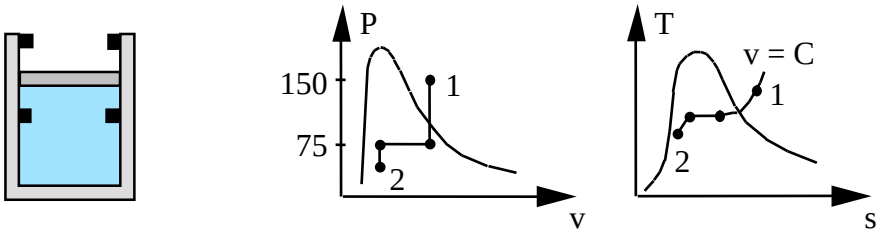
Water in a piston/cylinder is at 150 lbf/in.^{2}, 900 F, as shown in Fig. P6.177. There are two stops, a lower one at which V_{min} = 35 ft^3 and an upper one at V_{max} = 105 ft^3. The piston is loaded with a mass and outside atmosphere such that it floats when the pressure is 75 lbf/in.^{2}. This setup is now cooled to 210 F by rejecting heat to the surroundings at 70 F. Find the total entropy generated in the process.

C.V. Water.

State 1: Table F.7.2 $v_1 = 5.3529$ ft^3/lbm, $u_1 = 1330.2$ btu/lbm,

$s_1 = 1.8381$ Btu/lbm

$m = V/v_1 = 105/5.353 = 19.615$ lbm



State 2: 210 F and on line in P-v diagram.

Notice the following: $v_g(P_{float}) = 5.818$ ft^3/lbm, $v_{bot} = V_{min}/m = 1.7843$

$T_{sat}(P_{float}) = 307.6$ F, $T_2 < T_{sat}(P_{float}) \Rightarrow V_2 = V_{min}$

State 2: 210 F, $v_2 = v_{bot} \Rightarrow x_2 = (1.7843 - 0.0167)/27.796 = 0.06359$

$u_2 = 178.1 + 0.06359 \times 898.9 = 235.26$ btu/lbm,

$s_2 = 0.3091 + 0.06359 \times 1.4507 = 0.4014$ btu/lbm R

Now we can do the work and then the heat transfer from the energy equation

$${}_1W_2 = \int PdV = P_{float}(V_2 - V_1) = 75(35 - 105)\frac{144}{778} = -971.72 \text{ Btu}$$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 19.615(235.26 - 1330.2) - 971.72 = -22449$ Btu

Take C.V. total out to where we have 70 F:

$m(s_2 - s_1) = {}_1Q_2/T_0 + S_{gen} \Rightarrow$

$$S_{gen} = m(s_2 - s_1) - {}_1Q_2/T_0 = 19.615(0.4014 - 1.8381) + \frac{22449}{529.67}$$

$= \mathbf{14.20\ Btu/R}$ ($= \Delta S_{water} + \Delta S_{sur}$)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.244E

A cylinder/piston contains 5 lbm of water at 80 lbf/in.^{2}, 1000 F. The piston has cross-sectional area of 1 ft^2 and is restrained by a linear spring with spring constant 60 lbf/in. The setup is allowed to cool down to room temperature due to heat transfer to the room at 70 F. Calculate the total (water and surroundings) change in entropy for the process.

State 1: Table F.7.2 $v_1 = 10.831$ ft^3/lbm, $u_1 = 1372.3$ btu/lbm,

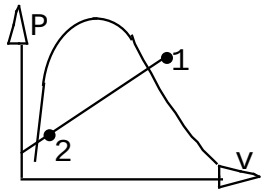
$s_1 = 1.9453$ Btu/lbm R

State 2: T_2 & on line in P-v diagram.

$P = P_1 + (k_s/A_{cyl}^2)(V - V_1)$

Assume state 2 is two-phase,

$\Rightarrow P_2 = P_{sat}(T_2) = 0.3632$ lbf/in^2



$v_2 = v_1 + (P_2 - P_1)A_{cyl}^2/mk_s = 10.831 + (0.3632 - 80)1\times12/5\times60$

$= 7.6455$ ft^3/lbm $= v_f + x_2 v_{fg} = 0.01605 + x_2\ 867.579$

$x_2 = 0.008793$, $u_2 = 38.1 + 0.008793\times995.64 = 46.85$ btu/lbm,

$s_2 = 0.0746 + 0.008793\times1.9896 = 0.0921$ Btu/lbm R

$${}_1W_2 = \frac{1}{2}(P_1 + P_2)m(v_2 - v_1)$$

$$= \frac{5}{2}(80 + 0.3632)(7.6455 - 10.831)\frac{144}{778} = -118.46 \text{ Btu}$$

${}_1Q_2 = m(u_2 - u_1) + {}_1W_2 = 5(46.85 - 1372.3) - 118.46 = -6746$ Btu

$\Delta S_{tot} = S_{gen\ tot} = m(s_2 - s_1) - {}_1Q_2/T_{room}$

$= 5(0.0921 - 1.9453) + 6746/529.67 =$ **3.47 Btu/R**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

6.245E

A cylinder with a linear spring-loaded piston contains carbon dioxide gas at 300 lbf/in.^{2} with a volume of 2 ft^3. The device is of aluminum and has a mass of 8 lbm. Everything (Al and gas) is initially at 400 F. By heat transfer the whole system cools to the ambient temperature of 77 F, at which point the gas pressure is 220 lbf/in.^{2}. Find the total entropy generation for the process.

Solution:

CO_2: $m = P_1V_1/RT_1 = 300 \times 2 \times 144/(35.10 \times 860) = 2.862$ lbm

$V_2 = V_1(P_1/P_2)\,(T_2 / T_1) = 2(300/220)(537/860) = 1.703$ ft^3

${}_1W_{2\ CO_2} = \int PdV = 0.5(P_1 + P_2)\,(V_2 - V_1)$

$$= [(300 + 220)/2]\,(1.703 - 2)\,\frac{144}{778} = -14.29 \text{ Btu}$$

${}_1Q_{2\ CO_2} = mC_{V0}(T_2 - T_1) + {}_1W_2 = 0.156 \times 2.862(77 - 400) - 14.29 = -158.5$ Btu

${}_1Q_{2\ Al} = mC\,(T_2 - T_1) = 8 \times 0.21(77 - 400) = -542.6$ Btu

System: CO_2 + Al

Entropy Eq.: $m_{CO_2}(s_2 - s_1)_{CO_2} + m_{AL}(s_2 - s_1)_{AL} = {}_1Q_2/T_0 + S_{gen\ tot}$

${}_1Q_2 = -542.6 - 158.5 = -701.14$ Btu

$m_{CO_2}(s_2 - s_1)_{CO_2} + m_{AL}(s_2 - s_1)_{AL} =$

$2.862[0.201 \ln (537/860) - (35.10/778) \ln (220/300)]$

$+ 8 \times 0.21 \ln(537/860) = -0.23086 - 0.79117 = -1.022$ Btu/R

$S_{gen\ tot} = m_{CO_2}(s_2 - s_1)_{CO_2} + m_{AL}(s_2 - s_1)_{AL} - {}_1Q_2/T_0$

$$= -1.022 + \frac{701.14}{537} = \mathbf{+0.2837\ Btu/R}$$

In-Text Concept Questions

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.a

A reversible adiabatic flow of liquid water in a pump has increasing P. How about T?

Solution:

Steady state single flow: $s_e = s_i + \int_i^e \frac{dq}{T} + s_{gen} = s_i + 0 + 0$

Adiabatic (dq = 0) means integral vanishes and reversible means $s_{gen} = 0$, so s is constant. Properties for liquid (incompressible) gives Eq.6.19

$$ds = \frac{C}{T}\, dT$$

then constant s gives constant T.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.b

A reversible adiabatic flow of air in a compressor has increasing P. How about T?

Solution:

Steady state single flow: $s_e = s_i + \int_i^e \frac{dq}{T} + s_{gen} = s_i + 0 + 0$

so s is constant. Properties for an ideal gas gives Eq.6.15 and for constant specific heat we get Eq.6.16. A higher P means a higher T, which is also the case for a variable specific heat, recall Eq.6.19 using the standard entropy.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.c

A compressor receives R-134a at –10^{o}C, 200 kPa with an exit of 1200 kPa, 50^{o}C. What can you say about the process?
Solution:

Properties for R-134a are found in Table B.5

Inlet state: $s_i = 1.7328$ kJ/kg K

Exit state: $s_e = 1.7237$ kJ/kg K

Steady state single flow: $s_e = s_i + \int_i^e \frac{dq}{T} + s_{gen}$

Since s decreases slightly and the generation term can only be positive, it must be that the heat transfer is negative (out) so the integral gives a contribution that is smaller than $-s_{gen}$.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.d

A flow of water at some velocity out of a nozzle is used to wash a car. The water then falls to the ground. What happens to the water state in terms of **V**, T and s?

let us follow the water flow. It starts out with kinetic and potential energy of some magnitude at a compressed liquid state P, T. As the water splashes onto the car it looses its kinetic energy (it turns in to internal energy so T goes up by a very small amount). As it drops to the ground it then looses all the potential energy which goes into internal energy. Both of theses processes are irreversible so s goes up.

If the water has a temperature different from the ambient then there will also be some heat transfer to or from the water which will affect both T and s.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.e

In a steady state single flow *s* is either constant or it increases. Is that true?
Solution:

No.

Steady state single flow: $s_e = s_i + \int_i^e \frac{dq}{T} + s_{gen}$

Entropy can only go up or stay constant due to s_{gen}, but it can go up or down due to the heat transfer which can be positive or negative. So if the heat transfer is large enough it can overpower any entropy generation and drive s up or down.

7.f

If a flow device has the same inlet and exit pressure, can shaft work be done?

The reversible work is given by Eq.7.14

$$w = -\int v\, dP + (\mathbf{V}_i^2 - \mathbf{V}_e^2) + g\,(Z_i - Z_e)$$

For a constant pressure the first term drops out but the other two remains. Kinetic energy changes can give work out (windmill) and potential energy changes can give work out (a dam).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.g

A polytropic flow process with n = 0 might be which device?

As the polytropic process is $Pv^n = C$, then n = 0 is a constant pressure process. This can be a pipe flow, a heat exchanger flow (heater or cooler) or a boiler.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

Concept Problems

7.1

If we follow a mass element going through a reversible adiabatic flow process what can we say about the change of state?

Following a mass (this is a control mass)

$de = dq - dw = 0 - Pdv = - Pdv;$ compression/expansion changes e

$ds = dq/T + ds_{gen} = 0 + 0 \quad \Rightarrow$ s = constant, isentropic process.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.2

Which process will make the statement in concept question e) on page 330 true?

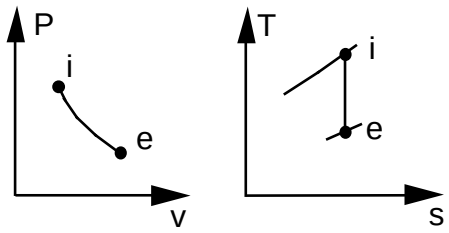
Solution:

If the process is said to be adiabatic then:
Steady state adiabatic single flow: $s_e = s_i + s_{gen} \geq s_i$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.3

A reversible process in a steady flow with negligible kinetic and potential energy changes is shown in the diagrams. Indicate the change $h_e - h_i$ and transfers w and q as positive, zero or negative



$dw = -v\,dP > 0$ P drops so work is positive out.

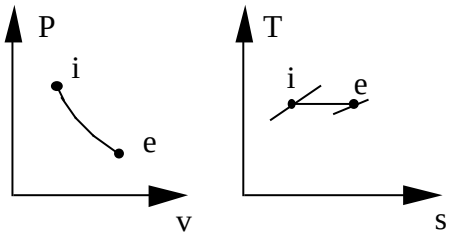
$dq = T\,ds = 0$ s is constant, and process reversible so adiabatic.

$h_e - h_i = q - w = 0 - w < 0$ so enthalpy drops

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.4

A reversible process in a steady flow of air with negligible kinetic and potential energy changes is shown in the diagrams. Indicate the change $h_e - h_i$ and transfers w and q as positive, zero or negative



$dw = -v\,dP > 0$ P drops so work is positive out.

$dq = T\,ds > 0$ s is increasing and process reversible so q is positive.

$h_e - h_i = 0$ as they are functions of T and thus the same.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.5

A reversible steady isobaric flow has 1 kW of heat added with negligible changes in KE and PE, what is the work transfer?

P = C: Shaft work Eq. 7.14:

$$dw = -v\,dP + \Delta KE + \Delta PE - T\,ds_{gen} = 0 + 0 + 0 - 0 = \mathbf{0}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.6

An air compressor has a significant heat transfer out. See example 9.4 for how high T becomes if there is no heat transfer. Is that good, or should it be insulated?

That depends on the use of the compressed air. If there is no need for the high T, say it is used for compressed air tools, then the heat transfer will lower T and result in lower specific volume reducing the work. For those applications the compressor may have fins mounted on its surface to promote the heat transfer. In very high pressure compression it is done in stages between which is a heat exchanger called an intercooler.

This is a small compressor driven by an electric motor. Used to charge air into car tires.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.7

Friction in a pipe flow causes a slight pressure decrease and a slight temperature increase. How does that affect entropy?

Solution:

The friction converts flow work (P drops) into internal energy (T up if single phase). This is an irreversible process and s increases.

If liquid: Eq. 6.10 $ds = \frac{C}{T} dT$ so s follows T

If ideal gas Eq. 6.14 $ds = C_p \frac{dT}{T} - R \frac{dP}{P}$ (both terms increase)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.8

To increase the work out of a turbine for a given inlet and exit pressure how should the inlet state be changed?

$$w = -\int v\, dP + \ldots\ldots \qquad \text{Eq.7.14}$$

For a given change in pressure boosting v will result in larger work term. So for **larger inlet T** we get a larger v and thus larger work. That is why we increase T by combustion in a gasturbine before the turbine section.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.9

An irreversible adiabatic flow of liquid water in a pump has higher P. How about T?

Solution:

Steady state single flow: $s_e = s_i + \int_i^e \frac{dq}{T} + s_{gen} = s_i + 0 + s_{gen}$

so s is increasing. Properties for liquid (incompressible) gives Eq.6.10 where an increase in s gives an increase in T.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.10

The shaft work in a pump to increase the pressure is small compared to the shaft work in an air compressor for the same pressure increase. Why?

The reversible work is given by Eq. 7.14 or 7.15 if reversible and no kinetic or potential energy changes

$$w = -\int v \, dP$$

The liquid has a very small value for v compared to a large value for a gas.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.11

Liquid water is sprayed into the hot gases before they enter the turbine section of a large gasturbine power plant. It is claimed that the larger mass flow rate produces more work. Is that the reason?

