1. Core Definitions

To answer conceptual questions, you must know how the authors define these terms:

- **Climate Change:**
  - **General Definition:** The alteration of the environment resulting from human activities (like waste disposal, fuel combustion, deforestation) that increase Greenhouse Gases (GHG)[2].
  - **UN Framework Convention on Climate Change (UNFCCC) Definition:** Alteration of the global environment due to direct or indirect human practices, changing the composition of the global atmosphere[3].
- **Environmental Degradation:**
  - The degeneration of the ecosystem caused by the over-depletion of natural resources, disrupting the natural balance[4444].
  - **UN Strategy Definition:** The decline in the environment's capacity to support social and ecological needs[5].

2. Current Statistics & Evidence (Important for Quiz Data)

Memorize these numbers as they are likely to be tested:

- **Temperature Rise:**
  - **Historical:** 11 out of the 12 years between **1995 and 2006** were the warmest since **1885**[6].
  - **Future Projection:** Temperatures are expected to rise by **1.1°C to 6.4°C** by the year **2100**[777].
  - **Rate:** The earth's temperature has been rising at about **0.8°C since 1900**[8].
- **Disasters (General):**
  - **3,852** natural catastrophes have occurred recently[9].
  - **780,000+** lives lost; **2 billion+** people affected[10].
  - Economic loss: Over **$960 billion**[11].
  - Disasters are predicted to **double** in the next 10–15 years[12].
- **Migration/Displacement:**
  - Between **1979 and 2008**: **1.6 billion** people suffered from droughts, and **718 million** were hit by storms[13].
  - **Refugees:** In 2001, **25 million** became refugees due to climate. This is predicted to rise to **50 million by 2050**[14].
- **Sea Level:**

- Rising at a rate of **1.7mm/year** over the past 100 years[15].

3. Causes of Climate Change

The document identifies specific drivers for these changes:

- **Primary Cause:** Human activities are the leading force[16161616].
- **Greenhouse Gases (GHGs):**
  - Accumulation of gases like Carbon Dioxide (CO_2), Methane, Nitrogen (IV) oxide, and hydrofluorocarbons[171717171717171717].
  - **Mechanism:** These gases form a "blanket" that absorbs infrared rays from the sun and prevents heat from escaping, causing Global Warming[18].
  - **CO_2 Specifics:** CO_2 is the largest contributor. Its accumulation increased by **70%**, with more than half occurring after **1970** due to energy consumption[19].
- **Deforestation:**
  - Reduces the planet's ability to absorb CO_2 via photosynthesis[20].
  - Leads to soil erosion because trees no longer hold the topsoil against wind and water[21].
- **Industrialization:** Developing countries are losing forests to industrialization; only **one-fifth** of the world's forest remains intact[22].

4. Climate Change as a Security Threat

The document argues that climate change is not just environmental, but a threat to **Global Peace**.

- **Definition of Security:** The UN defines security as protection from hunger, disease, crime, social discord, and **environmental hazards**[23].
- **Types of Security Threats:**
  - **Water Wars: 1.1 billion** people lack safe water[24]. By 2020, **120 million to 1.2 billion** people in South/South East Asia will face scarcity[25]. There are currently **300 potential water conflicts** globally (e.g., Indo-Pak conflict)[26].
  - **Food Insecurity:** If global warming rises to **3°C**, the number of hungry people will rise from 250 million to **550 million**[27].
  - **Agriculture:** By 2020, **50%** of rain-fed arable land in some regions could be lost[28].

- **Infrastructure:** Climate change destroys energy plants (e.g., the Fukushima nuclear explosion in Japan caused by an earthquake/tsunami)[29].

5. Specific Country Case Studies (High Probability for Quiz)

The authors provide specific examples of how climate change impacts different nations.

A. Bangladesh (Most Detailed Example)

- **Risk:** One of the most predisposed nations to climate impacts[30].
- **Water Crisis: 77 million** people are at risk of using dirty water, exposing them to **Arsenic**[31].
- **Health Impact:** Arsenic exposure is likely to cause **2,000 to 270,000 deaths**[32].
- **Flooding:** Rainfall is expected to rise by **10%**[33].
- **Displacement:** A sea-level rise of **2-3 ft** will displace **30 million** people[34].
- **Agriculture:** By 2050, rice production will drop by **10%** and wheat by **30%**[35].

B. Nigeria

- **Conflict:** Climate change causes conflicts between **herders and farmers**[36].
- **Reason:** Herders struggle for survival for their cattle, leading to violence[37].
- **Fatalities:** Annual average of more than **2,000 deaths** (2011-2016), which at times exceeded deaths from the Boko Haram insurgency[38].

C. Sudan (Darfur)

- **Conflict:** The War in Darfur was a result of conflict caused by **drought and land deterioration**[39].
- **Migration:** Desertification eroded topsoil in the North, forcing people to migrate South, triggering war over resources[40].

D. Haiti

- **Event:** Violent protests in **2008** were linked to environmental destruction[41].
- **Deforestation:** In 1923, 60% of Haiti was forested; by 2008, only **1.5%** was forested[42].

6. Conclusion & Recommendations

- **Developing Countries:** They are most vulnerable but lack the funds to respond. They need at least **$50 billion** to prepare for catastrophes[43434343].
- **Global Response:**
    - About **70 UN member states** prioritized climate security risks at the 2015 Paris Conference[44].
    - Establishment of the **IPCC** (Intergovernmental Panel on Climate Change) to provide data[45].
- **Proposed Solutions:**
    - States must engage in environmentally friendly activities[46].
    - International agencies must hold countries responsible[47].
    - **Trade restrictions** or penalties should be imposed on defiant nations that fail to control emissions[48].

Quick Quiz Cheat Sheet (Memorize These!)

Data Point	Value/Fact
Warmest Years	11 of the 12 years between 1995-2006 [49]
Temp Rise by 2100	Predicted 1.1°C - 6.4°C [50]
Refugees by 2050	50 Million [51]
Bangladesh Displacement	30 Million people (due to 2-3ft sea rise) [52]
Haiti Forest Cover	Dropped to 1.5% in 2008 [53]
Hunger Risk (at 3°C rise)	550 Million people [54]
Primary GHG	Carbon Dioxide (CO_2) [55]
Water Scarcity Deaths	3.5 million/year (84% are children) [56]

Is there a specific section (like the Bangladesh statistics or the definitions) you want me to create practice questions for?