No. More mass through the turbine does give more work, but the added mass is only a few percent. As the liquid vaporizes the specific volume increases dramatically which gives a much larger volume flow throught the turbine and that gives more work output.

$$\dot{W} = \dot{m}w = -\dot{m}\int v\, dP = -\int \dot{m}v\, dP = -\int \dot{V}\, dP$$

This should be seen relative to the small work required to bring the liquid water up to the higher turbine inlet pressure from the source of water (presumably atmospheric pressure).

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.12

A tank contains air at 400 kPa, 300 K and a valve opens up for flow out to the outside which is at 100 kPa, 300 K. What happens to the air temperature inside?

As mass flows out of the tank the pressure will drop, the air that remains basically goes through a simple (adiabatic if process is fast enough) expansion process so the temperature also drops. If the flow rate out is very small and the process thus extremely slow, enough heat transfer may take place to keep the temperature constant.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

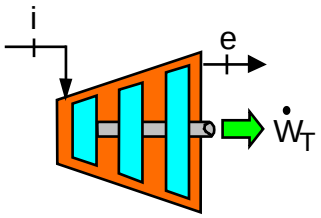
Steady state reversible processes single flow

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.13

A turbine receives steam at 6 MPa, 600°C with an exit pressure of 600 kPa. Assume the stage is adiabatic and negelect kinetic energies. Find the exit temperature and the specific work.

Solution:



C.V. Stage 1 of turbine.

The stage is adiabatic so $q = 0$ and we will assume reversible so $s_{gen} = 0$

Energy Eq.4.13: $w_T = h_i - h_e$

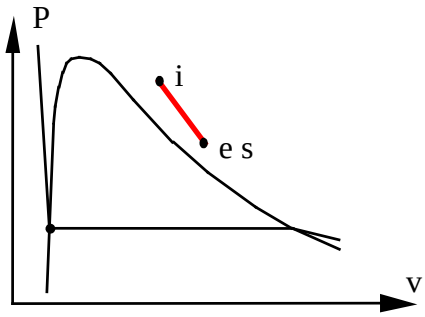
Entropy Eq.7.9: $s_e = s_i + \int dq/T + s_{gen} = s_i + 0 + 0$

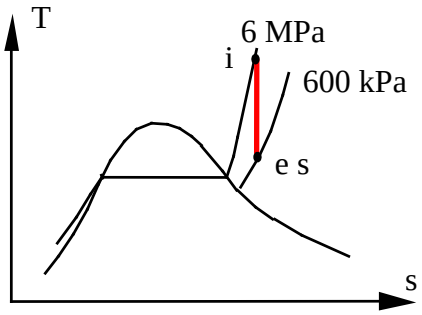
Inlet state: B.1.3: $h_i = 3658.40$ kJ/kg, $s_i = 7.1676$ kJ/kg K

Exit state: 600 kPa, $s = s_i$

Table B.1.3 $\Rightarrow$ $T \cong$ **246.7°C,** $h_e = 2950.19$ kJ/kg

$w_T = 3658.4 - 2950.19 =$ **708.2 kJ/kg**





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.14

An evaporator has R-410A at -20^{o}C and quality 80% flowing in with the exit flow being saturated vapor at -20^{o}C. Consider the heating to be a reversible process and find the specific heat transfer from the entropy equation.

Entropy Eq.7.9: $s_e = s_i + \int dq/T + s_{gen} = s_i + q/T + 0$

$q = T\,(s_e - s_i) = T\,(s_g - s_i)$

Inlet: $s_i = 0.1154 + x_i\, 0.9625 = 0.8854$ kJ/kg-K

Exit: $s_g = 1.0779$ kJ/kg-K

$q = (273.15 - 20)\ \text{K} \times (1.0779 - 0.8854)\ \text{kJ/kgK} =$ **48.73 kJ/kg**

Remark: It fits with $h_e - h_i = (1 - x_i)\, h_{fg} = 0.2 \times 243.65 = 48.73$ kJ/kg

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.15

Steam enters a turbine at 3 MPa, 450°C, expands in a reversible adiabatic process and exhausts at 50 kPa. Changes in kinetic and potential energies between the inlet and the exit of the turbine are small. The power output of the turbine is 800 kW. What is the mass flow rate of steam through the turbine?

Solution:

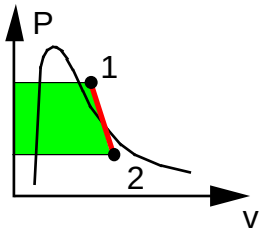
C.V. Turbine, Steady single inlet and exit flows. Adiabatic: $\dot{Q} = 0$.

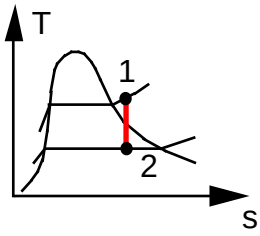
Continuity Eq.4.11: $\dot{m}_i = \dot{m}_e = \dot{m}$,

Energy Eq.4.12: $\dot{m}h_i = \dot{m}h_e + \dot{W}_T$,

Entropy Eq. 7.8: $\dot{m}s_i + \emptyset = \dot{m}s_e$ (Reversible $\dot{S}_{gen} = 0$)

Explanation for the work term is in Sect. 7.3, Eq.7.14





Inlet state: Table B.1.3 $h_i = 3344$ kJ/kg, $s_i = 7.0833$ kJ/kg K

Exit state: P_e , $s_e = s_i \Rightarrow$ Table B.1.2 saturated as $s_e < s_g$

$x_e = (7.0833 - 1.091)/6.5029 = 0.92148$,

$h_e = 340.47 + 0.92148 \times 2305.40 = 2464.85$ kJ/kg

$$\dot{m} = \dot{W}_T/w_T = \dot{W}_T/(h_i - h_e) = \frac{800}{3344 - 2464.85} \frac{\text{kW}}{\text{kJ/kg}} = \mathbf{0.91\ kg/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.16

The exit nozzle in a jet engine receives air at 1200 K, 150 kPa with neglible kinetic energy. The exit pressure is 80 kPa and the process is reversible and adiabatic. Use constant heat capacity at 300 K to find the exit velocity.

Solution:
C.V. Nozzle, Steady single inlet and exit flow, no work or heat transfer.

Energy Eq.4.13: $h_i = h_e + \mathbf{V}_e^2/2 \quad (Z_i = Z_e)$

Entropy Eq.7.9: $s_e = s_i + \int dq/T + s_{gen} = s_i + 0 + 0$

Use constant specific heat from Table A.5, $C_{Po} = 1.004 \frac{\text{kJ}}{\text{kg K}}$, $k = 1.4$

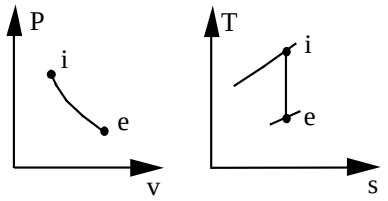
The isentropic process ($s_e = s_i$) gives Eq.6.23

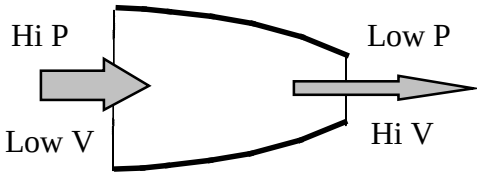
$$\Rightarrow \quad T_e = T_i(P_e/P_i)^{\frac{k-1}{k}} = 1200 \text{ K } (80/150)^{0.2857} = 1002.7 \text{ K}$$

The energy equation becomes

$$\mathbf{V}_e^2/2 = h_i - h_e \cong C_P(T_i - T_e)$$

$$\mathbf{V}_e = \sqrt{2\, C_P(T_i - T_e)} = \sqrt{2 \times 1.004(1200\text{-}1002.7) \times 1000} = \mathbf{629.4\ m/s}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.17

Do the previous problem using the air tables in A.7
The exit nozzle in a jet engine receives air at 1200 K, 150 kPa with neglible kinetic energy. The exit pressure is 80 kPa and the process is reversible and adiabatic. Use constant heat capacity at 300 K to find the exit velocity.

Solution:
C.V. Nozzle, Steady single inlet and exit flow, no work or heat transfer.

Energy Eq.4.13: $h_i = h_e + \mathbf{V}_e^2/2 \quad (Z_i = Z_e)$

Entropy Eq.7.9: $s_e = s_i + \int dq/T + s_{gen} = s_i + 0 + 0$

Process: $q = 0, \quad s_{gen} = 0$ as used above leads to $s_e = s_i$

Inlet state: $h_i = 1277.8$ kJ/kg, $\quad s^o_{Ti} = 8.3460$ kJ/kg K

The constant s is rewritten from Eq.6.19 as

$$s^o_{Te} = s^o_{Ti} + R \ln(P_e / P_i) = 8.3460 + 0.287 \ln (80/150) = 8.1656 \text{ kJ/kg K}$$

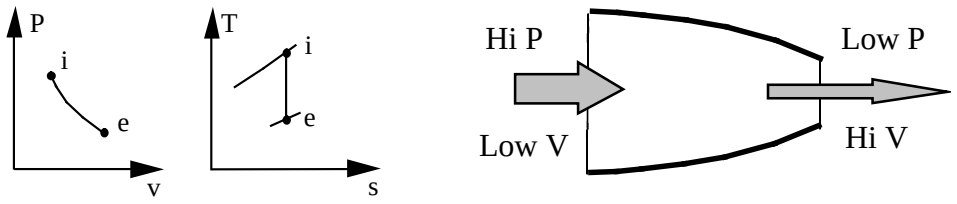
Interpolate in A.7 =>

$$T_e = 1000 + 50 \frac{8.1656 - 8.1349}{8.1908 - 8.1349} = 1027.46 \text{ K}$$

$$h_e = 1046.2 + (1103.5 - 1046.3) \times \frac{8.1656 - 8.1349}{8.1908 - 8.1349} = 1077.7 \text{ kJ/kg}$$

From the energy equation we have $\mathbf{V}_e^2/2 = h_i - h_e$, so then

$$\mathbf{V}_e = \sqrt{2 (h_i - h_e)} = \sqrt{2(1277.8 - 1077.7) \text{ kJ/kg} \times 1000 \text{ J/kJ}} = \mathbf{632.6 \text{ m/s}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.18

A reversible adiabatic compressor receives 0.05 kg/s saturated vapor R-410A at 400 kPa and has an exit presure of 1800 kPa. Neglect kinetic energies and find the exit temperature and the minimum power needed to drive the unit.

Solution:

C.V. Compressor, Steady single inlet and exit flows. Adiabatic: $\dot{Q} = 0$.

Continuity Eq.4.11: $\dot{m}_i = \dot{m}_e = \dot{m}$,

Energy Eq.4.12: $\dot{m}h_i = \dot{m}h_e + \dot{W}_C$,

Entropy Eq.7.8: $\dot{m}s_i + \emptyset = \dot{m}s_e$ (Reversible $\dot{S}_{gen} = 0$)

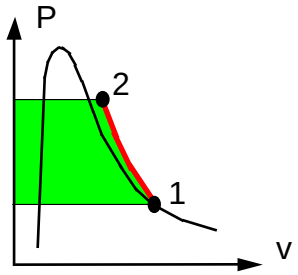
Inlet state: B 4.2.: $h_i = 271.90$ kJ/kg, $s_i = 1.0779$ kJ/kg K

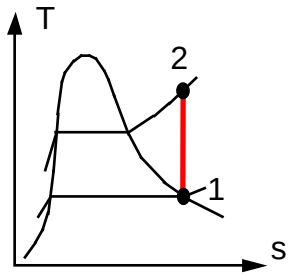
Exit state: P_e , $s_e = s_i$ $\Rightarrow$ Table B.4.2 $h_e = 314.33$ kJ/kg, $\mathbf{T_e \cong 51.9°C}$

$-w_c = h_e - h_i = 314.33 - 271.90 = 42.43$ kJ/kg

$-\dot{W}_c$ = Power In $= -w_c\dot{m} = 42.43$ kJ/kg $\times$ 0.05kg/s = **2.12 kW**

Explanation for the work term is in Sect. 7.3, Eq.7.14





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.19

In a heat pump that uses R-134a as the working fluid, the R-134a enters the compressor at 150 kPa, −10°C and the R-134a is compressed in an adiabatic process to 1 MPa using 4 kW of power input. Find the mass flow rate it can provide assuming the process is reversible.

Solution:

C.V. Compressor, Steady single inlet and exit flows. Adiabatic: $\dot{Q} = 0$.

Continuity Eq.4.11: $\dot{m}_1 = \dot{m}_2 = \dot{m}$,

Energy Eq.4.12: $\dot{m}h_1 = \dot{m}h_2 + \dot{W}_C$,

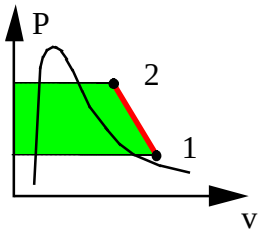
Entropy Eq.7.8: $\dot{m}s_1 + \emptyset = \dot{m}s_2$ (Reversible $\dot{S}_{gen} = 0$)

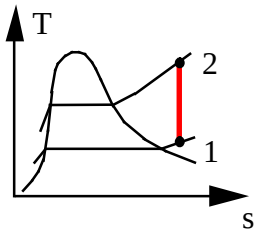
Inlet state: Table B.5.2 $h_1 = 393.84$ kJ/kg, $s_1 = 1.7606$ kJ/kg K

Exit state: $P_2 = 1$ MPa & $s_2 = s_1$ $\Rightarrow$ $h_2 = 434.9$ kJ/kg

$$\dot{m} = \dot{W}_c / w_c = \dot{W}_c / (h_1 - h_2) = -4 \text{ kW} / (393.84 - 434.9) \text{ kJ/kg}$$
$$= \mathbf{0.097\ kg/s}$$

Explanation for the work term is in Sect. 7.3 Eq.7.14





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.20

Nitrogen gas flowing in a pipe at 500 kPa, 200°C, and at a velocity of 10 m/s, should be expanded in a nozzle to produce a velocity of 300 m/s. Determine the exit pressure and cross-sectional area of the nozzle if the mass flow rate is 0.15 kg/s, and the expansion is reversible and adiabatic.

Solution:

C.V. Nozzle. Steady flow, no work out and no heat transfer.

Energy Eq.4.13: $h_i + \mathbf{V}_i^2/2 = h_e + \mathbf{V}_e^2/2$

Entropy Eq.7.9: $s_i + \int dq/T + s_{gen} = s_i + 0 + 0 = s_e$

Properties Ideal gas Table A.5:

$$C_{Po} = 1.042 \frac{kJ}{kg\ K}, \quad R = 0.2968 \frac{kJ}{kg\ K}, \quad k = 1.40$$

$h_e - h_i = C_{Po}(T_e - T_i) = 1.042(T_e - 473.2) = (10^2 - 300^2)/(2\times1000)$

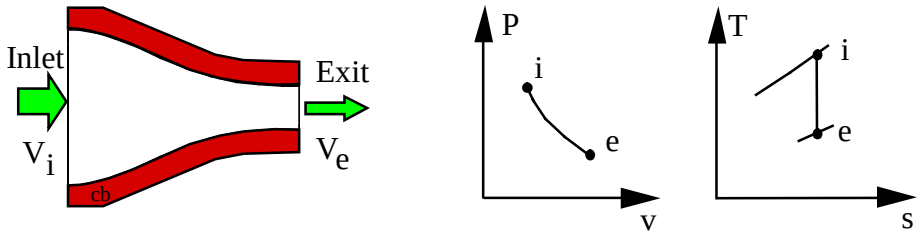
Solving for exit T: $T_e = 430$ K,

Process: $s_i = s_e$ => For ideal gas expressed in Eq.6.23

$$P_e = P_i(T_e/T_i)^{\frac{k}{k-1}} = 500 \text{ kPa} \left(\frac{430}{473.2}\right)^{3.5} = \mathbf{357.6\ kPa}$$

$v_e = RT_e/P_e = (0.2968 \text{ kJ/kg-K} \times 430 \text{ K})/357.6 \text{ kPa} = 0.35689 \text{ m}^3/\text{kg}$

$$A_e = \dot{m}v_e/\mathbf{V}_e = \frac{0.15 \times 0.35689}{300} \frac{(\text{kg/s})\ (\text{m}^3/\text{kg})}{\text{m/s}} = \mathbf{1.78 \times 10^{-4}\ m^2}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.21

A reversible isothermal expander (a turbine with heat transfer) has an inlet flow of carbon dioxide at 3 MPa, 80^{o}C and an exit flow at 1 MPa, 80^{o}C. Find the specific heat transfer from the entropy equation and the specific work from the energy equation assuming ideal gas.

CV the expander, control surface at 80^{o}C.

Energy Eq.4.13: $0 = h_i - h_e + q - w$

Entropy Eq.7.9: $0 = s_i - s_e + \int dq/T + s_{gen} = s_i - s_e + q/T + 0$

From entropy equation

$$q = T\,(s_e - s_i) = T\,(C_{Po} \ln \frac{T_e}{T_i} - R \ln \frac{P_e}{P_i}) = -RT \ln \frac{P_e}{P_i}$$

$$= -0.1889 \text{ kJ/kg-K} \times 353.15 \text{ K} \times \ln \frac{1}{3} = \mathbf{73.29\ kJ/kg}$$

From energy equation

$$w = h_i - h_e + q = q = \mathbf{73.29\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.22

Solve the previous Problem using Table B.3

Energy Eq.4.13: $0 = h_i - h_e + q - w$

Entropy Eq.7.9: $0 = s_i - s_e + \int dq/T + s_{gen} = s_i - s_e + q/T + 0$

Inlet state: $h_i = 421.16$ kJ/kg, $s_i = 1.5385$ kJ/kg-K

Exit state: $h_e = 435.23$ kJ/kg, $s_e = 1.775$ kJ/kg-K

From entropy equation

$$q = T (s_e - s_i) = 353.15 (1.775 - 1.5385) = \mathbf{83.52\ kJ/kg}$$

From energy equation

$$w = h_i - h_e + q = 421.16 - 435.23 + 83.52 = \mathbf{69.45\ kJ/kg}$$

Remark: When it is not an ideal gas h is a fct. of both T and P.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.23

A compressor in a commercial refrigerator receives R-410A at -25^{o}C and unknown quality. The exit is at 2000 kPa, 60^{o}C and the process assumed reversible and adiabatic. Neglect kinetic energies and find the inlet quality and the specific work.

CV Compressor. q = 0.

Energy Eq.4.13: $w_C = h_i - h_e$

Entropy Eq.7.9: $s_e = s_i + \int dq/T + s_{gen} = s_i + 0 + 0$

Exit state: 2000 kPa, 60^{o}C => $s_e = 1.0878$ kJ/kgK = s_i , $h_e = 320.62$ kJ/kg

Inlet state: T, s Table B.4.1 $\Rightarrow x_i = (1.0878 - 0.0871)/1.0022 =$ **0.9985**

$h_i = 21.08 + x_i\, 248.69 = 269.4$ kJ/kg

$w_C = 269.4 - 320.62 =$ **–51.2 kJ/kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.24

A boiler section boils 3 kg/s saturated liquid water at 2000 kPa to saturated vapor in a reversible constant pressure process. Assume you do not know that there is no work. Prove that there is no shaftwork using the first and second laws of thermodynamics.

Solution:

C.V. Boiler. Steady, single inlet and single exit flows.

Energy Eq.4.13: $h_i + q = w + h_e$;

Entropy Eq.7.9: $s_i + q/T = s_e$

States: Table B.1.2, $T = T_{sat} = 212.42°C = 485.57$ K

$h_i = h_f = 908.77$ kJ/kg, $s_i = 2.4473$ kJ/kg K

$h_e = h_g = 2799.51$ kJ/kg, $s_e = 6.3408$ kJ/kg K

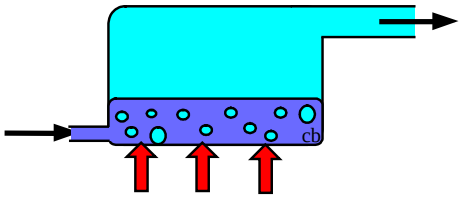
From entropy equation

$q = T(s_e - s_i) = 485.57$ K $(6.3408 - 2.4473)$ kJ/kg-K = **1890.6 kJ/kg**

From energy equation

$w = h_i + q - h_e = 908.77 + 1890.6 - 2799.51 =$ **-0.1 kJ/kg**

It should be zero (non-zero due to round off in values of s, h and T_{sat}).



Often it is a long pipe and not a chamber

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.25

A compressor brings a hydrogen gas flow at 280 K, 100 kPa up to a pressure of 1000 kPa in a reversible process. How hot is the exit flow and what is the specific work input?

CV Compressor. Assume q = 0.

Energy Eq.4.13: $w_C = h_i - h_e \approx C_p (T_i - T_e)$

Entropy Eq.7.9: $s_e = s_i + \int dq/T + s_{gen} = s_i + 0 + 0$

So constant s gives the power relation in Eq. 6.23 with k from A.5

$$T_e = T_i (P_e/P_i)^{(k-1)/k} = 280 \text{ K } (1000/100)^{(1.409-1)/1.409} = \mathbf{546.3\ K}$$

Now the work from the energy equation, C_p from A.5

$$w_C = 14.209 \text{ kJ/kg-K} \times (280 - 546.3) \text{ K} = \mathbf{-3783.9\ kJ/kg}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.26

Atmospheric air at -45°C, 60 kPa enters the front diffuser of a jet engine with a velocity of 900 km/h and frontal area of 1 m^2. After the adiabatic diffuser the velocity is 20 m/s. Find the diffuser exit temperature and the maximum pressure possible.

Solution:

C.V. Diffuser, Steady single inlet and exit flow, no work or heat transfer.

Energy Eq.4.13: $h_i + \mathbf{V}_i^2/2 = h_e + \mathbf{V}_e^2/2$, and $h_e - h_i = C_p(T_e - T_i)$

Entropy Eq.7.9: $s_i + \int dq/T + s_{gen} = s_i + 0 + 0 = s_e$ (Reversible, adiabatic)

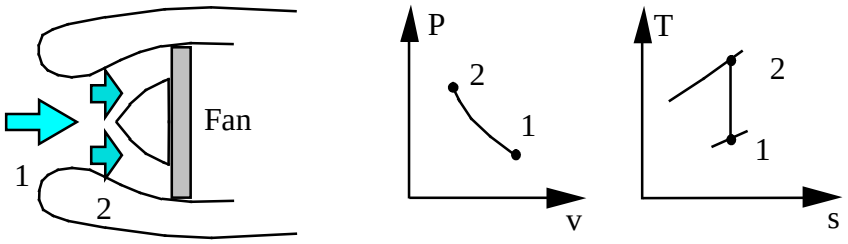
Specific heat and ratio of specific heats from Table A.5: $C_{Po} = 1.004 \frac{kJ}{kg\ K}$, $k = 1.4$, the energy equation then gives:

$$1.004[\ T_e - (-45)] = 0.5[(900\times1000/3600)^2 - 20^2\ ]/1000 = 31.05\ kJ/kg$$

$$\Rightarrow \quad T_e = -14.05\ °C = \mathbf{259.1\ K}$$

Constant s for an ideal gas is expressed in Eq.6.23 (we need the inverse relation here):

$$P_e = P_i\,(T_e/T_i)^{\frac{k}{k-1}} = 60\ kPa\ (259.1/228.1)^{3.5} = \mathbf{93.6\ kPa}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.27

A compressor is surrounded by cold R-134a so it works as an isothermal compressor. The inlet state is 0°C, 100 kPa and the exit state is saturated vapor. Find the specific heat transfer and specific work.

Solution:

C.V. Compressor. Steady, single inlet and single exit flows.

Energy Eq.4.13: $h_i + q = w + h_e$;

Entropy Eq.7.9: $s_i + q/T = s_e$

Inlet state: Table B.5.2, $h_i = 403.4$ kJ/kg, $s_i = 1.8281$ kJ/kg K

Exit state: Table B.5.1, $h_e = 398.36$ kJ/kg, $s_e = 1.7262$ kJ/kg K

From entropy equation

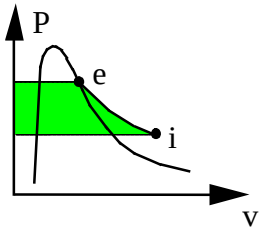
$q = T(s_e - s_i) = 273.15\ \text{K} \times (1.7262 - 1.8281)\ \text{kJ/kg-K} =$ **- 27.83 kJ/kg**

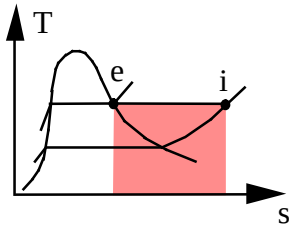
From energy equation

$w = 403.4 + (-27.83) - 398.36 =$ **-22.8 kJ/kg**

Explanation for the work term is in Sect. 7.3

Eq. 7.14





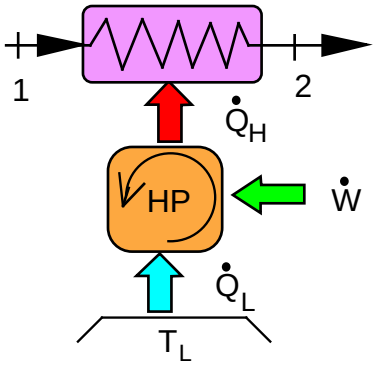
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.28

A flow of 2 kg/s saturated vapor R-410A at 500 kPa is heated at constant pressure to 60°C. The heat is supplied by a heat pump that receives heat from the ambient at 300 K and work input, shown in Fig. P7.28. Assume everything is reversible and find the rate of work input.

Solution:

C.V. Heat exchanger



Continuity Eq.: $\dot{m}_1 = \dot{m}_2$;

Energy Eq.: $\dot{m}_1 h_1 + \dot{Q}_H = \dot{m}_1 h_2$

Table B.4.2:

$h_1 = 274.33$ kJ/kg, $s_1 = 1.0647$ kJ/kg K

$h_2 = 342.32$ kJ/kg, $s_2 = 1.2959$ kJ/kg K

Notice we can find $\dot{Q}_H$ but the temperature T_H is not constant making it difficult to evaluate the COP of the heat pump.

C.V. Total setup and assume everything is reversible and steady state.

Energy Eq.: $\dot{m}_1 h_1 + \dot{Q}_L + \dot{W}_{in} = \dot{m}_1 h_2$

Entropy Eq.: $\dot{m}_1 s_1 + \dot{Q}_L/T_L + 0 = \dot{m}_1 s_2$ (T_L is constant, $s_{gen} = 0$)

$$\dot{Q}_L = \dot{m}_1 T_L [s_2 - s_1] = 2 \text{ kg/s} \times 300 \text{ K} \times [1.2959 - 1.0647] \text{ kJ/kg-K}$$
$$= 138.72 \text{ kW}$$

$$\dot{W}_{in} = \dot{m}_1 [h_2 - h_1] - \dot{Q}_L = 2 (342.32 - 274.33) - 138.72 = \mathbf{-2.74\ kW}$$

Comment: Net work is nearly zero, due to the very low T the flow comes in at so the first heating of the flow actually generates work out and only the heating to above ambient T requires work input.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.29

A flow of 2 kg/s hot exhaust air at 150°C, 125 kPa supplies heat to a heat engine in a setup similar to the previous problem with the heat engine rejecting heat to the ambient at 290 K and the air leaves the heat exchanger at 50°C. Find the maximum possible power out of the heat engine.

CV. Total setup. Assume everything is reversible.

Energy Eq.: $\dot{m}_1 h_1 = \dot{Q}_L + \dot{W}_{HE} + \dot{m}_1 h_2$

Entropy Eq.: $\dot{m}_1 s_1 + 0 = \dot{Q}_L / T_L + \dot{m}_1 s_2$ (T_L is constant, $s_{gen} = 0$)

$$\dot{Q}_L = \dot{m}_1 T_L (s_1 - s_2) = 2 \text{ kg/s} \times 290 \text{ K} \times 1.004 \text{ kJ/kgK} \times \ln(423/323)$$
$$= \mathbf{157\ kW}$$

From the energy equation

$$\dot{W}_{HE} = \dot{m}_1(h_1 - h_2) - \dot{Q}_L = \dot{m}_1 C_{Po}(T_1 - T_2) - \dot{Q}_L$$
$$= 2 \text{ kg/s} \times 1.004 \text{ kJ/kgK} \times (150 - 50) \text{ K} - 157 \text{ kW} = \mathbf{43.8\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.30

A diffuser is a steady-state device in which a fluid flowing at high velocity is decelerated such that the pressure increases in the process. Air at 120 kPa, 30°C enters a diffuser with velocity 200 m/s and exits with a velocity of 20 m/s. Assuming the process is reversible and adiabatic what are the exit pressure and temperature of the air?

Solution:
C.V. Diffuser, Steady single inlet and exit flow, no work or heat transfer.

Energy Eq.4.13: $h_i + \mathbf{V}_i^2/2 = h_e + \mathbf{V}_e^2/2$, => $h_e - h_i = C_{Po}(T_e - T_i)$

Entropy Eq.7.9: $s_i + \int dq/T + s_{gen} = s_i + 0 + 0 = s_e$ (Reversible, adiabatic)

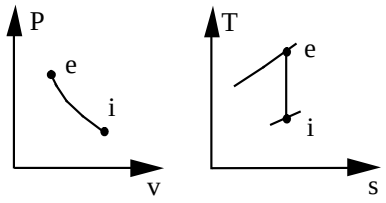
Use constant specific heat from Table A.5, $C_{Po} = 1.004 \frac{kJ}{kg\ K}$, $k = 1.4$

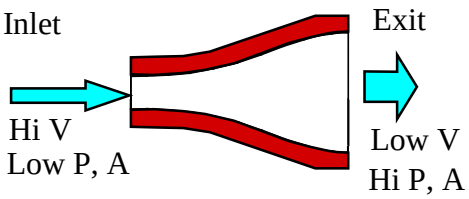
Energy equation then gives:

$C_{Po}(T_e - T_i) = 1.004(T_e - 303.2) = (200^2 - 20^2)/(2\times1000)$ => T_e = **322.9 K**

The isentropic process ($s_e = s_i$) gives Eq.6.23

$$P_e = P_i(T_e/T_i)^{\frac{k}{k-1}} = 120 \text{ kPa } (322.9/303.2)^{3.5} = \mathbf{149.6\ kPa}$$



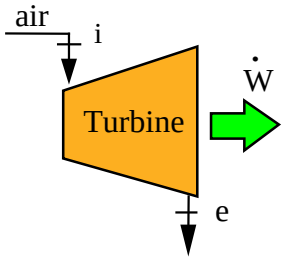


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.31

Air enters a turbine at 800 kPa, 1200 K, and expands in a reversible adiabatic process to 100 kPa. Calculate the exit temperature and the specific work output using Table A.7 and repeat using constant specific heat from Table A.5

Solution:



C.V. Air turbine.

Adiabatic: $q = 0$, reversible: $s_{gen} = 0$

Energy Eq.4.13: $w_T = h_i - h_e$,

Entropy Eq.7.9: $s_e = s_i$

a) Table A.7: $h_i = 1277.8$ kJ/kg, $s^o_{Ti} = 8.34596$ kJ/kg K

The constant s process is written from Eq.6.19 as

$$\Rightarrow s^o_{Te} = s^o_{Ti} + R \ln\left(\frac{P_e}{P_i}\right) = 8.34596 + 0.287 \ln\left(\frac{100}{800}\right) = 7.7492 \text{ kJ/kg K}$$

Interpolate in A.7.1 $\Rightarrow$ $T_e =$ **706 K**, $h_e = 719.9$ kJ/kg

$w = h_i - h_e =$ **557.9 kJ/kg**

b) Table A.5: $C_{Po} = 1.004$ kJ/kg K, $R = 0.287$ kJ/kg K, $k = 1.4$, then from Eq.6.23

$$T_e = T_i (P_e/P_i)^{\frac{k-1}{k}} = 1200 \text{ K} \left(\frac{100}{800}\right)^{0.286} = \textbf{662.1 K}$$

$w = C_{Po}(T_i - T_e) = 1.004$ kJ/kg-K (1200 - 662.1) K = **539.8 kJ/kg**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.32

An expander receives 0.5 kg/s air at 2000 kPa, 300 K with an exit state of 400 kPa, 300 K. Assume the process is reversible and isothermal. Find the rates of heat transfer and work neglecting kinetic and potential energy changes.

Solution:

C.V. Expander, single steady flow.

Energy Eq.: $\dot{m}h_i + \dot{Q} = \dot{m}h_e + \dot{W}$

Entropy Eq.: $\dot{m}s_i + \dot{Q}/T + \dot{m}s_{gen} = \dot{m}s_e$

Process: T is constant and $s_{gen} = 0$

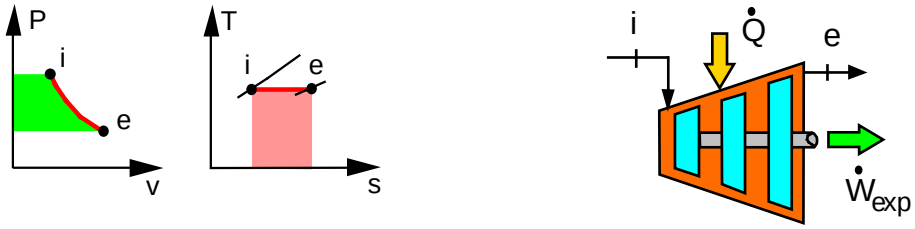
Ideal gas and isothermal gives a change in entropy by Eq. 6.15, so we can solve for the heat transfer

$$\dot{Q} = T\dot{m}(s_e - s_i) = -\dot{m}RT \ln \frac{P_e}{P_i}$$

$$= -0.5 \text{ kg/s} \times 300 \text{ K} \times 0.287 \text{ kJ/kg-K} \times \ln \frac{400}{2000} = \mathbf{69.3\ kW}$$

From the energy equation we get

$$\dot{W} = \dot{m}(h_i - h_e) + \dot{Q} = \dot{Q} = \mathbf{69.3\ kW}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.33

A highly cooled compressor brings a hydrogen gas flow at 300 K, 100 kPa up to a pressure of 800 kPa in an isothermal process. Find the specific work assuming a reversible process.

CV Compressor. Isothermal $T_i = T_e$ so that ideal gas gives $h_i = h_e$.

Energy Eq.4.13: $w_C = h_i + q - h_e = q$

Entropy Eq.7.9: $s_e = s_i + \int dq/T + s_{gen} = s_i + q/T + 0$

$q = T(s_e - s_i) = T\,[-R \ln(P_e/P_i)\,]$

$w = q = -\,4.1243\ \text{kJ/kg-K} \times 300\ \text{K} \times \ln(8) =$ **–2573 kJ/kg**

R is from Table A.5.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.34

A compressor receives air at 290 K, 95 kPa and a shaft work of 5.5 kW from a gasoline engine. It should deliver a mass flow rate of 0.01 kg/s air to a pipeline. Find the maximum possible exit pressure of the compressor.

Solution:

C.V. Compressor, Steady single inlet and exit flows. Adiabatic: $\dot{Q} = 0$.

Continuity Eq.4.11: $\dot{m}_i = \dot{m}_e = \dot{m}$,

Energy Eq.4.12: $\dot{m}h_i = \dot{m}h_e + \dot{W}_C$,

Entropy Eq.7.8: $\dot{m}s_i + \dot{S}_{gen} = \dot{m}s_e$ (Reversible $\dot{S}_{gen} = 0$)

$$\dot{W}_C = \dot{m}w_C \quad => \quad -w_C = -\dot{W}/\dot{m} = 5.5/0.01 = 550 \text{ kJ/kg}$$

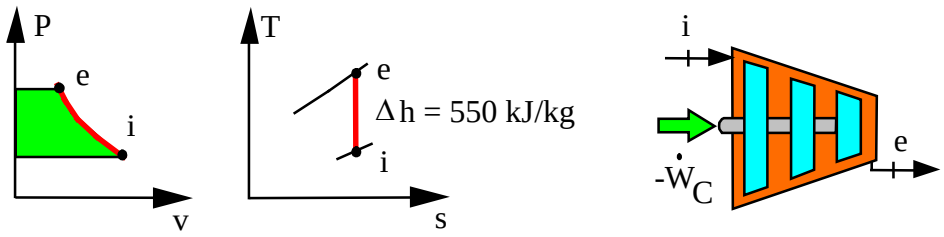
Use constant specific heat from Table A.5, $C_{Po} = 1.004$ kJ/kgK, $k = 1.4$

$$h_e = h_i + 550 \quad => \quad T_e = T_i + 550 \text{ kJ/kg} / 1.004 \text{ kJ/kgK}$$

$$T_e = 290 + 550/1.004 = 837.81 \text{ K}$$

$$s_i = s_e \quad => \quad P_e = P_i \, (T_e/T_i)^{\frac{k}{k-1}} \qquad \text{Eq.6.23}$$

$$P_e = 95 \text{ kPa} \times (837.81/290)^{3.5} = \mathbf{3893 \text{ kPa}}$$



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.35

A reversible steady state device receives a flow of 1 kg/s air at 400 K, 450 kPa and the air leaves at 600 K, 100 kPa. Heat transfer of 900 kW is added from a 1000 K reservoir, 50 kW rejected at 350 K and some heat transfer takes place at 500 K. Find the heat transferred at 500 K and the rate of work produced.

Solution:

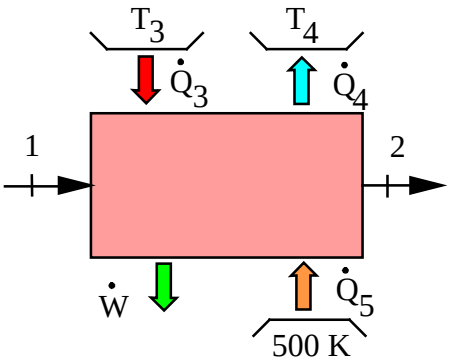
C.V. Device, single inlet and exit flows.

Energy equation, Eq.4.12:

$$\dot{m}h_1 + \dot{Q}_3 - \dot{Q}_4 + \dot{Q}_5 = \dot{m}h_2 + \dot{W}$$

Entropy equation with zero generation, Eq.7.8:

$$\dot{m}s_1 + \dot{Q}_3/T_3 - \dot{Q}_4/T_4 + \dot{Q}_5/T_5 = \dot{m}s_2$$



Solve for the unknown heat transfer using Table A.7.1 and Eq. 6.19 for change in s

$$\dot{Q}_5 = T_5\ [s_2 - s_1]\,\dot{m} + \frac{T_5}{T_4}\dot{Q}_4 - \frac{T_5}{T_3}\dot{Q}_3$$

$$= 500 \times 1\ (7.5764 - 7.1593 - 0.287 \ln\frac{100}{450}) + \frac{500}{350} \times 50 - \frac{500}{1000} \times 900$$

$$= 424.4 + 71.4 - 450 = 45.8 \text{ kW}$$

Now the work from the energy equation is

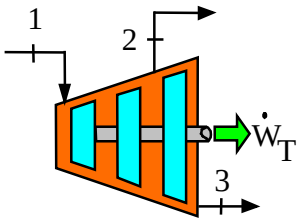
$$\dot{W} = 1 \times (401.3 - 607.3) + 900 - 50 + 45.8 = \mathbf{689.8\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.36

A steam turbine in a powerplant receives 5 kg/s steam at 3000 kPa, 500°C. 20% of the flow is extracted at 1000 kPa to a feedwater heater and the remainder flows out at 200 kPa. Find the two exit temperatures and the turbine power output.

C.V. Turbine. Steady flow and adiabatic q = 0.



Continuity Eq.4.9: $\dot{m}_1 = \dot{m}_2 + \dot{m}_3$;

Energy Eq.4.10: $\dot{m}_1 h_1 = \dot{m}_2 h_2 + \dot{m}_3 h_3 + \dot{W}$

Entropy Eq.7.7: $\dot{m}_1 s_1 + \dot{S}_{gen} = \dot{m}_2 s_2 + \dot{m}_3 s_3$

State 1: $h_1 = 3456$ kJ/kg, $s_1 = 7.234$ kJ/kgK

We also assume turbine is reversible $\dot{S}_{gen} = 0$ => $s_1 = s_2 = s_3$

State 2: (P,s) **$T_2 = 330.6^{o}$C**, $h_2 = 3116$ kJ/kg

State 3: (P,s) **$T_3 = 140.7^{o}$C**, $h_3 = 2750$ kJ/kg

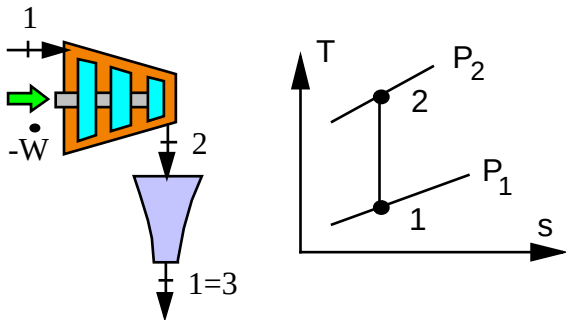
$$\dot{W} = \dot{m}_1 h_1 - \dot{m}_2 h_2 - \dot{m}_3 h_3 = 5 \times 3456 - 1 \times 3116 - 4 \times 2750 = \mathbf{3164\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.37

A reversible adiabatic compression of an air flow from 20°C, 100 kPa to 200 kPa is followed by an expansion down to 100 kPa in an ideal nozzle. What are the two processes? How hot does the air get? What is the exit velocity?

Solution:



Separate control volumes around compressor and nozzle. For ideal compressor we have
inlet : 1 and exit : 2

Adiabatic : q = 0.
Reversible: $s_{gen} = 0$

Energy Eq.4.13: $h_1 + 0 = w_C + h_2$; $h_2 = h_3 + \frac{1}{2}\mathbf{V}^2$

Entropy Eq.7.9: $s_1 + 0/T + 0 = s_2$; $s_2 + 0/T = s_3$

So both processes are **isentropic**.

$$- w_C = h_2 - h_1 , \quad s_2 = s_1$$

Properties Table A.5 air: $C_{Po} = 1.004$ kJ/kg K, $R = 0.287$ kJ/kg K, $k = 1.4$

Process gives constant s (isentropic) which with constant C_{Po} gives Eq.6.23

$$\Rightarrow \quad T_2 = T_1(P_2/P_1)^{\frac{k-1}{k}} = 293.15\ (200/100)^{0.2857} = \mathbf{357.4\ K}$$

$$\Rightarrow \quad -w_C = C_{Po}(T_2 - T_1) = 1.004\ (357.4 - 293.2) = 64.457\ \text{kJ/kg}$$

The ideal nozzle then expands back down to P_1 (constant s) so state 3 equals state 1. The energy equation has no work but kinetic energy and gives:

$$\frac{1}{2}\mathbf{V}^2 = h_2 - h_1 = -w_C = 64\ 457\ \text{J/kg} \quad \text{(remember conversion to J)}$$

$$\Rightarrow \quad \mathbf{V}_3 = \sqrt{2 \times 64\ 457} = \mathbf{359\ m/s}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

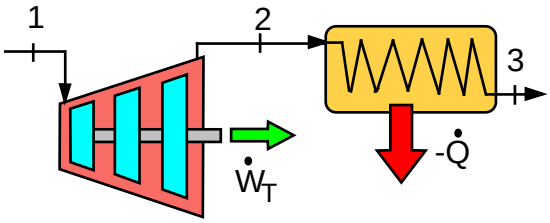
7.38

A small turbine delivers 1.5 MW and is supplied with steam at 700°C, 2 MPa. The exhaust passes through a heat exchanger where the pressure is 10 kPa and exits as saturated liquid. The turbine is reversible and adiabatic. Find the specific turbine work, and the heat transfer in the heat exchanger.

Solution:

Continuity Eq.4.11: Steady

$$\dot{m}_1 = \dot{m}_2 = \dot{m}_3 = \dot{m}$$



Turbine: Energy Eq.4.13: $w_T = h_1 - h_2$

Entropy Eq.7.9: $s_2 = s_1 + s_{T\,gen}$

Inlet state: Table B.1.3 $h_1 = 3917.45$ kJ/kg, $s_1 = 7.9487$ kJ/kg K

Ideal turbine $s_{T\,gen} = 0$, $s_2 = s_1 = 7.9487 = s_{f2} + x\, s_{fg2}$

State 3: P = 10 kPa, $s_2 < s_g$ => saturated 2-phase in Table B.1.2

$\Rightarrow x_{2,s} = (s_1 - s_{f2})/s_{fg2} = (7.9487 - 0.6492)/7.501 = 0.9731$

$\Rightarrow h_{2,s} = h_{f2} + x\, h_{fg2} = 191.8 + 0.9731 \times 2392.8 = 2520.35$ kJ/kg

$w_{T,s} = h_1 - h_{2,s} =$ **1397.05 kJ/kg**

$\dot{m} = \dot{W} / w_{T,s} = 1500 / 1397 = 1.074$ kg/s

Heat exchanger:

Energy Eq.4.13: $q = h_3 - h_2$,

Entropy Eq.7.9: $s_3 = s_2 + \int dq/T + s_{He\,gen}$

$q = h_3 - h_{2,s} = 191.83 - 2520.35 =$ **-2328.5 kJ/kg**

$\dot{Q} = \dot{m}\, q = 1.074$ kg/s $\times$ (-2328.5) kJ/kg = **- 2500 kW**

Explanation for the work term is in Sect. 7.3, Eq.7.14

7.39

One technique for operating a steam turbine in part-load power output is to throttle the steam to a lower pressure before it enters the turbine, as shown in Fig. P7.39. The steamline conditions are 2 MPa, 400°C, and the turbine exhaust pressure is fixed at 10 kPa. Assuming the expansion inside the turbine is reversible and adiabatic, determine the specific turbine work for no throttling and the specific turbine work (part-load) if it is throttled to 500 kPa. Show both processes in a *T–s* diagram.

C.V Turbine. Full load reversible and adiabatic

Entropy Eq.7.9 reduces to constant s so from Table B.1.3 and B.1.2

$$s_3 = s_1 = 7.1270 = 0.6492 + x_{3a} \times 7.5010$$

$$\Rightarrow \quad x_{3a} = 0.86359$$

$$h_{3a} = 191.81 + 0.86359 \times 2392.82 = 2258.2 \text{ kJ/kg}$$

Energy Eq.4.13 for turbine

$$_1w_{3a} = h_1 - h_{3a} = 3247.6 - 2258.2 = \mathbf{989.4\ kJ/kg}$$

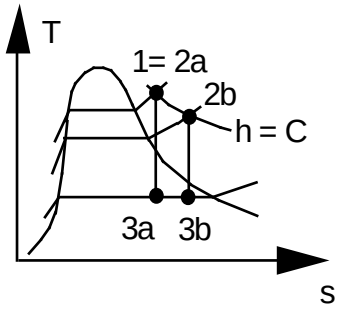
The energy equation for the part load operation gives the exit h. Notice that we have constant h in the throttle process, $h_2 = h_1$:

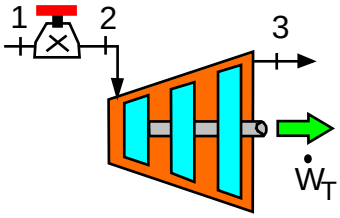
2b: P, $h_{2b} = h_1 = 3247.6$ kJ/kg => $s_{2b} = 7.7563$ kJ/kgK

3b: P, $s = s_{2b} = 7.7563$ => $x_{3b} = (7.7563 - 0.6492)/7.501 = 0.9475$

$$h_{3b} = 191.81 + x_{3b} \times 2392.82 = 2459.0 \text{ kJ/kg}$$

$$w_T = 3247.6 - 2459.0 = \mathbf{788.6\ kJ/kg}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.40

An adiabatic air turbine receives 1 kg/s air at 1500 K, 1.6 MPa and 2 kg/s air at 400 kPa, T_2 in a setup similar to Fig. P4.87 with an exit flow at 100 kPa. What should the temperature T_2 be so the whole process can be reversible?

The process is reversible if we do not generate any entropy. Physically in this problem it means that state 2 must match the state inside the turbine so we do not mix fluid at two different temperatures (we assume the pressure inside is exactly 400 kPa).

For this reason let us select the front end as C.V. and consider the flow from state 1 to the 400 kPa. This is a single flow

Entropy Eq.7.9: $s_1 + 0/T + 0 = s_2$;

Property Eq.6.19 $s_2 - s_1 = 0 = s^o_{T2} - s^o_{T1} - R \ln(P_2 / P_1)$

$$s^o_{T2} = s^o_{T1} + R \ln(P_2 / P_1) = 8.61208 + 0.287 \ln \frac{400}{1600} = 8.2142 \text{ kJ/kg-K}$$

From A.7.1: $T_2 =$ **1071.8 K**

If we solve with constant specific heats we get from Eq.6.23 and k = 1.4

$$T_2 = T_1 (P_2 / P_1)^{(k-1)/k} = 1500 \text{ K } (400/1600)^{0.2857} = 1009.4 \text{ K}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.41

A turbo charger boosts the inlet air pressure to an automobile engine. It consists of an exhaust gas driven turbine directly connected to an air compressor, as shown in Fig. P7.41. For a certain engine load the conditions are given in the figure. Assume that both the turbine and the compressor are reversible and adiabatic having also the same mass flow rate. Calculate the turbine exit temperature and power output. Find also the compressor exit pressure and temperature.

Solution:

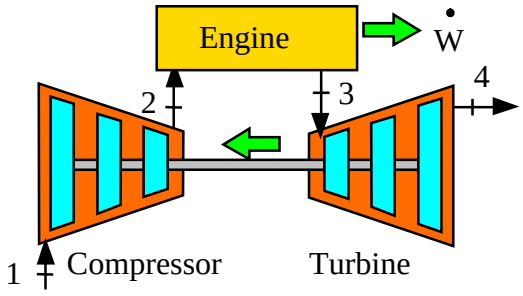
CV: Turbine, Steady single inlet and exit flows,

Process: adiabatic: $q = 0$,

reversible: $s_{gen} = 0$

EnergyEq.4.13: $w_T = h_3 - h_4$,

Entropy Eq.7.8: $s_4 = s_3$



The property relation for ideal gas gives Eq.6.23, k from Table A.5

$$s_4 = s_3 \rightarrow T_4 = T_3(P_4/P_3)^{\frac{k-1}{k}} = 923.2\ \text{K}\left(\frac{100}{170}\right)^{0.286} = \mathbf{793.2\ K}$$

The energy equation is evaluated with specific heat from Table A.5

$$w_T = h_3 - h_4 = C_{P0}(T_3 - T_4) = 1.004(923.2 - 793.2) = 130.5\ \text{kJ/kg}$$

$$\dot{W}_T = \dot{m} w_T = \mathbf{13.05\ kW}$$

C.V. Compressor, steady 1 inlet and 1 exit, same flow rate as turbine.

Energy Eq.4.13: $-w_C = h_2 - h_1$,

Entropy Eq.7.9: $s_2 = s_1$

Express the energy equation for the shaft and compressor having the turbine power as input with the same mass flow rate so we get

$$-w_C = w_T = 130.5\ \text{kJ/kg} = C_{P0}(T_2 - T_1) = 1.004(T_2 - 303.2)$$

$$T_2 = \mathbf{433.2\ K}$$

The property relation for $s_2 = s_1$ is Eq.6.23 and inverted as

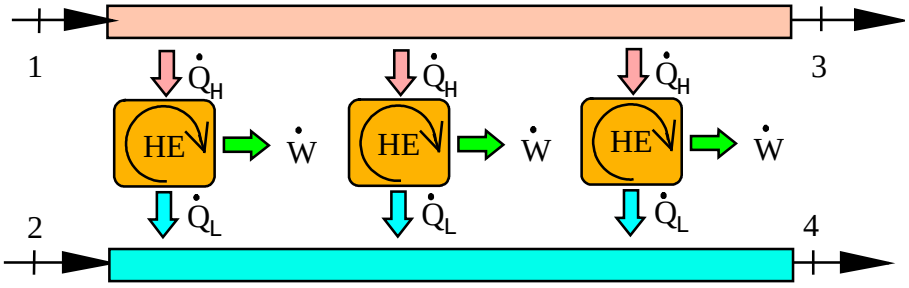
$$P_2 = P_1(T_2/T_1)^{\frac{k}{k-1}} = 100\ \text{kPa}\left(\frac{433.2}{303.2}\right)^{3.5} = \mathbf{348.7\ kPa}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.42

Two flows of air both at 200 kPa, one has 3 kg/s at 400 K and the other has 2 kg/s at 290 K. The two lines exchange energy through a number of ideal heat engines taking energy from the hot line and rejecting it to the colder line. The two flows then leave at the same temperature. Assume the whole setup is reversible and find the exit temperature and the total power out of the heat engines.

Solution:



C.V. Total setup

Energy Eq.4.10: $\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_1 h_3 + \dot{m}_2 h_4 + \dot{W}_{TOT}$

Entropy Eq.7.7: $\dot{m}_1 s_1 + \dot{m}_2 s_2 + \dot{S}_{gen} + \int d\dot{Q}/T = \dot{m}_1 s_3 + \dot{m}_2 s_4$

Process: Reversible $\dot{S}_{gen} = 0$ Adiabatic $\dot{Q} = 0$

Assume the exit flow has the same pressure as the inlet flow then the pressure part of the entropy cancels out and we have

Exit same T, P => $h_3 = h_4 = h_e$; $s_3 = s_4 = s_e$

$$\dot{m}_1 h_1 + \dot{m}_2 h_2 = \dot{m}_{TOT} h_e + \dot{W}_{TOT}$$

$$\dot{m}_1 s_1 + \dot{m}_2 s_2 = \dot{m}_{TOT} s_e$$

$$s^o_{Te} = \frac{\dot{m}_1}{\dot{m}_{TOT}} s^o_{T1} + \frac{\dot{m}_2}{\dot{m}_{TOT}} s^o_{T2} = \frac{3}{5} \times 7.1593 + \frac{2}{5} \times 6.8352 = 7.02966 \text{ kJ/kgK}$$

Table A.7: => $T_e \cong 351.98$ K; $h_e = 352.78$ kJ/kg

$$\dot{W}_{TOT} = \dot{m}_1(h_1 - h_e) + \dot{m}_2 (h_2 - h_e)$$
$$= 3(401.3 - 352.78) + 2(290.43 - 352.78) = \mathbf{20.86\ kW}$$

Note: The solution using constant heat capacity writes the entropy equation using Eq.6.16, the pressure terms cancel out so we get

$$\frac{3}{5} C_p \ln(T_e/T_1) + \frac{2}{5} C_p \ln(T_e/T_2) = 0 \quad => \quad \ln T_e = (3 \ln T_1 + 2 \ln T_2)/5$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.43

A flow of 5 kg/s water at 100 kPa, 20°C should be delivered as steam at 1000 kPa, 350°C to some application. We have a heat source at constant 500°C. If the process should be reversible how much heat transfer should we have?

CV Around unknown device out to the source surface.

Energy Eq.: $\dot{m}h_i + \dot{Q} = \dot{m}h_e + \dot{W}$

Entropy Eq.: $\dot{m}s_i + \dot{Q}/T_S + 0 = \dot{m}s_e$ (T_S is constant, $s_{gen} = 0$)

Inlet state: $s_i = 0.2966$ kJ/kgK, Table B.1.1

Exit state: $s_e = 7.301$ kJ/kgK, Table B.1.3

$$\dot{Q} = \dot{m}\, T_S\, (s_e - s) = 5 \text{ kg/s} \times 773.15 \text{ K} \times (7.301 - 0.2966) \text{ kJ/kg-K}$$
$$= \mathbf{27.1\ MW}$$

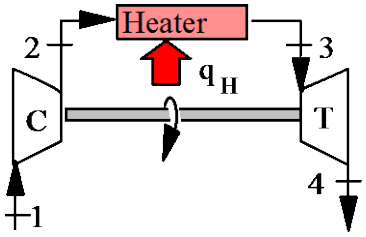
The theory does not say exactly how to do it. As the pressure goes up we must have a pump or compressor and since the substance temperature is lower than the source temperature a reversible heat transfer must happen through some kind of heat engine receiving a Q from the source and delivering it to the flow extracting some work in the process.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.44

A heat-powered portable air compressor consists of three components: (a) an adiabatic compressor; (b) a constant pressure heater (heat supplied from an outside source); and (c) an adiabatic turbine. Ambient air enters the compressor at 100 kPa, 300 K, and is compressed to 600 kPa. All of the power from the turbine goes into the compressor, and the turbine exhaust is the supply of compressed air. If this pressure is required to be 200 kPa, what must the temperature be at the exit of the heater?

Solution:



$P_2 = 600$ kPa, $P_4 = 200$ kPa

Adiabatic and reversible compressor:

Process: $q = 0$ and $s_{gen} = 0$

Energy Eq.4.13: $h - w_c = h_2$

Entropy Eq.7.8: $s_2 = s_1$

For constant specific heat the isentropic relation becomes Eq.8.23

$$T_2 = T_1\left(\frac{P_2}{P_1}\right)^{\frac{k-1}{k}} = 300\ \text{K}\ (6)^{0.2857} = 500.8\ \text{K}$$

$$-w_c = C_{P0}(T_2 - T_1) = 1.004(500.8 - 300) = 201.5\ \text{kJ/kg}$$

Adiabatic and reversible turbine: $q = 0$ and $s_{gen} = 0$

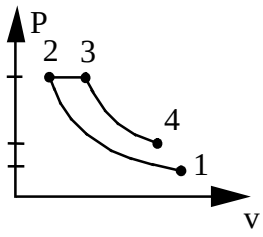
Energy Eq.4.13: $h_3 = w_T + h_4$; Entropy Eq.7.8: $s_4 = s_3$

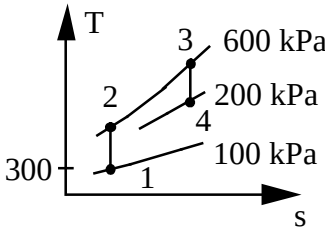
For constant specific heat the isentropic relation becomes Eq.6.23

$$T_4 = T_3(P_4/P_3)^{\frac{k-1}{k}} = T_3\ (200/600)^{0.2857} = 0.7304\ T_3$$

Energy Eq. for shaft: $-w_c = w_T = C_{P0}(T_3 - T_4)$

$$201.5\ \text{kJ/kg} = 1.004\ \text{kJ/kgK} \times T_3(1 - 0.7304) \quad \Rightarrow \quad T_3 = \mathbf{744.4\ K}$$



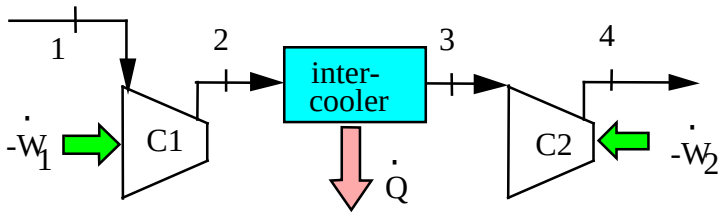


Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.45

A two-stage compressor having an interstage cooler takes in air, 300 K, 100 kPa, and compresses it to 2 MPa, as shown in Fig. P7.46. The cooler then cools the air to 340 K, after which it enters the second stage, which has an exit pressure of 15 MPa. Both stages are adiabatic, and reversible. Find q in the cooler, total specific work, and compare this to the work required with no intercooler.

Solution:



C.V.: Stage 1 air, Steady flow

Process: adibatic: q = 0, reversible: $s_{gen} = 0$

Energy Eq.4.13: $-w_{C1} = h_2 - h_1$, Entropy Eq.7.8: $s_2 = s_1$

Assume constant $C_{P0} = 1.004$ from A.5 and isentropic leads to Eq.6.23

$$T_2 = T_1(P_2/P_1)^{\frac{k-1}{k}} = 300(2000/100)^{0.286} = 706.7 \text{ K}$$

$$w_{C1} = h_1 - h_2 = C_{P0}(T_1 - T_2) = 1.004 \text{ kJ/kgK} \times (300 - 706.7) \text{ K}$$

$$= \mathbf{-408.3 \text{ kJ/kg}}$$

C.V. Intercooler, no work and no changes in kinetic or potential energy.

$$q_{23} = h_3 - h_2 = C_{P0}(T_3 - T_2) = 1.004(340 - 706.7) = \mathbf{-368.2 \text{ kJ/kg}}$$

C.V. Stage 2. Analysis the same as stage 1. So from Eq.6.23

$$T_4 = T_3(P_4/P_3)^{\frac{k-1}{k}} = 340 \text{ K } (15/2)^{0.286} = 604.6 \text{ K}$$

$$w_{C2} = h_3 - h_4 = C_{P0}(T_3 - T_4) = 1.004(340 - 604.6) = \mathbf{-265.7 \text{ kJ/kg}}$$

Same flow rate through both stages so the total work is the sum of the two

$$w_{comp} = w_{C1} + w_{C2} = -408.3 - 265.7 = \mathbf{-682.8 \text{ kJ/kg}}$$

For no intercooler ($P_2 = 15.74$ MPa) same analysis as stage 1. So Eq.6.23

$$T_2 = 300 \text{ K } (15000/100)^{0.286} = 1255.6 \text{ K}$$

$$w_{comp} = 1.004 \text{ kJ/kg-K } (300 - 1255.6) \text{ K} = \mathbf{-959.4 \text{ kJ/kg}}$$

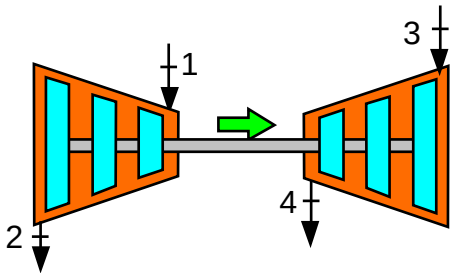
Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.46

A certain industrial process requires a steady supply of saturated vapor steam at 200 kPa, at a rate of 0.5 kg/s. Also required is a steady supply of compressed air at 500 kPa, at a rate of 0.1 kg/s. Both are to be supplied by the process shown in Fig. P7.46. Steam is expanded in a turbine to supply the power needed to drive the air compressor, and the exhaust steam exits the turbine at the desired state. Air into the compressor is at the ambient conditions, 100 kPa, 20°C. Give the required steam inlet pressure and temperature, assuming that both the turbine and the compressor are reversible and adiabatic.

Solution:

C.V. Each device. Steady flow. Both adiabatic (q = 0) and reversible (s_{gen} = 0).



Steam turbine Air compressor

Compressor: $s_4 = s_3$ => $T_4 = T_3(P_4/P_3)^{\frac{k-1}{k}} = 293.2\ \text{K} \left(\frac{500}{100}\right)^{0.286} = 464.6\ \text{K}$

$$\dot{W}_C = \dot{m}_3(h_3 - h_4) = 0.1\ \text{kg/s} \times 1.004\ \text{kJ/kg-K}\ (293.2 - 464.6)\ \text{K} = -17.2\ \text{kW}$$

Turbine: Energy: $\dot{W}_T = +17.2\ \text{kW} = \dot{m}_1(h_1 - h_2)$; Entropy: $s_2 = s_1$

Table B.1.2: P_2 = 200 kPa, x_2 = 1 =>

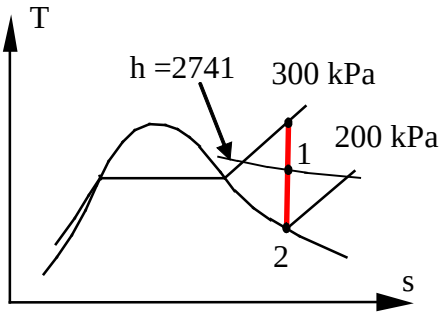
h_2 = 2706.6 kJ/kg, s_2 = 7.1271 kJ/kgK

h_1 = 2706.6 + 17.2/0.5 = 2741.0 kJ/kg

$s_1 = s_2$ = 7.1271 kJ/kg K,

300 kPa: $s = s_2$ => h = 2783.0 kJ/kg

Interpolate between the 200 and 300 kPa



$$P = 200 + (300 - 200)\ \frac{2741 - 2706.63}{2783.0 - 2706.63} = \mathbf{245\ kPa}$$

$$T = 120.23 + (160.55 - 120.23)\ \frac{2741 - 2706.63}{2783.0 - 2706.63} = \mathbf{138.4°C}$$

If you use the software you get: At h_1, $s_1 \rightarrow P_1$ = **242 kPa**, T_1 = **138.3°C**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.47

A certain industrial process requires a steady 0.75 kg/s supply of compressed air at 500 kPa, at a maximum temperature of 30°C. This air is to be supplied by installing a compressor and aftercooler. Local ambient conditions are 100 kPa, 20°C. Using an reversible compressor, determine the power required to drive the compressor and the rate of heat rejection in the aftercooler.
Solution:

Air Table A.5: R = 0.287 kJ/kg-K, C_p = 1.004 kJ/kg K, k = 1.4

State 1: $T_1 = T_o = 20^oC$, $P_1 = P_o$ = 100 kPa, $\dot{m}$ = 0.5 kg/s

State 2: $P_2 = P_3$ = 500 kPa

State 3: $T_3 = 30^oC$, P_3 = 500 kPa

Compressor: Assume Isentropic (adiabatic q = 0 and reversible $s_{gen} = 0$) From entropy equation Eq.7.9 this gives constant s which is expressed for an ideal gas in Eq.6.23

$$T_2 = T_1 (P_2/P_1)^{\frac{k-1}{k}} = 293.15 \text{ K } (500/100)^{0.2857} = 464.6 \text{ K}$$

Energy Eq.4.13: $q_C + h_1 = h_2 + w_C$; $q_C = 0$,

assume constant specific heat from Table A.5

$$w_C = C_p(T_1 - T_2) = 1.004 \text{ kJ/kgK } (293.15 - 464.6) \text{ K} = -172.0 \text{ kJ/kg}$$

$$\dot{W}_C = \dot{m} w_C = \mathbf{-129\ kW}$$

Aftercooler Energy Eq.4.13: $q + h_2 = h_3 + w$; $w = 0$,

assume constant specific heat

$$\dot{Q} = \dot{m}q = \dot{m}C_p(T_3 - T_2) = 0.75 \text{ kg/s} \times 1.004 \text{ kJ/kg-K } (303.15 - 464.6) \text{ K}$$
$$= \mathbf{-121.6\ kW}$$

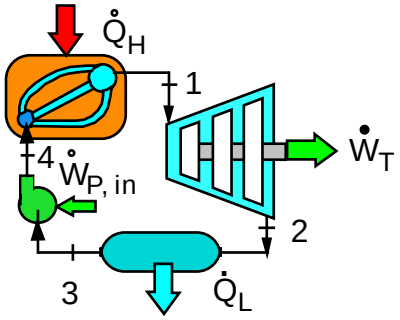
7.48

Consider a steam turbine power plant operating near critical pressure, as shown in Fig. P7.48. As a first approximation, it may be assumed that the turbine and the pump processes are reversible and adiabatic. Neglecting any changes in kinetic and potential energies, calculate

a. The specific turbine work output and the turbine exit state
b. The pump work input and enthalpy at the pump exit state
c. The thermal efficiency of the cycle

Solution:



$P_1 = P_4 = 20$ MPa
$T_1 = 700$ °C
$P_2 = P_3 = 20$ kPa
$T_3 = 40$ °C

a) State 1: (P, T) Table B.1.3 $h_1 = 3809.1$ kJ/kg, $s_1 = 6.7993$ kJ/kg K

C.V. Turbine.

Entropy Eq.7.9: $s_2 = s_1 = 6.7993$ kJ/kg K

Table B.1.2 $s_2 = 0.8319 + x_2 \times 7.0766$ => $x_2 = 0.8433$

$h_2 = 251.4 + 0.8433 \times 2358.33 =$ **2240.1**

Energy Eq.4.13: $w_T = h_1 - h_2 =$ **1569 kJ/kg**

b) State 3: (P, T) Compressed liquid, take sat. liq. Table B.1.1

$h_3 = 167.5$ kJ/kg, $v_3 = 0.001008$ m^3/kg

Property relation v = constant gives work from Eq.7.15 as

$w_P = - v_3(P_4 - P_3) = -0.001008(20000 - 20) =$ **-20.1 kJ/kg**

$h_4 = h_3 - w_P = 167.5 + 20.1 =$ **187.6 kJ/kg**

c) The heat transfer in the boiler is from energy Eq.4.13

$q_{boiler} = h_1 - h_4 = 3809.1 - 187.6 = 3621.5$ kJ/kg

$w_{net} = 1569 - 20.1 =$ **1548.9 kJ/kg**

$$\eta_{TH} = w_{net}/q_{boiler} = \frac{1548.9}{3621.5} = \mathbf{0.428}$$

7.49

A 10 m tall, 2 m^2 cross sectional area water tank is on a tower so the bottom is 5 m up from ground level and the top is open to the atmosphere. It is initially empty and then filled by a pump taking water at ambient T = 17°C, 100 kPa from a small pond at ground level. Assume the process is reversible and find the total pump work.

CV Pump, pipe and water tank.

In this problem there clearly is a potential energy change but we will neglect any kinetic energy. Pressure of the water in and pressure in the tank is the same P_o, which is the pressure where the volume (water surface) expands in the tank.

Continuity Eq.4.15: $m_2 - 0 = m_{in}$

Energy Eq.4.16: $m_2(u_2 + gZ_2) - 0 = 0 - {}_1W_{2\ atm} + m_{in}(h_{in} + gZ_{in}) + W_{pump}$

Entropy Eq.7.13: $m_2 s_2 - 0 = \int dQ/T + {}_1S_{2\ gen} + m_{in}s_{in} = m_{in}s_{in}$

Process: Adiabatic ${}_1Q_2 = 0$, Process ideal ${}_1S_{2\ gen} = 0$, $s_2 = s_{in}$ and $Z_{in} = 0$

From the entropy we conclude the T stays the same, recall Eq.6.11 and the work to the atmosphere is

$${}_1W_{2\ atm} = P_o\,(V_2 - 0) = m_2 P_2 v_2$$

So this will cancel the the incoming flow work included in $m_{in}h_{in}$. The energy equation becomes with $Z_{in} = 0$

$$m_2(u_2 + gZ_2) = -\,m_2 P_2 v_2 + m_{in}(u_{in} + P_{in}v_{in}) + W_{pump}$$

and then since state 2: P_o, T_{in} and state in: P_o, T_{in} then $u_2 = u_{in}$. Left is

$$m_2 g Z_2 = W_{pump}$$

The final elevation is the average elevation for the mass $Z_2 = 5\text{m} + 5\text{m} = 10\text{m}$.

$$W_{pump} = m_2 g\, Z_2$$

$$= 997\ \text{kg/m}^3 \times (10 \times 2)\ \text{m}^3 \times 9.807\ \text{m/s}^2 \times 10\ \text{m}$$

$$= 1\,955\,516\ \text{J} = \mathbf{1\ 955.5\ kJ}$$

7.50

Air in a tank is at 300 kPa, 400 K with a volume of 2 m^3. A valve on the tank is opened to let some air escape to the ambient to a final pressure inside of 200 kPa. Find the final temperature and mass assuming a reversible adiabatic process for the air remaining inside the tank.

Solution:

C.V. Total tank.

Continuity Eq.4.15: $m_2 - m_1 = -m_{ex}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = -m_{ex}h_{ex} + {}_1Q_2 - {}_1W_2$

Entropy Eq.7.12: $m_2s_2 - m_1s_1 = -m_{ex}s_{ex} + \int dQ/T + {}_1S_{2\,gen}$

Process: Adiabatic ${}_1Q_2 = 0$; rigid tank ${}_1W_2 = 0$

This has too many unknowns (we do not know state 2).

C.V. m_2 the mass that remains in the tank. This is a control mass.

Energy Eq.3.5: $m_2(u_2 - u_1) = {}_1Q_2 - {}_1W_2$

Entropy Eq.6.14: $m_2(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

Process: Adiabatic ${}_1Q_2 = 0$; Reversible ${}_1S_{2\,gen} = 0$

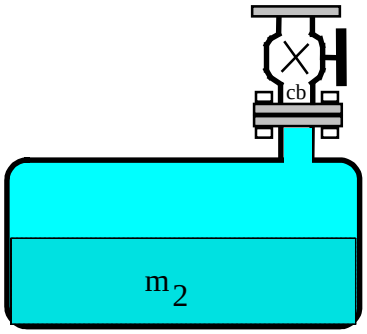
$\Rightarrow \quad s_2 = s_1$

Ideal gas and process Eq.6.23

$$T_2 = T_1\left(\frac{P_2}{P_1}\right)^{\frac{k-1}{k}} = 400\ \text{K}\ (200/300)^{0.2857} = \mathbf{356.25\ K}$$

$$m_2 = \frac{P_2V}{RT_2} = \frac{200 \times 2}{0.287 \times 356.25}\frac{\text{kPa m}^3}{\text{(kJ/kg-K)} \times \text{K}} = \mathbf{3.912\ kg}$$

Notice that the work term is not zero for mass m_2. The work goes into pushing the mass m_{ex} out.



Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.51

A 0.5 m^3 tank contains carbon dioxide at 300 K, 150 kPa is now filled from a supply of carbon dioxide at 300 K, 150 kPa by a compressor to a final tank pressure of 450 kPa. Assume the whole process is adiabatic and reversible. Find the final mass and temperature in the tank and the required work to the compressor.

C.V. The tank and the compressor.

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = {}_1Q_2 - {}_1W_2 + m_{in}h_{in}$

Entropy Eq.7.13: $m_2s_2 - m_1s_1 = \int dQ/T + {}_1S_{2\,gen} + m_{in}s_{in}$

Process: Adiabatic ${}_1Q_2 = 0$, Process ideal ${}_1S_{2\,gen} = 0$, $s_1 = s_{in}$

$\Rightarrow m_2s_2 = m_1s_1 + m_{in}s_{in} = (m_1 + m_{in})s_1 = m_2s_1 \Rightarrow s_2 = s_1$

Constant s so since the temperatures are modest use Eq.6.23

$$T_2 = T_1\left(\frac{P_2}{P_1}\right)^{\frac{k-1}{k}} = 300\ \text{K}\ (450/150)^{0.2242} = \mathbf{383.79\ K}$$

$$m_1 = P_1V_1/RT_1 = \frac{150\ \text{kPa} \times 0.5\ \text{m}^3}{0.1889\ \text{kJ/kg-K} \times 300\ \text{K}} = 1.3235\ \text{kg}$$

$m_2 = P_2V_2/RT_2 = 450\ \text{kPa} \times 0.5\ \text{m}^3/(0.1889 \times 383.79)\ \text{kJ/kg} = \mathbf{3.1035\ kg}$

$\Rightarrow m_{in} = 1.78$ kg

${}_1W_2 = m_{in}h_{in} + m_1u_1 - m_2u_2 = m_{in}RT_{in} + m_1(u_1 - u_{in}) - m_2(u_2 - u_{in})$

$= 1.78\ (0.1889 \times 300) + m_1\ (0) - 3.1035 \times 0.653\ (383.79 - 300)$

$= \mathbf{-68.93\ kJ}$ (work must come in)

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.52

A tank contains 1 kg of carbon dioxide at 6 MPa, 60°C and it is connected to a turbine with an exhaust at 1000 kPa. The carbon dioxide flows out of the tank and through the turbine to a final state in the tank of saturated vapor is reached. If the process is adiabatic and reversible find the final mass in the tank and the turbine work output.

C.V. The tank and turbine. This is a transient problem.

Continuity Eq.4.15: $m_2 - m_1 = -m_{ex}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = -m_{ex}h_{ex} + {}_1Q_2 - {}_1W_2$

Entropy Eq.7.12: $m_2s_2 - m_1s_1 = -m_{ex}s_{ex} + \int dQ/T + {}_1S_{2\,gen}$

Process: Adiabatic ${}_1Q_2 = 0$; reversible ${}_1S_{2\,gen} = 0$

State 1: $v_1 = 0.00801$ m^3/kg, $u_1 = 322.51$ kJ/kg, $s_1 = 1.2789$ kJ/kg-K

State 2: Sat. vapor, 1 property missing

C.V. m_2 the mass that remains in the tank. This is a control mass.

Process: Adiabatic ${}_1Q_2 = 0$; Reversible ${}_1S_{2\,gen} = 0$

Entropy Eq.6.14: $m_2(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen} = 0 + 0$

$\Rightarrow$ $s_2 = s_1$ this is the missing property.

State 2: $T_2 = -19.19$°C, $v_2 = 0.018851$ m^3/kg, $u_2 = 285.87$ kJ/kg

State exit: $s_{ex} = s_2 = s_1$ follows from entropy Eq. for first C.V. with the use of the continuity equation. Use 1004.5 kPa for -40°C.

$x_{ex} = (1.2789 - 0)/1.3829 = 0.924796$ => $h_{ex} = 298.17$ kJ/kg

Tank volume constant so $V = m_1v_1 = m_2v_2$

$$m_2 = m_1\, v_1 / v_2 = 1 \text{ kg} \times 0.00801 / 0.018851 = \mathbf{0.4249\ kg}$$

From energy eq.

$${}_1W_2 = m_1u_1 - m_2u_2 - m_{ex}h_{ex}$$
$$= 1 \times 322.51 - 0.4249 \times 285.87 - 0.5751 \times 298.17 \text{ [kg kJ/kg]}$$
$$= \mathbf{29.57\ kJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.53

Air in a tank is at 300 kPa, 400 K with a volume of 2 m^3. A valve on the tank is opened to let some air escape to the ambient to a final pressure inside of 200 kPa. At the same time the tank is heated so the air remaining has a constant temperature. What is the mass average value of the s leaving assuming this is an internally reversible process?

Solution:

C.V. Tank, emptying process with heat transfer.

Continuity Eq.4.15: $m_2 - m_1 = -m_e$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = -m_eh_e + {}_1Q_2$

Entropy Eq.7.13: $m_2s_2 - m_1s_1 = -m_es_e + {}_1Q_2/T + 0$

Process: $T_2 = T_1$ => ${}_1Q_2$ in at 400 K

Reversible ${}_1S_{2\ gen} = 0$

State 1: Ideal gas $m_1 = P_1V/RT_1 = 300 \times 2/0.287 \times 400 = 5.2265$ kg

State 2: 200 kPa, 400 K

$m_2 = P_2V/RT_2 = 200$ kPa $\times$ 2 $m^3/(0.287 \times 400)$ kJ/kg = 3.4843 kg

=> $m_e = 1.7422$ kg

From the energy equation:

$${}_1Q_2 = m_2u_2 - m_1u_1 + m_eh_e$$

$$= 3.4843 \times 286.49 - 5.2265 \times 286.49 + 1.7422 \times 401.3$$

$$= 1.7422 \text{ kg } (401.3 - 286.49) \text{ kJ/kg} = 200 \text{ kJ}$$

$$m_es_e = m_1s_1 - m_2s_2 + {}_1Q_2/T$$

$$= 5.2265[7.15926 - 0.287 \ln (300/100)] - 3.4843[7.15926 - 0.287 \ln (200/100)] + (200/400)$$

$$m_es_e = 35.770 - 24.252 + 0.5 = 12.018 \text{ kJ/K}$$

$$s_e = 12.018/1.7422 = 6.89817 = \mathbf{6.8982\ kJ/kg\ K}$$

Note that the exit state e in this process is for the air before it is throttled across the discharge valve. The throttling process from the tank pressure to ambient pressure is a highly irreversible process.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.54

An insulated 2 m^3 tank is to be charged with R-134a from a line flowing the refrigerant at 3 MPa. The tank is initially evacuated, and the valve is closed when the pressure inside the tank reaches 2 MPa. The line is supplied by an insulated compressor that takes in R-134a at 5°C, quality of 96.5 %, and compresses it to 3 MPa in a reversible process. Calculate the total work input to the compressor to charge the tank.

Solution:

C.V.: Compressor, R-134a. Steady 1 inlet and 1 exit flow, no heat transfer.

Energy Eq.4.13: $q_C + h_1 = h_1 = h_2 + w_C$

Entropy Eq.7.9: $s_1 + \int dq/T + s_{gen} = s_1 + 0 = s_2$

inlet: $T_1 = 5^oC$, $x_1 = 0.965$ use Table B.5.1

$s_1 = s_f + x_1 s_{fg} = 1.0243 + 0.965 \times 0.6995 = 1.6993$ kJ/kg K,

$h_1 = h_f + x_1 h_{fg} = 206.75 + 0.965 \times 194.57 = 394.51$ kJ/kg

exit: $P_2 = 3$ MPa

From the entropy eq.: $s_2 = s_1 = 1.6993$ kJ/kg K;

$T_2 = 90^oC$, $h_2 = 436.19$ kJ/kg

$w_C = h_1 - h_2 = -41.68$ kJ/kg

C.V.: Tank; $V_T = 2\ m^3$, $P_T = 2$ MPa

Energy Eq.4.16: $Q + m_i h_i = m_3 u_3 - m_1 u_1 + m_e h_e + W$;

Process and states have: $Q = 0$, $W = 0$, $m_e = 0$, $m_1 = 0$, $m_3 = m_i$

Final state: $P_3 = 2$ MPa, $u_3 = h_i = h_2 = 436.19$ kJ/kg,

$\rightarrow T_3 = 90^oC$, $v_3 = 0.01137\ m^3/kg$, $s_3 = 1.785$ kJ/kgK

$m_3 = V_T/v_3 = 2/0.01137 = 175.9$ kg;

The work term is from the specific compressor work and the total mass

$-W_C = m_T(-w_C) =$ **7 331 kJ**

Comment: The filling process is not reversible note $s_3 > s_2$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.55

An underground salt mine, 100 000 m^3 in volume, contains air at 290 K, 100 kPa. The mine is used for energy storage so the local power plant pumps it up to 2.1 MPa using outside air at 290 K, 100 kPa. Assume the pump is ideal and the process is adiabatic. Find the final mass and temperature of the air and the required pump work.

Solution:

C.V. The mine volume and the pump

Continuity Eq.4.15: $m_2 - m_1 = m_{in}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = {}_1Q_2 - {}_1W_2 + m_{in}h_{in}$

Entropy Eq.7.13: $m_2s_2 - m_1s_1 = \int dQ/T + {}_1S_{2\,gen} + m_{in}s_{in}$

Process: Adiabatic ${}_1Q_2 = 0$, Process ideal ${}_1S_{2\,gen} = 0$, $s_1 = s_{in}$

$$\Rightarrow m_2s_2 = m_1s_1 + m_{in}s_{in} = (m_1 + m_{in})s_1 = m_2s_1 \Rightarrow s_2 = s_1$$

Constant s $\Rightarrow$ Eq.8.19 $s^o_{T2} = s^o_{Ti} + R \ln(P_2 / P_{in})$

$$s^o_{T2} = 6.83521 + 0.287 \ln(21) = 7.7090 \text{ kJ/kg K}$$

A.7 $\Rightarrow T_2 = \mathbf{680\ K}$, $u_2 = 496.94$ kJ/kg

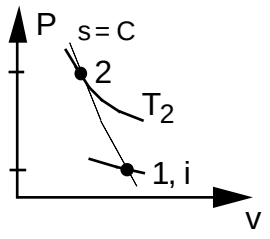
$$m_1 = P_1V_1/RT_1 = \frac{100 \text{ kPa} \times 10^5 \text{ m}^3}{0.287 \text{ kJ/kg-K} \times 290 \text{ K}} = 1.20149 \times 10^5 \text{ kg}$$

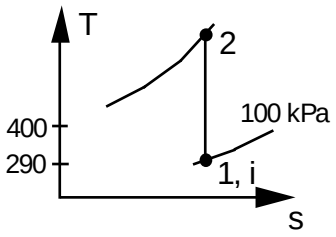
$$m_2 = P_2V_2/RT_2 = 100 \text{ kPa} \times 21 \times 10^5 \text{ m}^3/(0.287 \times 680) \text{ kJ/kg} = \mathbf{10.760 \times 10^5\ kg}$$

$$\Rightarrow m_{in} = 9.5585 \times 10^5 \text{ kg}$$

$${}_1W_2 = m_{in}h_{in} + m_1u_1 - m_2u_2$$

$$= m_{in}(290.43) + m_1(207.19) - m_2(496.94) = \mathbf{-2.322 \times 10^8\ kJ}$$





Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.56

R-410A at 120°C, 4 MPa is in an insulated tank and flow is now allowed out to a turbine with a backup pressure of 800 kPa. The flow continue to a final tank pressure of 800 kPa and the process stops. If the initial mass was 1 kg how much mass is left in the tank and what is the turbine work assuming a reversible process?

Solution:

C.V. Total tank and turbine.

Continuity Eq.4.15: $m_2 - m_1 = -m_{ex}$

Energy Eq.4.16: $m_2u_2 - m_1u_1 = -m_{ex}h_{ex} + {}_1Q_2 - {}_1W_2$

Entropy Eq.7.12: $m_2s_2 - m_1s_1 = -m_{ex}s_{ex} + \int dQ/T + {}_1S_{2\,gen}$

Process: Adiabatic ${}_1Q_2 = 0$; Reversible ${}_1S_{2\,gen} = 0$

This has too many unknowns (we do not know state 2 only P_2).

C.V. m_2 the mass that remains in the tank. This is a control mass.

Entropy Eq.7.3 (6.37): $m_2(s_2 - s_1) = \int dQ/T + {}_1S_{2\,gen}$

Process: Adiabatic ${}_1Q_2 = 0$; Reversible ${}_1S_{2\,gen} = 0$

$\Rightarrow \quad s_2 = s_1$

State 1: $v_1 = 0.00897\ m^3/kg$, $u_1 = 331.39$ kJ/kg, $s_1 = 1.1529$ kJ/kg-K

State 2 (P,s): $T_2 = 33.23°C$, $v_2 = 0.37182\ m^3/kg$, $u_2 = 281.29$ kJ/kg

State exit: $s_{ex} = s_2 = s_1$ follows from entropy Eq. for first C.V. using the continuity eq., this is identical to state 2, $h_{ex} = 312.85$ kJ/kg

Tank volume constant so $V = m_1v_1 = m_2v_2$

$m_2 = m_1\, v_1 / v_2 = 1\ kg \times 0.00897 / 0.37182 =$ **0.0241 kg**

From energy eq.

${}_1W_2 = m_1u_1 - m_2u_2 - m_{ex}h_{ex}$

$= 1 \times 331.39 - 0.0241 \times 281.29 - 0.9759 \times 312.85$ [kg kJ/kg]

= **19.3 kJ**

7.57

A river flowing at 0.5 m/s across 1 m high and 10 m wide area has a dam that creates an elevation difference of 2 m. How much energy can a turbine deliver per day if 80% of the potential energy can be extracted as work?

CV Dam from upstream to downstream 2 m lower elevation

Continuity Eq.: $\dot{m} = \text{constant} = \dot{m}_e = \dot{m}_i = A_e \mathbf{V}_e / v_e = A_i \mathbf{V}_i / v_i$

Find the mass flow rate

$$\dot{m} = A\mathbf{V}_i / v = \rho A \mathbf{V}_i = 997 \text{ kg/m}^3 \times (1 \times 10) \text{ m}^2 \times 0.5 \text{ m/s} = 4985 \text{ kg/s}$$

Energy Eq.: $0 = \dot{m} (h_i + 0.5\mathbf{V}_i^2 + gZ_i) - \dot{m} (h_e + 0.5\mathbf{V}_e^2 + gZ_e) - \dot{W}$

The velocity in and out is the same assuming same flow area and the two enthalpies are also the same since same T and $P = P_0$.

This is consistent with Eq.7.14 [$w = g(Z_i - Z_e)$ - loss]

$$\dot{W} = 0.8\, \dot{m}\, g(Z_i - Z_e) = 0.8 \times 4985 \text{ kg/s} \times 9.807 \text{ m/s}^2 \times 2 \text{ m}$$
$$= 78\,221 \text{ J/s} = 78\,221 \text{ W} = 78.2 \text{ kW}$$

$$W = \dot{W}\, \Delta t = 78.2 \text{ (kJ/s)} \times 24 \times 60 \times 60 \text{ s} = \mathbf{6.76\ GJ}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.58

How much liquid water at 15^{o}C can be pumped from 100 kPa to 300 kPa with a 3 kW motor?

Incompressible flow (liquid water) and we assume reversible. Then the shaftwork is from Eq.7.15 (7.16)

$$w = -\int v\, dP = -v\, \Delta P = -0.001\ m^3/kg\ (300 - 100)\ kPa$$
$$= -\ 0.2\ kJ/kg$$

$$\dot{m} = \frac{\dot{W}}{-w} = \frac{3}{0.2}\frac{kW}{kJ/kg} = \mathbf{15\ kg/s}$$

Remark: The pump should also generate the kinetic energy, so the $\dot{m}$ will be smaller.

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.59

A large storage tank contains saturated liquid nitrogen at ambient pressure, 100 kPa; it is to be pumped to 500 kPa and fed to a pipeline at the rate of 0.5 kg/s. How much power input is required for the pump, assuming it to be reversible?

Solution:

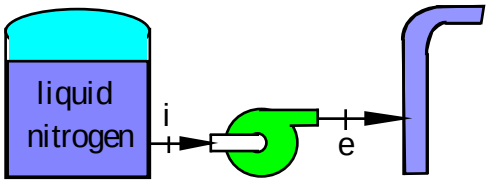
C.V. Pump, liquid is assumed to be incompressible.

Table B.6.1 at P_i = 101.3 kPa , v_{Fi} = 0.00124 m^3/kg

Eq.7.15

$w_{PUMP} = - w_{cv} = \int vdP \approx v_{Fi}(P_e - P_i)$

$= 0.00124(500 - 101) = 0.494$ kJ/kg



$$\dot{W}_{PUMP} = \dot{m} w_{PUMP} = 0.5 \text{ kg/s } (0.494 \text{ kJ/kg}) = \mathbf{0.247\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.60

Liquid water at 300 kPa, 15°C flows in a garden hose with a small ideal nozzle. How high a velocity can be generated? If the water jet is directed straight up how high will it go?

Solution:

Liquid water is incompressible and we will assume process is reversible.

Bernoulli's Eq. across the nozzle Eq.7.16: $v\Delta P = \Delta(\frac{1}{2}\mathbf{V}^2)$

$\mathbf{V} = \sqrt{2v\Delta P} = \sqrt{2 \times 0.001001 \times (300\text{-}101) \times 1000}$ = **19.96 m/s**

Bernoulli's Eq.7.16 for the column: $\Delta(\frac{1}{2}\mathbf{V}^2) = \Delta gZ$

$\Delta Z = \Delta(\frac{1}{2}\mathbf{V}^2)/g = v\Delta P/g$

$= 0.001001\ m^3/kg \times (300 - 101)\ kPa \times 1000\ (Pa/kPa)/\ 9.807\ m/s^2$

= **20.3 m**

7.61

A wave comes rolling in to the beach at 2 m/s horizontal velocity. Neglect friction and find how high up (elevation) on the beach the wave will reach.

We will assume a steady reversible single flow at constant pressure and temperature for the incompressible liquid water. The water will flow in and up the sloped beach until it stops ($\mathbf{V}$ = 0) so Bernoulli Eq.7.17 leads to

$$gz_{in} + \frac{1}{2}\mathbf{V}^2_{in} = gz_{ex} + 0$$

$$(z_{ex} - z_{in}) = \frac{1}{2g}\mathbf{V}^2_{in} = \frac{1}{2 \times 9.807\ \text{m/s}^2}\, 2^2\ (\text{m/s})^2 = \mathbf{0.204\ m}$$

7.62

A small pump takes in water at 20°C, 100 kPa and pumps it to 2.5 MPa at a flow rate of 100 kg/min. Find the required pump power input.

Solution:

C.V. Pump. Assume reversible pump and incompressible flow.

With single steady state flow it leads to the work in Eq.7.15

$$w_p = -\int v dP = -v_i(P_e - P_i) = -0.001002\ m^3/kg\ (2500 - 100)\ kPa = -2.4\ kJ/kg$$

$$\dot{W}_p = \dot{m} w_p = \frac{100}{60}\frac{kg/min}{sec/min}(-2.4\ kJ/kg) = \mathbf{-4.0\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.63

An irrigation pump takes water from a river at 10°C, 100 kPa and pumps it up to an open canal at a 50 m higher elevation. The pipe diameter in and out of the pump is 0.1 m and the motor driving the pump is 5 hp. Neglect kinetic energies and friction, find the maximum possible mass flow rate.

CV the pump. The flow is incompressible and steady flow. The pump work is the difference between the flow work in and out and from Bernoulli's eq. for the pipe that is equal to the potential energy increase sincle pump inlet pressure and pipe outlet pressure are the same.

$$w_p = v\,\Delta P = g\,\Delta Z = 9.81 \times 50 \text{ J/kg} = 0.49 \text{ kJ/kg}$$

The horsepower is converted from Table A.1

$$\dot{W}_{motor} = 5 \text{ hp} = 5 \text{ hp} \times 0.746 \text{ kW/hp} = 3.73 \text{ kW}$$

$$\dot{m} = \dot{W}_{motor} / w_p = 3.73 \text{ kW} / 0.49 \text{ kJ/kg} = \mathbf{7.6\ kg/s}$$

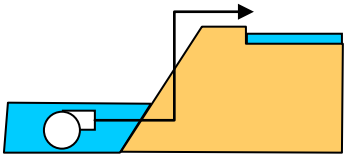
Comment:

$$\dot{m} = AV/v \quad \Rightarrow \quad V = \frac{\dot{m}v}{A} = \frac{4\dot{m}}{\rho\,\pi\,D^2} = \frac{4 \times 7.6}{997 \times \pi \times 0.1^2} = 0.97 \text{ m/s}$$

The power to generated the kinetic energy is

$$\text{Power} = \dot{m}\ 0.5\ V^2 = 7.6 \text{ kg/s} \times 0.5 \times 0.97^2 \text{ (m/s)}^2 = 3.57 \text{ W}$$

This is insignificant relative to the power needed for the potential energy increase.



Pump inlet and the pipe exit both have close to atmospheric pressure.

7.64

A firefighter on a ladder 25 m above ground should be able to spray water an additional 10 m up with the hose nozzle of exit diameter 2.5 cm. Assume a water pump on the ground and a reversible flow (hose, nozzle included) and find the minimum required power.

Solution:

C.V.: pump + hose + water column, total height difference 35 m.

Continuity Eq.4.3, 6.11: $\dot{m}_{in} = \dot{m}_{ex} = (\rho A \mathbf{V})_{nozzle}$

Energy Eq.4.12: $\dot{m}(-w_p) + \dot{m}(h + \mathbf{V}^2/2 + gz)_{in} = \dot{m}(h + \mathbf{V}^2/2 + gz)_{ex}$

Process: $h_{in} \cong h_{ex}$, $\mathbf{V}_{in} \cong \mathbf{V}_{ex} = 0$, $z_{ex} - z_{in} = 35$ m , $\rho = 1/v \cong 1/v_f$

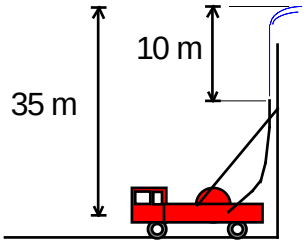
$$-w_p = g(z_{ex} - z_{in}) = 9.81 \times (35 - 0) = 343.2 \text{ J/kg}$$

The velocity in the exit nozzle is such that it can rise 10 m. Make that column a C.V. for which Bernoulli Eq.7.17 is:

$$gz_{noz} + \frac{1}{2}\mathbf{V}^2_{noz} = gz_{ex} + 0$$

$$\mathbf{V}_{noz} = \sqrt{2g(z_{ex} - z_{noz})}$$

$$= \sqrt{2 \times 9.81 \times 10} = 14 \text{ m/s}$$



$$\dot{m} = \frac{\pi}{v_f}\left(\frac{D}{2}\right)^2 \mathbf{V}_{noz} = (\pi/4)\, 0.025^2 \times 14 / 0.001 = 6.873 \text{ kg/s}$$

$$-\dot{W}_p = -\dot{m} w_p = 6.873 \text{ kg/s} \times 343.2 \text{ J/kg} = \mathbf{2.36\ kW}$$

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.65

Saturated R-410A at -10°C is pumped/compressed to a pressure of 2.0 MPa at the rate of 0.5 kg/s in a reversible adiabatic process. Calculate the power required and the exit temperature for the two cases of inlet state of the R-410A:

a) quality of 100 %.
b) quality of 0 %.

Solution:

C.V.: Pump/Compressor, $\dot{m}$ = 0.5 kg/s, R-410A

a) State 1: Table B.5.1, $T_1 = -10^oC$, $x_1 = 1.0$ Saturated vapor

$P_1 = P_g = 573.1$ kPa, $h_1 = h_g = 275.78$ kJ/kg, $s_1 = s_g = 1.0567$ kJ/kg-K

Assume Compressor is isentropic, $s_2 = s_1 = 1.0567$ kJ/kg-K

$h_2 = 334.18$ kJ/kg, $\mathbf{T_2 = 52^oC}$

Energy Eq.4.13: $q_C + h_1 = h_2 + w_C$; $q_C = 0$

$w_{CS} = h_1 - h_2 = -58.4$ kJ/kg; => $\dot{W}_C = \dot{m}w_C = \mathbf{-29.2\ kW}$

b) State 1: $T_1 = -10^oC$, $x_1 = 0$ Saturated liquid. This is a pump.

$P_1 = 573.1$ kPa, $h_1 = h_f = 42.80$ kJ/kg, $v_1 = v_f = 0.000827$ m^3/kg

Energy Eq.4.13: $q_p + h_1 = h_2 + w_p$; $q_p = 0$

Assume Pump is isentropic and the liquid is incompressible, Eq.7.15:

$$w_{ps} = -\int v\, dP = -v_1(P_2 - P_1) = -1.18 \text{ kJ/kg}$$

$h_2 = h_1 - w_p = 42.80 - (- 1.18) = 43.98$ kJ/kg, $P_2 = 2$ MPa

Assume State 2 is approximately a saturated liquid => $\mathbf{T_2 \cong -9.2^oC}$

$$\dot{W}_P = \dot{m}w_P = \mathbf{-0.59\ kW}$$

7.66

Liquid water at ambient conditions, 100 kPa, 25°C, enters a pump at the rate of 0.5 kg/s. Power input to the pump is 3 kW. Assuming the pump process to be reversible, determine the pump exit pressure and temperature.

Solution:

C.V. Pump. Steady single inlet and exit flow with no heat transfer.

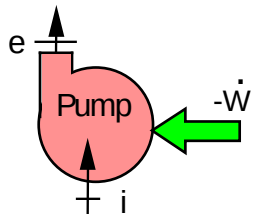
Energy Eq.4.13: $w = h_i - h_e = \dot{W}/\dot{m} = -3/0.5 = -6.0$ kJ/kg

Using also incompressible media we can use Eq.7.15

$$w = -\int v dP \approx -v_i(P_e - P_i) = -0.001003(P_e - 100)$$

from which we can solve for the exit pressure

$$P_e = 100 + 6.0/0.001003 = 6082 \text{ kPa} = \mathbf{6.082\ MPa}$$



$-\dot{W} = 3$ kW, $P_i = 100$ kPa

$T_i = 25°C$, $\dot{m} = 0.5$ kg/s

Energy Eq.: $h_e = h_i - w = 104.87 - (-6) = 110.87$ kJ/kg

Use Table B.1.4 at 5 MPa => $\mathbf{T_e = 25.3°C}$

Remark:

If we use the software we get: $s_i = 0.36736 = s_e$ at s_e & P_e $\rightarrow T_e =$ **25.1°C**

7.67

The underwater bulb nose of a container ship has a velocity relative to the ocean water as 10 m/s. What is the pressure at the front stagnation point that is 2 m down from the water surface.

Solution:

C.V. A stream line of flow from the freestream to the stagnation point on the front of the bulb nose.

Eq.7.17: $v(P_e - P_i) + \frac{1}{2}(\mathbf{V}_e^2 - \mathbf{V}_i^2) + g(Z_e - Z_i) = 0$

Horizontal so $Z_e = Z_i$ and $\mathbf{V}_e = 0$

$$\Delta P = \frac{1}{2v}\mathbf{V}_i^2 = \frac{10^2}{0.001001 \times 2000} = 49.95 \text{ kPa}$$

$P_i = P_o + gH/v = 101 \text{ kPa} + 9.81 \text{ m/s}^2 \times 2 \text{ m}/(0.001001 \text{ m}^3/\text{kg} \times 1000 \text{ J/kJ})$

$= 120.6 \text{ kPa}$

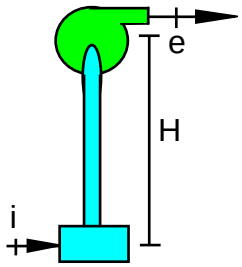
$P_e = P_i + \Delta P = 120.6 + 49.95 =$ **170.6 kPa**

Excerpts from this work may be reproduced by instructors for distribution on a not-for-profit basis for testing or instructional purposes only to students enrolled in courses for which this textbook has been adopted. *Any other reproduction or translation of this work beyond that permitted by Sections 107 or 108 of the 1976 United States Copyright Act without the permission of the copyright owner is unlawful.*

7.68

A small water pump on ground level has an inlet pipe down into a well at a depth H with the water at 100 kPa, 15°C. The pump delivers water at 400 kPa to a building. The absolute pressure of the water must be at least twice the saturation pressure to avoid cavitation. What is the maximum depth this setup will allow?

Solution:



C.V. Pipe in well, no work, no heat transfer

From Table B.1.1
